The realisation of this paper relies on both primary and secondary sources. Primary sources were retrieved by performing archival research in the State Archive of Cuneo, in which the whole documentation of Santa Croce Hospital is kept. Documents analysed were of a different nature. In the first instance, accounting documents such as balance sheets were considered of crucial importance and were deeply analysed. Second, other kinds of documents, such as relations, declarations, circulars and epistolary exchanges, were considered, aiming to complete or specify accounting information already retrieved. The consultation and analysis of those documents was fundamental because they provided the reasons, the problems and the negotiations which led to choosing the Santa Croce Hospital as the new sanitary hub for the Piazza district. Moreover, because of the merger, consulting those non-accounting or economic documents permitted to highlight the position of the Church and the local authority, and that of the different Confraternities interested in the organisational operation. Regarding Confraternities, it was interesting to understand the new configuration in the merged hospital and the new destination of the old sanitary buildings obtained after the merger and the end of their use as healthcare facilities. Secondary sources are composed of an analysis of the scientific literature that helps frame the topic of the research in a faithful historical context, analysing both the role of Confraternities in society and their relationships with the Church and civil authorities. Furthermore, part of the secondary sources consists of specific productions regarding charity organisations in Mondovì, including particular information about the history and major events of local hospitals, as well as the history of every hospital in Mondovì, including those that merged into the Santa Croce Hospital throughout history. This was helpful not only for increasing the accuracy of the narration and the description of the organisations and the facts, especially from a historical perspective, but also because, thanks to some charts, it was possible to identify the strategic advantage that the position of the Santa Croce Hospital gave to the organisation, undoubtedly influencing the choice when the merger process was about of being designed and applied.

Accounting for Displacement: Governing Smyrna Refugees in Colonial Malta (1919–1922)

Alberto Caratozzolo[1], Ivan Paul Grixti[2], Carmelo Marisca[3], Nicola Rappazzo[4]

1. Introduction

In September 1922, the recapture of Smyrna by Turkish nationalist forces and the devastating fire that followed precipitated one of the most dramatic episodes of displacement in the eastern Mediterranean. The destruction of the city's Greek, Armenian, and European quarters transformed a long-standing commercial and cosmopolitan centre into a scene of panic, death, and forced displacement. As thousands of civilians crowded the waterfront in search of escape, Allied naval forces stationed in the harbour became the last possible channel of rescue. Among those evacuated were not only Greek and Armenian refugees, but also individuals connected to the British Empire through passports, descent, or legal status. A number of them, though culturally and linguistically integrated into the Levantine world of Smyrna, were transported to Malta.

The arrival of Smyrna refugees in Malta must be understood within a broader Mediterranean and imperial context. Malta occupied a strategic location within British imperial infrastructure and had long served as a military, naval, medical, and logistical hub. During the First World War it was widely described as the "nurse of the Mediterranean," a phrase that reflected both its military centrality and its imagined humanitarian usefulness. Yet by 1922 the island was no longer governed through a simple colonial chain of command. The constitutional reforms introduced in 1921 had established a limited form of self-government under a diarchic system that divided responsibility between imperial and local authorities. Certain matters remained reserved to the colonial government, while others were devolved to Maltese ministers. This institutional arrangement created uncertainty over fiscal responsibility, especially in moments of emergency.

The Smyrna refugee crisis therefore posed not only a humanitarian challenge but also an administrative and accounting problem. Who was responsible for receiving, housing, feeding, and possibly repatriating the refugees? Which categories of displaced persons were to be treated as a legitimate charge on local funds, and which were to be referred back to imperial authorities? How were donations to be allocated? These were not secondary issues that followed relief efforts; they were constitutive of them. The refugee emergency was organised through financial distinctions, bureaucratic procedures, and classificatory practices that transformed mobile and complex lives into categories legible to government (Mignolo, 2011; Stoler, 2008).

This paper argues that accounting was central to that process. It did not merely document costs after decisions had already been taken. Rather, accounting provided the language, categories, and calculative rationality through which the crisis was interpreted and governed. The

archival material reveals repeated efforts to separate refugees by birthplace, nationality, ancestry, and entitlement "to facilitate accounting." It also shows that standards of food provision, accommodation, labour obligations, and fund allocation were closely tied to these distinctions. Refugees thus emerged not simply as vulnerable persons in need of assistance, but as differentiated units of fiscal responsibility.

This argument matters for at least three reasons. First, it extends the literature on accounting for refugees by locating refugee governance within a colonial maritime setting rather than within the contemporary nation-state alone. Recent studies have shown that accounting plays an important role in rendering migrants visible, countable, governable, and often suspect. Yet historical cases remain comparatively underdeveloped, especially where imperial structures, overlapping jurisdictions, and layered forms of belonging complicate the operation of public authority (D'Cruz, 2014; Pianezzi et al., 2022; Quayle and Haque, 2023). Malta provides a particularly revealing site because it combined strategic insularity, partial self-government, and deep entanglement with British imperial and Mediterranean political dynamics.

Second, the case allows us to reconsider the relationship between accounting and bureaucracy. Max Weber's reflections on rational-legal authority and bureaucracy remain highly relevant in explaining how administration translates social complexity into formal categories. However, the Maltese material also shows the limits of bureaucratic rationality when confronted with hybrid identities. Many of the refugees evacuated from Smyrna were British by nationality, Maltese by family origin, and Greek by language and social world. Such layered identities did not fit neatly within administrative grids. Accounting therefore became a means not only of order but also of exclusion, reducing ambiguity by attaching costs and obligations to fixed labels (Weber, 2019; Beetham, 1991; Du Gay, 2000).

Third, the paper contributes to postcolonial accounting scholarship by showing how classification, costing, and administrative fragmentation were implicated in the politics of empire. Malta in the early 1920s was also marked by ideological struggles involving British imperial loyalty, local constitutional claims, and the influence of Italian irredentism. Refugee management was not insulated from these tensions. Decisions about who should be supported, under what terms, and at whose expense reflected deeper anxieties about allegiance, belonging, and political legitimacy (Funnell and Chwastiak, 2015; Cobbin and Burrows, 2018).

2. Theoretical framework

This study is positioned at the intersection of three strands of literature: accounting for refugees, Weberian bureaucracy, and critical-postcolonial accounting history. Taken together, these perspectives make it possible to interpret the Maltese response to the Smyrna crisis not as a merely technical exercise in relief administration but as a politically charged process of classification, calculation, and selective responsibility.

A first point of departure is the emerging literature on accounting for refugees. This body of work has shown that accounting is deeply implicated in the governance of forced displacement. Refugees are made knowable to institutions through acts of naming, counting, documenting, and costing. These practices do more than describe a population; they help produce it administratively. Categories of vulnerability, dependency, entitlement, and risk are stabilised through forms, registers, budgets, and statistics. In this sense, accounting contributes to defining who is visible to the state, who qualifies for care, and who remains outside the legitimate frame of obligation (D'Cruz, 2014; Pianezzi et al., 2022; Quayle and Haque, 2023).

These studies are especially useful because they shift attention from accounting as a neutral reporting tool to accounting as an active participant in statecraft. The present paper extends that insight historically. In Malta during the Smyrna crisis, accounting practices were not ancillary to humanitarian relief; they structured the very possibility of relief by linking assistance to categories

of origin and cost liability. The question was never only how many refugees had arrived, but who among them could be considered a proper charge on public or imperial resources.

A second and closely related perspective comes from Max Weber's analysis of rational-legal authority and bureaucracy. Weber's account of bureaucracy emphasises hierarchy, written documentation, formal rules, specialisation, and impersonal decision-making. Bureaucracy is powerful precisely because it renders administration calculable, predictable, and ostensibly objective. It replaces personalised judgment with procedures, classifications, and records. In its ideal form, this generates efficiency and regularity. Yet Weber also warns of the restrictive and depersonalising tendencies of this rational order. The bureaucratic apparatus can trap actors within what later commentators famously described as an "iron cage," where human complexity is subordinated to administratively manageable categories (Weber, 2019; Beetham, 1991; Du Gay, 2000).

The Maltese response to the Smyrna refugees illustrates this dynamic with particular clarity. Faced with a sudden emergency and uncertain lines of authority, officials sought to reduce complexity through categories that could assign responsibility. The distinction between British-born, Maltese-born, and alien refugees was not simply descriptive. It served to determine who should be maintained at local expense, who should be charged to imperial funds, and who fell outside the primary circle of obligation. The instruction to separate refugees "to facilitate accounting" captures bureaucracy in Weber's sense: an effort to transform a politically and emotionally complex human situation into a rationalised administrative order.

At the same time, Weber alone is not sufficient. His framework helps explain the formal logic of the administrative response, but it does not fully capture the colonial and political asymmetries within which that logic operated. For that reason, the analysis is also informed by critical and postcolonial accounting scholarship. This literature has shown that accounting in imperial and wartime settings cannot be understood as merely technical or neutral. Rather, it has historically been implicated in conquest, extraction, control, and the normalisation of unequal relations (Funnell, 2006; Chwastiak and Lehman, 2008; Funnell and Chwastiak, 2015).

These insights are particularly important for understanding the Maltese case. The crisis was not managed by a unitary humanitarian authority but within a colonial system marked by divided sovereignty, political suspicion, and unequal access to recognition. In such settings, accounting practices can help transform coercive or exclusionary decisions into apparently neutral administrative routines. They also provide one of the principal means through which political tensions are displaced into the language of procedure, budget, and competence.

This postcolonial sensitivity also requires attention to the archive itself. Colonial archives should be read not simply as repositories of facts but as sites where imperial common sense was produced and preserved. They reveal what institutions considered important to know, measure, and record (Stoler, 2008). Spivak's reflections on subalternity are equally relevant: the absence of direct refugee voices is not a minor empirical inconvenience but part of the problem. The refugees appear in the archive primarily as entries, categories, liabilities, and administrative cases. Their speech is mediated or absent (Spivak, 2023).

Accounting records are particularly significant in this respect. Ledgers, manifests, and telegrams might appear dry and impersonal, yet they are saturated with assumptions about value, entitlement, and obligation. They encode distinctions between those who are a "proper charge" and those who are not; they specify acceptable standards of maintenance; and they connect identity to expenditure. Such records do not narrate refugee suffering directly, but they shape the institutional conditions under which suffering is recognised, ignored, or minimised. In that sense, accounting serves as a framing device that organises visibility, support, and administrative silence (Sargiacomo, 2011).

The Maltese case also benefits from insights drawn from Mediterranean studies and scholarship on islands as sites of border management and imperial experimentation. Islands often serve as laboratories of governance precisely because their boundaries can be more tightly

controlled while their strategic significance magnifies administrative decisions. Malta's insular geography, military role, and constitutional ambiguity made it especially suited to a mode of refugee administration in which bodies, funds, and jurisdictions were all subject to close scrutiny. The island was both a place of refuge and a filtering station, a humanitarian threshold and an accounting checkpoint.

This broader perspective helps illuminate an important feature of the case: the mismatch between the refugees' lived identities and the administrative categories available to the state. Many of those arriving from Smyrna embodied layered affiliations that complicated simple classification. They might hold British papers, descend from Maltese families long settled in the Levant, speak Greek, and be perceived locally as culturally foreign. Bureaucratic rationality did not eliminate this complexity so much as contain it through categories that attached responsibility to birthplace, ancestry, and legal form. Accounting thus became a tool for stabilising ambiguity in ways that often disadvantaged the refugees themselves.

The notion of ad personam cost accounting is useful here as an analytical concept. It refers to a mode of fiscal reasoning in which the cost of care is attached to the personal legal and administrative status of each refugee rather than to the collective reality of displacement. This is not a formal accounting term used by the actors themselves, but it captures the logic visible in the archival material. Costs were not simply calculated for a refugee population as such. They were disaggregated and redistributed according to origin, nationality, or classificatory entitlement. Such a system reveals how accounting can individualise administrative burden while depoliticising the broader structures that produce vulnerability.

In sum, the theoretical framework allows the paper to move beyond a descriptive history of refugee relief. Weber helps explain how classification and documentation made the crisis governable in formal terms. Accounting for refugees shows how counting and costing shape the field of humanitarian obligation. Postcolonial and archival perspectives reveal how these processes were embedded in imperial hierarchies, institutional silences, and contested politics of belonging. Together, these approaches support the central claim of the paper: in colonial Malta, accounting was not merely a record of refugee management but one of its principal technologies.

3. Methodology

The paper adopts a qualitative historical methodology grounded in interpretive, discursive, and archival analysis. Its purpose is not only to reconstruct the management of the Smyrna refugee crisis in Malta but also to examine how accounting practices framed that management and participated in the production of administrative distinctions. The approach is therefore historical in source base, interpretive in orientation, and critical in analytical intent.

The empirical material is drawn primarily from the National Archives of Malta and from parliamentary documents relating to the crisis. The key sources include official telegrams exchanged between Maltese ministers and colonial authorities; relief fund ledgers that record receipts, allocations, and reimbursements; ship manifests listing the refugees who disembarked in Malta; and memoranda on the condition of affairs in Smyrna tabled before the Legislative Assembly. Together, these documents offer a rich evidential basis for examining both the language and the calculations through which the refugee emergency was governed.

Particular importance attaches to the telegram of 7 November 1922 signed by the Head of Ministry, Joseph Howard. This document sets out an official policy framework for handling the refugees and makes explicit reference to distinctions drawn in order to facilitate accounting. It also prescribes standards of maintenance and labour expectations. Relief fund ledgers are equally significant because they show how receipts and expenditures were separated by category, making visible the material consequences of administrative classification. The ship manifests, meanwhile, reveal how officials labelled refugees on arrival, while parliamentary papers provide broader political context and help trace how the issue was represented in public debate.

The analysis proceeds in two complementary ways. First, it employs critical discourse analysis to examine the language of official documents. Particular attention is paid to recurring phrases such as “proper charge”, “foreign-born”, “British subject”, and references to the “Poor House” standard. These expressions are treated not as neutral administrative vocabulary but as indicators of the categories and moral assumptions through which the crisis was framed. Second, the study follows Stoler’s suggestion of reading “along the archival grain”. Rather than treating the archive as transparent evidence, the paper reads documents as artefacts of administrative reason (Stoler, 2008).

This interpretive stance is especially necessary because direct refugee voices are largely absent from the material. The archive preserves the perspective of the state more readily than that of the displaced. Refugees appear in the documents primarily as counted bodies, legal statuses, and financial cases. Their experiences must therefore be reconstructed indirectly through traces such as maintenance arrangements, rations, labour requirements, and classificatory distinctions. Following postcolonial approaches to subaltern silence, the paper does not treat this absence as accidental. It is bound up with the very nature of the accounting records under examination (Spivak, 2023; Thomason, 2011).

The concept of ad personam cost accounting, used throughout the analysis, is therefore an interpretive device that synthesises what emerges from the sources. It captures a fiscal logic in which responsibility is assigned to individuals according to origin and status rather than addressed collectively as a humanitarian question. This concept helps reveal how accounting categories operated as politically loaded constructs even when presented in technical form.

Although the Maltese case is historically specific, the methodology has wider relevance. It shows how accounting historians can analyse archival traces of displacement in situations where direct testimony is limited and where the main surviving records are administrative. Such an approach is particularly useful for colonial and maritime settings, where the management of mobility often depended on institutions of classification, cost allocation, and jurisdictional negotiation (Servalli et al., 2024).

4. Findings and discussion

The archival evidence reveals that accounting was deeply embedded in the Maltese response to the Smyrna refugee crisis. Four interrelated findings emerge from the material. First, accounting categories structured access to aid and thereby operated as mechanisms of inclusion and exclusion. Second, the administration developed what can be interpreted as an ad personam system of cost allocation that redistributed responsibility according to personal status rather than collective need. Third, budgeting and provisioning took disciplinary form through the imposition of standardised diets and labour expectations. Fourth, accounting became intertwined with broader political tensions concerning imperial authority, local self-government, and contested identities.

A first finding is that the categorisation of refugees was central to the administration of relief. The documents repeatedly distinguish among British subjects, Maltese by birth or parentage, and aliens. These labels might appear to perform a simple descriptive function, but in practice they determined access to material support. Housing, food, maintenance, and possible reimbursement all depended on how an individual was classified. In this respect, classification was not a neutral prelude to action. It was itself a governing act. By sorting displaced persons into legally and politically significant groups, the state transformed an emergency of mass displacement into a manageable series of differentiated cases.

This point is analytically important because it shows that the administration’s response was not driven solely by humanitarian need. Need was filtered through classificatory schemes that linked recognition to cost liability. A refugee’s claim on support depended not merely on vulnerability but on their fit with available categories of responsibility. Those who could be

presented as properly chargeable to local or imperial funds were more legible to the system than those whose identity was ambiguous. The case therefore confirms that accounting can operate as a mechanism of economic and administrative selection rather than as a neutral background to relief (Chwastiak and Lehman, 2008).

The evidence also reveals how such categories were shaped by colonial anxieties about belonging. Many refugees possessed connections to Malta but had been born and raised abroad. They might have been descendants of Maltese emigrants settled in Smyrna for generations, yet still be treated as culturally external or administratively marginal. Their legal relationship to the British Empire did not eliminate the ambiguity attached to their social identity. Classification thus worked not only as a fiscal tool but as a mechanism through which the state translated uncertain belonging into differentiated entitlement. From a Weberian perspective, this reflects the drive of bureaucracy to stabilise complexity through formal categories. Yet the Maltese case also shows the violence embedded in that process.

A second major finding concerns the way costs were allocated. Rather than treating the refugee emergency as a single collective expenditure requiring joint public responsibility, the authorities sought to disaggregate costs according to each refugee's status. This logic is visible in correspondence over which categories of refugees should be borne by local funds, which should be charged to imperial authorities, and which should be excluded from the central streams of support. The relief fund records reinforce this picture by showing differentiated allocations and the separation of donations according to the intended beneficiaries.

This is what the paper conceptualises as ad personam cost accounting. The term captures a mode of reasoning in which financial responsibility attaches not to the event of displacement as such but to the legal and administrative identity of each person displaced. Care is thereby fragmented into discrete fiscal cases. The result is a system in which humanitarian obligation is mediated by bureaucratic distinctions and intergovernmental negotiation. This finding is particularly significant in the Maltese constitutional context. The diarchic system introduced in 1921 had already divided authority between local and imperial institutions. The refugee crisis exposed how fragile and contested that division remained. Accounting became one of the main instruments through which these disputes were managed.

The material on donations is especially revealing. Appeals directed at "All British" support were reserved for certain categories of refugees, rather than for the displaced population as a whole. Such earmarking demonstrates that accounting distinctions were reproduced even in the distribution of charitable aid. Donations did not necessarily soften the classificatory logic of the system; in some respects, they reinforced it. Relief thus became segmented not only by state finance but also by philanthropic channels aligned with identity categories.

A third finding concerns the disciplinary dimensions of refugee maintenance. The archival material shows that relief was not conceived as an open-ended humanitarian duty. It was calibrated through standards of minimum subsistence and linked to expectations of conduct. The directive that refugee diets should conform to those of the Poor House is especially important in this regard. On the surface, the instruction appears as a budgeting measure: an attempt to control expenditure by adopting an already established maintenance standard. Yet its meaning is broader. To align refugee provisioning with the Poor House was to place the displaced within a moral and institutional framework associated with dependency, destitution, and disciplinary oversight.

The symbolic force of the Poor House reference should not be underestimated. It effectively reframed the refugees not as victims of a violent geopolitical rupture but as subjects to be maintained under the lowest acceptable standard consistent with public order. In this sense, accounting intersected with what might be called a moral economy of relief. Cost control was intertwined with assumptions about deservingness, dependence, and the dangers of excessive generosity. The labour expectations recorded in the material reinforce this interpretation. Refugees were required, or at least expected, to contribute through maintenance work in exchange

for their upkeep. This arrangement narrowed the space of humanitarian care by recoding it as an exchange (Sargiacomo et al., 2014).

A fourth finding is that accounting practices were entangled with wider political tensions concerning identity and loyalty. Malta in the early 1920s was not a politically neutral receiving station. The island was marked by the tensions of diarchic constitutionalism, by local contestation over the scope of self-government, and by the influence of Italian cultural and political currents. In such a context, refugee management could not be detached from broader anxieties about allegiance and legitimacy. The refugees arriving from Smyrna posed a particular challenge because many embodied hybrid identities that unsettled simple distinctions. Some held British nationality, some had Maltese ancestry, and many were culturally Hellenised.

Accounting became one of the means by which this ambiguity was handled. By translating identity into categories of cost, the administration could avoid confronting its full social and political complexity. A person's place within the relief system depended on formal designations that appeared objective even when they were saturated with political judgment. Parliamentary material concerning conditions in Smyrna and the possibility of return further underscores this point. Financial concerns were used to support caution regarding repatriation and longer-term support. Cost projections and liability arguments helped frame decisions that were not merely economic but also strategic and political. In other words, accounting served as both a practical and rhetorical resource. It organised expenditure while also legitimising the terms on which the crisis would be interpreted (Cobbin and Burrows, 2018).

A final point deserves emphasis. The refugees themselves are largely absent as speaking subjects in the archival record. We learn about them through categories, allocations, standards, and administrative concerns. This absence is not simply a limitation of the sources; it is part of the finding. The very records that made the crisis governable also contributed to rendering refugee experience administratively mute. Yet the archive is not entirely silent. Through the insistence on classification, the disputes over charges, the use of minimum dietary standards, and the requirement of labour, we can infer the institutional pressures placed upon the refugees. Reading accounting documents critically therefore makes it possible to reconstruct part of the social reality they helped produce (Stoler, 2008; Spivak, 2023).

This is where accounting history can contribute meaningfully to refugee studies. Historical accounting records are often among the few surviving traces of how displaced populations were handled by states and empires. If read narrowly, they appear as dry administrative remnants. If read critically, they reveal the material and symbolic organisation of care, neglect, and exclusion. The Maltese case shows that such records can illuminate not only costs but the politics of human worth embedded in systems of classification and relief.

5. Conclusion

This paper has examined the role of accounting in the management of the Smyrna refugee crisis in colonial Malta. It has argued that accounting was not merely a secondary instrument used to register expenditure after humanitarian decisions had been made. Rather, it was one of the principal means through which the crisis was rendered governable. By classifying refugees, allocating costs, standardising maintenance, and fragmenting responsibility across authorities, accounting helped determine who counted as a legitimate object of care and under what conditions.

The Maltese case makes three contributions. First, it contributes to the literature on accounting for refugees by offering a historical analysis rooted in a colonial and maritime setting. This widens the geographical and temporal scope of the field and shows that many issues associated with contemporary refugee governance, such as counting, categorisation, and differentiated entitlement, have deeper historical precedents. Second, the paper contributes to accounting history by showing how archival accounting records can be used to reconstruct refugee

governance even where direct testimonies are largely absent. Third, it adds to postcolonial studies of accounting by demonstrating how fiscal rationality was intertwined with imperial politics, contested sovereignty, and unstable identities.

The findings also illuminate the strengths and limits of Weberian analysis. Weber's account of bureaucracy is highly useful for understanding the administration's reliance on written rules, formal categories, and impersonal decision-making. However, the Maltese material shows that bureaucratic rationality was never simply neutral. It operated within a colonial field structured by unequal recognition and political suspicion. The categories through which order was achieved were themselves shaped by imperial assumptions about who belonged, who should pay, and who could be excluded without scandal (Weber, 2019; Funnell and Chwastiak, 2015).

The notion of ad personam cost accounting developed in this paper helps capture that process. It shows how responsibility for relief could be individualised and redistributed according to legal status and ancestry, thereby obscuring the collective humanitarian nature of the crisis. The displaced were not primarily treated as a community in need, but as a series of differentiated fiscal claims.

At the same time, the paper has limitations. The archival base is rich in administrative evidence but poor in direct refugee testimony. This makes it difficult to reconstruct fully the lived experience of those who passed through Malta. The analysis must therefore remain attentive to mediation and silence. In addition, Malta's constitutional and geopolitical specificities mean that the case cannot be generalised without caution. Its value lies less in statistical representativeness than in analytical depth.

Future research could fruitfully proceed in at least three directions. Comparative studies might examine whether similar accounting logics were at work in other Mediterranean islands or colonial ports dealing with refugee movements in the interwar period. Additional work might also bring in newspapers, memoirs, family records, or oral histories where available, in order to recover more of the social worlds obscured by official documentation. Finally, contemporary scholars of migration governance may find in historical cases like this one a reminder that the calculative management of displacement is not a recent development but a long-standing feature of state and imperial responses to mobility.

Seen from Malta, the Smyrna crisis reveals a broader truth about accounting. In moments of emergency, accounting does not simply follow politics and administration. It helps make them possible. It translates uncertainty into categories, vulnerability into charges, and human movement into the terms of responsibility and refusal. In colonial settings especially, those translations could carry profound consequences for who was sheltered, who was disciplined, and who remained at the margins of recognition.

Accounting for Fairness: A Genealogical Analysis of the Monte di Pietà of Naples

Antonio D'Alessio[1]

1. Introduction

Accounting research increasingly views accounting as a social practice that shapes organizational and human behavior, rather than a purely technical activity (Carnegie et al., 2020; Gomes et al., 2008; Hopwood, 1983; Hopwood e Miller, 1994; Napier, 1989). Hopwood (1983) argued that accounting must be studied within its social and institutional contexts, as it does not merely record reality but also contributes to creating it. This insight supports subsequent calls for historically grounded analyses that examine how accounting practices acquire meaning within specific places, institutions, and cultural settings (Carnegie, 2014).

This study follows this perspective by examining the Monte di Pietà of Naples, a charitable credit institution founded in 1539. Historical accounting research often focuses on localized settings because accounting practices are shaped by the political, social, and moral climate in which they operate. Sixteenth-century Naples—a major European capital under Spanish rule and a densely populated commercial hub—provides a particularly rich context. Issues of credit and usury were not only economic matters, but also public concerns linked to morality, religious teaching, and civic stability.

The Monte di Pietà was established by Neapolitan nobles and religious leaders inspired by Franciscan ideals of just lending. Its mission was to offer fair, non-usurious credit to the poor, backed by pledges. To achieve this, the institution relied on a structured system of offices and an extensive set of accounting records—journals, ledgers, pledge registers, and periodic balances. These tools were designed to support proportionality in lending, transparency in operations, and accountability to the community.

Examining the Monte's accounting system therefore offers insight into how accounting functioned as a civic practice, shaped by the broader cultural expectations of early modern Naples. In this context, fairness (aequitas) was a widely shared principle that guided economic and social life: it reflected classical ideas of proportional justice, Franciscan critiques of usury, and, later, the Neapolitan tradition of Economia Civile, which framed economic activity as grounded in reciprocity and the common good.

Against this background, the present study adopts fairness as its guiding theoretical framework and uses archival materials to explore how the Monte's accounting practices supported equitable credit relations. By focusing on place, culture, and institutional design, the paper aims to illuminate the ways accounting shaped legitimacy, trust, and social balance in early modern Naples.

2. Theoretical background

[1] Docente a contratto, ECON-06/A, Università degli Studi di Napoli "Parthenope"; antonio.dalessio@collaboratore.uniparthenope.it – corresponding author

2.1. The Intellectual Roots of Fairness: From Classical Thought to the Neapolitan Enlightenment

The conceptual lens of fairness adopted in this study draws on a set of intellectual traditions that, although historically distinct, provide a meaningful cultural backdrop for understanding charitable credit institutions such as the Monte di Pietà di Napoli. The starting point is Aristotle's notion of epieikeia, a corrective form of justice that restores proportional balance when general rules fail to capture the complexity of concrete situations (Aristotle, 2000). This idea was taken up and adapted within medieval scholastic thought, where theologians—including Aquinas—developed principles of proportional exchange, the just price, and the moral evaluation of contracts, shaping European reflections on economic justice for centuries (Aquinas, 1948; Langholm, 1998). From the late Middle Ages onward, Franciscan thinkers transformed these abstract principles into institutional practice through their critique of usury and their promotion of transparent, pledge-backed credit to safeguard the poor and preserve civic harmony (Todeschini, 2023). Their ideas directly informed the establishment and governance of the Monti di Pietà across the Italian peninsula (Menning, 1993).

While this broader Mediterranean tradition illuminates the moral vocabulary surrounding fairness, the Neapolitan Enlightenment is particularly relevant for the present study because the case examined is located in Naples. In the eighteenth century, authors such as Antonio Genovesi, Filangieri, and Galiani articulated a distinctive vision of economic life as a form of civil cooperation grounded in trust, reciprocity, and public happiness (Bruni e Zamagni, 2007; Robertson, 2005). Although chronologically distant from the sixteenth-century Monte, this intellectual climate reflects enduring Neapolitan expectations about how economic institutions should contribute to social equilibrium and collective welfare (Genovesi, 1765/2013). For this reason, the Neapolitan Enlightenment is not invoked as the culmination of a linear genealogy, but as a cultural frame that helps interpret the meanings attributed locally to fairness, proportionality, and accountability. Taken together, these traditions support the use of fairness as an interpretive framework for analyzing how the Monte di Pietà di Napoli structured its procedures, valuations, and accounting practices within a civic understanding of economic justice.

2.2. Accounting studies on Monti di Pietà

Over the past two decades, accounting history has broadened its scope to include everyday contexts and the practices of religious, charitable, and other non-profit institutions (Carnegie e Napier, 2012; see also Hopwood, 1994; Jeacle, 2012). This expansion reflects a growing recognition that accounting is deeply implicated in the social, moral, and organizational arrangements of institutions outside the corporate sphere. Within this line of inquiry, a significant body of work has examined how accounting practices in Italian charitable and religious settings have shaped institutional legitimacy, internal control, and public trust.

Orelli et al. (2013) provide a detailed reconstruction of the emergence of accounting as a mechanism of governance in the Monte di Pietà of Bologna, demonstrating how bookkeeping procedures reinforced managerial oversight and operational reliability. Similarly, Del Sordo, Fornasari, and Orelli (2019), studying the Monte di Pietà of Ravenna, show that accounting acted as a disciplinary and organizational device, especially in the aftermath of fraud. Their Foucauldian interpretation positions accounting as a technology of order—one that reconstituted stability and continuity within the charity. More recently, Nicoliello e Aliabadi (2022) examined the Congrega of Apostolic Charity of Brescia (1860–1886), illustrating how accounting routines evolved in response to broader social and political transformations and became vehicles for institutionalizing new rules and expectations.

Taken together, these contributions indicate that accounting in charitable institutions cannot be reduced to a neutral administrative technique. Rather, it operates as a regulative practice that

mediates between institutional values, social expectations, and governance imperatives. Within this historiographical trajectory, the case of the Monte di Pietà of Naples adds a further layer of insight: its accounting arrangements—designed to ensure proportionality, transparency, and structured control—offer a lens through which to explore how early modern financial institutions sought to cultivate fairness and sustain public confidence. This study engages with that tradition by examining how accounting practices were constructed and mobilized within the Neapolitan context, without presuming any predetermined normative function, but recognising their embeddedness in the cultural and institutional fabric of the sixteenth century.

3. Research methodology

The term "new accounting history" (Miller et al., 1991) has been used to describe an interdisciplinary approach to historical accounting research aimed at investigating the social, political, and ethical processes that have shaped the evolution of accounting practices over time (Bertalan e Napier, 2013). As Carnegie and Napier (1996, p. 31) note, this perspective takes form in critical and interpretive histories "firmly grounded in the archive," in which accounting records are examined not as mere administrative documents but as cultural and institutional artefacts that reveal the rationalities, values, and conflicts underpinning systems of recording.

The methodology adopted in this study aligns closely with this tradition. It combines a narrative approach (Previts et al., 1990) with an interpretive perspective (Parker, 2015), applied to the analysis of original archival documents from the Monte di Pietà of Naples, now preserved at the Fondazione Banco di Napoli. Archival investigation enables direct observation of the institution's accounting practices, valuation rules, and control mechanisms between the sixteenth and seventeenth centuries, attending both to formal procedures and to the moral and relational logics embedded within them.

Following Zan (2004), historical sources are used not as mere illustrative material but as theoretical building blocks, allowing interpretive hypotheses to be tested against evidence of practice. In this sense, the research does not aim to reconstruct a linear chronology but to develop a genealogy of accounting equity, illustrating how the language of ledgers and financial statements can be read as a device for social and moral balance. The methodology therefore rests on the interplay between archival analysis, contextual interpretation, and theoretical reflection, situating the study within a broader body of work that understands accounting history as a form of critical engagement with the present (history of the present, Foucault, 1977; Hoskin e Macve, 1986).

To translate the theoretical conception of fairness—understood as corrective justice and practical balance—into an operational framework for archival analysis, this study adopts a multidimensional approach grounded in Organizational Justice Theory (Greenberg, 1990; Colquitt, 2001). While these constructs are developed within modern management literature, they are employed here as a heuristic framework to organize and interpret historical evidence. This approach avoids anachronism by distinguishing between the analytical categories (derived from modern theory) and the normative content (derived from the historical context).

In this study, modern dimensions of organizational justice serve as lenses to detect how the Monte di Pietà operationalized centuries-old concepts of proportional justice, public trust, and civil cooperation. The analysis is structured around four key dimensions:

- Procedural Fairness: Drawing on Leventhal's (1980) criteria of consistency, accuracy, and correctability, this dimension examines accounting as a mechanism of governance. In the context of the Monte, it refers to transparency, redundancy, and the collegial verification of records. These were not merely bureaucratic routines, but structural safeguards designed to ensure the impartiality of the institution and maintain the "public faith" (fede pubblica) essential to the Neapolitan civil economy (Genovesi, 1765).

- Distributive Fairness: Rooted in the Aristotelian principle of geometric proportion and modern equity theory (Adams, 1965), this dimension focuses on the allocation of resources. It is reflected in the appraisal of pledges and the granting of loans, where fairness is achieved not by equality of outcome, but by a balanced ratio between the value of the collateral, the need of the borrower, and the financial sustainability of the institution.
- Interactional Fairness: Based on Bies and Moag's (1986) concept of interactional justice, this dimension concerns the interpersonal treatment of stakeholders. It captures the extent to which the Monte recognized debtors not as passive beneficiaries of charity but as moral agents deserving of dignity. This aligns with the Neapolitan Enlightenment's emphasis on reciprocity and fratellanza (brotherhood) as the basis of economic exchange (Bruni & Zamagni, 2007).
- Substantive Fairness: Extending beyond formal procedures, this dimension addresses the material outcomes of justice, specifically regarding restitution. It is empirically analyzed through the management of the "soprappiù" (the surplus generated from auctioned pledges). The return of this surplus to the debtor embodies a concrete form of corrective justice (Aristotle, Nicomachean Ethics, V), ensuring that the institution restores the economic equilibrium and does not profit unjustly from the misfortune of the poor.

Together, these four dimensions form the conceptual structure of the analytical model. By applying this framework, the archival investigation can interpret the accounting practices of the Monte di Pietà not merely as technical routines, but as historical artifacts of proportional and civic regulation. This allows the study to explore how abstract principles of fairness were embedded in the daily operational logic of the institution, fostering a social order grounded in trust.

4. Expected contribution

Drawing on Foucault's notion of a "history of the present" (1977, 1979) and following recent methodological reflections (McBride et al., 2025), this study employs historical analysis not to reconstruct the past as a linear progression, but to critically illuminate the present. Examining the accounting practices of the Monte di Pietà of Naples reveals how accounting operated as a site where civic and moral values were translated into technical form and invites reflection on how those values—once central—have been gradually reframed or marginalised within contemporary accounting discourse.

Rather than treating the Monte's accounting as an "early" or "primitive" stage in the evolution toward modern banking, the study adopts a genealogical approach that interprets the institution as an alternative rationality of accounting. This rationality emerged from specific social and moral conditions: the struggle against usury, concerns for equitable economic relations, and expectations of public accountability in the management of resources. A genealogical perspective makes it possible to identify discontinuities (shifts between different logics of reporting), contestation (tensions between collective interests and administrative power), and contingency (the non-inevitability of prevailing accounting forms).

This approach also avoids reproducing dominant narratives—those that read the history of accounting solely through modern categories such as efficiency, control, and performance. Instead, it foregrounds practices grounded in equity, justice, and reciprocity, core principles of the Italian Economia Civile tradition. From this perspective, the Monte's accounting system is not a deficient precursor to contemporary practices but a plausible alternative model of accountability, one in which rendering account was inseparable from fairness understood as a higher form of justice.

Finally, this genealogical analysis offers insights for the present. By recovering historical forms of fairness embedded in the accounting of the Monti di Pietà, the study contributes to imagining alternative accounting perspectives—ones potentially better equipped to address

current crises of trust, sustainability, and institutional legitimacy. In this way, the past becomes a resource for rethinking what accounting could be, rather than merely a record of what it has been.

Beyond the hype: employees' real feelings about Artificial Intelligence at work. Preliminary Evidence from an Italian SME

Filomena Pagnozzi[1], Gilda Antonelli[2]

1. Introduction

In recent years, Artificial Intelligence (AI) has evolved from an experimental technology to an everyday presence in the workplace. It is no longer merely a technical tool, but a pervasive and transformative force that is reshaping how organizations operate, make decisions, and define the meaning of human work. Across sectors, algorithms now assist people in performance evaluation, personnel selection, task planning, and the management of production flows (Meijerink et al., 2021; Davenport & Ronanki, 2018).

While large corporations have been early adopters of AI, small and medium-sized enterprises (SMEs) have experienced a slower diffusion of these technologies. Nevertheless, recent studies show that AI can play a transformative role in SMEs, providing access to advanced analytical and operational capabilities that were once available only to larger firms (Rajaram & Tinguely, 2024). This gap, however, continues to widen as large organizations leverage AI to enhance efficiency and competitiveness, leaving smaller firms—particularly in Italy—at risk of falling behind (European Investment Bank, 2022). Italian SMEs, as defined by the National Institute of Statistics, are firms with fewer than 250 employees, forming the backbone of the national economy. With more than four million enterprises—the highest concentration among EU Member States—they employ around 13 million people and generate over 65% of the country's added value, as well as more than half of its total exports (OECD, 2024). Despite their centrality, many SMEs still face challenges in adopting AI due to limited financial resources, infrastructural constraints, and uneven levels of digital literacy (OECD, 2024). To address this gap, the European Commission has launched the AI Innovation Package, which provides funding, access to high-performance computing, and programs to develop AI-related competencies aligned with European standards. Yet, technological investment alone is not sufficient: successful AI integration also depends on understanding the human and organizational dynamics that shape how employees perceive and engage with intelligent systems (Serpa et al., 2022).

From this perspective, AI should not be viewed solely as a technical innovation but as part of a broader sociotechnical system. According to Sociotechnical Systems Theory (Trist & Bamforth, 1951), every organization comprises two interdependent subsystems: a technical one (machines, tools, algorithms, and workflows) and a social one (people, culture, and relationships). The introduction of new technologies can disrupt this balance, triggering psychological and relational adjustments that shape acceptance, trust, and meaning at work (Spagnoli et al., 2020). When the equilibrium between these systems is not maintained, tensions may arise in the form of resistance, anxiety, or perceived loss of control (Singh et al., 2012).

However, while AI offers significant benefits in terms of efficiency and productivity, employees' perceptions of these technologies remain a relatively underexplored domain.

[1] Research fellow, ECON-08/A, University of G. d'Annunzio Chieti-Pescara; filomena.pagnozzi@unich.it – corresponding author

[2] Full Professor, ECON-08/A, University of G. d'Annunzio Chieti-Pescara; gilda.antonelli@unich.it

Individuals respond to AI not only as users but as social actors who interpret, embrace, or resist automation depending on their experiences, values, and interpersonal relationships (Glikson & Woolley, 2020). Understanding these perceptions is essential, as the success of AI adoption depends not only on technical accuracy but also on trust, sense of control, and social integration that workers maintain in the face of technological change (Lee & See, 2004; Zerilli et al., 2019).

This issue is particularly relevant in SMEs, where decision-making processes are less formalized, interpersonal ties are stronger, and human capital remains the main driver of innovation (Unioncamere, 2024). In these contexts, the introduction of AI tools can generate deep ambivalences—enthusiasm for learning and simplification coexisting with fears of substitution, unfairness, and loss of social cohesion (Tarafdar et al., 2019; He et al., 2022). As highlighted by Davenport and Ronanki (2018), AI implementation requires an incremental, human-centered strategy that enhances human capabilities rather than replacing them. Likewise, Serpa et al. (2022) emphasize that digital transformation is successful only when supported by a digital culture founded on openness, transparency, and value alignment.

The present study is part of a broader research project aimed at exploring and measuring the psychological and social reactions of employees toward the adoption of AI technologies in organizations. In this specific case, the focus is on a medium-sized enterprise operating in the construction and engineering sector. At this stage, the research takes the form of a quantitative and exploratory work in progress, based on a survey designed to capture employees' perceptions across three key dimensions: automation and personal control; algorithmic fairness and trust, and communication and collaboration.

In the next phase, the study will be extended through qualitative interviews and further survey waves to deepen the understanding of how employees negotiate trust, professional identity, and belonging within an increasingly hybrid work environment, where humans and algorithms co- produce organizational value (Arcidiacono et al., 2025).

2. Theoretical background

The integration of AI in organizational contexts raises critical questions about how employees perceive and adapt to technological transformation. Beyond operational efficiency, AI profoundly affects the psychological and social dimensions of work—shaping employees' sense of control, fairness, and relational connectedness (Glikson & Woolley, 2020).

The Sociotechnical Systems Theory (STS) (Trist & Bamforth, 1951) provides a foundational lens for understanding these dynamics. According to STS, every organization operates through the interdependence of technical and social subsystems. Sustainable performance emerges only when both systems are jointly optimized. When new technologies such as AI are introduced, this balance may be disrupted, affecting employees' perceived autonomy, meaning, and control over their work (Singh et al., 2012). Employees must navigate a psychological transition, not just a technological change—redefining their professional roles and sense of agency. If this transition is not supported, AI adoption can result in stress, disengagement, and resistance (Tarafdar et al., 2019; Spagnoli et al., 2020). The sociotechnical approach thus emphasizes the need for human-centered AI integration, where organizations design technological change processes that respect human values, promote trust, and reinforce collaboration (Arcidiacono et al., 2025; Davenport & Ronanki, 2018).

Building on this perspective, three key dimensions have emerged as central for understanding employees' perceptions of AI in the workplace:

- Automation and control

AI can function both as a source of empowerment and of threat. On the one hand, it can relieve employees from repetitive or low-value tasks, thereby improving precision and enabling them to focus on more meaningful or creative work (Parasuraman & Riley, 1997). On the other hand, it may reduce discretion and perceived autonomy, undermining employees' sense of control

and relevance (Tarafdar et al., 2019). Previous studies have shown that perceived loss of control and fear of technological substitution can lead to anxiety, technostress, and resistance to automation (Spagnoli et al., 2020). This tension reflects the sociotechnical principle that effective technology adoption requires preserving the social equilibrium—that is, employees' sense of agency and identity within the technical system (Trist & Bamforth, 1951).

- Algorithmic fairness and trust

The second dimension concerns perceptions of justice and transparency in AI-supported decision- making. Trust in AI systems depends on employees' understanding of how algorithms function and on their belief that outcomes are impartial and fair (Lee & See, 2004; Zerilli et al., 2019). When AI processes appear opaque or dehumanized, employees may develop concerns about injustice and loss of procedural fairness (Longoni et al., 2019; Tursunbayeva & Chalutz-Ben Gal, 2024). Conversely, high levels of algorithmic transparency foster what Hancock et al. (2011) describe as trust calibration—a realistic balance between confidence and critical vigilance. From a sociotechnical perspective, fairness is crucial for maintaining legitimacy and trust within the human–machine system.

- Communication and collaboration

The third dimension concerns the impact of AI on interpersonal dynamics and team collaboration. Intelligent technologies can enhance cooperation by improving data sharing and coordination across tasks and teams (Jarrahi, 2018; Seeber et al., 2020). Yet, when communication becomes mediated or substituted by AI systems, relational distance and reduced psychological safety may emerge—undermining the open dialogue and mutual trust essential to collective learning (Edmondson, 1999). In SMEs, where informal interactions and relational cohesion are key elements of organizational culture, such disruptions can be particularly sensitive. Thus, AI should be implemented as a collaborative partner, rather than a replacement, reinforcing human connection rather than eroding it.

3. Methodology

This study adopts a quantitative–exploratory work-in-progress design (Creswell & Creswell, 2017), as part of a broader research project investigating the psychological and social perceptions of employees regarding the introduction of Artificial Intelligence (AI) in organizational contexts. The research adopts a sociotechnical perspective, examining how technological systems interact with social structures, values, and behaviors within a real-world company setting.

3.1. Case study context

The empirical investigation was conducted within a medium-sized Italian enterprise operating in the construction and engineering sector, located in central Italy. The organization, founded in the 1980s, is recognized for its strong tradition of innovation and its multidisciplinary integration of expertise across energy, construction, and infrastructure projects.

Over the years, the company has developed a corporate culture deeply oriented toward research, sustainability, and the enhancement of human capital, promoting a business model that values synergy between technology and specialized competences.

Although the company remains anonymous for confidentiality reasons, it represents a notable example of a technically complex SME currently undergoing digital transformation and gradually adopting AI tools for operational management and strategic planning. Such a context provides an ideal setting for examining the social and psychological dimensions of AI introduction in an SME environment, where interpersonal relations and tacit knowledge play a crucial role (OECD, 2024; Serpa et al., 2022).

3.2. Survey design

An online survey was distributed using Survey Monkey to all 201 employees of the organization. At the time of analysis, 58 respondents completed the questionnaire, representing a response rate of approximately 28.9%.

The instrument consisted of two main sections:

- Socio-demographic and professional information, collecting data on age, gender, education level, contractual type, tenure, and professional role (administrative employee, technical/engineering, manual worker, manager/supervisor, external consultant, intern).
- AI perception items, evaluated on a 7-point Likert scale (1 = strongly disagree; 7 = strongly agree). This section aimed to assess attitudes, beliefs, and emotional responses toward the adoption of AI in the workplace.

The survey was designed as part of a broader process of scale development and validation, aimed at constructing a reliable instrument to measure employees' perceptions of AI.

This specific case study served as an opportunity to test and refine the scale within a real organizational setting, observing how items performed empirically, and which dimensions emerged most clearly among workers. Rather than focusing on statistical generalization, this phase seeks to identify emerging perceptual patterns and assess the construct validity and internal coherence of the proposed dimensions (Creswell & Plano Clark, 2017).

3.3. Measures

The questionnaire items were grouped into two broad interpretative categories, inspired by prior research on human–AI interaction, technology acceptance, and technostress (Parasuraman & Riley, 1997; Glikson & Woolley, 2020; Tarafdar et al., 2019):

- AI Positive perception: capturing perceptions of usefulness, collaboration, and learning opportunities.

Example items include: "AI helps me focus on more meaningful tasks by automating routine activities" and "The introduction of new technologies stimulates my professional growth." These items align conceptually with constructs such as perceived usefulness and technology-enabled learning (Davis, 1985; Venkatesh & Bala, 2008).

- AI Negative perceptions: capturing perceptions of threat, distrust, and discomfort toward automation.

Example items include: "I fear that automation may make my role less relevant" and "I feel under pressure when I think about competing with AI systems." These items reflect technostress, loss of autonomy, and automation anxiety (Tarafdar et al., 2019; Spagnoli et al., 2020).

Internal consistency analyses (Cronbach's α) and descriptive statistics are being used to assess the reliability and preliminary construct validity of the two dimensions. This process contributes to the progressive validation of the scale, which will later be tested on a broader sample.

4. Preliminary results and discussion

Preliminary results provide an overview of the sample's demographic composition, including gender, age group, organizational role, educational level, and job tenure. Regarding gender, most respondents were male (69.0%), while female employees accounted for 31.0% of the sample (Table 1).

Gender	Frequency	Percentage	Valid %	Cumulative %
Male	40	69.0	69.0	69.0
Female	18	31.0	31.0	100.0
Total	58	100.0	100.0	

Table 1. Gender of the sample

This distribution reflects a workforce predominantly composed of men, which is consistent with the characteristics of the organizational and industrial context under investigation.

In terms of age, the respondent population can be described as predominantly young to middle- aged: 27.6% of participants were between 20 and 30 years old, 22.4% between 31 and 40, 24.1% between 41 and 50, and 19.0% between 51 and 60, while only 6.9% were over 60 years old (Table 2).

Age class	Frequency	Percentage	Valid %	Cumulative %
20–30	16	27.6	27.6	27.6
31–40	13	22.4	22.4	50.0
41–50	14	24.1	24.1	74.1
51–60	11	19.0	19.0	93.1
60+	4	6.9	6.9	100.0
Total	58	100.0	100.0	

Table 2. Age classes of the sample

Overall, more than three-quarters of the sample (74.1%) were under 50, indicating a workforce primarily in the central phase of their professional careers. This age profile may have implications for attitudes toward technological innovation, as younger and mid-career employees are often more open and adaptable to technological change compared to older cohorts (Venkatesh et al., 2003; Parasuraman & Colby, 2015).

Regarding educational level, most respondents held a high school diploma (55.2%), while 27.6% had obtained a Master's degree, and 6.9% a Bachelor's degree. A smaller proportion, 5.2%, reported having completed middle school, and an additional 5.2% indicated they had completed a PhD, a master's program, or another postgraduate specialization (Table 3).

Educational Level	Frequency	Percentage	Valid %	Cumulative %
Lower secondary school diploma	3	5.2	5.2	5.2
Upper secondary school diploma (high school)	32	55.2	55.2	60.3
Doctorate, Master's, or Postgraduate Specialization	3	5.2	5.2	65.5
Master's Degree	16	27.6	27.6	93.1
Bachelor's Degree	4	6.9	6.9	100.0
Total	58	100.0	100.0	100.0

Table 3. Education level of the sample

This educational distribution reflects the mixed composition of the company's workforce, encompassing both technical–operational and professional–managerial roles. Higher educational attainment has been linked to greater confidence and readiness in engaging with emerging technologies, including AI (Ezer et al., 2009; Marler & Boudreau, 2017).

As for professional role, the data reveals a prevalence of participants occupying technical or managerial positions.

Specifically, 20.7% identified as managers, 19.0% as technicians, and 15.5% as administrative employees. These were followed by blue-collar workers (13.8%), supervisors (8.6%), professionals or consultants (3.4%), and interns (1.7%). 15.5% of participants did not indicate their job position (Table 4).

Professional Role	Frequency	Percentage	Valid %	Cumulative %

Administrative employee	9	15.5	15.5	15.5
Manager	12	20.7	20.7	36.2
Supervisor / Coordinator	5	8.6	8.6	44.8
Blue-collar worker	9	15.5	15.5	60.3
Professional / Consultant	2	3.4	3.4	63.8
Technician / Engineer	11	19.0	19.0	82.8
Not specified	9	15.5	15.5	98.3
Intern	1	1.7	1.7	100.0
Total	58	100.0	100.0	100.0

Table 4. Professional role of the sample

This distribution suggests a heterogeneous sample composition, with a significant presence of qualified profiles and technical–managerial roles. However, it is plausible that the lower representation of blue-collar workers and lower-qualified personnel may reflect the greater difficulty of engaging these groups in survey participation—a common phenomenon in organizational research, where availability and familiarity with online survey tools tend to vary depending on employees' role and professional background (Dillman et al., 2014).

Finally, regarding job tenure, 41.4% of respondents had been working in their current position for more than ten years, 22.4% for four to ten years, 19.0% for one to three years, and 17.2% for less than one year (Table 5).

Job Tenure	Frequency	Percentage	Valid %	Cumulative %
Less than 1 year	10	17.2	17.2	17.2
1–3 years	11	19.0	19.0	36.2
4–10 years	13	22.4	22.4	58.6
More than 10 years	24	41.4	41.4	100.0
Total	58	100.0	100.0	100.0

Table 5. Job tenure of the sample

These findings indicate a stable and experienced workforce, with a substantial proportion of long- serving employees, alongside a smaller group of younger workers who have joined the organization more recently.

To explore employees' perceptions of artificial intelligence (AI) within the organization, two composite indices were computed.

The AI Negative Perception scale (9 items) captured attitudes of distrust, perceived threat, and discomfort toward AI, while the AI Positive Perception scale (6 items) assessed perceived benefits of usefulness, learning, and collaboration.

Both scales demonstrated satisfactory internal reliability ($\alpha = .84$ and $\alpha = .79$, respectively), consistent with prior studies showing that employees' responses to AI tend to cluster into two main attitudinal domains—empowerment and technostress (Parasuraman & Riley, 1997; Tarafdar et al., 2019; Spagnoli et al., 2020).

Descriptive statistics indicated that employees expressed an overall moderately positive attitude toward AI ($M = 4.87$, $SD = 0.76$), while concerns and negative perceptions were present but less pronounced ($M = 3.66$, $SD = 0.75$). This pattern aligns with prior research suggesting that, although employees acknowledge AI's potential to enhance efficiency, collaboration, and learning (Jarrahi, 2018; Davenport & Ronanki, 2018), residual apprehensions remain regarding fairness, transparency, and social cohesion (Longoni et al., 2019; Zerilli et al., 2019).

From a sociotechnical perspective (Trist & Bamforth, 1951; Pasmore, 1988), these mixed perceptions reflect the ongoing negotiation between the technical and social subsystems of organizational life, where feelings of control loss and relational distance may coexist with optimism toward technological innovation. The findings suggest that AI is perceived as a useful yet ambivalent innovation—one that simultaneously challenges and enriches the meaning of work.

4.1. Theoretical and practical implications

From a theoretical perspective, this study contributes to extending the Sociotechnical Systems Theory (Trist & Bamforth, 1951) to the context of small and medium-sized enterprises (SMEs). The findings reveal that the interaction between the technical and social subsystems—core to STS—remains both fragile and essential within organizations characterized by dense interpersonal networks. The coexistence of enthusiasm and apprehension toward AI suggests that technological adoption represents not merely a structural or operational shift but a deep socio-psychological transition (Bridges, 2009; Singh et al., 2012).

Employees interpret AI not only as a productivity-enhancing tool but as a transformative agent that challenges professional identity, control, and fairness. This confirms that effective AI integration depends on the ability to manage both the situational change (the implementation of new systems) and the psychological transition through which individuals make sense of it.

By situating AI adoption within this socio-technical and psychological framework, the study underscores that organizational success emerges from the joint optimization of the technological and human systems (Pasmore, 1988; Serpa et al., 2022). The evidence from the SME case supports the idea that sustainable digital transformation cannot occur without reinforcing the cultural and relational dimensions that sustain trust, collaboration, and meaning at work.

Moreover, the findings highlight the critical role of organizational culture as a mediating force in socio-technical adaptation (Pescatore et al., 2022). A strong digital culture—defined by openness, learning orientation, and value alignment—acts as an enabling condition for employees to embrace AI constructively rather than resist it (Pagnozzi et al., 2025; Serpa et al., 2022). As prior research shows, technological change becomes a true catalyst for innovation only when accompanied by a parallel evolution of mindset, leadership, and cultural readiness (He et al., 2022).

From this view, the transition to AI-enhanced work systems is as much a cultural process as it is a technical one: it requires rethinking not only workflows but also shared beliefs about autonomy, responsibility, and the role of technology in organizational life.

From a managerial perspective, these insights suggest that leaders play a decisive role in shaping how AI is perceived and integrated. Transparent communication, participatory design, and inclusive training initiatives can help build psychological safety and trust, mitigating fears of obsolescence and unfairness (Edmondson, 1999; Lee & See, 2004; Zerilli et al., 2019).

Particular attention should be given to supporting employees through the transition phase, providing both technical upskilling and emotional scaffolding to help them adapt to new hybrid human–machine environments. This is especially critical in SMEs, where cultural cohesion and informal networks are strong drivers of innovation but can also amplify collective resistance if the change is perceived as externally imposed.

Practically, organizations seeking to integrate AI successfully should: foster a digital culture that values transparency, continuous learning, and human–machine collaboration; encourage co-design processes, involving employees early in the conception and deployment of AI tools; invest in digital literacy and reskilling programs, reducing asymmetries in competence and confidence; promote awareness and education about both the opportunities and the risks associated with AI technologies, ensuring that employees develop informed and responsible engagement with these

tools; and cultivate adaptive leadership, capable of guiding cultural transformation and managing ambiguity in complex systems.

Ultimately, this study reaffirms that the success of AI-driven transformation depends not solely on algorithmic precision or data sophistication, but on the organization's capacity to cultivate a culture that supports adaptation, trust, and shared meaning.

AI thus emerges not only as a technological innovation but more as a socio-cultural phenomenon—one that reshapes how people understand work, value human contribution, and envision the future of organizations.

5. Conclusion and future directions

As AI quietly changes the way people work, this study offers an early view of how employees, especially in SMEs, interpret and adapt to this transformation. For many workers, AI is becoming part of their everyday environment, supporting tasks, improving efficiency, and creating new opportunities for collaboration. In this SME, survey results showed that employees—above all those in technical and managerial roles—generally perceive AI not as an intruder, but as a new coworker: useful, sometimes difficult to understand, yet increasingly integrated into daily routines. This contributes to a form of pragmatic acceptance, where technology is welcomed as long as it helps people perform their jobs better and does not threaten their sense of purpose or autonomy.

Yet, some tensions remain. Several respondents expressed concerns about fairness, control, and the future meaning of human work in an increasingly automated environment. These mixed feelings suggest that, although AI has become a pervasive presence in both private and professional life, true innovation does not depend only on technological progress. Rather, it begins with the emotional, social, and cultural dimensions that shape how people experience and make real sense of technological change.

Future developments of this research will include qualitative interviews with employees and managers to deepen understanding of the meanings and emotions associated with AI in everyday work practices; and a second wave of survey dissemination to broaden the sample and verify whether the emerging patterns hold across different departments and organizational roles.

By integrating quantitative and qualitative insights, the project aims to contribute to the growing field of Human-AI interaction in organizations, offering an empirically grounded reflection on how Italian SMEs can manage the social side of digital transformation — fostering trust, equity, and collaboration between humans and intelligent systems.

Keywords: Artificial intelligence; SMEs; employee perception; socio-technical system theory

L'evoluzione epistemica delle organizzazioni pubbliche. Il cambiamento dei processi di decision making attraverso l'intelligenza artificiale

Valerio Giampaola[1], Nicola Capolupo[2], Emilia Romeo[3], Paola Adinolfi[4]

1. Introduzione e obiettivi

La progressiva introduzione dell'Intelligenza Artificiale (IA) nel settore pubblico ha suscitato un diffuso – ma cauto - ottimismo circa il suo potenziale nel migliorare i processi decisionali (Oryshchuk e Minenko, 2024). Ciononostante, questa prospettiva prevalentemente strumentale tende a trascurare una trasformazione più profonda che essa sta innescando all'interno delle organizzazioni, ovvero una ridefinizione del modo in cui la conoscenza viene creata, interpretata e impiegata nei processi decisionali organizzativi (Bolton *et al.,* 2021; Leoni *et al.,* 2024). Le organizzazioni pubbliche, oggi, si avviano ad essere concepite come organizzazioni epistemiche, ossia configurazioni il cui funzionamento dipende dalla continua produzione e dallo scambio di conoscenza (Knorr Cetina, 2007; Patriotta, 2020). Qui, legittimità e autorità non derivano unicamente dal verticalismo gerarchico, bensì dalla capacità di generare e sostenere pratiche epistemiche orizzontali.

L'emergere dell'IA, pertanto, non si limita a modificare la prassi burocratica, ma trasforma i meccanismi epistemici attraverso i quali le organizzazioni definiscono i propri problemi, percepiscono l'informazione e il suo flusso, e legittimano le proprie decisioni. In questo processo, l'IA partecipa concretamente ai processi epistemici influenzando le modalità di raccolta di dati e conoscenza, individuando poi dei pattern e stabilizzando le relative interpretazioni.

Sebbene numerosi studi abbiano analizzato l'adozione dell'IA sotto le lenti di governance e automazione (Camilleri, 2024), minore attenzione è stata prestata al modo in cui essa stia modificando processi di apprendimento e di condivisione della conoscenza nelle organizzazioni pubbliche, particolarmente in condizioni di incertezza (Albous e Alboloushi, 2025). Invero, l'IA viene spesso considerata un'innovazione tecnica, mentre più raramente viene interpretata come un'infrastruttura cognitiva che plasma la comprensione istituzionale della complessità e la capacità di svolgere lavoro epistemico (Larsen, 2021). Ciò si riscontra particolarmente nel momento in cui le organizzazioni pubbliche devono affrontare sfide che richiedono non solo decisioni più rapide, ma anche forme di ragionamento più intelligenti, riflessive e reattive, capaci di coniugare giudizio umano e inferenza algoritmica.

Lo studio proposto si propone di esaminare come l'IA venga impiegata nei processi di generazione della conoscenza e di ragionamento interpretativo all'interno delle amministrazioni, e in quali condizioni organizzative e istituzionali tali applicazioni risultino possibili o, al contrario, limitate. Tale prospettiva supera la classica dicotomia tra controllo tecnico e burocrazia, indagando come l'IA interagisca con le dimensioni epistemiche e cognitive del decision-making

pubblico e contribuisca così alla costruzione di un'amministrazione intesa come organizzazione epistemica dinamica, nella quale la conoscenza costituisce il nucleo stesso della governance. In questa prospettiva olistica, l'IA si riconfigura non più come uno strumento di automazione, bensì come un vero e proprio agente cognitivo (Capolupo, 2024) capace di amplificare, e talvolta riorientare, i processi di costruzione della conoscenza collettiva. Gli algoritmi non si limitano a estrarre correlazioni dai dati, ma introducono nuovi modi di interpretare la realtà, fondati su logiche probabilistiche e su inferenze generative che, pur distanti dal giudizio umano, contribuiscono a espandere i confini epistemici delle istituzioni. L'IA opererebbe come una tecnologia della conoscenza, ridefinendo i confini tra sapere tacito e sapere esplicito (Capolupo, 2025), e sollecitando le organizzazioni pubbliche a sviluppare competenze metacognitive in grado di comprendere, interpretare e governare le inferenze algoritmiche. Al contempo, introdurre tali tecnologie richiede una riflessione sulla razionalità amministrativa: l'azione pubblica non è più il risultato esclusivo di procedure formali e di gerarchie normative, ma emerge da un'interazione continua tra sistemi umani e non umani, in cui la responsabilità decisionale si distribuisce lungo catene sociotecniche complesse (Capolupo *et al.,* 2025)

Le organizzazioni pubbliche, da sistemi chiusi e procedurali, sono chiamate a divenire sistemi adattivi complessi, capaci di apprendere in modo iterativo attraverso feedback, sperimentazione e riflessione collettiva. Invero, l'IA può fungere da catalizzatore per processi di apprendimento organizzativo "di secondo ordine" (Argyris e Schön, 1996), in cui non si tratta soltanto di correggere errori operativi, ma di ridefinire continuamente i paradigmi interpretativi e le routine cognitive con cui l'amministrazione legge e governa la realtà. Nel settore pubblico, essa rappresenta un passaggio paradigmatico dalla logica burocratica della standardizzazione alla logica epistemica della scoperta. *Inter alia,* sfida non è più soltanto tecnologica, bensì conoscitiva e culturale: consiste nel costruire amministrazioni capaci di apprendere, riflettere e decidere insieme alle macchine, mantenendo al contempo salda la dimensione etica e deliberativa del giudizio umano.

2. Metodologia della ricerca

Viene proposta una meta-sintesi qualitativa della letteratura scientifica recente sull'interfaccia tra pubblica amministrazione e IA (Walsh e Downe, 2005). L'approccio consente di integrare i risultati di diversi studi, facendo emergere gli elementi interpretativi e concettuali che delineano il processo di produzione della conoscenza e le dinamiche epistemiche nel settore pubblico in conseguenza dell'introduzione dell'IA. La ricerca segue un protocollo multi-step per la meta-sintesi qualitativa, in linea con Noah (2017) e Weinberger (2022).

Due domande di ricerca guidano l'indagine, delimitandone di fatto i confini cognitivi:

RQ1. Quali meccanismi facilitano la generazione di conoscenza, il riconoscimento di pattern e il potenziamento dei processi interpretativi tramite l'IA nella pubblica amministrazione?

RQ2. In quali condizioni organizzative e/o istituzionali tali funzioni basate sulla conoscenza possono prosperare o, viceversa, stagnare?

La revisione include studi peer-reviewed pubblicati tra il 2003 e oggi. I criteri di inclusione prevedono che i lavori analizzino l'applicazione dell'IA o di sistemi algoritmici nel settore pubblico in relazione a conoscenza, apprendimento organizzativo, supporto decisionale, scoperta o innovazione nelle politiche; vengono esclusi invece gli studi puramente tecnici privi di implicazioni organizzative. La raccolta del materiale viene effettuata mediante una ricerca strutturata nel database Scopus, il cui prompt viene di seguito riportato:

TITLE-ABS-KEY (("artificial intelligence" OR AI OR "machine learning" OR "generative AI" OR chatbot OR "algorithmic system*")*

AND ("knowledge sharing" OR "knowledge management" OR "organizational learning" OR "knowledge transfer" OR "knowledge creation" OR "epistemic organization" OR "epistemic community" OR "knowledge governance")*
AND ("public administration" OR "public sector" OR "government organization" OR "public institution*" OR "public policy" OR "e-government" OR "digital government")).*

Risultati preliminari (riportati nella Figura 1 e nella Tabella 1) mostrano una crescita costante della produzione scientifica, con un incremento marcato a partire dal 2017 e un salto quantitativo significativo nel periodo 2021–2026. La maggioranza dei contributi risulta composta da conference papers (43) e conference reviews (16), seguiti da articoli scientifici (34), capitoli di libro (9) e monografie (4).

Tabella 1. Distribuzione preliminare dei contributo

Per l'analisi, viene adottato un approccio interpretativo-computazionale misto. Il corpus di 108 articoli è ordinato mediante mappatura lessicale al fine di individuare concetti ricorrenti e il loro grado di rilevanza rispetto alle domande di ricerca. L'analisi tematica impiegata consente di integrare risultati provenienti da ambiti eterogenei — studi organizzativi, ricerca sulla governance e sistemi informativi — fornendo strumenti per identificare pattern di ragionamento ricorrenti, meccanismi abilitanti e barriere contestuali. La meta-sintesi qualitativa, quindi, si limitata ad

aggregare dati, ma consente di sviluppare un quadro interpretativo che descrive come l'IA stia ridefinendo i processi di apprendimento collettivo e di pensiero nelle organizzazioni pubbliche.

3. Risultati preliminari

I risultati indicano che l'IA funge da strumento interpretativo e generativo di conoscenza, più che da supporto decisionale. Tre meccanismi principali (RQ1) emergono dalla letteratura. Il primo è quello di potenziare la capacità cognitiva organizzativa, consentendo di individuare correlazioni e pattern sottostanti e di tradurre l'informazione in ipotesi utili ai processi decisionali pubblici. Il secondo, prevede di favorire la costruzione di senso, grazie a sistemi esplicabili e interattivi che promuovono un dialogo tra esperienza umana e inferenza algoritmica, consentendo agli amministratori di co-costruire significati e mettere in discussione le assunzioni implicite nei dati. Il terzo e ultimo, di agire come infrastruttura di apprendimento, abilitando processi istituzionali adattivi fondati su cicli di feedback, aggiornamenti continui dei modelli e revisioni basate sull'errore.

Il quadro emerso suggerirebbe che l'IA sia in grado trasformare l'amministrazione pubblica da un apparato regolato da norme a un sistema collettivo di pensiero esplorativo, riflessivo e adattivo (Babšek et al., 2025). L'effettiva realizzazione di tali capacità cognitive dipende tuttavia da specifiche condizioni organizzative e istituzionali (RQ2): governance trasparenti e partecipative, leadership sperimentale, cultura del dibattito rigoroso e disponibilità di risorse infrastrutturali e competenze tecniche adeguate. Viceversa, rigidità gerarchiche, mentalità tecnocratiche e un eccesso di controllo regolatorio ostacolano i processi di apprendimento, confinando l'IA a funzioni procedurali o predittive. L'analisi mostra dunque che il contributo cognitivo dell'IA alle organizzazioni pubbliche costituisca la risultante di una trasformazione organizzativa fondata sull'allineamento coerente tra tre caratteristiche e/o condizioni strutturali: giudizio umano, apprendimento istituzionale e ragionamento algoritmico (Mainardi, 2025; Tangi et al., 2025).

4. Discussioni e implicazioni

Lo studio intende contribuire all'odierno dibattito su IA e governance pubblica, proponendo una visione a suo modo alternativa per il futuro delle organizzazioni pubbliche in quanto organizzazioni epistemiche. Il potenziale dell'IA non risiede soltanto nell'efficienza o nell'automazione, ma anche nella capacità di abilitare processi di scoperta e apprendimento, a condizione che essa operi entro contesti istituzionali adeguati.

Sotto il profilo teorico, la ricerca arricchisce la letteratura integrando filoni tradizionalmente distinti, quali apprendimento organizzativo, decision-making e forme di governance pubblica, in un quadro complesso che concettualizza l'IA come agente cognitivo nei processi istituzionali. La meta-sintesi pone l'enfasi su come gli algoritmi non si limitino ad ampliare la capacità analitica, ma partecipino attivamente alla costruzione di senso attraverso interazione, feedback e traduzione interpretativa. Ciò invita a riconsiderare le ipotesi classiche di razionalità amministrativa: il processo decisionale non è più vincolato alle sole menti umane o alle tradizioni istituzionali, ma viene co-prodotto da combinazioni uomo-macchina. Ne deriva un passaggio da una concezione statica di mera adozione tecnologica a una visione relazionale della base di conoscenza organizzativa, in cui IA, infrastrutture dati e competenze professionali costituiscono sistemi di scoperta in continua evoluzione.

Dal punto di vista pratico, i risultati offrono indicazioni utili a dirigenti pubblici e policy maker interessati a progettare sistemi di IA capaci di potenziare la riflessività e la capacità di apprendimento delle istituzioni. È fondamentale promuovere architetture di governance equilibrate tra trasparenza e controllo, laboratori interdisciplinari per l'analisi dei dati, programmi di leadership e formazione che incoraggino il dialogo e la sperimentazione, oltre a una regolazione

flessibile che permetta sperimentazioni adattive. Infine, si sottolinea la necessità di investire in interdisciplinarità e alfabetizzazione ai dati, per favorire la collaborazione tra funzionari pubblici, esperti tecnici e cittadini (Romeo et al., 2025). Laddove tali elementi convergono, l'IA si configura non come infrastruttura di automazione, bensì come infrastruttura generativa di apprendimento per le istituzioni pubbliche.

In ultima analisi, lo studio fornisce solide basi concettuali ed empiriche per reinterpretare le organizzazioni pubbliche come sistemi cognitivi capaci di riflessione e adattamento continui, nei quali gli algoritmi diventano co-creatori di conoscenza e strumenti di una governance che integra, piuttosto che sostituire, il giudizio umano e la saggezza collettiva.

The Value of Gender Board Diversity in SMEs: Human Capital Investment and Sustainability

Maria Cristina Manocchio[1], Antonia Puccio[2], Francesca Di Virgilio[3], Gianluigi Mangia[4]

1. Introduction

This research proposal aims to present a thorough overview of the connection between gender diversity on boards and the performance of small and medium-sized enterprises (SMEs), with a specific focus on the impact of human capital investment. The objective is to critically examine how current academic research approaches the link between board gender diversity and SME performance, while identifying unresolved questions and opportunities for further inquiry. Special attention will be given to understanding the contextual factors and practical conditions that allow gender-diverse boards to foster sustainable, long-term growth—seeking not only theoretical insights but real-world relevance for businesses and society.

Research on gender diversity in corporate governance shows enhanced cooperation, task execution, and innovation capabilities (Ferrary and Déo, 2023). At the board level, enterprises generally experience performance enhancements only upon achieving a critical mass threshold (Jayaraman et al., 2025; Baghdadi et al., 2023). While these trends are predominantly positive, research also identifies instances where gender diversity does not enhance performance and may even correlate with neutral or adverse outcomes. Some studies report non-significant or adverse relationships, especially in innovative SMEs and sectors marked by rapid growth or high risk-taking (Adeoye et al., 2023; Radziwon and Vanhaverbeke, 2024; Schifilliti and La Rocca, 2024; Khan et al., 2024b). For instance, data from 2,264 Italian innovative SMEs indicates a negative link between female board presence and financial performance (Schifilliti and La Rocca, 2024, p. 474). The connection between board gender diversity and SME performance has become a central topic in organizational research, particularly as SMEs undergo digital transformation, adopt smart working, and strive for organizational well-being (Morrone et al., 2022; Schifilliti and La Rocca, 2024). Several studies emphasize that the positive impact of board gender diversity on performance is significantly influenced by the level of HR investment (Adiazmil et al., 2024; Boopathi, 2024; Qiao et al., 2024). SMEs that dedicate more resources to personnel costs and human capital development see improvements in innovation, productivity, and employee well-being (Ferrary and Déo, 2023; Capozza and Divella, 2024; Gaio et al., 2024; Alodat and Hao, 2025; Joo et al., 2023). Conversely, in SMEs with low HR investment, the effect of board diversity is reduced or even negative. The growing digitalization of SMEs has underscored the importance of inclusive governance and HR strategies. Gender-diverse boards are more proficient in navigating technological transformations, promoting sustainable innovation, and boosting employee engagement, particularly when supported by effective human resource practices (Del Mar Fuentes-Fuentes et al., 2023; Capozza and Divella, 2024; Gerged et al., 2023; Tajeddini et al., 2023). In the current context, sustainability is no longer an accessory aspect but a strategic

driver that affects competitiveness, market access, value creation, and organizational well-being (Ahmad et al., 2023; Omowole et al., 2024). For SMEs, the integration of sustainable practices necessitates prioritizing human capital and board composition, which are pivotal in fostering enduring and sustainable performance (Ahmad et al., 2023; Kutaula et al., 2025). This study conceptualizes sustainability through an integrated Environmental, Social, and Governance (ESG) framework. For SMEs, sustainability is defined as the organization's capacity to cultivate long-term organizational practices that enhance internal well-being, uphold social responsibility, and ensure transparent decision-making processes, all of which are supported by investments in human capital (Ahmad et al., 2023; Shalhoob and Hussainey, 2022). While there are numerous conceptual definitions and measurement methodologies, the importance of gender diversity is supported by a range of theoretical perspectives. The table 1 provides a summary of these perspectives, detailing their fundamental principles, original contributors, and significant applications in the context of board diversity value.

Theory	**Description**	**Original Author(s)**	**Key Authors Who Extended the Theory**
Resource-Based View	Firm resources, encompassing a diverse range of human capital, are essential for attaining a competitive advantage and superior performance.	Jay Barney (1991), Wernerfelt (1984)	Khan et al., 2024a; Ozdemir et al., 2023
Agency Theory	Board diversity can enhance oversight and mitigate agency issues by incorporating diverse perspectives and supervisory approaches.	Jensen and Meckling (1976), Fama and Jensen (1983)	Fayyaz et al., 2023; Zattoni et al., 2023; Lu et al., 2022
Social Role and Expectation States theories	Gender roles and societal expectations influence behavior and impact board dynamics and decision-making.	Alice Eagly (1987)	Khatri, 2023; Issa and Bensalem, 2023
Stakeholder Theory	Organizations must evaluate and align the interests of all stakeholders, not just shareholders, to attain sustained success and legitimacy.	R. Edward Freeman (1984)	Heubeck, 2024; Ozdemir et al., 2023; Lu et al., 2022
Signalling Theory	Board diversity communicates to external entities, such as investors and stakeholders, that the firm prioritizes inclusivity, ethical standards, and progressive governance, thereby enhancing its reputation and fostering trust.	Michael Spence (1973)	Lu et al., 2022
Resource Dependence Theory	Board diversity grants access to a wider range of resources, expertise, and external networks, thereby enhancing	Pfeffer and Salancik (1978)	Islam et al., 2022; Lu et al., 2022

	decision-making and organizational adaptability.		
Human Capital Theory	The incorporation of diverse perspectives expands the collective repository of knowledge, proficiencies, and experiences, thereby augmenting both problem-solving capabilities and innovation processes.	Gary Becker (1964)	Heubeck, 2024; Lu et al., 2022
Social Identity Theory	Group members categorize themselves and others into social groups (e.g., according to gender), thereby influencing group dynamics and patterns of inclusion or exclusion.	Henri Tajfel and John Turner (1979)	Zattoni et al., 2023; Lu et al., 2022
Token Theory	When minority representation is minimal, individuals are perceived as "tokens," resulting in marginalization and restricted influence unless a sufficient critical mass is attained.	Rosabeth Moss Kanter (1977a)	Yadav and Prashar, 2023; Lu et al., 2022
Critical Mass Theory	A minimum threshold of minority representation (e.g., women) is required to impact board decisions and prevent tokenism.	Rosabeth Moss Kanter (1977b)	Khatri, 2023; Yadav and Prashar, 2023; Issa, 2023
Complexity Theory	Board diversity interacts with various board and business characteristics in complex ways, influencing performance in nonlinear and context-dependent manners.	W. Ross Ashby (1956)	Pandey et al., 2023
Upper Echelons Theory	The backgrounds of top managers, including gender, influence strategic decision-making and organizational performance.	Hambrick and Mason (1984)	Heubeck, 2024; Khatri, 2023; Issa and Bensalem, 2023
Stakeholder/Institutional	Organizations are affected by both stakeholder interests and institutional pressures (such as norms and regulations), which influence board composition and governance practices.	Freeman (1984), DiMaggio and Powell (1983)	Ozdemir et al., 2023; Naveed et al., 2023

Table 1. Theories on Gender Board Diversity

In our study, our theoretical perspective is grounded in three prominent frameworks from the literature on gender board diversity: the Resource-Based View (RBV), Agency Theory and the

Social Role and Expectation States theories, as these approaches provide a robust lens to examine the specific variables of interest in our analysis.

From the RBV, gender diversity is regarded as a strategic and distinctive organizational asset that enhances the company's knowledge base and problem-solving capabilities (KS, 2024). Boards with gender diversity benefit from a wider array of cognitive inputs, diverse professional networks, and a broader spectrum of viewpoints, which can improve strategic decision-making – which is especially beneficial for complex challenges like sustainability and climate change – and strengthen competitive edge (Fouad et al., 2023; Ferrary and Déo, 2023; Gaio et al., 2024). This approach argues that diversity is most valuable when it permeates not only the boardroom but also managerial and operational levels, where day-to-day decisions and collaborative processes occur (Ouni et al., 2022; Saeed et al., 2024; Del Mar Fuentes-Fuentes et al., 2023; Laique et al., 2023; Khan et al., 2024a; Ozdemir et al., 2023). This diversity also improves innovation and long-term performance, particularly when leveraged through HR strategies such as environmental management training (Khan et al., 2025). In SMEs, where resources are often limited, gender diversity can be a critical differentiator of sustainable growth and adaptability (Khan et al., 2025; Naveed et al., 2021).

While the RBV highlights diversity as an internal resource that enhances value, Agency Theory concentrates on the governance roles of diverse boards, particularly in terms of oversight and managerial accountability (Adeusi et al., 2024). Agency Theory offers a complementary perspective by underscoring governance and monitoring functions. Gender diversity can reduce agency conflicts between owners and managers by strengthening oversight and improving accountability (Amin et al., 2024; Kalia, 2025). Research has demonstrated that women in directorial roles are frequently associated with enhanced monitoring practices, increased focus on transparency, and more detailed assessments of managerial decisions (Kalia, 2025; Baghdadi et al., 2023; Ouni et al., 2022; Laique et al., 2023). In SMEs, where governance structures may be less formalized, gender-diverse boards can play a key role in aligning management actions with stakeholder interests and promoting responsible and sustainable practices (Zhu et al., 2022; Abed et al., 2025).

In addition to structural and economic factors, behavioral and sociological perspectives illuminate the impact of gender diversity on organizational performance and outcomes.

Social Role and Expectation States theories propose that women frequently introduce leadership styles characterized by relational, cooperative, and stakeholder-focused approaches, which can significantly influence corporate priorities, particularly in areas such as sustainability, employee welfare, and socially responsible strategies (Khatri, 2023; Issa and Bensalem, 2023).

Expectation States Theory posits that even a single woman can influence outcomes in areas typically associated with feminine characteristics, such as social interaction (Khatri, 2023; Del Mar Fuentes-Fuentes et al., 2023). Despite the advancements in current research, several limitations persist, notably the lack of a comprehensive theoretical framework and difficulties in establishing a precise definition.

Various theoretical frameworks link gender diversity on corporate boards to sustainability outcomes, particularly within the three dimensions of ESG criteria (EmadEldeen et al., 2025; Khalid et al., 2025). Table 2 outlines the primary theories associated with sustainability, as well as the key authors who have made recent contributions to this field.

Theory	**Core Idea and Link to Sustainability**	**Citations**
Critical Mass Theory	A threshold, typically 30% or a minimum of three women, is required for gender diversity to exert a meaningful influence on sustainability outcomes.	Khatri, 2023; Yadav and Prashar, 2023; Amorelli and García-Sánchez, 2021

Resource Dependence Theory	Female directors contribute distinctive resources and networks, thereby strengthening sustainability and fostering innovation.	EmadEldeen et al., 2025; Konadu et al., 2022
Signalling Theory	The inclusion of women indicates a company's dedication to social ideals and sustainability to stakeholders.	Fernández-Méndez et al., 2025
Social Role Theory	Women are conditioned to exhibit greater compassion and ethical awareness, resulting in an enhanced emphasis on sustainability and social responsibility in boardroom decisions.	Khatri, 2023; Nadeem et al., 2020; Lin et al., 2022
Stakeholder Theory	Gender-diverse boards are more attuned to stakeholder needs, improving sustainability and ESG performance.	EmadEldeen et al., 2025; Konadu et al., 2022
Upper Echelons Theory	Board members' demographic characteristics (e.g., gender) shape strategic choices, including sustainability initiatives.	Khatri, 2023; Nadeem et al., 2020; Lin et al., 2022

Table 2. Theories Linking Gender Board Diversity and Sustainability

While theoretical models do not always align with empirical data, the evidence on gender diversity's impact is intricate, non-linear, and highly context-specific. Empirical findings vary and show non-linear patterns. Positive impacts are frequently noted at the middle-management and operational levels, but in more traditional or male-dominated settings, the effect may be weaker or even absent (Schifilliti and La Rocca, 2024; Bogdan et al., 2023; García-Meca and Santana-Martín, 2023; Hemmert et al., 2024; Marquez-Cardenas et al., 2022; Tran et al., 2023; Zahoor et al., 2024; Jayaraman et al., 2025).

Overall, the literature indicates that board gender diversity can serve as a strategic asset for SMEs, particularly when coupled with substantial investment in human capital, linking to the dimension "Social" of ESG criteria. Theories such as the RBV and upper echelons theory suggest that diverse boards contribute to superior decision-making and innovation potential (Del Mar Fuentes-Fuentes et al., 2023; Ferrary and Déo, 2023; Capozza and Divella, 2024; Gaio et al., 2024; Alodat and Hao, 2025; Joo et al., 2023). Despite advancements, there remain critical gaps in comprehending how HR investment magnifies these effects and the impact of digitalization for SMEs.

According to Schifilliti and La Rocca (2024), concerning Italian SMEs suggest that the inclusion of women on corporate boards is correlated with the development of more inclusive corporate cultures, an enhanced focus on human resource development, and the adoption of improved sustainability-oriented organizational practices.

However, these effects are not consistent and are influenced by contextual aspects such as the number of women on the board, their active participation in strategic decision-making, and the overarching organizational culture in which they function.

Most evidence on gender diversity and governance is drawn from large corporations; research specifically targeting SMEs is comparatively limited (Schifilliti and La Rocca, 2024; Boffa et al., 2023). This gap suggests the need to understand how gender-diverse boards influence financial performance in smaller firms, particularly during sustainability transitions, such as circular economy, sustainable business models and ESG governance transitions. (Ahmadov et al., 2025, Bargavi et al., 2025; Caputo et al., 2024).

Emerging literature suggests that the impact of board gender diversity on performance is moderated by the degree of investment in human capital (Adeoye et al., 2023; Zayed et al., 2022; Schifilliti and La Rocca, 2024). SMEs allocating greater resources to personnel development, training, and organizational well-being are better able to translate the cognitive and relational advantages of board diversity into strategic outcomes (Zayed et al., 2022). Conversely, when HR investment is low, the positive effects of gender diversity may be weakened or may not emerge at all. This highlights the importance of considering internal resource allocation as a mechanism that enables gender diversity to enhance firm financial performance and sustainability.

Table 3 outlines the impact of women on boards in Italian SMEs, with a focus on areas such as inclusivity and diversity, human resource policies, internal sustainability and financial performance.

Impact Area	**Effect of Women on Boards**	**Citations**
Inclusivity and Diversity	Strongly positive with critical mass	Cambrea et al., 2023; De Masi et al., 2021; García-Sánchez et al., 2024; Boffa et al., 2023
HR Policies	Enhanced focus, especially as chair	Furlotti et al., 2019; Cambrea et al., 2023
Internal Sustainability	Improved ESG and ethical performance	Provasi and Harasheh, 2021; Cambrea et al., 2023; De Masi et al., 2021; Romano et al., 2020
Financial Performance	Mixed or neutral in SMEs; sometimes negative in innovative/high-growth sectors	Provasi and Harasheh, 2021; Schifilliti and La Rocca, 2024

Table 3. Board Gender Diversity and Human Resources

To the best of our knowledge, our literature search in databases such as Scopus and Web of Science reveals that only a limited number of studies on Italian SMEs have empirically examined the relationship between board gender diversity and firm performance while incorporating dimensions of human capital investment (Morrone et al., 2022; Schifilliti and La Rocca, 2024; Baghdadi et al., 2023; Naciti et al., 2025; Bedeir, 2024). Existing research has predominantly concentrated on financial indicators such as profitability and efficiency (Morrone et al., 2022), the performance of innovative SMEs in growth-oriented sectors (Schifilliti and La Rocca, 2024), and managerial ability alongside human capital development (Baghdadi et al., 2023). While some studies have explored issues of wage equity and female leadership within European SMEs (Naciti et al., 2025), and others have investigated executive remuneration and accounting conservatism (Bedeir, 2024), there is a lack of empirical studies that explicitly connect board gender diversity to personnel costs as a proxy for HR policies, particularly within the context of Italian SMEs and across regional variations.

This study is currently under development, and the results will be discussed in future work. According to Schifilliti and La Rocca (2024), firm performance is explained through the share of women on the board alongside a standard set of control variables. In our study, we extend this model by incorporating the numerical variable *Personnel Costs*, sourced from the AIDA database (Computerized Analysis of Italian Firms), to capture the extent of investment in human capital. This approach will be further developed and refined in future research endeavors, wherein additional specifications and robustness analyses will be conducted to more accurately assess the moderating role of personnel expenditure. While the original study concentrated exclusively on Italian innovative SMEs—a category established by the Italian government in 2015 to promote

technological development and growth, characterized by mandatory criteria such as R&D expenditures, qualified personnel, and ownership of patents or registered software—it reported a negative and significant effect of female presence on financial performance (ROA), particularly in high-growth sectors. These findings may be influenced by the highly innovation-oriented nature of the sample, where strategic and technical priorities may overshadow the benefits of inclusive governance practices.

Although there is an increasing body of studies on board gender diversity in various domains, substantial gaps remain about such research in Italian SMEs considering human capital investment. The theory and empirical research methods of this field must also be greatly expanded.

The present study proposes to expand the empirical scope in two keyways. First, rather than restricting the sample to innovative SMEs, the analysis now includes the broader universe of Italian SMEs. Second, the temporal range is extended to cover the years 2022 to 2024. This expanded empirical setting enables an assessment of whether the negative effect of board gender diversity on ROA, measured as the ratio between EBIT and total assets, commonly used as an indicator of operating profitability according to Krstić et al. (2023), observed in innovative SMEs appear to be specific to environments with rapid growth and intense innovation, but it remains to be seen whether a similar trend is also present across Italy's broader SME sector.

The dataset employed in this study is obtained from AIDA, which provides standardized and comparable accounting data and firm characteristics at the SME level. The variable "Personnel Costs" has been included to capture the moderating effect of human capital investment, acting as an indicator of the firm's commitment to developing its workforce by covering expenses such as salaries, social security contributions, and other employee-related costs. This measure reflects the amount of resources allocated to human capital and allows analysis of how female board representation influences HR investment strategies in driving performance outcomes. The purpose of this study is to examine the influence of board gender diversity on SME performance, with a specific focus on how this interplay is affected by the extent of human capital investment.

Specifically, we investigate whether the presence of women on the board contributes more positively to firm performance in SMEs that allocate greater resources to personnel development and organizational well-being. Furthermore, this study lays the conceptual groundwork for future empirical research. In subsequent work, we will conduct a quantitative analysis using firm-level data to test this moderating effect more rigorously and to determine whether the performance outcomes of gender board diversity vary across different levels of human capital investment within Italian SMEs.

The following main research question was posed:

RQ1**:** *What is the impact of board gender diversity on SME performance when considering different levels of human capital investment?*

The moderating RQ1 will be tested by estimating an analysis that includes an interaction term between the share of women on the board (GBDR) and Personnel Costs:

$$ROA_{it} = \beta_0 + \beta_1 GBDR_{it} + \beta_2 PersonnelCosts_{it} + \beta_3 (GBDR_{it} * PersonnelCosts_{it}) + X_{it\gamma} + \alpha_i + \delta_t + \varepsilon_{it}$$

where X_{it} is a vector of firm controls (size, leverage, industry dummies, age, R&D intensity, etc.), α_i are firm fixed effects, and δ_t are year fixed effects.

In addition to the moderating model described above, we develop and include in the analysis a new incidence proxy—defined as the ratio between the Gender Board Diversity Rate (GBDR) and Personnel Costs—and introduce it explicitly as an additional independent predictor in the regression model. This incidence proxy is operationalized as*:*

$$IncidenceProxy_{it} \frac{GBDR_{it}}{PersonnelCosts_{it}}$$

The incidence proxy is included as a direct explanatory variable in the ROA regression to capture the strategic alignment between gender-inclusive governance and HR investment intensity (i.e., whether diversity in decision-making is matched by concrete investment in human capital). By entering the ratio as an independent predictor, the model can evaluate whether firms that simultaneously exhibit higher board gender diversity and stronger personnel expenditure perform differently from those without such alignment.

Consequently, the extended specification estimated to assess the predictive role of the incidence proxy is:

$$ROA_{it} = \beta_0 + \beta_1 GBDR_{it} + \beta_2 PersonnelCosts_{it} + \beta_3 IncidenceProxy_{it} + X_{it\gamma} + \alpha_i + \delta_t + \varepsilon_{it}$$

This approach permits two complementary tests: (i) the moderation test (interaction term) that examines whether Personnel Costs change the marginal effect of GBDR on ROA, and (ii) the direct predictive test provided by the incidence proxy to measure whether the *alignment* between governance diversity and HR investment correlates with ROA above and beyond the main effects and interaction.

Robustness checks will include alternative operationalizations of personnel investment (e.g., Personnel Costs scaled by total assets or by sales), alternative performance measures (e.g., Tobin's Q, Return on Sales), and sub-sample analyses by industry, firm size, and family vs. non-family ownership. Endogeneity concerns will be addressed through lagged independent variables, firm fixed effects, and where possible instrumental variable approaches inspired by prior literature.

This research proposal aims to investigate the specific circumstances under which board gender diversity contributes to improved financial performance, human resource strategies, and sustainable outcomes in SMEs. The proposed framework is structured to show that the relationship between board gender diversity and SME financial performance is affected by the level of investment in human capital.

The theoretical foundation argues that merely appointing women to boards does not consistently translate into better financial outcomes unless accompanied by strategic resource allocation (Schifilliti and La Rocca, 2024; Adeoye et al., 2023; Zayed et al., 2022). The research indicates that the beneficial effects of gender diversity are enhanced in SMEs that significantly allocate resources to human expenses. From the Resource-Based View (RBV), which regards diverse human capital as a crucial resource for competitive advantage (Barney, 1991; Wernerfelt, 1984), gender diversity is a strategic asset that enriches the knowledge base of SMEs (Khan et al., 2024a; Ozdemir et al., 2023; KS, 2024). The model aims to demonstrate that allocating resources to employee development, technical proficiency, and organizational well-being (Personnel Costs) is crucial, as this investment cultivates the environment necessary to effectively leverage diverse inputs, thereby strengthening the competitive edge and enabling sustainable growth.

The analysis, built on Agency Theory (Jensen and Meckling, 1976; Fama and Jensen, 1983), examines how substantial Human Capital Investment promotes improved governance and oversight. Gender diversity on boards can help reduce agency conflicts between owners and managers by improving oversight and strengthening accountability frameworks (Fayyaz et al., 2023; Zattoni et al., 2023; Adeusi et al., 2024). The model proposed in this research seeks to demonstrate that substantial investment in human capital allows gender-diverse boards to more effectively engage in strategic decision-making and monitoring, ensuring management actions align with stakeholder interests and promote responsible, sustainable business practices (Zhu et al., 2022; Abed et al., 2025). These behavioral theories suggest that women often introduce leadership styles characterized by relational, cooperative, and stakeholder-focused approaches (Khatri, 2023; Issa and Bensalem, 2023). The analysis is designed to examine if substantial

Personnel Costs act as the necessary infrastructure (e.g., resources, training) that allows these diversity-driven strategies to translate into tangible organizational resilience and internal sustainability results. The research introduces and tests a novel incidence proxy (Gender Board Diversity Rate / Personnel Costs).

The data proposes to measure the strategic alignment between gender-diverse governance on boards and the extent of strategic investment in human resources. Incorporating this ratio as a direct explanatory variable enables the model to evaluate whether organizations exhibiting both enhanced board gender diversity and increased personnel investment vary in performance from those without such alignment.The use of both a moderation test (through an interaction term) and a direct predictive test (via the incidence proxy) seeks to clarify if the value generated by gender diversity on boards primarily depends on substantial investment in human capital, thereby implying that HR practices act as key enablers of sustainable financial performance in SMEs.

This chapter demonstrates that the benefits of board gender diversity are influenced by the extent of internal human capital investment, offering a refined understanding of how gender-inclusive governance impacts economic performance (Adeoye et al., 2023; Zayed et al., 2022). This perspective is particularly relevant to Italian SMEs (Schifilliti and La Rocca, 2024; Boffa et al., 2023; Morrone et al., 2022), where limited financial resources and cultural factors may reduce the effectiveness of diversity initiatives unless supported by adequate investment in employee development and organizational capabilities.

The expected findings of this study may offer relevant implications for policymakers, stakeholders, and managers. This research explores how the influence of board gender diversity on the performance of SMEs varies with the degree of investment in human capital, aiming to contribute to the continuing debate on how governance structure and HR strategies together affect SMEs' financial outcomes (Capozza and Divella, 2024; Kutaula et al., 2025; Schifilliti and La Rocca, 2024). From a managerial viewpoint, the research emphasizes that appointing women to boards should move beyond symbolic or compliance-based actions (Martínez-García et al., 2021; Wang et al., 2024). Instead, gender diversity must be integrated within a broader strategic framework that focuses on developing human capital, retaining talent, and fostering collaborative organizational practices (Uthman, 2024). SMEs that align inclusive governance with substantial HR investment may be better equipped to innovate, adapt to technological change, and promote sustainable growth (Al Malki, 2023). Additionally, the study offers evidence-based guidance for public institutions seeking to support SMEs in sustainability transitions, highlighting the importance of internal organizational conditions that generate value.

Keywords: Board gender diversity; SMEs performance; human capital investment; sustainability; corporate governance

Exploring risks of human-centered artificial intelligence in human resource management

Silvia Barghini[1], Mariacristina Bonti[2], Sara Sassetti[3]

1. Introduction

The increasing diffusion of Artificial Intelligence (AI) systems is radically transforming Human Resource Management (HRM), redefining processes, roles, and decision-making practices (Vrontis et al., 2022, Gupta, 2024, Fenwick et al., 2024). Predictive algorithms, intelligent platforms, and behavioral analytics systems are becoming integral components of key HR practices (Al-Shammari et al., 2024, Alsaif and Sabih Aksoy, 2023), such as recruitment and selection (Gupta and Mishra, 2023, Mori et al., 2025), performance management (Nyathani, 2023), personalized training and development (Huang et al., 2023), and well-being management (Sadeghi, 2024). While these technologies promise efficiency, accuracy, and predictive capabilities, their adoption also introduces new and complex ethical, social, organizational, and technical issues (Shaw et al., 2019, Rane et al., 2024, Kumar and Kumar, 2024). The use of AI systems in HRM carries the potential for algorithmic discrimination (Köchling and Wehner, 2020), reduced transparency in decision-making processes (Rodgers et al., 2023), and diminished employee autonomy and trust (Bankins, 2021).

AI, understood as a set of systems capable of learning, adapting, and making data-driven decisions (Kumari et al., 2024), includes discriminative models, which classify or predict outcomes, and generative models, which create new data or content (Jaakkola and Haussler, 1998, Jebara, 2012). While their application in HRM has enhanced corporate capacity to manage large volumes of information and optimize complex processes, this has also introduced additional forms of risk (Budhwar et al., 2022). Predictive models, for instance, may reproduce or amplify biases present in historical data (Sarstedt and Danks, 2022); evaluation algorithms can reduce human complexity to numerical parameters (Raschka, 2018); and automated decisions may undermine the relational dimension of people management (Raisch and Krakowski, 2021, Parker and Grote, 2022).

To address these challenges, Shneiderman (2020), Ozmen Garibay et al. (2023), Schmager et al. (2025) have proposed a conceptual shift toward Human-Centered Artificial Intelligence (HCAI). This approach aims to develop AI systems capable of collaborating with humans, enhancing their cognitive and decision-making abilities, while ensuring that human oversight remains central. HCAI is grounded in the need to design technologies that are ethical, transparent, and controllable. In the HRM context, this entails creating systems that respect employees' dignity and rights, ensure fairness, and contribute to organizational well-being, while preventing automated decisions from producing distortive or unjust outcomes (Bankins et al., 2022, Folger and Cropanzano, 1998). Given that the concept of HCAI has been articulated explicitly only in recent years, a substantial portion of the existing literature refers to these principles implicitly. In many studies, the term "AI" is used in form, while in substance it denotes intelligent systems that are designed to be ethically grounded, transparent, controllable, and respectful of human values.

[1] Ph.D. Candidate, ECON-08/A, University of Pisa; silvia.barghini@phd.unipi.it – corresponding author

[2] Full Professor, ECON-08/A, University of Pisa; mariacristina.bonti@unipi.it

[3] Associate Professor, ECON-08/A, University of Pisa; sara.sassetti@unipi.it

Recognizing this conceptual continuity is essential for interpreting prior research and situating it within the emerging HCAI discourse. However, even systems designed to be "human-centered" are not without risks. Their effectiveness and reliability depend on the context in which they are implemented, the skills of those who use them, and the values shaping organizational culture (Jiang et al., 2025, Becker and Smidt, 2016).

To understand the complexity of risks associated with the application of HCAI in HRM processes, the socio-materiality paradigm (Orlikowski, 2010, Orlikowski and Scott, 2008) may provide a significant theoretical contribution. From this perspective, humans and technologies constitute an integrated system in which the meaning and value of technology emerge from the relationships it establishes with people and the social context. Within this view, the risks of HCAI could not stem solely from technical or algorithmic limitations, but primarily from socio-organizational interactions that shape its use. Studying these dynamics, therefore, entails examining how human, structural, and technological factors intertwine to generate or amplify ethical, managerial, and trust-related challenges.

The analysis of risks associated with HCAI in HRM seems to represent a research topic of growing relevance for both academia and practice. Research to date has primarily focused on the benefits of AI in terms of efficiency, accuracy, and predictive capability (Zong and Guan, 2025, Adekunle et al., 2021, Paramesha et al., 2024), while paying less attention to the unintended consequences that may arise when these tools are integrated into processes directly affecting people. For HR professionals, this topic is of strategic importance in ensuring the fairness, transparency, and sustainability of the HCAI systems they implement.

Given these considerations, this study seeks to address this research gap by examining the HCAI-related challenges within HR practices. The central research question driving this research work is: What are the main risks arising from HCAI applications in the HR practices most covered in literature? The objective is to provide an integrated and systematic view of the risks associated with the adoption of HCAI systems in HRM.

To achieve this goal, the study adopts a mixed-methods approach, combining a Systematic Literature Review (SLR) (Tranfield et al., 2003) and the Gioia method (Gioia et al., 2013). In line with Mori et al. (2025), Barghini and Bonti (2024), Al-Shammari et al. (2024), Alsaif and Sabih Aksoy (2023), the SLR was employed for data collection to ensure a rigorous and transparent empirical foundation. Subsequently, the Gioia method was applied to analyze the 60 selected articles inductively, allowing the main conceptual categories of risk to emerge. This methodological integration combines scientific rigor with interpretive depth, providing a robust and comprehensive framework for understanding the critical issues associated with HCAI in HRM.

Preliminary results suggest the presence of 3 main types of HCAI-related risks in HRM: machine-related risks, human-related risks, and context-related risks. These categories allow for the identification of the primary sources of vulnerability in HCAI systems, highlighting that risks are not confined to the technical level but arise from the interaction between machines, humans, and the organizational context.

This study, still in progress, aims to contribute to the research field by providing a conceptual model of HCAI-related risks in HRM and by opening new avenues for research on HCAI in organizational contexts. From a practical perspective, the research seeks to support HR managers in designing and implementing intelligent systems that are genuinely human-centered, promoting a balance between technological innovation, fairness, and well-being. In the long term, understanding and managing HCAI risks consciously could prove essential not only to protect people but also to build an HCAI system in HRM grounded in trust, transparency, and accountability.

2. Methodology

This study adopts a mixed-method approach that combines a Systematic Literature Review (SLR) (Tranfield et al., 2003) and the Gioia method (Gioia et al., 2013) to ensure both rigor and depth in the research process. The SLR was employed for data collection, providing a transparent, replicable, and comprehensive overview of existing knowledge in the field of HRM. The SLR is widely regarded as one of the most rigorous methods for synthesizing and critically appraising academic literature (Mulrow, 1994). Subsequently, the Gioia method was applied for data analysis, enabling the development of grounded theoretical insights through structured qualitative coding (Miles and Huberman, 1994, Strauss and Corbin, 1990).

Integrating these two approaches allows for a robust synthesis of prior research while fostering the emergence of novel conceptual understanding, thereby enhancing both the validity and originality of the findings.

2.1. Data collection

The initial phase focused on the systematic collection of relevant articles that would inform the subsequent analysis and discussion of the phenomenon under investigation. The search occurred on 28/10/2025 and the research query performed on Scopus® and Web of Science. Consistently with previous literature, the authors searched the following keywords in the title, abstract, and keywords of papers:

"("*risk" OR "challenge") AND ("AI" OR "artificial intelligence") AND ("HR" OR "human resource")*"

Notably, the authors deliberately adopted the broader term "AI" rather than "HCAI" in the search strategy. This choice was intended to ensure a wider coverage of relevant contributions and to avoid the premature exclusion of studies that, although not explicitly labeled as HCAI, are clearly aligned with its underlying principles.

The authors included only those journal articles that have been written in English, published until 28/10/2025, and included in the subject area "Business and Management". The authors obtained 205 documents from Scopus® and 46 from Web of Science.

In the second step, the authors removed 17 overlapping articles and defined the inclusion/exclusion criteria. They decided to focus their review on the influential business journals that were catalogued by the Chartered Association of Business Schools (CABS, 2024) in the most relevant fields for their research. The selected fields were in detail: General Management, Ethics, Gender and Social Responsibility ("ETHICS-CSRMAN"), Human Resource Management and Employment Studies ("HRM&EMP"), Organizational Studies ("ORG STUD"), Psychology (Organizational) ("PSYCH (WOPOB)"), Social Sciences ("SOC SCI"), and Strategy ("STRAT"). There were therefore 96 papers left in the sample. Then, by reading their title, abstract, and full text, the authors excluded those papers not related to the relationship between HCAI and HRM in terms of research topic, scope, and focus (substantive relevance criterion). Accordingly, papers that were not substantively aligned with a human-centered perspective were excluded through a manual, content-based analysis of the retrieved documents. This approach enabled a more nuanced, rigorous, and conceptually grounded selection process. Thus, a final sample of 60 relevant articles was obtained. Figure 1 describes the steps followed.

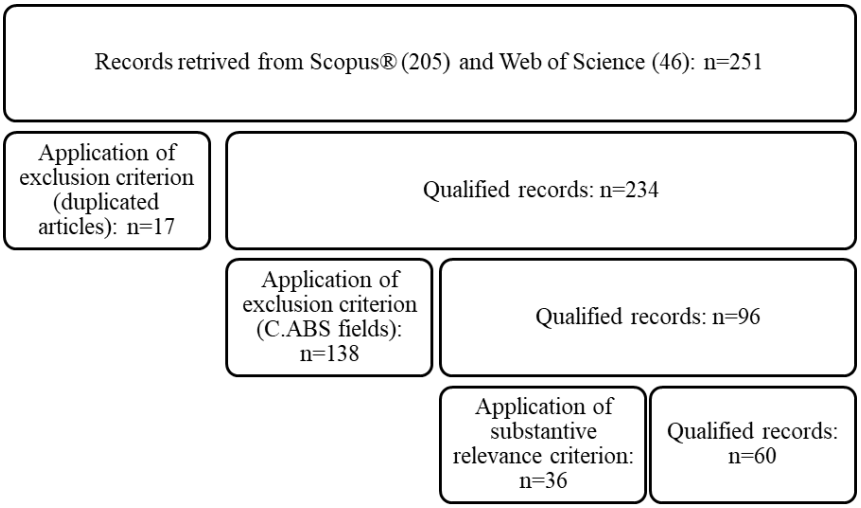

Figure 1. Flowchart of the literature search process

2.2. Data analysis

To develop a deep understanding of the challenges related to HCAI applications in HRM, the authors decided to approach the document analysis and study by adopting a qualitative approach. Their investigation focused on identifying and analyzing risks characterizing an HCAI system employed in HR practices.

The accepted documents (60) were analyzed using inductive open coding (Miles and Huberman, 1994, Strauss and Corbin, 1990), supported by Excel software. The structure proposed by Gioia et al. (2013) was followed for coding. The first-order codes were identified from the texts of the papers. Then, based on the theoretical background of the researchers, grounded first-order codes were progressively aggregated into more abstract second-order themes and overarching conceptual dimensions. This inductive coding process was carried out through triangulation among the three of us and involved several iterative rounds of coding.

Initially, the authors conducted open coding of the transcripts to identify instances related to the dimensions related to HCAI risks in HRM. These initial first-order categories and their associated second-order concepts formed a preliminary data structure. Subsequently, they reviewed this preliminary data structure and re-examined the extrapolated material to critically assess and refine the emerging codes. This collective process led to the removal of some codes, the merging of others, and the creation of new codes. The iterative cycles of coding and discussion continued until theoretical saturation was reached – that is, until no new conceptual insights emerged – resulting in a finalized data structure.

The coding process was complex and required several critical judgment calls. One key challenge was defining what constitutes a HCAI risk and its specific characteristics. To address this, a detailed review of the codes is still under way to ensure that only risks explicitly and unambiguously linked to HCAI applications in HRM are retained. As a result, some quotes initially coded under this category have been reassessed and subsequently removed when they did not meet this criterion.

Second, throughout the labeling and categorization process, the authors have to make several interpretive decisions concerning the assignment of first-order codes to second-order themes, as well as the definition and naming of second-order themes and overarching aggregate dimensions.

Finally, the authors have to determine appropriate cutoff points for including categories. As a guiding principle, they aim for their first-order categories to reflect the perspectives arising from all the accepted documents. Specifically, they are considering those codes that are consistent with

the research scope, closely aligned with a second-order category, contributing additional nuance without compromising the coherence of the data structure.

The coding results are still being refined to ensure the inclusion of concrete examples for discussion. The final coding scheme is therefore developed inductively, grounded in the data, and informed by their triangulated judgments.

In conclusion, 28 first-order codes, 11 second-order codes, and 3 aggregate dimensions have been preliminary identified. Table 1 presents a visualization of the preliminary data structure.

First-Order categories (28)	***Second-Order themes (11)***	***Aggregates dimensions (3)***
Representation risks	Input-related risks	Machine-related risks
Measurement risks		
Functional risks		
Selection risks	Data collection-related risks	
Omission risks		
Allocation risks	Algorithm-related risks	
Correlation risks		
Data optimization risks		
Emerging distortion risks	Process-related risks	
Reiteration risks		
Redesign risks	Structural and operational risks	Human-related risks
Over-reliance risks		
Cognitive-and-emotional overload risks	Person-related risks	
De-skilling risks		
Unprofessionalism risks		
Misinformation-and-manipulation risks		
Losing-humanity risks	Action-related risks	
Misbehave risks		
Cultural-resistance risks	Historic-cultural risks	Context-related risks
Technological-gap risks		
Regulatory-change risks	Institutional risks	
Regulatory-divergence risks		
Liability-attribution risks		
Technological lock-in risks		
Reputational risks		
Rising-inequalities risks	Sustainability risks	
Misalignment-with-CSR risks		
Environmental risks		

Table 1. Preliminary output of data analysis

3. Preliminary results

At this preliminary stage, the study has identified 3 overarching aggregates dimensions of the HCAI-related risks in HRM: machine-related risks, human-related risks, context-related risks. These are conceptually aligned with the framework on AI biases proposed by Schwartz et al. (2022). The first aspect concerns the technical risks intrinsic to HCAI systems, the second is about the risks associated with the human-machine relationship from a human perspective, and the last one involves risks arising from the specific historical, cultural, legislative, social, and environmental context in which an organization operates. Although here these are presented individually, they seem typically to coexist and be strongly interrelated. In addition, these dimensions seem to reflect a multi-layered perspective, capturing the interplay between contextual, human, and technological factors within AI applications in HRM.

The framework in Table 1 does not conceptualize these risks as being caused by the absence of a human-centered design, nor does it suggest that they are specific to poorly designed or purely automation-oriented AI systems. Rather, the risks identified should be understood as risks that may persist, and in some cases emerge, even when AI systems are intentionally designed and implemented according to human-centered principles. In this sense, the framework explicitly advances the argument that HCAI is still risky. Human-centered design reduces, but does not eliminate, the potential for unintended, harmful, or socially problematic outcomes in HRM. This seems therefore to highlight how ethical, transparent, and controllable intelligent systems can generate new forms of vulnerability in organizational practices, power relations, and institutional contexts. By adopting this perspective, the framework shifts the focus from a normative assumption that human-centeredness guarantees safety, toward a more critical understanding of HCAI as an ongoing socio-organizational accomplishment that requires continuous governance, monitoring, and reflexive oversight.

Please, note. As this study is still a work in progress, the authors are continuing to refine the description and analysis of the codes, as well as the conceptual development of the findings. These sections will be fully elaborated in the final version of the manuscript.

4. Conclusion

The expected outcomes of this study aim to provide a comprehensive and systematic understanding of the risks associated with the application of HCAI systems in HRM. This may contribute to the development of an integrated conceptual framework linking technological, human, and contextual dimensions. The research is expected to highlight that these risks could not primarily stem from the intrinsic limitations of technology. They rather could from the socio-organizational interactions that shape its use, thereby confirming the relevance of the socio-materiality paradigm (Orlikowski, 2010) for interpreting human-machine integration in complex organizational contexts. From this perspective, HCAI systems should not be understood as autonomous or neutral entities, but as co-constituted elements within HR practices.

From a theoretical perspective, the study aims to contribute to the advancement of the literature on HCAI in HRM by proposing an interpretive model of risks grounded in a socio-material reading of human-technology interactions. This approach enables a deeper understanding of phenomena related to HCAI, moving beyond technocentric or purely normative perspectives. It intends to emphasize the relational and organizational dynamics that mediate the extent to which AI can be genuinely human-centered.

From a practical perspective, the findings may provide actionable guidance for HR professionals and policymakers involved in the implementation of intelligent systems within HRM. Mapping the main risks associated with HCAI can support system design and promote the development of interdisciplinary competencies for the informed and responsible use of AI. In this regard, the study aims to foster a balance between technological innovation and the human dimension of work, contributing to the creation of organizational ecosystems that are more ethical, inclusive, and resilient.

However, the study may suffer certain limitations. The analysis is based on an SLR and qualitative theoretical development. While the adopted approach provides interpretive depth, it does not allow for direct empirical validation of the identified categories.

Future research might expand and validate the proposed model through empirical analyses, comparative case studies, or longitudinal investigations. It may also be important to further explore the variables that influence the perception and management of risks arising from the use of AI.

Sustainable employability as a decision-based capability in SMEs confronting systemic disruptions

Federico Ceschel[1], Lucia Marchegiani[2], Michela Marchiori[3]

1. Objectives and relevance

Contemporary SMEs operate in a context characterized by systemic disruptions: geopolitical instability, fragmented value chains, evolving and contested trajectories of deglobalization, the pervasiveness of AI and digital platforms, demographic aging, and escalating environmental risks (Baldwin et al., 2024; Balsa-Barreiro et al., 2020; Paul, 2023; Volpi, 2024). Supply chain restructuring and near/reshoring efforts further increase volatility and reshape competitive strategies and labor markets (H.-M. Kim et al., 2020; Thakur-Weigold & Miroudot, 2024), particularly in manufacturing, where skill shortages, volatile career expectations, and growing pressures on productivity, compliance, and sustainability coexist and reinforce one another (Pencarelli et al., 2021; Prasanna et al., 2019). Recent debates on responsible and sustainable innovation, stakeholder-centered value creation, and local development show that SMEs face both heightened vulnerability, due to limited resources and exposure to global shocks—and new opportunities rooted in local embeddedness, networks for sustainable innovation, and "made in local" positioning (Giampaoli et al., 2025; Kramer & Porter, 2011; Moore & Manring, 2009; Voegtlin & Scherer, 2017) Smith, 2023). Within this scenario, the competitiveness of SMEs depends not only on technological upgrading and digitalization but also on their ability to align innovation with environmental and social commitments through responsible governance models and non-disruptive, value-driven innovation paths (Anadon et al., 2016; W. C. Kim & Mauborgne, 2019).

This paper addresses a specific aspect of this challenge: how SMEs conceive and implement sustainability as a people-related organizational capability that structurally connects work organization, skill development, well-being, and outcomes. We argue that sustainability becomes effective when embedded in coherent decision-making systems—rather than in isolated initiatives—capable of supporting workers' sustainable employability, stabilizing work processes, and enabling responsible innovation grounded in everyday organizational routines. These conditions call for SMEs not only to innovate technologically, but to develop new coherent forms of organizational intelligences — decision architectures that enable workers to remain valuable over time and organizations to innovate responsibly.

2. Theoretical framework

Our framework connects three related strands of literature.

First, research on sustainable employability conceptualizes the long-term capacity of workers to remain productive, healthy, and valuable under changing conditions, highlighting the interdependence between health, competence development, and meaningful work (Fleuren et al., 2020; Guest, 2017; van der Klink et al., 2016). Sustainable employability thus extends

[1] Roma Tre University; federico.ceschel@uniroma3.it – corresponding author

[2] Roma Tre University; lucia.marchegiani@uniroma3.it

[3] Roma Tre University; michela.marchiori@uniroma3.it

employability studies by introducing an individual and collective dimension: individuals' capability to work sustainably depends on the organizational and institutional contexts that support learning, well-being, and fairness over time (De Vos et al., 2020).

Second, scholarship on social sustainability and sustainable HRM underscores that organizational contributions to human well-being and dignity require more than fragmented welfare or training programs. Social sustainability is achieved through coherent systems of practices that enhance employee participation, equity, and long-term employability, linking individual flourishing to organizational resilience (Kramar, 2014; Macke & Genari, 2019).

Taken together, these two strands show that sustainable employability can be interpreted as the people-related expression of social sustainability: while social sustainability articulates the broader organizational commitment to participation, equity, and well-being, sustainable employability translates these principles into the concrete capacity of workers to remain valuable and healthy over time. We therefore conceptualize sustainable employability as the mechanism through which the social dimension of sustainability becomes actionable and measurable within firms. In this sense, sustainable employability serves as the micro–meso bridge through which social sustainability becomes an operational, measurable organizational capability.

Building on these elements, we propose a decision-centered perspective that positions sustainable employability and responsible innovation not as a program or initiative, but as an emergent property of managerial choices architecture with a clear internal logic. Drawing on configuration theory and the concept of HRM system strength (Becker & Gerhart, 1996; Bowen & Ostroff, 2004; Delery & Doty, 1996), we contend that internal social sustainability—and, by extension, sustainable employability—emerges when managerial decisions show coherence across four interconnected dimensions:

- Content, referring to the integration of health, safety, learning, participation, and performance goals;
- Ownership, indicating the straightforward assignment of responsibilities at different hierarchical and functional levels;
- Timing, involving steady yet flexible rhythms of implementation, review, and feedback; and
- Linkage, referring to the presence of credible yet straightforward indicators that connect people-related outcomes to operational and strategic objectives.

Rather than relying on value-driven orientations or declarative commitments, it is this structure of decisions—their coherence, continuity, and traceability—that determines whether sustainability becomes a lasting organizational capability rather than just a symbolic discourse.

Research questions

In light of this framework, the study addresses one question:

RQ1: Can sustainable employability—as an internally grounded form of social sustainability—serve as a viable response to skill shortages, retention issues, and the sustainability challenge of manufacturing SMEs?

3. Methodology

The empirical analysis is based on an interpretive multiple-case study of seven Italian SMEs participating in a national research project on social sustainability, health, and safety. The cases, mainly in manufacturing and related sectors, were selected through purposeful criterion-based and maximum variation sampling to capture heterogeneity in size, sector, ownership structure, and exposure to supply-chain and labour-market pressures.

The dataset comprises 48 complete interview transcripts with owners, top managers, HR professionals, and operational leaders, complemented by thematic summaries organized around

key analytical dimensions, including organizational identity, work organization, health and safety practices, competence development, welfare, involvement, external training networks, and labor market conditions. The analysis followed the procedures outlined by Miles, Huberman, and Saldaña (2020), combining inductive thematic coding with cross-case comparison.

Particular attention was given to how interviewees defined "sustainability," how decisions and responsibilities were described, which practices became routine over time, and how external partners (schools, ITS, universities, local institutions) were engaged. Consistent with the decision-centered perspective, the coding focused not only on the presence of practices but on the underlying decision structures—what is decided, by whom, when, and how these decisions are monitored or revised. Variations in emphasis across cases are viewed as empirical signals of what actors consider necessary to share about their strategies, while avoiding simplistic assumptions that the absence of explicit mention necessarily implies the absence of the phenomenon.

4. Results

The findings portray sustainable employability primarily as an operational, decision-driven capability. Across the cases, managers describe sustainability not as a standalone initiative but as "a way of working and deciding" embedded in routine choices about people and operations, maintaining people's well-being, product and process reliability, regulatory compliance, and economic viability. When present, this capability is activated through everyday decisions about organizing work, managing risks, and supporting and engaging employees, rather than in separate CSR programs.

First, in areas where internal social sustainability effectively translates into sustainable employability, we observe short, recurring organizational rituals—daily briefings, toolbox talks on safety, structured onboarding and on-the-job training, regular cross-functional reviews—anchored to clearly defined roles and minimal indicators. These routines make expectations visible, reduce uncertainty, and link individual efforts to collective outcomes; they also turn relational norms such as respect and listening into observable, responsible behaviours, enabling mutual accountability and smoother coordination.

Second, additional patterns indicate that sustainable employability remains partial, as several practices have not yet been approached or implemented in a planned and systematic manner. In these cases, sustainability is selectively emphasized, mainly highlighting environmental efficiency, technical standards, and formal certifications, compliance, with less focus on skill development, participation, or career trajectories. In such situations, technological or compliance investments and formal standards show limited performance impact because they focus primarily on skills, workload, and employees' attachment to the company.

Third, across all cases, we observe recurring vulnerabilities: difficulties in attracting and retaining essential talent; "capex without adoption" (where technology upgrades outpace routines and skills); overload of coordinating roles during organizational changes; and promising practices that fail to consolidate due to dependency on specific key individuals. These vulnerabilities highlight that sustainable employability emerges only when decisions are consistent across time, actors, and systems, rather than episodic or personality-driven.

Finally, a crucial enabling factor common across all firms—especially relevant to RQ1—is the robustness and permeability of the labor market and training. SMEs that collaborate continuously with vocational schools, ITS institutes, universities, and training providers benefit from a steady flow of technical talent, alleviated skill shortages, and clearer internal growth paths. Conversely, firms with weak or non-existent external training networks face heightened recruitment difficulties and higher turnover risks, and capability erosion over time. This external ecosystem serves as a vital supplement to internal decision-making, helping develop sustainable employability as a stable organizational capacity rather than a reactive response to labour shortages.

5. Discussion

Viewed through a decision-centered perspective, the findings indicate that the SMEs best equipped to handle systemic disruptions are those that do not merely adopt sustainability practices but progressively align decision-making across the four outlined dimensions. This involves integrating content related to safety, health, learning, and involvement rather than treating them as separate or secondary elements; clarifying ownership of decisions involving people instead of centralizing or hiding responsibilities; supporting timing with short but consistent routines that help set clear expectations; and ensuring connections through a small set of indicators and transparent feedback processes. When these elements work together, sustainable employability becomes a stable organizational capability rather than just a sum of disconnected practices.

Adopting a broader system perspective, the evidence also shows that SMEs tend to approach sustainability in a fragmented way, with emphasis skewed toward environmental efficiency, certifications, or compliance, while only partially addressing the social dimension. Where skill development, participation, workload management, and career opportunities are not integrated, sustainability remains procedural rather than transformative. By contrast, the strongest configurations are those in which safety, skill development, daily work organization, and employee involvement are viewed as interconnected and mutually reinforcing components of the same decision system. This systemic approach enables consistent routines, minimizes uncertainty, and creates conditions for workers to stay healthy, productive, and motivated over time.

A second insight emerging from the cases is that SMEs rarely succeed on their own. The internal sustainability of work and skills depends on the presence of stable external ecosystems—training institutions, sectoral funds, territorial partnerships, and vocational networks—that support firms in developing and renewing capabilities. The analysis shows that the labor market–training link acts as a critical enabling condition: firms embedded in strong vocational and territorial training networks are better able to attract the skills they need, organize onboarding processes, and sustain learning over time. Where such ecosystems are weak or absent, even promising internal routines risk becoming fragile or overly dependent on specific individuals, and difficult to scale or maintain.

Taken together, these findings suggest that sustainable employability reflects not only a people capability but an emerging form of organizational intelligence, in which decisions about skills, workload, and safety are integrated rather than siloed.

The link to the sustainable employability literature becomes clear. What differentiates robust, institutionalized forms of sustainable employability from more fragile or sporadic ones is the combination of (1) coherent internal decision-making frameworks and (2) external institutional arrangements that support them. Sustainable employability thus results not only from consistent managerial decisions but also from their alignment with broader training and labor-market ecosystems, allowing SMEs to build adaptive capacity rooted in people, learning, and daily work processes.

6. Value and implications

The study highlights three main contributions. Theoretically, it integrates sustainable HRM, social sustainability, and sustainable employability by advancing a decision-centered perspective on how people-related capabilities develop in SMEs. This perspective demonstrates that coherence in managerial decisions across content, ownership, timing, and linkage serves as the core mechanism through which internal social sustainability becomes operational and measurable, thereby enabling sustainable employability and, in turn, supporting forms of responsible innovation rooted in everyday work processes.

From a managerial perspective, the study offers a practical framework for action. Practices aimed at developing sustainable employability should be designed and evaluated with respect to the decisions made, who is responsible for them, when those decisions are implemented, and how outcomes are monitored and communicated. This approach promotes alignment and transparency in HRM choices and reduces the risk of fragmented or sporadic initiatives that fail to consolidate as stable capabilities.

For policymakers and intermediary institutions, the findings highlight the strategic value of robust territorial training and innovation ecosystems as capability infrastructures. Consistent collaboration with vocational schools, ITS institutes, universities, training organizations, and sectoral funds is vital to skill development, attraction, and retention, especially for SMEs in manufacturing sectors exposed to vulnerability. Strengthening these ecosystems is therefore crucial for supporting the long-term adaptability and competitiveness of manufacturing SMEs facing systemic disruptions, while also mitigating recruitment bottlenecks and capability erosion.

7. Conclusion

In a time when SMEs face overlapping economic, technological, and social challenges, sustainability cannot be viewed as isolated projects or compliance-oriented efforts. It must be understood as a pattern of interdependent decisions that connect people, work, and innovation. By conceptualizing sustainable employability as an internally grounded, decision-based organizational capability, this study shows how sustainability moves beyond rhetoric and becomes a lever for resilience, skill renewal, and responsible transformation.

Human Uniqueness in the Age of AI: Toward Sustainable Human Flourishing in Organizations

Giovanni Masino[1], Davide Lotito[2]

1. Introduction

The goal of this long abstract is to introduce a multi-year empirical research about the role of human work in organizations where tasks and activities are increasingly and significantly reshaped by advanced AI tools and agents. We are not going to focus on specific hypotheses or conceptual models, but on the general conceptual framework, rationale and motivations that inspire this project.

Artificial Intelligence has become profoundly integrated into the contemporary world of work, reshaping not only how tasks are performed but also work environments are structured and how work itself is experienced and understood by employees (Soulami et al, 2024). The growing presence of advanced AI systems has breathed new life into the long-standing debates about technological substitution, deskilling, and the future of human labor (Sarala et al, 2025).

The real challenge, however, may not lie in the act of predicting how many jobs will soon become obsolete or face a radical transformative change. Indeed, this study proposes a shift in focus: from a discourse centered on replacement and efficiency to one more concerned with the underlying conditions that will allow humans to flourish and generate value in workplaces and organizations in which advanced AI tools and agents will be increasingly capable and pervasive. Rather than asking which tasks humans will retain in AI-intensive workplaces, our project asks under which organizational conditions human individuality itself can become a source of irreplaceable value.

Our general thesis is that realizing such conditions will depend on rethinking jobs and organizational arrangements so that the "individual uniqueness" of humans will become the main (or even the only) way through which they will be able to maintain a key role in AI-centered economic systems. As mentioned, our emphasis is on uniqueness and individuality. Only what is "unique" is, by definition, unreplaceable. And what is truly unique, in humans, is the fact that we are single "individuals" (while we share many traits, we are never identical to one another) who are able and willing to cooperate towards shared purposes while, at the same time, preserving our individuality. As (and to the extent that) AI agents become more capable and cheaper over time, the areas in which humans may provide valuable contributions may recede significantly in most, if not all, industries and activities. If that's the case, it does not seem too farfetched to hypothesize that only the uncovering our human "individual uniqueness" may provide value that not even extremely capable AI agents could replace. It is worth emphasizing that by human uniqueness we do not simply refer to isolated traits such as creativity or personality, but to an emergent configuration of meaning, agency, and contribution that unfolds in interaction with organizational and technological contexts.

Obviously, we cannot be sure about the future evolutionary trajectory of AI technology. It may be the case that the upper limit of LLM's capabilities will soon be reached (Zhou et al., 2024). If that's the case, it is quite likely that humans will nonetheless maintain significant relevance in the organizational world. In our research project, we do not make assumptions or

[1] Full Professor, ECON-08/A, University of Ferrara; giovanni.masino@unife.it – corresponding author

[2] Ph.D. Candidate, ECON-08/A, University of Ferrara; davide.lotito@unife.it

predictions on future developments of AI. Even in its current state, it seems clear that this technology has already the potential for decreasing the economic value of human work in many, if not most, activities and industries. Indeed, AI adoption is accelerating quickly (Felten et al, 2025). However, it is also plausible (as many key experts suggest being the most likely scenario) that such limit is distant, and that we may expect, in the not-so-distant future, AI agents that will be orders of magnitude more capable than the current versions. Either way, the concern with the future of the interaction between human workers and advanced AI is still relevant, but it appears to be even more urgent in the latter scenario, which is, for obvious reasons, the most uncertain and problematic.

The key question, of course, is what we really mean by "individual uniqueness". In other words, we need to ask what are the conditions by which organizations may find economically sound reasons to employ humans in a world populated by machines that are cheaper, more efficient, more effective, more creative than most human employees. In this scenario, the existence of valuable "individual uniqueness" should be considered, at the same time, axiomatic (that is, a premise that we postulate as true, without being able to prove it) but also derivative: in other words, a possible but not guaranteed "outcome" that will depend on how we rethink, reconceptualize, redesign work vis a vis highly capable AI agents. Thus, the general aim of our study is to contribute to such effort.

It is possible to hypothesize at least some general directions that such rethinking may need to take in order to maintain human relevance in the workplace. Broadly speaking, our current intuition is that context (industry, tasks, culture, legal frameworks etc.) may play a role. But we also believe that specific organizational work arrangements may play an even more important role. For example, it seems plausible that, in some if not most contexts, the value of human uniqueness may emerge more significantly not by segregating human-only tasks from AI-only tasks, but by developing jobs centered on a synergistic cooperation between humans and AI agents (Przegalińska et al., 2025). Indeed, recent literature on human–AI collaboration (e.g., Jarrahi, 2018; Seeber et al., 2020) suggests that the relationship between humans and AI is shifting from "users and tools" to "partners and collaborators." Recent versions of AIs have the unprecedented ability to acts not only as passive instruments but also, and more significantly, as active counterparts that, in and through dialogue, shape, respond to, and even inspire human action. That, of course, may have relevant implications for how human work could be and / or should be organized vis-à-vis such technology.

Thus, our aim is to explore how organizations could create work environments in which individuals, rather than being marginalized by the advent of advanced technologies, can express abilities that reveal what is most distinctive about them: the combination of experiences, values, aspirations, sensibilities, and interpretive skills, and how this expression can foster sustainable and meaningful forms of employment.

While the current literature offers examples of AI adoption and implementation in the workplace in relation to psychological effects such as automation anxiety, less attention has been given to the subtle human dimensions that make people irreplaceable resources, resulting in a gap that requires further exploration and study (Bankins & Formosa, 2023). The rationale of this research revolves around the fact that social sustainability in the age of AI depends not only on technological adaptation but also on the capacity of organizations to recognize and nurture the uniqueness of each individual. When people see themselves as valuable contributors, work acquires deeper meaning and generates reciprocal benefits for both the person and the organization (Michaelson et al., 2023).

2. Theoretical background

Classic organizational theories often conceived work as designed from the top down: tasks were assigned, roles defined, and workers were expected to adapt. More recent perspectives, such

as job crafting (Wrzesniewski & Dutton, 2001), conceptualize job design as a dynamic process, where bottom-up proactive processes integrate with top-down coordination and control needs, in which individuals continuously reshape their jobs to align them with their strengths, interests, and meaning. Within this view, work is co-authored, not imposed.

In the context of AI-intensive workplaces, we argue that this perspective gains renewed relevance. As machines take over routine and, increasingly, even non-routine functions, human contribution depends on how individuals redefine and personalize their work so that it becomes more coherent with their own unique abilities (Babashahi et al., 2024). However, such potential abilities are not always obvious, not even to the subjects themselves, as they need to be not only nurtured, developed and facilitated, but also discovered. A job design logic that emphasizes these elements by combining the need for coordination and control (via some form of top-down planning and oversight) with a significant, non-residual emphasis on self-determination (such as job crafting) seems to be a plausible path to discovering unique, valuable, unreplaceable human abilities. We could roughly distinguish three "phases" of such discovery process. In the exploration phase, individuals search for new ways to develop skills, capabilities, and resources, as well as to reinterpret their work demands, to find new interests and orientations, and to uncover their natural talents and predispositions. The experimentation phase involves testing these possibilities in practice: an action that requires organizational climates where initiative and trial are encouraged rather than sanctioned, and "good mistakes" are tolerated because they are seen as the necessary investment for innovation, at any scale. Finally, the expression phase translates the insights and competencies developed through exploration and experimentation into tangible adjustments to one's job: new activities, challenges, or relationships that better reflect the individual's distinctive potential.

Overall, it is worth noting that the capacity for human flourishing within technologically dense environments is not only a matter of individual well-being; it is also a foundation of social sustainability. Work that allows people to feel recognized, autonomous, and authentic, contributes to psychological resilience, community cohesion, and long-term organizational viability (Ho & Chan, 2022). In this sense, human uniqueness functions as both a moral and a practical axis for the social sustainability of technological evolution: it links personal fulfilment with systemic balance.

Building on these premises, the aim of the study is to explore the conditions that enable human uniqueness to flourish in AI-intensive organizational contexts and to understand how its expression contributes to socially and economically sustainable outcomes for individuals and organizations.

3. Methodological framework

From a methodological standpoint, the first step of our research, which is what we are presenting in this long abstract, is an exploratory one. We will adopt a qualitative research design based on in-depth interviews that will help shedding light on meanings and subjective interpretations of the protagonists rather than testing predetermined hypotheses (Lee & Lings, 2008). Later, based on the outcomes of this phase, we plan on formulating hypothesis to be tested through quantitative methods.

Consistent with the exploratory nature of the first phase of this research, the analysis will follow a thematic interpretive strategy (Braun & Clarke, 2006), which enables the identification of recurring patterns and tensions in participants' accounts while preserving the richness and nuance of individual narratives. This method provides an adaptable yet systematic analytical framework that allows a reflection on how people perceive and make sense of their job roles, identities, and relationships with technology without imposing pre-established theoretical categories (Nowell et al.,2017). Building on this methodological orientation, this study aims to explore the following questions:

- How do employees describe and make sense of their collaboration with AI systems in their daily work practices?
- How do individuals reshape and reinterpret their tasks or roles to make room for their distinctive abilities when interacting with AI?
- Which set of characteristics stand out when the individual feels that their contribution is "unique" during their work?

3.1. Partecipants

Participants will be selected through purposive sampling, ensuring that all respondents have direct experience working with or alongside AI-based systems in their professional activities. The inclusion criteria are:

- current or recent employment in organizations that use AI or algorithmic technologies
- familiarity with everyday work interactions where technology influences task execution or decision-making processes
- willingness to reflect on and discuss their personal experiences of work, change, and self-expression

No restriction will be imposed regarding age, gender, ethnicity, job position, or hierarchical level, since diversity of background and perspectives represent important factors that can only contribute to the enrichment of how uniqueness is enacted across various roles and settings.

The number of participants will not be predetermined, and interviews will continue until thematic saturation is reached. Each participant will receive detailed information about the study's purpose, procedures, and the voluntary nature of participation. Informed consent will be obtained before data collection, and participants will retain the right to withdraw at any point without giving any explanation.

All data will be treated with the utmost confidentiality. Identifying information will be removed, and pseudonyms will be used in any dissemination of findings. The study complies with ethical principles of respect, anonymity, and transparency in qualitative research. In addition, given the reflective and potential personal nature of the topic, particular attention will be focused on researcher reflexivity: acknowledging that interpretation may be inevitably shaped by the researcher's perspective and background.

3.2. Data collection

Data will be gathered through the use of semi-structured qualitative interviews aimed at investigating how participants experience, interpret, and express their sense of uniqueness while working in environments where artificial intelligence plays a significant role. This method has been selected for its balanced structure and openness. It provides a clear and direct connection with the research questions while also granting participant freedom to articulate their point of view and experiences.

Interviews will be conducted individually, either face-to-face or online (via video call), depending on participants' preference and logistic availability. Each conversation is expected to last approximately 30-45 minutes. Prior to each interview, participants will receive a short briefing outlining the aims of the study, the voluntary nature of participation, and their right to withdraw at any time. Informed consent will be obtained before starting the interview, and, with participants' permission, all sessions will be audio-recorded to ensure accurate transcription and data analysis.

Following data collection, all interviews will be transcribed verbatim and anonymized to ensure confidentiality. Transcripts will be securely stored and subsequently analyzed following the principles of thematic analysis (Braun & Clarke, 2006). As previously mentioned, data

collection will continue until additional interviews no longer yield substantially new insight, signaling that thematic saturation has been reached.

4. Expected results

While our methodological posture, in this exploratory stage, does not require, or even allow clear expectations about the research outcomes, we can certainly envision some possibilities. We expect, for example, to find a variety of situations in which the interaction between AI and human workers may unfold in significantly different ways.

In some cases, we may observe workers that do not feel that their interaction with AI has changed, in any meaningful way, their capacity to explore, experiment and express their individualities and unique talents and abilities. We also expect to find a variety of antecedents and contextual factors that may help explain these circumstances, including organizational (constraints, incentives, nature of tasks etc) and personal factors (subjective attitudes and goals, personality traits, experiences, etc).

In other cases, we may observe the opposite situation, where the interaction with AI opens, for the individual, a new pathway of potential self-expression, self-determination and, in some cases, even an actual process of self-discovery and self-development, at least in relation to some work tasks and activities. Again, we expect that a variety of contingent organizational and subjective factors may be correlated with the occurrence of this different kind of scenario.

Naturally, we may also find situations where such difference is blurry, context-dependent, time-dependent, or even situations that are completely different from the two "types" that we just described and may lead to a more fine-grained typification of work situations.

We also expect, and this is a central element in our framework, that differences in how "interaction with AI" is actually manifested in the daily reality of work may be highly consequential. These differences may include how the interaction is carried out, the goals it serves, the "division of labor" between human and AI, the kind of "dialogue" that occurs (or lack thereof), and the degree of autonomy the individuals exert when shaping such interaction, and more. Such factors may play a significant or even crucial role in creating the "right" (or "wrong") "conditions" leading to different types and degrees of valorization (or, marginalization) of individual unique abilities.

5. Expected Theoretical and Practical Contributions

This study aims to contribute to the fields of organizational behavior and human resource management by addressing a still underexplored question: how human uniqueness can be recognized, sustained, and valued in work environments increasingly shaped by advanced AIs. Although research on AI has expanded rapidly, the human dimension, particularly the ways in which individuals preserve meaning, agency, and distinctiveness, remains largely neglected. By exploring these dynamics qualitatively (and, in subsequent phases, quantitively), this project tries to bring its contribution in starting to fill this gap, offering an interpretive perspective of how humans experience and express individuality and uniqueness in AI-mediated workplaces, and which contextual factors might support or hinder its flourishing.

In this scenario, this proposed research tries to enrich existing theories of work design and employee motivation by suggesting that human uniqueness should be understood not just as an individual and given trait, but as an emergent condition that can sprout from the interlaced interaction between the individual, the organization, and the technology.

A further theoretical contribution lies in the attempt this study makes in conceptually locating human uniqueness and value within the broader framework of the interconnection between social and economic sustainability. This research assumes that valuing human individuality is not only a moral imperative, but it can also represent a strategic source of adaptability, innovation, and

long-term organizational health. In this sense, this study may substantially infer that social sustainability, defined by a meaningful, autonomous, and dignified work, could co-exist with, and even reinforce, economic sustainability.

A further dimension of relevance can be seen in the implications this research may bring to organizations, managers, and human resources practitioners. In particular, we believe the findings may help companies understand how to create and set those favorable conditions that allow employees' uniqueness to emerge and translate into value, both in terms of well-being and performance.

By highlighting the importance of environments that support autonomy, learning and psychological safety, the research might encourage leaders to design workplaces where exploration, experimentation, and self-expression are not penalized but actively encouraged. In such contexts, employees are likely to experience greater engagement, intrinsic motivation, and sense of purpose: all factors that available scientific literature consistently associates with lower turnover, reduced absenteeism, and higher productivity.

Moreover, the study may also provide HR departments with the starting conceptual tools to rethink professional development and management practices in workplaces where AI-human interaction is intense. Rather than focusing exclusively on standardization or task optimization, organizations could benefit from identifying and cultivating employees' distinctive capabilities, their unique capital, as a source of innovation and competitive resources.

More broadly, the project might help decision-makers reflect on how the integration of intelligent technologies can be aligned with human-centered values, fostering sustainable forms of organizational growth. Recognizing and nurturing human uniqueness is not merely an ethical choice; it could become a key driver for long-term resilience, adaptability, and organizational learning in the digital era.

6. Limitations

Given the novelty of the topic explored, this research faces a number of limitations that define both its scope and its potential for further development. These limitations do not undermine the value of the project but rather highlight the challenges inherent in studying a new and rapidly evolving field such as human–AI collaboration and the expression of human uniqueness in work contexts.

Concepts such as human uniqueness, individual value, and flourishing are inherently difficult to operationalize. This creates interpretative richness but also ambiguity, as definitions may vary and overlap with neighboring constructs such as creativity, identity, or meaning at work.

Methodologically, the qualitative and exploratory nature of the first phase of the research highlights the interpretive dimension of the results, which may limit their applicability to broader populations or cultural contexts. The same applies to the diversity of work environments considered: findings will reflect experiences situated within specific organizational and technological settings, while other contexts may reveal alternative dynamics.

Recognizing these limitations provides a necessary frame of humility and positions this inquiry as an initial step toward a deeper, cumulative understanding of human uniqueness in the age of AI.

7. Final remarks

This study tries to position itself as an initial attempt to lay a foundational stone for a different way of thinking about the human-AI dynamic in the workplace. In a scholarly and public debate often polarized between dystopian fears of replacement and utopian salvation, this research aims to pave a third path: one of synergistic change, collaboration and mutual enhancement.

The project aspires to give its contribution to this reframing by implying that coexistence of humans and intelligent technologies need not be defined by competition or substitution but can instead become a space for co-evolution and a conceptual space to uncover dormant resources and potential. Within this view, the sustainability that organizations pursue cannot be reduced to mere economic performance, but it must also address the social and human dimension that make work meaningful and sustainable. If future research continues to build upon this perspective, the discourse on AI and work may gradually shift from one of survival to one of sustainable coexistence, where technological progress and human flourishing evolve together rather than apart.

Distributed Trust and the Organizational Governance of AI in HRM

Giorgia Moretti[1]

1. Introduction

Artificial Intelligence has become a central infrastructural component of contemporary Human Resource Management (HRM), reshaping not only operational processes but also the epistemic foundations of decision-making in organisations. What was once a domain grounded in professional judgment, contextual interpretation and direct interpersonal communication is now supported by automated systems capable of processing large volumes of data and generating structured indications in a matter of seconds (Kadirov et al., 2024; Tamilselvan et al., 2025). This transformation has unfolded gradually, driven by the expansion of digital applications in HR, the availability of machine learning and generative AI tools (Aguinis et al., 2024; Alborè et al., 2025), and the pressure on organisations to manage growing workloads efficiently.

The increasing presence of AI in HRM processes introduces potential benefits, such as reduced screening time and more consistent evaluations (Kadirov et al., 2024; Tamilselvan et al., 2025). Recruitment represents a paradigmatic example of these transformations, as automated tools increasingly contribute to decisions about access to employment opportunities, raising questions that go beyond technical performance and extend to issues of transparency, fairness, accountability and the broader legitimacy of decision-making processes (Alborè et al., 2025; Mujtaba, 2025). HR professionals, who remain responsible for final decisions, must determine not only whether the system performs adequately but also how to interpret its outputs, how to integrate them with their own judgments, and how to respond when system suggestions diverge from human assessment. These challenges are made more complex by the fact that AI tools utilized in HRM are often purchased from external vendors (Radonjić et al., 2022), meaning that those who use them are not the same individuals who developed them. The result is a layered form of dependency that influences how trust develops and how decisions are made.

Rather than treating AI as a neutral decision support tool, this study approaches AI-supported HRM as an organisational reconfiguration of judgement and responsibility. As algorithmic outputs gain authority in recruitment and evaluation processes, organisations must renegotiate who is accountable, how decisions are justified, and what counts as legitimate evidence In this sense, the adoption of AI represents not only a technological change, but a socio-technical reordering of roles, interpretive work, and governance routines - where trust becomes distributed across people, artefacts, and institutions.

Against this backdrop, this study develops a conceptual framework for understanding distributed trust in AI-supported HRM. The work is grounded in a systematic literature review (SLR) covering the period 2015-2025 and seeks to integrate insights from HRM, information systems, organisational studies, computer science, law and ethics. The goal is to examine how trust is constructed in contexts where multiple actors interact: the system itself, the vendor who designed it, the HR professionals who use it, the organisation that hosts it, and the regulatory environment that defines boundaries and responsibilities. This study identifies a structural decoupling between informational control and formal accountability in AI-supported HRM, particularly in vendor-mediated configurations, and examines how this condition reshapes the organisational construction of trust. This decoupling represents the core condition under which

[1] Ph.D. Candidate, ECON-08/A, University of Genoa; giorgia.moretti@edu.unige.it – corresponding author

distributed trust emerges as an organisational accomplishment rather than an individual disposition.

The following sections develop the conceptual grounding of distributed trust, outline the review design, present preliminary interpretive insights, and clarify the theoretical contribution of the study.

2. Conceptual Development

To understand the impact of AI, trust must first be grounded within the traditional HRM context. Historically, HRM decision-making is rooted in professional judgment, contextual interpretation, and direct interpersonal communication. In functions like recruitment, trust has traditionally relied on holistic assessments where HR professionals interpret career trajectories and 'cultural fit' through tacit and subjective expertise. The introduction of AI reconfigures this landscape, transforming trust from a centralized interpersonal reliance into a layered, distributed form of dependency where the locus of responsibility is fragmented across multiple actors and technical artifacts. Trust has long been recognised as an important element in the adoption of new technologies. Much of the literature on trust in AI focuses on individual users and examines how system characteristics-such as transparency, explainability, accuracy and fairness-shape perceptions and willingness to rely on automated outputs. These contributions highlight important issues, yet they often narrow the focus to the relationship between a single user and a technical artefact. In recruitment, however, this relationship is part of a broader configuration in which additional actors and expectations come into play. Recruitment decisions, for example, typically rely on holistic assessments that incorporate both quantitative and qualitative information. HR professionals interpret career trajectories, evaluate motivation, identify transferable skills and reflect on cultural fit. These activities involve forms of judgment that are contextual, interpretive and often tacit.

When AI tools enter the picture, they interact with this interpretive work in various ways. Some tools act as filters, selecting candidates based on specific criteria. Others analyse text or digital traces to identify patterns (Chowdhury et al., 2022). Still others generate ranked lists or scores intended to support decision-making. Each of these functions influences how HR professionals structure their work and how they understand the meaning of system outputs.

A key observation emerging from the literature is that trust is not solely a function of system transparency. While transparency can help users understand what the system does, it often relies on forms of explanation that are difficult for non-technical users to interpret (Radonjić et al., 2022). Technical documentation, model descriptions or algorithmic explanations may convey information about how the system works, but they do not necessarily clarify how outputs should be used in practice. HR professionals frequently assess the reliability of a tool based not on its internal logic but on how stable and interpretable its behaviour appears in the context of real tasks.

The literature also shows that trust depends heavily on the relationship between organisations and vendors. In many cases, vendors determine what information is available to users. They control documentation, update schedules, training materials and access to system logs. HR professionals often rely on the vendor to describe system capabilities, limitations and error patterns. This dependency introduces a relational dimension to trust, shaped by the vendor's responsiveness, communication style and willingness to share meaningful information rather than generic reassurance. Several studies point out that HR professionals tend to feel more confident when they can ask questions, receive clear explanations, and observe that the vendor acknowledges system limitations without minimising them.

Another dimension concerns organisational structures. Trust does not emerge solely from individual perceptions but is shaped by how organisations incorporate AI tools into their workflows. Governance practices, documentation routines, spaces for discussion and opportunities for oversight play a significant role (Alborè et al., 2025; Al-Alawi et al., 2024;

Madanchian, 2025; Taslim et al., 2025). For example, when organisations create regular forums where HR professionals discuss ambiguous cases, compare interpretations or reflect on unexpected outputs, users tend to develop a more balanced and informed relationship with AI tools. Conversely, when systems are introduced without structured support, staff may feel isolated in their attempts to interpret outputs, which can undermine trust. Regulation forms a further layer in this configuration. The GDPR and the AI Act introduce requirements for transparency, human oversight, documentation and risk management, particularly for high-risk applications such as hiring, promotion or performance evaluation (Alborè et al., 2025; Madanchian, 2025; Sandeep et al., 2025). These obligations influence how organisations structure their processes and how responsibilities are allocated. They also shape expectations: when regulatory duties are clear and translated into practical routines, users tend to see the system as embedded in a controlled environment. When duties remain abstract, the uncertainty can affect trust. This distributed nature of trust aligns with socio-technical perspectives (Fenwick et al., 2024; Uren et al., 2022) that emphasise how technology adoption depends on the alignment of multiple components rather than on isolated factors. The concept of distributed trust therefore offers a useful framework for describing how confidence in AI develops across different stages of adoption, shaped by relationships, routines and expectations that extend beyond the system itself.

This distributed configuration, however, does not merely raise the risk of organisational responsibility gaps; it structurally decouples decision authority, informational control, and formal accountability. When algorithmic systems are developed externally, operated internally, and regulated institutionally, no single actor fully controls the epistemic infrastructure underpinning HR decision-making. Responsibility becomes simultaneously present and diffused. In such arrangements, accountability is not simply clarified through governance routines, but continuously renegotiated across organisational boundaries, generating zones of indeterminacy in which authority and answerability no longer coincide. The proposed framework moves beyond a descriptive list to show how each dimension actively constitutes distributed trust. System characteristics (transparency, fairness) serve as the epistemic foundation, providing the justifications needed for HR professionals to validate decisions. Vendor relationships manage information asymmetry in B2B contexts, where trust is a function of the provider's responsiveness and willingness to disclose system limitations. Organisational practices act as social stabilizers, creating collective routines and forums that transform individual suspicion into informed adoption. Finally, regulatory frameworks (e.g., EU AI Act, GDPR) provide systemic legitimacy, translating abstract ethical imperatives into verifiable organisational duties.

3. Methodological approach

The study is grounded in a Systematic Literature Review (SLR) covering the period 2015–2025. Following PRISMA 2020 guidelines, searches were conducted in April 2025 across Scopus and Web of Science using combinations of the following keywords: artificial intelligence, machine learning, human resource management, trust, transparency, explainability, bias, fairness, privacy, governance and accountability. The search initially identified 752 records (Scopus = 542; Web of Science = 210). After removing 87 duplicates, 665 unique articles were screened based on titles and abstracts. Studies were retained for full-text assessment if they addressed at least one of the following criteria:

- the adoption or evaluation of AI tools in HRM processes
- trust in algorithmic decision-making relevant to HR contexts
- organisational or regulatory aspects affecting AI-supported decisions

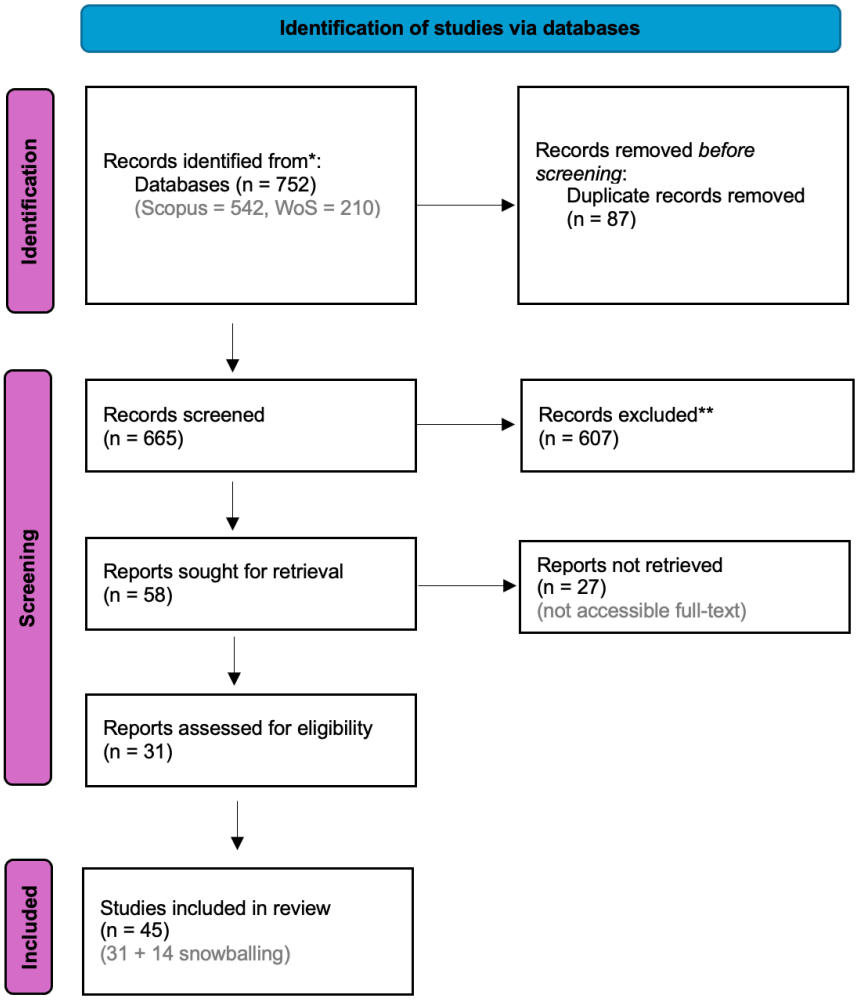

Figure 1. PRISMA 2020 flow diagram illustrating the study identification, screening, eligibility, and inclusion process

Following title and abstract screening, 58 articles were selected for full-text retrieval. Of these, 27 were excluded due to lack of full-text access, resulting in 31 studies assessed for eligibility. An additional 14 relevant contributions were identified through backward and forward snowballing, bringing the total number of included studies to 45.

To ensure methodological robustness, a quality assessment was conducted using the Mixed Methods Appraisal Tool (MMAT, 2018). Only empirical studies scoring above 2 were retained for in-depth analysis. The final analytical corpus therefore consists of 33 empirical studies, complemented by conceptual and regulatory contributions used to contextualize findings.

The dataset reflects the interdisciplinary nature of the field, including qualitative interview-based studies, survey research, experimental designs simulating recruitment decisions, technical analyses of AI system performance, conceptual governance papers, and legal analyses addressing GDPR and the EU AI Act.

To synthesise the material, an abductive thematic analysis was conducted. Initial coding identified recurring themes such as transparency concerns, interpretive challenges, vendor-client dynamics, accountability distribution, governance practices, and regulatory translation. Through iterative comparison and clustering, these codes were organised into four analytical dimensions: system attributes, relational dynamics, organisational practices, and regulatory structures.

Given the rapid evolution of AI adoption in HRM, the SLR is complemented by a planned qualitative phase involving semi-structured interviews with HR professionals and AI vendors. These interviews aim to refine and validate the emerging framework by exploring dimensions of trust that remain underrepresented in academic literature, particularly in B2B communication practices and internal organisational sense-making processes.

4. Preliminary Results

The preliminary results of the Systematic Literature Review (SLR) provide insight into how trust is constructed in the context of AI-supported HRM and where the literature leaves unanswered questions. Gaps in one area can affect perceptions in others, underscoring the need for a framework that captures this distributed nature.

The findings suggest that this socio-technical configuration operates across three interconnected layers: (i) system attributes, (ii) relational dynamics in vendor-client settings, and (iii) organisational and regulatory contexts. Importantly, weaknesses in any single layer tend to spill over into the others, amplifying uncertainty and complicating the practical legitimacy of AI-supported decisions. At the system level, transparency emerges as the most frequently discussed dimension, yet its organisational value appears limited when transparency is framed primarily as technical disclosure. Several studies suggest that HR professionals often struggle to translate model descriptions into actionable understanding, which shifts the burden of interpretation onto users and increases dependence on vendor mediation. Similarly, accuracy and reliability are rarely treated as stable properties: performance is shaped by local norms, task definitions, and organisational expectations, meaning that what counts as "good performance" may vary across contexts. Fairness is also highly salient in the literature, but it is not reducible to technical bias mitigation; rather, it becomes a contested organisational issue when HR teams lack the data access, expertise, or authority to independently evaluate models and must rely on vendor cooperation.

Relational dynamics are therefore central. The vendor-client relationship structures information asymmetries around training data, updates, auditability, and the practical meaning of model outputs. Trust tends to be more grounded where vendors provide accessible documentation, respond to questions with specificity, and acknowledge limitations without resorting to generic reassurance. Conversely, opaque communication practices can stabilise neither expectations nor accountability, leaving HR professionals uncertain about how to justify decisions and how to respond to errors. In this context, accountability is not simply "assigned" but negotiated: the literature shows that responsibility for harms or mistakes often remains ambiguous at the boundary between organisational decision-making and vendor-controlled infrastructures.

Finally, contextual layers shape whether trust can be institutionalised. Organisational governance routines - such as documentation practices, periodic review meetings, and spaces for collective interpretation - appear crucial in turning individual uncertainty into shared sensemaking and controllable oversight. However, the review also reveals a striking gap between the normative emphasis on human-in-the-loop (HITL) and its empirical operationalisation. While oversight is widely endorsed, it is rarely translated into concrete practices, raising the risk that "human oversight" functions as a symbolic safeguard that stabilizes legitimacy discursively without materially redistributing control. In such cases, human involvement may absorb responsibility while leaving underlying algorithmic authority largely intact. Regulation (GDPR and the EU AI Act) interacts with these dynamics by setting requirements for transparency, oversight, and risk management, yet organisations differ in how they translate legal obligations into everyday routines. This variability contributes to uneven conditions for trust across settings. This configuration produces a paradox of control. Organisations remain formally accountable for HR decisions, yet they increasingly depend on algorithmic infrastructures whose internal logics may remain partially opaque. The more organisations rely on AI systems to enhance rationality and

consistency, the more they confront epistemic opacity that complicates justification, contestability, and responsibility attribution.

Together, these findings indicate that trust in AI-supported HRM is less an individual disposition toward technology and more a fragile organisational accomplishment, continuously negotiated across socio-technical and inter-organisational boundaries.

5. Discussion and implications for Organisational research

The objective of this study is to analytically clarify how trust is constructed, stabilised, and contested within AI-supported HRM. Rather than proposing a prescriptive model, the framework contributes by examining the organisational conditions under which algorithmic authority becomes legitimate, the ways in which information asymmetries between vendors and organisations shape accountability arrangements, and how governance routines transform individual uncertainty into collective oversight. Particular attention is given to the translation of regulatory requirements into everyday organisational practices, highlighting how formal obligations are interpreted, enacted, and sometimes reconfigured within local contexts. In doing so, the study contributes to understanding AI adoption not as a purely technological upgrade, but as an organisational process through which responsibility, interpretive work, and decision legitimacy are continuously renegotiated.

The framework is intended to be descriptive rather than prescriptive. It does not impose a single model but offers a way for organisations to reflect on their own practices and adapt them as needed. By focusing on the process through which trust develops, it supports decisions that are informed, transparent and responsive to context.

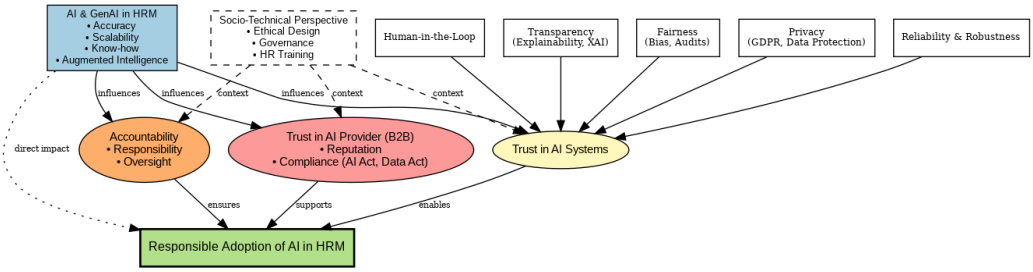

Figure 2. Conceptual Framework developed in this study

Towards an Operational Understanding of Distributed Trust

The review indicates that trust in AI-supported HRM takes shape through a series of interactions that begin before the system is implemented and continue as users gain experience. It is therefore helpful to describe these interactions in a narrative way, emphasising how different elements become relevant at different stages.

A first moment concerns the initial contact between the organisation and the vendor. At this stage, the organisation seeks to understand what the system does, what assumptions it makes and what information will be available for oversight. The quality of the vendor's communication plays a central role. Clear explanations, accessible documentation and openness about limitations help establish a shared understanding of the system's capabilities (Radonjić et al., 2022). When communication is limited or difficult to interpret, uncertainty can influence later stages of adoption. As the system is introduced into the workflow, internal exchanges become important. HR professionals interpret outputs in light of their own knowledge and compare impressions with colleagues. These conversations help users develop a sense of how the system behaves in real cases. When organisations create opportunities for these exchanges, users tend to develop more

realistic expectations. Without such support, AI outputs may be interpreted in isolation, potentially limiting users' ability to integrate them with their own assessments.

Over time, users develop interpretive familiarity. They recognise typical patterns, understand when an output appears unusual and learn how to contextualise system suggestions (Gonzalez et al., 2022). This form of learning does not require technical expertise but benefits from clear documentation and training that focuses on practical examples (Aguinis et al., 2024). Interpretive familiarity supports balanced reliance on AI tools, reducing the risk of both overreliance and undue skepticism. As users gain experience, governance routines naturally develop. Issues such as how to document decisions, how to manage discrepancies between human and system judgments and how to escalate uncertain cases become part of ongoing practice. Even simple routines, such as periodic check-ins or shared logs of difficult cases, help create continuity and support consistent decision-making.

Regulation interacts with these stages by providing boundaries and expectations. When regulatory duties-such as documentation or oversight requirements-are translated into concrete activities, they support a more structured approach to adoption. When they remain abstract, they may introduce uncertainty rather than clarity.

Overall, these dynamics form the basis of an operational understanding of distributed trust.

Trust does not reside in a single actor or artefact. It emerges from a combination of communication, interpretation, governance and regulatory alignment (Fenwick et al., 2024; Uren and Edwards, 2022). The framework provides an analytical lens for examining how these elements interact and become stabilised in practice. The transition to AI-supported HRM can lead to the development of what Roumbanis (2025) describes as 'meta-algorithmic judgment'. At the initial stage (contact), trust is shaped by the vendor's transparency in managing information asymmetry. During implementation (workflow), trust becomes a collective organisational property through shared discussion and routine-building. In the maturity stage, HR professionals develop interpretive familiarity, allowing them to not only rely on but also critically contest and override algorithmic outputs when necessary (Aguinis et al., 2024; Roumbanis, 2025). Thus, distributed trust is the mechanism that enables this higher-level human oversight.

The contribution of this work lies in reframing trust in AI-supported HRM beyond a micro-level focus on technology acceptance and individual perceptions. Rather than treating trust as a psychological disposition toward an artefact, the study conceptualises trust as an organisational alignment process through which judgement, responsibility, and legitimacy are redistributed across actors, technical systems, vendor infrastructures, and regulatory expectations.

From an organisational perspective, distributed trust can be interpreted as an ongoing sensemaking process through which actors attempt to stabilize legitimacy under conditions of technological mediation and epistemic uncertainty. Rather than emerging automatically from system features, trust is enacted through interpretive work, boundary-spanning coordination, and the continuous alignment of governance practices with institutional expectations.

By foregrounding distributed trust, the study highlights the organisational mediation of algorithmic authority: organisations must determine how algorithmic outputs are interpreted, contested, and incorporated into decision routines, and how accountability is negotiated when key information remains controlled by external providers. In doing so, the framework bridges the gap between socio-technical adoption dynamics and the institutional requirements emerging from GDPR and the EU AI Act, particularly in high-risk domains such as recruitment and selection.

Empirically, the review identifies a persistent discrepancy between the normative emphasis on human oversight and the limited evidence of how oversight is operationalised in practice. This gap provides a clear agenda for future research on interpretive work, internal governance routines, and vendor-client arrangements that shape whether “oversight” becomes substantive or merely symbolic. Future research may build on these insights through qualitative interviews with HR professionals and AI vendors, aimed at refining the framework and capturing organisational practices that remain underrepresented in the current literature.

Building on these insights, the framework invites organisations to examine how oversight and accountability become organisationally visible and discussable through structured routines. Rather than offering a universal solution, the intention is to open an analytical space in which organisations can interrogate how responsibility is enacted and how algorithmic authority is stabilized in practice.

Illustrative analytical questions for organisational reflection

Rather than offering a prescriptive checklist, the framework can be used to stimulate organisational reflection around key tensions that characterise AI-supported HRM. For instance, organisations may ask:

- Where does epistemic control reside in our AI-supported processes, and who has access to relevant system information?
- How are discrepancies between human judgment and algorithmic outputs discussed and documented?
- In what ways does human oversight substantively redistribute decision authority, rather than symbolically absorb responsibility?

These questions do not constitute a model to be adopted, but an analytical device to make visible how distributed trust is enacted, stabilised, or destabilised in practice.

Taken together, these findings suggest that trust in AI-supported HRM should not be understood as a property of technology or individual cognition, but as an emergent organisational condition shaped by the alignment (or misalignment) of epistemic control, decision authority, and accountability structures. In this sense, distributed trust provides a lens to analyse how organisations stabilise legitimacy under conditions of technological opacity and inter-organisational dependency in AI-enabled HRM.

AI and Performance Management: A Work-in-Progress Review

Martina Mori[1]

1. Introduction

Performance management has long been recognised as a multi-layered process closely connected to strategic HRM (Den Hartog et al., 2004). It encompasses an integrated set of activities through which managers and employees jointly define expectations, monitor progress, discuss results, and allocate rewards, with the overarching aim of supporting individual performance and, ultimately, organisational success (DeNisi & Murphy, 2017).

The growing diffusion of artificial intelligence (AI) systems—ranging from predictive analytics to automated feedback tools—has begun to reshape this process. AI-enabled applications in the broader HRM promise greater accuracy, timeliness, and data richness, but they also raise fundamental questions about transparency, fairness, and responsible use (Bankins, 2021; Vrontis et al., 2022). Despite the rapid evolution of AI applications in HRM and in the context of performance management, existing research remains fragmented and dispersed across different disciplinary domains, making it difficult to develop a coherent understanding of how AI is transforming employee performance management.

To address this gap, the present study aims to conduct a systematic literature review to classify, synthesise, and critically assess the state of research on AI-enabled performance management. This article is therefore a work in progress and presents preliminary findings.

2. Research protocol

In line with recent systematic reviews in HRM and AI (Jatobá et al., 2023; Kaushal et al., 2021; Malik et al., 2023; Pereira et al., 2023), this study adopted a classifying literature review approach (Kunisch et al., 2022) to map existing knowledge on AI within employee performance management. The review follows the Scientific Procedures and Rationales for Systematic Literature Reviews (SPAR-4-SLR, Paul et al., 2021), a protocol increasingly used in social sciences (Palumbo et al., 2023). Ensuring methodological transparency and replicability was a core priority. SPAR-4-SLR was thus followed, combining its steps with the practical guidelines developed by Simsek et al. (2021). These two approaches are complementary and together strengthen the overall robustness of the review. After defining the research question, the boundary conditions of the review were outlined. Building on prior analyses of AI in HRM (Kaushal et al., 2021) and related works (Qamar & Samad, 2021; Sharma & Chillakuri, 2022; Sokolov & Zavyalova, 2021), a comprehensive search involved two major databases: (1) the Web of Science (WoS) Social Science Citation Index and (2) Scopus. To ensure quality and relevance (Le Brocq et al., 2022; Sokolov & Zavyalova, 2021), the 2021 Academic Journal Guide (CABS, 2021) was adopted to focus the search on selected management subcategories. An iterative keyword strategy was developed, drawing on prior work on AI-enabled HRM and performance management (Meijerink et al., 2021). The final WoS search string was cross-validated in Scopus. The initial search returned 1,019 articles after duplicate removal. A three-step set of exclusion criteria was applied (Palumbo et al., 2023): Off-topic (studies unrelated to employee performance

[1] Assistant Professor, ECON-08/A, e-Campus University; martina.mori@uniecampus.it – corresponding author

management); Off-scope (articles addressing organisational or managerial issues without an explicit link between AI and performance management); and Off-focus (works on adjacent HR domains, e.g., recruitment, learning and development) unless they provided relevant and transferable insights. For example, studies on digital learning as a driver of performance (e.g., Nguar & Appolloni, 2025) were excluded because they did not explicitly address AI-enabled performance management.

A two-stage screening process was conducted (Simsek et al., 2021): first, title and abstract screening, then, full-text assessment to confirm relevance and quality. The final dataset included 127 articles.

Following Paul et al. (2021) and Simsek et al. (2021), the analysis extracted and analysed key themes from the selected studies. Articles were coded iteratively and clustered into thematic categories representing the main perspectives and patterns emerging from the literature. The final step concerned reporting the review's consolidated findings, highlighting existing gaps, and outlining directions for future research on AI-enabled performance management.

3. Preliminary findings

Our preliminary findings show that AI-enabled performance management is emerging along three main lines: (1) the design of new tools and measurement systems; (2) the motivational and well- being implications of AI-mediated evaluation, and (3) employee perceptions of fairness and justice in algorithmic performance decisions. A set of recent reviews and position papers further outlines a research agenda for responsible, practice-informed AI in HRM.

3.1. AI-enabled tools and measurement systems in performance management

A first group of contributions focuses on how AI reshapes the infrastructure of performance management through new tools, data sources, and measurement approaches.

Gu et al. (2025) analyse the introduction of an algorithmic supervisor, a data-driven system that monitors service employees, provides real-time feedback, and contributes to performance evaluation. They find that algorithmic supervision improves service quality (higher customer satisfaction) but reduces service quantity (fewer customers served), revealing a clear trade-off between quality and throughput. The study also uncovers gender effects: while men initially outperform women, after the introduction of the algorithmic supervisor, female employees achieve higher levels of both quantity and quality. These findings illustrate how AI-based monitoring tools can simultaneously enhance performance on some dimensions, reshape productivity profiles, and alter performance dynamics across employees.

Other contributions focus on the measurement architecture underpinning performance management. Beckman and Sharif (2025) proposed a method to analyse employee performance by applying temporal mining to large-scale network data on task collaborations. Conceptualising employees as nodes and collaborative tasks as links, they use mathematically validated algorithms to track performance patterns over time, thereby demonstrating how networked work structures and performance trajectories can be evaluated with greater granularity. Similarly, Nesterak et al. (2025) proposed the Workplace Performance Measurement (WPM) method, which combines process mining and machine learning to monitor work execution. Unlike traditional work measurement techniques that focus on task duration and frequency, WPM integrates data on workers' activities, physiological indicators, and tool use, enabling continuous, automated analysis of errors, irregularities, and opportunities for improvement in production processes. These studies point to the growing use of AI and advanced analytics to create high-resolution, continuous performance measurement systems that operate in the background of everyday work. At a more synthetic level, Pereira et al. (2023) map how different AI techniques—such as neural networks, machine learning, fuzzy logic, and other soft computing approaches—have been

applied to performance management and appraisal across multiple levels of analysis. Their review identifies themes related to job performance, engagement, satisfaction, and extra-role behaviour, showing that AI has been used to model links between job satisfaction and performance, enhance knowledge management systems, support problem solving in teams, and connect performance management with cognitive and emotional outcomes such as creativity and well-being. Overall, this work suggests that AI can help address long-standing concerns about validity, reliability, and transparency in appraisal, for instance, by detecting behavioural patterns, predicting turnover or low performance, and reducing delays and inefficiencies through advanced analytics.

Further empirical research illustrates how AI is embedded within talent management and performance systems. Tatiparti et al. (2025) examine AI support in preselection, organisational culture, interviews, and workload reduction, and find that AI-enabled talent management practices are positively associated with employee performance in medium-sized firms. Karina et al. (2025), in turn, identify three key factors for successfully integrating big data analytics into performance management systems: robust organisational data management capabilities, qualified human resources to interpret and use the analytics, and decision-making processes that effectively incorporate analytic insights.

Taken together, these studies show that a pipeline of AI-based tools and methods exists to reconfigure performance management. At the same time, they converge on the idea that the value of these systems depends on clear implementation criteria, governance mechanisms, and explicit design choices regarding trade-offs (e.g., quality vs. quantity), distributional effects (e.g., gender dynamics), and alignment with organisational goals.

3.2. Motivational and well-being implications of AI-mediated performance management

A second set of studies highlights that AI in performance management not only affect "objective" performance outcomes, but also employees' motivational states, autonomy perceptions, and psychological well-being, often drawing on self-determination and self-regulation theories.

Edwards et al. (2024) examine the motivational consequences of algorithmic HR systems that both collect performance metrics and make decisions based on them. They distinguish between the automated monitoring and metricization of performance and the automated decision-making built on these metrics. Building on self-determination theory (SDT), they argue that such systems are likely to elicit extrinsic motivation, especially when employees perceive them as instruments of control. The study introduces the notion of metricized behaviour prioritisation: employees focus their efforts on those dimensions captured by the metrics, potentially neglecting unmeasured but important aspects of performance. Empirical findings show that when employees attribute controlling intent to algorithmic systems, they report stronger extrinsic motivation, greater prioritisation of metricised tasks, and increased emotional exhaustion. Conversely, when systems are interpreted as developmental tools that support feedback and growth, intrinsic motivation is more likely, emotional exhaustion is lower, and employees are less prone to neglect unmeasured performance dimensions. This underscores the central role of employee sensemaking in shaping motivational outcomes.

Brown et al. (2025) revisit the job characteristics model through the lens of SDT in the context of algorithmic performance management. They show that while AI can augment non-routine work, the opacity of algorithmic evaluations may foster scepticism, distrust, and concealment behaviours, even among high performers. Their study highlights real-time automated feedback as a key intervention: by increasing knowledge of results and reducing surprise in final evaluations, real-time feedback enhances the perceived trustworthiness of algorithmic ratings and supports intrinsic motivation. However, trust declines when feedback diverges from expectations, even if the evaluation is more favourable than anticipated, suggesting that alignment and transparency matter more than valence alone. The authors conclude that

algorithmic management contributes positively to motivation and trust when it is implemented in ways that reinforce autonomy, competence, and relatedness, but can undermine these outcomes when transparency and alignment are lacking.

Tang et al. (2023) introduce a complementary perspective based on self-regulation theory, proposing a dual-path model of employees' dependence on intelligent machines. Dependence can reduce discrepancies—by helping to achieve goals more effectively and improving performance—or increase discrepancies, by threatening employees' sense of competence and self-esteem. Empirical evidence supports both: intelligent machines enhance perceived goal progress but can also trigger self-esteem threats that reduce performance. The moderating role of core self-evaluations (CSE) is especially significant. Although CSE usually predicts positive self-regulation, in this context, high CSE may intensify the negative pathway by heightening employees' sensitivity to the gap between their desired self-image and their actual reliance on machines.

Across these studies, AI-enabled performance management emerges as a psychologically consequential infrastructure: depending on how systems are designed, communicated, and interpreted, they can either support autonomous motivation, engagement, and reduced exhaustion or trigger controlled motivation, identity threats, and burnout.

3.3. Motivational and well-being implications of AI-mediated performance management

A third cluster of contributions focuses on employee perceptions, particularly regarding fairness, justice, and cognitive biases in AI-assisted performance judgments.

Carter and Liu (2025) investigate how AI interacts with anchoring and adjustment biases in performance appraisal. Their experiments show that performance ratings are sensitive to both the anchor level (high vs low) and the source of the recommendation (human vs AI). AI-generated anchors have a greater influence on supervisors' ratings than human anchors, indicating that the perceived objectivity and reliability of AI strengthen its anchoring effect. As a result, evaluations may reflect not only observed behaviour but also the interaction between algorithmic suggestions and human judgment, raising concerns about how AI can inadvertently magnify cognitive biases rather than eliminate them.

Majrashi (2025) examines employees' perceptions of the fairness of predictive features used in AI models for job performance assessment. The study finds that features are generally perceived by employees as fair when they are clearly linked to job performance and improve predictive accuracy—such as technology attitudes, job–role fit, tenure, and work experience. By contrast, demographic variables (gender, marital status, number of children) are widely seen as unfair because of their weak connection to performance and their implications for privacy and discrimination risks. The study also underscores an important conceptual distinction between predictive algorithms and decision-making algorithms: even when predictions appear accurate and fair, the organisational processes that translate predictions into decisions can still lead to unfair outcomes. This suggests that fairness needs to be assessed not only at the model and feature levels but also at the decision workflow level.

Focusing on the broader consequences of algorithmic justice, Jabagi et al. (2025) analyse how perceptions of algorithmic fairness shape job satisfaction and perceived organisational support among gig workers. Using survey data from Uber drivers, they distinguish between algorithmic matching decisions (task allocation) and performance evaluation decisions. Perceived fairness in both domains is positively associated with job satisfaction and perceived organisational support, but fairness in performance evaluation decisions has a more substantial impact than fairness in matching. The study shows that workers are particularly sensitive to the fairness of algorithmic evaluative judgments and that transparency and procedural justice in these decisions are crucial for sustaining positive attitudes and well-being.

Collectively, these studies reinforce the idea that what AI does in performance management cannot be separated from how employees perceive it. Perceptions of fairness, the salience of cognitive biases, and the perceived legitimacy of predictive features all play a central role in determining whether AI-based performance systems are accepted, trusted, and experienced as just.

3.4. Motivational and well-being implications of AI-mediated performance management

Alongside empirical studies, several recent reviews and position papers offer higher-level reflections on AI in HRM, including performance management, and stress the need for responsible governance and practice-driven research.

Nyberg et al. (2025) provide a practice-oriented review of generative AI in HRM, based on a Summit that brought together scholars and senior business leaders. Adapting Posthuma et al.'s (2013) taxonomy of HR practices, they cover six functional domains, including performance management. For performance management, discussions centre on four themes: GenAI as potentially transformative; adoption challenges; the risks of misuse and the importance of maintaining a human-in-the-loop; and the need for experimentation with multi-criteria evaluation (accuracy, validity, bias, ethicality). A key message is the call for use-inspired research that bridges academic rigour with pressing practical challenges, positioning scholars as active contributors to the design and governance of GenAI-enabled HR systems. In this regard, Budhwar et al. (2023) focus specifically on large language models such as ChatGPT, identifying performance management as a domain where such tools could significantly reshape evaluative work. They argue that ChatGPT can support raters by synthesising large volumes of qualitative and quantitative information, potentially clarifying links between individual performance data and organisational outcomes. At the same time, they caution that poor data quality, uncritical reliance on AI outputs, and insufficient training for raters can undermine rather than enhance appraisal practices, reinforcing the need for strong governance, oversight, and capability-building. Together with other reviews, such as Pereira et al. (2023), these contributions underscore that AI-enabled performance management remains an emerging field, marked by both optimism about efficiency and analytical sophistication and concern about ethics, fairness, and well-being. They converge on the idea that future work should move beyond purely technical solutions to consider design principles, governance structures, and participatory processes that ensure AI systems genuinely support responsible, human-centred performance management.

4. Discussion: expected contributions

This work-in-progress review aims to develop an integrative conceptual framework that organises existing knowledge on AI-enabled performance management across three emerging dimensions: (1) measurement systems and analytical tools, (2) motivational and well-being mechanisms, and (3) fairness perceptions and cognitive responses to algorithmic decisions. By synthesising heterogeneous contributions scattered across HRM, organisational behaviour, information systems, and algorithmic management, the review seeks to clarify the contours of this evolving field and to articulate the socio-technical nature of AI-mediated performance management.

The ongoing analysis is expected to produce a refined thematic classification, highlight cross- cutting mechanisms that have not yet been systematically theorised, and identify under-explored areas where future research could meaningfully advance conceptual development—particularly with respect to employee sensemaking processes, governance and design principles for algorithmic evaluation, and the interplay between human and machine judgement.

The final version of the study will present a consolidated framework and a practice-oriented research agenda outlining how AI can be embedded responsibly into performance management systems.

4.1. Expected Theoretical Directions

First, early evidence indicates that AI-enabled tools may do more than automate performance measurement. They appear to influence which dimensions of performance become salient (e.g., metricized behaviours, Edwards et al., 2024), how goals are prioritised, and how employees organise their work around algorithmic cues. If confirmed by further analysis, this would imply a shift from a traditional, human-driven evaluative process to a hybrid socio-technical architecture in which algorithms and humans jointly participate in sensemaking and decision-making.

Second, a recurring pattern across the studies reviewed concerns the psychological consequences of algorithmic evaluation (Brown et al., 2025; Tang et al., 2023). Drawing on SDT and self- regulation frameworks, preliminary findings suggest that employees' interpretations of algorithmic tools—supportive versus controlling—may shape whether AI fosters intrinsic motivation and competence or triggers controlled motivation, depletion, and identity threat. Should these trends hold across a broader body of evidence, AI-enabled performance management may need to be theorised not only as an information-processing system but also as a motivational and interpretive context.

Third, studies on anchoring, feature legitimacy, and algorithmic justice consistently highlight that employees evaluate AI-based systems through a fairness lens. Early indications suggest that fairness perceptions vary across types of algorithmic decisions (e.g., matching versus evaluation) and depend heavily on the perceived legitimacy of predictive features and transparency of decision workflows. These insights point toward the potential value of integrating organisational justice theory with research on algorithmic management. Rather than eliminating bias, AI appears to reconfigure its sources—a direction that future theorising will need to interrogate further.

While the above expected directions resonate with classic socio-technical perspectives, our preliminary analysis suggests that AI-enabled systems may not simply fit within existing frameworks. AI systems appear to amplify and transform the interaction between technological and social components, particularly through their capacity to autonomously generate, interpret, and act on data. This suggests the need to revisit and extend socio-technical assumptions in the context of AI-enabled performance management.

Overall, these expected contributions provide a preliminary roadmap for the conceptual development of AI-enabled performance management. As the analysis progresses, these emerging patterns will need to be refined, validated, or revised in light of additional evidence.

Sfide di sostenibilità organizzativa e logiche di employer branding nell'era dell'IA: l'esperienza della Regione Marche

Benedetta De Angelis[1], Enrico Cori[2]

1. Introduzione e contesto della ricerca

Negli ultimi anni, la Pubblica Amministrazione è attraversata da una crescente difficoltà nel mantenere la propria attrattività come datore di lavoro, in particolare nei confronti delle generazioni più giovani e dei profili ad alta qualificazione. In questo quadro, il tema dell'employer branding pubblico emerge come una leva centrale per comprendere come le amministrazioni possano comunicare la propria identità, i propri valori e l'impatto sociale del lavoro pubblico. La cosiddetta "quarta rivoluzione industriale" rappresenta una sfida per i consolidati modelli organizzativi e decisionali, imponendo una riflessione critica sulle modalità con cui la Pubblica Amministrazione (PA) attrae, seleziona, forma e trattiene il capitale umano.

Jakobsen et al. (2023) sottolineano come le amministrazioni pubbliche stiano affrontando una doppia sfida: da un lato, la difficoltà di reperire competenze tecniche e digitali adeguate; dall'altro, l'urgenza di mantenere sostenibilità organizzativa in un contesto di crescente disaffezione e turnover. In Italia, come in numerosi Paesi europei, il settore pubblico si confronta con quella che la letteratura internazionale definisce una human capital crisis (Jakobsen et al., 2023): un insieme di dinamiche strutturali caratterizzate dall'invecchiamento della forza lavoro, da tassi limitati di ricambio generazionale e da una ridotta capacità di attrarre nuove competenze, in particolare tra le generazioni più giovani. Nel contesto italiano, il Rapporto FPA–Indeed (2024) evidenzia come la Pubblica Amministrazione soffra di un problema strutturale di comunicazione e posizionamento, che incide negativamente sulla sua capacità di attrarre le giovani generazioni. Solo il 16% dei giovani tra i 18 e i 34 anni considera infatti un impiego pubblico come una scelta auspicabile, segnalando una difficoltà diffusa nel percepire la PA come un contesto lavorativo attrattivo, dinamico e innovativo. Tra coloro che partecipano ai concorsi, inoltre, una quota significativa rinuncia durante l'iter selettivo o abbandona nei primi mesi di lavoro. Le principali barriere percepite riguardano la scarsa trasparenza delle procedure, la lentezza dei processi di selezione e la limitata percezione di opportunità di crescita professionale. A ciò si aggiunge l'utilizzo, nei bandi di concorso, di un linguaggio spesso tecnico e impersonale, che fatica a valorizzare l'identità delle amministrazioni e a comunicare il significato e le finalità sociali del lavoro pubblico.

La sostenibilità organizzativa può essere intesa, in primo luogo, come la capacità delle amministrazioni di garantire condizioni durature di benessere alle persone che vi operano.

Rogers et al. (2012) affermano, infatti, che «la sostenibilità sociale implica la soddisfazione dei bisogni degli esseri umani», introducendo una visione del benessere come costrutto multidimensionale che non può essere ridotto a condizioni astratte o uniformi.

In un'ottica più ampia, questa impostazione consente di leggere la sostenibilità organizzativa come la capacità dell'ente pubblico di mantenere nel tempo un equilibrio tra innovazione

[2] Professore ordinario, ECON-08/A, Università Politecnica delle Marche; e.cori@staff.univpm.it

tecnologica, sviluppo delle competenze e benessere delle persone che compongono l'organizzazione. Tale equilibrio diventa particolarmente rilevante nel caso delle nuove generazioni che si affacciano al lavoro pubblico. Inoltre, capire perché i giovani siano meno attratti di un tempo o abbandonino l'ente precocemente, richiede di considerare anche il ruolo della fiducia istituzionale (Grimmelikhuijsen et al., 2013). La decisione di entrare o restare nella PA è strettamente legata alla convinzione che l'organizzazione sia in grado di ascoltare, riconoscere la diversità valoriale delle nuove generazioni e offrire opportunità di crescita coerenti con le loro aspettative. In questo senso, sostenibilità, benessere e fiducia si intrecciano per spiegare non solo l'attrattività della PA, ma anche la sua capacità di trattenere i giovani talenti.

Nel contesto emergente entro cui le amministrazioni pubbliche stanno ridefinendo strategie e modelli organizzativi si colloca un crescente interesse verso i processi di digitalizzazione e, più recentemente, verso le potenzialità offerte dall'intelligenza artificiale (IA) nei processi di gestione delle risorse umane.

In questo studio, tematiche e dinamiche appena descritte sono approfondite con specifico riferimento alla Regione Marche, attualmente interessata dal progressivo potenziamento di strumenti digitali nonché dalla valutazione di possibili applicazioni dell'IA a supporto dei processi di acquisizione del personale[3].

A partire dall'analisi delle attuali criticità riscontrate nei processi di selezione e inserimento di personale, la ricerca, nel suo disegno complessivo, si propone di esplorare come l'adozione di logiche di employer branding, supportate da un utilizzo mirato di strumenti e applicazioni di IA, possa migliorare l'efficacia dei processi di selezione e inserimento, in particolare la capacità di attrarre e trattenere giovani talenti, rafforzando con il tempo un'immagine dell'ente regionale come datore di lavoro innovativo, sostenibile e orientato alle nuove generazioni.

Nella fase embrionale della ricerca l'obiettivo è quello di incrociare il punto di vista dell'ente e quello dei candidati, analizzando le dinamiche di attrazione e abbandono che caratterizzano i concorsi pubblici, per comprendere quali fattori incidano sulle scelte individuali.

2. Obiettivi della ricerca

Nel quadro della trasformazione digitale e dell'evoluzione delle intelligenze artificiali nei processi HR pubblici, la capacità delle amministrazioni di attrarre e trattenere talenti, in particolare giovani, rappresenta una dimensione cruciale della sostenibilità organizzativa.

Parallelamente, la letteratura recente sul public employer branding sottolinea come la percezione dell'attrattività della PA dipenda sempre più dalla capacità di comunicare in modo autentico i propri valori, l'impatto sociale del lavoro e le reali opportunità di crescita professionale (Leijerholt et al., 2022; Ritz et al., 2022; Keppeler & Papenfuß, 2021).

Questi elementi contribuiscono a definire il contesto all'interno del quale si colloca il presente studio.

Il complessivo disegno della ricerca si propone due obiettivi principali, entrambi declinati con riferimento al contesto della Regione Marche:

- Analizzare i fattori che influenzano la partecipazione, la non partecipazione e l'abbandono nei concorsi pubblici banditi nel triennio 2022-24.
- Indagare le motivazioni del turnover giovanile entro il primo anno dall'assunzione.

[3] Lo studio è condotto nell'ambito di un progetto di ricerca condiviso tra Regione Marche e Dipartimento di Management dell'Università Politecnica delle Marche, nell'ambito del Programma «Dottorati InPA» del Dipartimento della Funzione Pubblica. L'autrice, nella sua duplice veste di dottoranda e di titolare di contratto di apprendistato presso la Regione Marche, beneficia del suo status di osservatore partecipante lungo l'intero progetto.

Con riferimento al primo asse di ricerca, l'analisi si concentrerà sull'intero percorso che conduce un candidato dal momento dell'iscrizione al concorso fino all'eventuale assunzione. Verranno quindi osservate in modo integrato le diverse fasi (iscrizione, partecipazione effettiva alle prove, collocazione in graduatoria e accettazione dell'incarico) con l'obiettivo di comprendere come e perché, lungo questo percorso, emergano specifici punti di caduta. L'interesse è rivolto in particolare a identificare se vi siano fasce generazionali più o meno inclini a partecipare o a confermare la propria candidatura nelle fasi successive, e quali elementi possano incidere sulle loro decisioni. Tra questi, particolare attenzione sarà dedicata alla qualità e al linguaggio della comunicazione dei bandi, al grado di chiarezza con cui vengono presentate mansioni e prospettive del ruolo, alla percezione di significato e impatto dell'impiego pubblico, nonché alla complessità delle prove e ai tempi delle procedure.

Il secondo asse di ricerca riguarda, invece, ciò che accade dopo l'ingresso in servizio. L'obiettivo è approfondire se, e in quale misura, il turnover nel primo anno sia attribuibile a un disallineamento tra le aspettative maturate durante la fase concorsuale e l'effettiva esperienza lavorativa. In questa prospettiva, verrà esplorato il ruolo del contesto organizzativo: la qualità del supporto ricevuto dai neoassunti, la percezione di contribuire a un impatto sociale reale e riconosciuto, la possibilità di intravedere percorsi di crescita e sviluppo professionale, la coerenza tra cultura interna e valori che i giovani portano con sé. Analizzare tali dinamiche consente di interrogarsi su come questi fattori, intrecciandosi, possano incidere sulla decisione di lasciare il posto nei primi mesi e, più in generale, sulla sostenibilità organizzativa dell'ente.

3. Quadro teorico

L'attrattività del lavoro pubblico rappresenta un tema emergente nella letteratura internazionale. La rassegna sistematica di Jakobsen et al. (2023) evidenzia come l'interesse accademico sul public sector attraction sia cresciuto a partire dagli anni 2000, in parallelo con le crescenti difficoltà di reclutamento, in particolare nei Paesi dell'Europa settentrionale e nel mondo anglosassone. Gli studi si concentrano prevalentemente sulla fase di attraction, mentre risultano ancora limitate le evidenze relative a selezione, onboarding e retention, suggerendo la necessità di adottare una prospettiva di ciclo di vita e approcci integrati e data-driven.

Tra i principali filoni di ricerca, la Public Service Motivation (PSM) occupa un ruolo centrale nell'analisi dell'attrattività del lavoro pubblico. La letteratura più recente sottolinea come la PSM sia un costrutto dinamico, influenzato da pratiche organizzative, percezioni di impatto sociale e stili di leadership. In particolare, la sostenibilità organizzativa e il supporto percepito possono rafforzare la PSM (Crucke et al., 2022), mentre differenti stili di leadership incidono significativamente su soddisfazione, commitment e intenzione di permanenza nel settore pubblico (Hameduddin & Engbers, 2022).

La Public Service Motivation (PSM) rappresenta uno dei pilastri della ricerca sull'amministrazione pubblica sin dalla sua formalizzazione a metà degli anni '90. Perry (1996) la definisce come una predisposizione individuale a rispondere a motivazioni radicate nelle istituzioni e nelle missioni del settore pubblico, riconducibili a un orientamento prosociale che si contrappone alle spiegazioni utilitaristiche del comportamento umano proprie del public choice (Perry & Wise, 1990).

Il modello originario di Perry (1996) individua quattro dimensioni chiave della PSM: attrazione verso la partecipazione al processo politico, impegno per l'interesse pubblico, compassione e disponibilità al sacrificio personale. Tali dimensioni risultano fortemente influenzate dal contesto organizzativo: ambienti caratterizzati da equità, coerenza valoriale e leadership credibile tendono a rafforzare la PSM, mentre disfunzioni e incoerenze organizzative possono progressivamente eroderla (Hinna, 2009).

La letteratura evidenzia in modo convergente che livelli elevati di PSM si associano a migliori performance, maggiore soddisfazione lavorativa, minori intenzioni di turnover e più forte

commitment organizzativo, oltre a una maggiore propensione ai comportamenti di cittadinanza organizzativa. Studi empirici mostrano inoltre che la PSM favorisce la percezione di significatività del lavoro e la stabilità nel tempo (Vandenabeele, 2008). Tuttavia, emergono differenze rilevanti tra contesti nazionali, con livelli mediamente più elevati nei Paesi nordici e anglosassoni rispetto all'Europa mediterranea, inclusa l'Italia, a conferma del ruolo dei fattori culturali e istituzionali (Hinna, 2009).

I contributi più recenti confermano che la PSM non è una caratteristica innata e immutabile, ma un costrutto sensibile alla qualità dell'ambiente lavorativo e delle pratiche gestionali.

Crucke et al. (2022) dimostrano che la sostenibilità organizzativa, attraverso equità interna, supporto percepito e senso di impatto sociale, rafforza la PSM e riduce turnover e insoddisfazione.

Hameduddin & Engbers (2022) evidenziano che diversi stili di leadership influenzano in maniera significativa la PSM, con effetti su performance e intenzione di rimanere.

Un secondo filone di studi rilevante per comprendere l'attrattività del lavoro pubblico riguarda le differenze generazionali nei valori lavorativi. La letteratura internazionale ha evidenziato come i lavoratori appartenenti alle generazioni Y (Millennials) e Z presentino aspettative e orientamenti valoriali differenti rispetto ai Baby Boomers e alla Generazione X (Hansen & Leuty, 2012; Bencsik et al., 2016). Le nuove generazioni attribuiscono maggiore importanza ad aspetti quali autonomia, apprendimento continuo, flessibilità, equilibrio tra vita privata e lavoro e senso di scopo sociale del proprio ruolo. Di conseguenza, tendono a privilegiare contesti professionali inclusivi, dinamici e coerenti con i propri principi etici, più che stabilità, status o percorsi di carriera lineari. Questo scarto valoriale, se non adeguatamente compreso e gestito, può generare un disallineamento tra aspettative e realtà organizzativa, traducendosi in una percezione della PA come rigida, gerarchica e poco meritocratica. Tale percezione contribuisce a spiegare sia la minore propensione dei giovani ad intraprendere un percorso lavorativo nel settore pubblico, sia fenomeni di turnover precoce e perdita di fiducia verso la PA come datore di lavoro. Per quanto di nostra conoscenza, la letteratura riferita al contesto pubblico italiano non offre contributi sistematici che approfondiscano in modo specifico le differenze generazionali nei valori lavorativi e il loro impatto sull'attrattività della PA. Ciò evidenzia un gap rilevante nella letteratura, che la ricerca in corso può contribuire a ridurre.

Un terzo filone è quello dedicato al public employer branding, che analizza come le amministrazioni costruiscono e comunicano la propria identità di datori di lavoro. Gli studi contemporanei evidenziano come l'attrattività del settore pubblico dipenda in misura crescente dalla capacità delle amministrazioni di presentarsi come organizzazioni moderne, inclusive e orientate al valore pubblico.

Leijerholt et al. (2022) dimostrano che pratiche di comunicazione interna coerenti, leadership credibili e processi organizzativi trasparenti rafforzano l'identità interna e la percezione di attrattività dell'ente. La qualità della comunicazione interna, spesso trascurata nella PA, emerge come un fattore decisivo per la costruzione di un brand pubblico forte.

Ritz et al. (2022) evidenziano che l'attrattività comparata di enti pubblici, privati e nonprofit dipende non solo dagli incentivi economici, ma soprattutto dal valore pubblico percepito, dalle opportunità di contribuire alla collettività e dalla credibilità dell'ente nel mantenere le proprie promesse verso i dipendenti.

Keppeler & Papenfuß (2021), attraverso esperimenti sui social media rivolti a potenziali futuri dipendenti pubblici, mostrano che messaggi chiari, personalizzati e orientati all'impatto sociale aumentano significativamente l'intenzione dei giovani a candidarsi, sottolineando come la PA debba ripensare linguaggi e canali di comunicazione se vuole risultare competitiva rispetto agli altri settori.

Nel loro complesso, questi studi convergono su un punto centrale: il settore pubblico non può più limitarsi a procedure standardizzate di reclutamento, ma deve elaborare strategie mirate di employer branding, focalizzate sulla narrazione del proprio contributo alla società, sulla trasparenza dei processi e sulla valorizzazione delle opportunità di sviluppo professionale. Ciò è

particolarmente rilevante per i giovani laureati, che tendono a scegliere contesti lavorativi percepiti come coerenti con i propri valori e capaci di offrire percorsi di crescita significativi.

Negli ultimi anni, diversi contributi nel campo dell'HRM digitale (Keppeler, 2023) hanno evidenziato come l'introduzione dell'intelligenza artificiale nei processi di gestione delle persone stia trasformando, in modo graduale, anche le pratiche di selezione nel settore pubblico. In generale, l'IA viene considerata una tecnologia potenzialmente utile per supportare attività quali l'analisi strutturata dei curricula, l'identificazione di pattern nei fabbisogni professionali e, più in prospettiva, la personalizzazione dei percorsi formativi. Tuttavia, la letteratura che esplora in modo sistematico queste applicazioni nella PA è ancora emergente.

Alcuni studi iniziano a mostrare come l'integrazione tra strumenti di IA e strategie di employer branding possa contribuire a migliorare la qualità della comunicazione verso i candidati, rendendo il processo più trasparente e coerente con un'immagine organizzativa orientata all'innovazione. In questa direzione, Strohmeier (2022) sottolinea il potenziale degli strumenti di smart e-data-driven recruitment nel rendere più efficiente la gestione delle candidature e nel migliorare l'esperienza dei candidati, riducendo al contempo alcune forme di opacità tipiche dei sistemi tradizionali.

Parallelamente, Benabou et al. (2024) richiamano l'attenzione sulla necessità di adottare un approccio di responsible AI, particolarmente rilevante per il settore pubblico, in cui trasparenza, equità e accountability rappresentano requisiti imprescindibili. L'adozione di algoritmi nei processi HR richiede quindi un bilanciamento tra automazione e supervisione umana, affinché gli strumenti tecnologici non generino bias o discriminazioni, ma fungano da supporto alle decisioni e non da sostituti del giudizio professionale.

Nel complesso, la letteratura disponibile indica con chiarezza che l'IA può rappresentare una leva utile per innovare le pratiche di reclutamento della PA solo se integrata in un framework etico, regolato e coerente con una visione centrata sulla persona.

4. Metodologia

In questa fase embrionale la ricerca adotta un approccio esplorativo, volto a indagare in profondità le dinamiche di attrazione, partecipazione e abbandono nei concorsi pubblici. La scelta di concentrare l'analisi sui concorsi banditi dalla Regione Marche nel triennio 2022–2024 risponde a motivazioni sia scientifiche sia contestuali.

In primo luogo, il ruolo di osservatore partecipante svolto dall'autrice, non solo consente un accesso diretto a dati amministrativi dettagliati e affidabili, ma, attraverso la quotidiana partecipazione ai processi organizzativi, consente di sviluppare una progressiva maggiore consapevolezza delle criticità operative che caratterizzano le pratiche di reclutamento e selezione dell'ente.

In secondo luogo, il focus sui concorsi regionali riflette un interesse concreto e crescente dell'amministrazione stessa verso il tema dell'attrattività e della retention del personale, criticità che si sono accentuate negli ultimi anni e che riguardano in particolare le fasce più giovani e qualificate della forza lavoro. Infine, la scelta di circoscrivere l'analisi al triennio 2022–2024 ha consentito di utilizzare le informazioni più recenti, complete e strutturate attualmente disponibili, rendendo possibile un confronto tra le diverse fasi del processo concorsuale, dalla fase di iscrizione fino all'eventuale abbandono entro il primo anno, offrendo una base empirica solida per comprendere le criticità dell'attrazione e della retention nel contesto regionale.

Il complessivo disegno della ricerca nel suo sviluppo prevede l'integrazione di approcci sia quantitativi che qualitativi.

Nella fase iniziale, l'analisi ha natura quantitativa e attinge prevalentemente al dataset della Regione Marche, relativo ai concorsi delle categorie C e D banditi nel triennio 2022–2024. Attraverso l'impiego di statistiche descrittive, il lavoro produce una prima fotografia del fenomeno, ricostruendo i livelli di iscrizione ai concorsi, le effettive partecipazioni alle prove e le

successive accettazioni dell'incarico. L'esame dei dati permette, inoltre, di osservare come si distribuiscano i candidati in base all'età, al titolo di studio e alla fascia generazionale, nonché di rilevare le proporzioni di abbandono entro il primo anno di servizio.

Una prima esplorazione dei pattern ricorrenti (es. maggiore rinuncia fra i più giovani), risulta utile a orientare le fasi successive, nelle quali si prevede di integrare i risultati prodotti nella prima fase attraverso la somministrazione di:

- interviste semi-strutturate a coloro che hanno lasciato l'incarico entro il primo anno;
- questionari esplorativi per rilevare percezioni di disallineamento, motivazioni alla candidatura e rappresentazioni del lavoro pubblico.

La natura qualitativa dell'indagine sarà essenziale per collegare i dati oggettivi di partecipazione/abbandono con i vissuti soggettivi dei giovani candidati.

Il disegno complessivo della ricerca include anche una analisi testuale (NLP, Natural Language Processing) dei testi dei bandi, volta a esaminare: il linguaggio utilizzato, i segnali valoriali esplicitati o impliciti, la presenza/assenza di elementi di public employer branding, la coerenza tra messaggi, valori e aspettative dei giovani.

L'obiettivo metodologico è costruire un quadro integrato che colleghi i dati oggettivi (partecipazione, turnover) con le dimensioni percettive (motivazioni, rappresentazioni del lavoro pubblico).

5. Raccolta e analisi dei dati

La raccolta e l'analisi dei dati si fondano sull'evidenza che il tema dell'attrattività dei concorsi pubblici e dell'abbandono precoce rappresenta una priorità concreta per la Regione Marche, sia sul piano organizzativo sia su quello strategico. Di conseguenza, il disegno di ricerca adotta un criterio logico-sequenziale che parte dall'analisi dei dati amministrativi per poi approfondire le cause sottostanti attraverso strumenti qualitativi.

In una prima fase, l'analisi quantitativa si concentra sui dati relativi ai concorsi banditi nel triennio 2022–2024, con l'obiettivo di ricostruire le diverse tappe del percorso dei candidati: iscrizione al concorso, partecipazione effettiva alle prove, assunzione o eventuale rinuncia all'assunzione, eventuale abbandono entro il primo anno di servizio. Questa sequenza analitica consente di individuare con precisione i punti di caduta del processo di attrazione, mettendo in evidenza dove e in quale misura si manifestino le principali criticità.

Per i concorsi più recenti, in particolare quelli banditi nel 2024, l'analisi dell'abbandono entro il primo anno non è ancora possibile, rendendo necessario un approccio temporale differenziato che tenga conto dello stato di avanzamento dei percorsi di assunzione.

I risultati quantitativi ottenuti costituiscono la base per la successiva fase, che sarà condotta utilizzando un approccio qualitativo. L'integrazione avverrà attraverso la realizzazione di interviste rivolte a due gruppi specifici di soggetti: i vincitori che non hanno accettato l'incarico e coloro che hanno lasciato il lavoro entro il primo anno dall'assunzione. Data la numerosità contenuta dei casi e la loro rilevanza per l'ente, l'obiettivo è intervistare l'intera popolazione dei soggetti individuabili, compatibilmente con la loro reperibilità.

La fase qualitativa è finalizzata a indagare in profondità le motivazioni che hanno indotto i candidati a rinunciare all'assunzione o ad abbandonare precocemente il lavoro, esplorando aspetti quali le aspettative maturate durante la fase concorsuale, la percezione dell'esperienza lavorativa iniziale, il contesto organizzativo e la coerenza tra valori individuali e valori percepiti dell'ente. In questo modo, l'integrazione tra dati quantitativi e qualitativi consentirà di collegare evidenze oggettive e vissuti soggettivi, rafforzando la comprensione delle dinamiche di attrattività e retention.

Per coerenza rispetto all'obiettivo di indagare l'attrattività della PA tra i giovani e i profili più qualificati, l'analisi ha selezionato solo i concorsi delle categorie C e D, in quanto: richiedono il possesso del diploma (C) o della laurea (D), livelli di istruzione maggiormente rappresentati

nelle fasce generazionali più giovani; presentano un tasso di partecipazione giovanile più elevato rispetto alle categorie A e B, storicamente popolate da profili meno istruiti e meno inclini al turnover e, inoltre, possono essere considerate categorie "strategiche" per comprendere il disallineamento tra aspettative e realtà lavorativa, poiché coinvolgono candidati altamente qualificati e potenzialmente attratti anche dal settore privato.

Il dataset regionale utilizzato contiene un insieme articolato di informazioni che permette di seguire l'intero percorso dei candidati: dai dati anagrafici e formativi (come età, genere e titolo di studio) alle diverse fasi del processo concorsuale, dall'iscrizione alle prove fino alla graduatoria finale e alla decisione di accettare o rifiutare l'incarico. A un anno dall'assunzione, il dataset restituisce inoltre il quadro aggiornato della situazione occupazionale dei vincitori, distinguendo tra chi è rimasto in servizio, chi ha rassegnato le dimissioni e chi non è mai stato effettivamente preso in servizio.

Queste informazioni consentono di analizzare in modo integrato il ciclo di ingresso nella PA regionale, mettendo in evidenza sia i fattori che possono ostacolare la partecipazione effettiva dopo l'iscrizione, sia le ragioni che inducono alcuni vincitori a non assumere l'incarico o ad abbandonarlo nei primi mesi. Attraverso la combinazione delle variabili sociodemografiche con gli esiti delle diverse fasi del processo concorsuale, sarà possibile ricostruire tendenze e comportamenti tipici delle varie generazioni, valutare in quale misura alcune categorie risultino maggiormente soggette a rinuncia o turnover e identificare pattern differenziati legati, ad esempio, al livello di competenze digitali o al titolo di studio. L'analisi dei tassi di conversione tra iscritti, partecipanti e assunti, così come delle dinamiche di abbandono entro il primo anno, permetterà infine di ottenere un quadro dettagliato delle criticità strutturali e dei punti di forza che caratterizzano l'ingresso nella PA.

6. Risultati attesi

In questa fase iniziale della ricerca, i risultati attesi riguardano principalmente l'identificazione delle tendenze relative alla partecipazione ai concorsi e ai fenomeni di rinuncia o abbandono precoce nel contesto della Regione Marche. Ci si attende, in particolare, di ricavare evidenze circa un'eventuale minore propensione delle fasce più giovani della popolazione a partecipare effettivamente alle prove e alla presa di servizio. L'analisi dei dati disponibili dovrebbe inoltre consentire di ricostruire tempi e modalità del turnover entro il primo anno, offrendo una prima base empirica per interpretare il possibile disallineamento tra le aspettative dei candidati e la realtà organizzativa sperimentata dopo l'ingresso in servizio.

Questi risultati preliminari costituiranno il punto di partenza per le successive fasi della ricerca nelle quali, grazie al ricorso ad analisi qualitative, sarà possibile indagare le motivazioni delle scelte dei candidati e dei neo-assunti, nonché evidenziare differenze generazionali nei valori lavorativi e nell'approccio al lavoro pubblico.

In una fase successiva sarà possibile replicare l'indagine presso altre Regioni e procedere con analisi comparative, al fine di verificare la sussistenza di criticità analoghe o, al contrario, di differenze significative legate a variabili quali dimensione dell'ente, collocazione territoriale o condizione di Regione a statuto ordinario o a statuto speciale.

Si ritiene che la ricerca possa offrire un contributo su più livelli:

- Sul piano teorico, potrà arricchire la letteratura su public sector attraction, integrando le prospettive di sostenibilità organizzativa e filoni studi sulla diffusione dell'AI nel settore pubblico regionale. Un ulteriore contributo teorico è individuabile nell' irrobustimento delle evidenze empiriche, ancora limitate nel contesto della Pubblica Amministrazione italiana.
- Sul piano operativo-manageriale**,** la ricerca potrà offrire indicazioni concrete alla Regione Marche, al fine di sviluppare azioni di miglioramento del processo di acquisizione e, più in generale, alle amministrazioni regionali che, nell'esercizio della propria autonomia organizzativa, possono intervenire su specifici ambiti critici: la revisione dei linguaggi e dei contenuti dei bandi

di concorso; la progettazione di percorsi di onboarding capaci di ridurre il disallineamento tra aspettative dei neoassunti e realtà organizzativa, lo sviluppo di strumenti di monitoraggio e dashboard predittive finalizzate a presidiare in modo proattivo il rischio di rinuncia o abbandono.

Parole chiave: Pubblica amministrazione; sostenibilità organizzativa; employer branding; giovani talenti; attrattività

Addressing Gender Bias in AI Business Implementation: A Latent Dirichlet Allocation-Based Analysis

Francesca Valentina Giglio Moro[1], Carlo Drago[2]

1. Introduction

The present study aims to define the literature approach to gender bias through a bibliometric dataset regarding the evidence of the research results on this social and moral topic affecting society in different areas and levels (see Aria & Cuccurullo, 2017; Drago et al., 2023).

AI gender bias is part of gender studies. It confirms Paoloni and Demartini's (2016) two studies that underlined the role of women in organizations and the debate relating to women's ability to promote knowledge in organizations.

The research questions to be answered concern the existence of gender bias, the level of AI technology at which it is present, and its impact on the enterprise's tools and values.

For the first research question, Friedman and Nissenbaum (1996), in their analysis, have suggested the meaning of the bias term and consider bias as a "slant." This word is neutral without a negative or positive sense, and according to the authors, the quality of technology in use could be defined on social matters through the moral meaning associated with the term bias. In this connotation, bias identifies discrimination towards people or clusters of individuals as "systematical" and "unfair" according to unjustified criteria (Friedman & Nissenbaum, 1996).

According to Gross (2023), biases cover different areas: demographic, cultural, linguistic, temporal, confirmation-based, ideological, or political. Friedman and Nissenbaum (1996) have identified three kinds of bias: pre-existing, technical, and emerged bias.

In order to answer the second research question, the former stage consists of clarifying AI technologies since AI bias involves different types of bias and dimension – i.e., bias management (Bernagozzi et al., 2021).

The study conducted by Corea (2019) counts two categories of AI according to the author's AI Knowledge Map (AIKM):

- AI paradigms (X-axis);
- AI problem domains (Y-axis).

The first group of AI technologies includes six paradigms (O'Connor & Liu, 2024). Corea (2019) classifies these paradigms, including "logic-based tools, knowledge-based tools, probabilistic methods, machine learning, embodied intelligence, and search and optimization," under three primary approaches: symbolic, subsymbolic, and statistical.

The second group comprises: reasoning, knowledge, planning, communication, and perception.

According to the Corea (2019) maps, the AI technology types appear at the intersection of the points on the two axes.

Once the categories of AI technologies have been identified, the study aims to underline the existence of gender bias correlated to the "technologies in use," which indicates the influence of contextual factors between humans and technology (O'Connor & Liu, 2023).

[1] Ph.D. Candidate, ECON-07/A, University Niccolò Cusano; valentina.gigliomoro@unicusano.it – corresponding author

[2] Associate Professor, STAT-02/A, University Niccolò Cusano; carlo.drago@unicusano.it

The subsisting relationship between AI algorithms and gender bias is a reflection of the biases present (i) in the training data and (ii) in the algorithms themselves (Gross, 2023).

Even though algorithms are considered more impartial in decision-making processes (Guitiérezz, 2021), according to an article by UN Women, the United Nations entity dedicated to gender equality and the empowerment of women (2024), AI replicates gender inequality in our society, and the evidence is present in the AI training data.

The Berkeley Hass Center for Equity, Gender, and Leadership's study analyzed the same results, which confirms the embedded bias in AI technologies due to human actions in terms of selection and collection of the data to insert in the datasets and the human decision-making process relating to the chosen datasets and rules to enter into the algorithm's learning path.

In addition, the AI teams in charge of developing and improving AI systems show a lower percentage of women presence (22 percent during 2021), and most of them work at low levels, according to Berkely's research.

The cited study discovered 44 percent gender bias by analyzing 133 AI applications in different industries.

The framework designed by O'Connor and Liu (2023) in their research on gender bias in AI systems has developed in two ways: the direction of gender bias—perpetuation and mitigation—and the AI data source—image and text.

Several studies show evidence of AI gender bias based on machine learning that involves text and image data source dimensions (Buolamwini & Gebru, 2018; Dastin, 2022) and, according to the AI Knowledge Map (Corea, 2019), regarding the statistical AI paradigms across the perception domain. In particular, the technologies identified are Natural Language Processing (NLP) and Computer Vision.

Analyzing NLP technologies, particularly machine translation (Corea, 2019), has shown the presence of gender bias.

Finally, for the third question, the study has analyzed the impact of AI gender bias applications in the organization's processes. Famous research from the Federal University of Rio Grande do Sul in Brazil (Prates et al., 2020) discovered gender bias using Google Translate. After the publication of this study, Google had to reveal the possibility of encountering gender bias and, in 2021, implemented the 'Translated Wikipedia Biographies' dataset (Stella, 2021) to quantify the distortions and reduce the bias by 67 percent.

Large Language Models (LLMs) are included in the generative AI as NLP technologies, "pre-trained and trained" on massive text data, and the learning process is "unsupervised or self-supervised" and is considered biased by default (Bender et al., 2021; Ferrara, 2023; Ray, 2023).

The UNESCO analysis (2024) on generative AI reports the existence of regressive gender stereotypes in LLM. Glosh and Caliskan (2023) show how ChatGPT reveals gender bias in assigning job positions and actions to a specific gender.

The studies in LLM technologies attest to gender discrimination in the hiring and education fields (Singh & Ramakrishnan, 2023) and recruiting processes (Dastin J., 2022); finally, Boulamwini and Gebru's (2018) study on computer vision technologies compared three facial recognition applications held by Microsoft, IBM, and Megvii. All three tools have shown gender bias, resulting in less accurate female recognition and an increase in error percentage for darker-skinned females.

2. Data and Methodology

The methodology used in this work is Latent Dirichlet Allocation (LDA), a topic modeling technique helpful in extracting relevant content from the bibliometric data in this literature (see also Drago and Giglio Moro, 2025; Drago, 2024).

In this way, we want to explore more where enterprises must develop resilience, analyze changes, and structure the correct strategies through a new approach (see also Cosentino and Paoloni, 2021).

We considered as Scopus query this one:

"gender discrimination" OR "gender-based discrimination" OR "sex discrimination" OR "gender prejudice" OR "gender bias" OR "sex bias" OR "gender-based bias" OR "sex-based bias" OR "gender inequality" OR "gender inequity" OR "gender-based inequality" OR "gender gap" OR "gender disparity" OR "gender imbalance" OR "algorithmic bias" AND "algorithmic hiring" OR "algorithm-based hiring" OR "AI hiring" OR "AI-driven hiring" OR "AI-based hiring" OR "AI-assisted hiring" OR "algorithmic recruitment" OR "algorithm-based recruitment" OR "AI-driven recruitment" OR "machine learning recruitment" OR "machine learning-based recruitment" OR "automated hiring" OR "automated recruitment" OR "data-driven hiring" OR data-driven AND recruitment.

We have considered just works that meet the criteria to be relevant for the study we are conducting (Odun et al., 2024). The query was performed the day 16/1/2025.

The classical pre-processing techniques was applied considering also different sensitivity checks to compare the different results using different pre-processing techniques (different stemming techniques). In this respect the different words were reduced to considering their specific root forms (stems) allowing for a simplification of the text and a reduction of the dimensionality (the result of the word cloud on word pre-processed in this way are in Figure 2).

3. Results

3.1. LDA analysis

In figure 1 we have found the different recurrent terms in the analysis. Considering a different type of stemming to improve the results.

hiring	algorithmic	bias	artificial	gender	recruitment	fairness	data	intelligence
30	29	28	24	22	21	20	19	17
human	study	performance	potential	process	paper	systems	digital	research
16	16	13	12	11	10	9	9	9
analysis	practices							
9	9							

Figure 1. Frequencies by term identified in the literature

In Figure 2 we can observe the relevant themes in the literature, and in particular we can observe that bias and gender are very relevant concepts which seems relevant and ubiquitous in literature as algorithmic bias, discrimination and fairness. The context is the recruitment bias and at the same time the different AI hiring practices which can be biased. Another relevant element is the importance of the ethics, governance and the regulation.

The methodology used in this work is Latent Dirichlet Allocation (LDA), a topic modeling technique helpful in extracting relevant content from the bibliometric data in this literature (see also Drago and Giglio Moro 2025, Drago 2024).

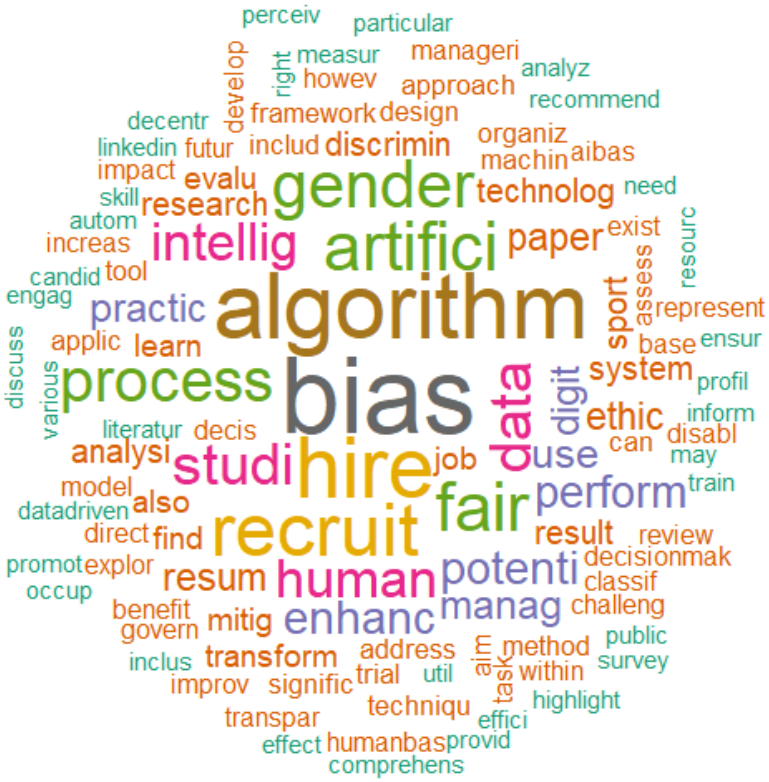

Figure 2. Word cloud depicting the different recurring terms in the literature identified

Then we have considered LDA analysis in which we extracted the top 10 terms for each topic LDA (Figure 3).

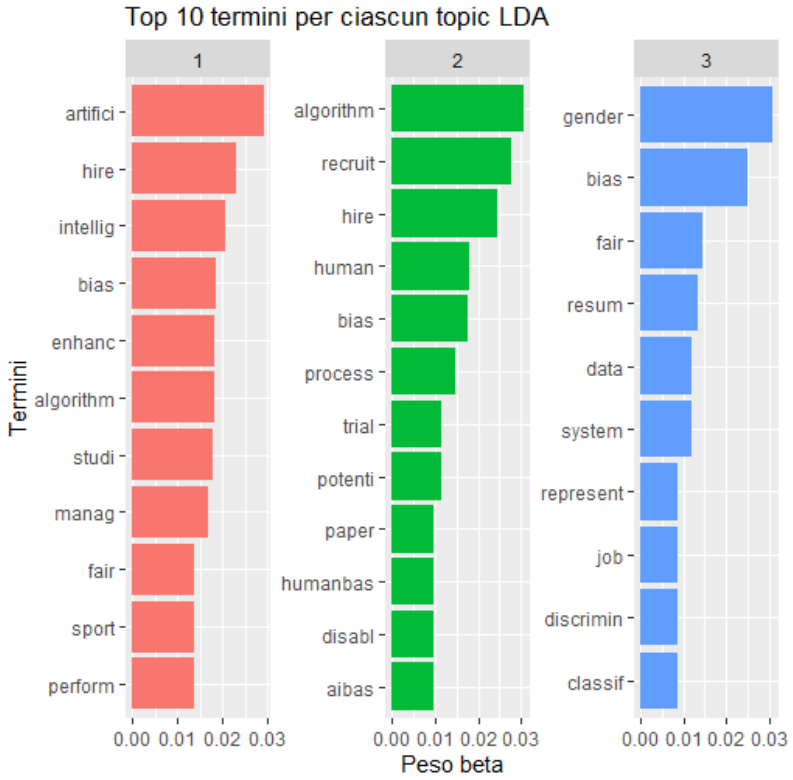

Figure 3. Top 10 terms for each topic LDA

In the first topic, it is possible to observe that the features terms like "artifici" (likely artificial), "hire", "intellig" (likely "intelligence"), "bias", "enhance" (likely "enhancement"), "algorithm", "studi" (likely "studies"), "manag" (likely "management"), "fair", and "perform". Overall these terms consider the theme in literature focusing the use of the artificial intelligence algorithms in the context of hiring.

In this way the different algorithms can have different results, performances and also be more or less "efficient" in the hiring process. On the other side the relevant problem is the "bias" and "fair" which show how in literature there is a relevant attention toward not only the advantages of the use of ai but also on the risks associated on hiring. The second topic contains terms including "algorithm," "recruit," "hire," "human," "bias," "process," "trial," "potenti" (likely "potential"), "paper," "humanbas" (likely "human-based"), and "disabil" (likely "disability").The mention in the terms of "humanbas", but also "disabil" implicate that as topic centers the comparison and also the integration betwenn human and AI in recruitment. In this way the comparison and the analysis is now on human biases versus the algorithmic biases. AI, in this respect, can have a positive or a negative result on the traditional human-based recruitment processes, analyzing more in detail the "fairness" for candidates with disabilities.

The third topic emphasizes terms like "gender," "bias," "fair," "resum" (likely "resume"), "data," "system," "represent," "job," "discrimin" (likely "discrimination"), and "classif" (likely "classification"). This topic address in this way critical issue related gender bias discrimination in AI recruitment. In this respect the word "resum" it is very important: the literature in this way suggests a relevant focus on how the resume-screeing algorithm can reflect and assume biases which are present in historical data. Term like "represent", "system" but also "classif" can indicate a relevant in literature around fairness in representation of the woman, thedata-driven algorithmic discrimination, but also ethical concerns regarding automated classification systems in job

candidate evaluations. In this sense, it is important to consider a relevant trend in literature on how mitigate and deeply understand the biases with aim to promote an equitable recruitment.

3.2. Business Impact

The results observed in paragraph 3.1 are the core data in order to proceed with a deeper analysis in the business implications due to the exploit of the AI and the management of the gender bias.

The starting point is linked to the strategic level in the companies which decide to adopt AI technologies.

The introducing of AI is a top management decision due to a time reducing, cost saving and more profitability could have different spillovers in the business functions and processes.

The Human Resources (HR) department though the AI tools is able to defy new processes related to the following areas:

- Hiring
- Employees evaluations
- Employees training

In recruitment practices has been underlined, in several studies, the presence of the gender bias (Andrews, & Bucher 2022; Drago et al. 2025), for instance, in the CV screenings, in the assignment of scores to the universities attended by women candidates and to pre-hire tests made by NLP systems (Albaroudi et al., 2024).

For the employee's evaluations, the AI tools, according to Koskinen and Sandberg (2017), provide gender based performance and wage disparities. In addition, for the employees training, the use of AI, can reduce the gender bias through the adoption of clear and objective criteria or could expand it (Albaroudi et al., 2024).

The HR department has a crucial role in the gender bis mitigation with the aim to reduce the employment gap between men and women that, according to the European Institute for Gender Equality Report on the Gender Equality Index 2024, has an estimate economic cost of Eur 370 billion per year.

The middle management in different departments, with the diffusion of generative AI in tools in the organizations have to control and manage the algorithms and the data adopted in the business solutions in order to avoid the gender bias, in addition, have to monitor the availability of the new technologies for the women who don't belong to the IT functions.

The last and major fundamental implications of the AI adoption correlated to the gender bias issue is the change and the improve of the business culture and value.

The ethic and values systems in the organizations are the basic aspects who can reflect all the company's business and beliefs.The crucial role of the gender bias mitigation is the ground of a innovative business with a powerful competitive advantage in order to attract the better employees, clients and suppliers reducing the internal and external conflicts.

4. Conclusions

This work aims to show the analysis in order to evidence the existence of the AI gender bias and his diffusion not only in visual systems but, in addition, in LLM technologies including generative AI.

The objective of this study is to underline how challenging is the path in order to obtain more equality systems. This difficult way is signed by a cultural changing and a major control on the data enclosed in the algorithms. In the Results paragraph of LDA analysis the word "algorithm" is present into the two first topic and linked into the third. As suggest by Cowgill & Tucker (2020), the biased algorithms are divided in two categories each one based on different causes:

Biased algorithmic predictions:

- Unrepresentative training samples: the algorithms could be manipulated by the creators by a statistical discriminations using base assumptions unrepresentative of the environment in which the data are included;
- Mislabeling outcomes in training Sample: the biased evaluation could be produced by humans beliefs and statistical reasons;
- Biased programmers: software engineers are more white, male with high education and salary according to the Bureau of Labor Statistics in 2018 and their approach could be translated into the algorithms, in fact, the biases in the translation tools against women and racial minorities are present in a lot of applications;
- Algorithmic feedback loops: the data can be biased by the feedback loop and the use of algorithmic labels affects the future datasets.

Biased algorithmic objectives:

- Race and gender specific thresholds: the question is linked to the technology fairness and the demographic data that can raise the diversity;
- Spillovers: where appear urgent to create a gender targeting to avoid the discrimination;
- Explore and exploit: it is relevant to create rules that manage the exploring of new and long term exploitation.
- Increasing value or lower costs: the use of algorithms can reduce the price and, contemporary, increase the surplus in transactions. For instance, in candidate selection the use of AI can generate inequality when the firms have not selected their preferences and have distinguishes the adoption of AI for the different candidates.

The existence of gender bias in AI is supported by several studies and in the literature are presents articles who show the impact and the breadth of this issue. Typically, this discrimination is associated with the "men fields" that include job, hobby, competence and so on.

This is the result of the cultural feelings and beliefs but the introducing of the ethical aspects in AI could mitigate the gender bias through the identification of the discriminations in the algorithms, in the choices made by the software engineers in order to naturalize and equalize or soften the biases (O'Connor & Liu, 2024).

Keywords: Artificial Intelligence; biases; AI bias; Latent Dirichlet Allocation (LDA); topic modeling

Beyond the Concert Hall: Spatial Deconstruction as a Mechanism for Cultural Engagement

Benedetta Lui[1], Chiara Paolino[2]

1. Introduction

This chapter explores the role of space deconstruction as a mechanism for democratizing access to culture, fostering collaboration and exchange between stakeholders and communities and opening new meanings and significance in co-designing and participate cultural experiences.

Building on literature rooted in organizational spaces (Lefebvre; 1991) and stakeholder management (Mainardes et al., 2012; Snis et al., 2021), the research investigates how classical music is redefined when performed outside traditional, institutionalized venues and relocated into unconventional spaces such as public parks, libraries, or peripheral neighborhoods. In doing so, this study highlights how space deconstruction activates processes of participation enhancement, cultural legitimacy reframing, and collaboration building, ultimately shaping a new mechanism of space re-signification for all the actors involved. This study draws on theories of organizational space, such as the practices of appropriation, reappropriation, and dis-appropriation as central to how individuals and groups continuously produce and transform space (Beyes & Holt, 2020; Cnossen & Bencherki, 2019). Especially it focuses on spaces as a place of experience, where meanings and practices' renegotiation can occur (Beyes, 2009; Ratner, 2020)

Extant research in this field has highlighted how new ways to activate spaces might produce new discourses, practices, both subverting and consolidating existing logics and assumptions (Aliberti & Paolino, 2024). However, the processes through which, from space deconstruction, space re-signification can occur and make space itself available to new patterns of action and experience have not yet been investigated. This is particularly true, when spaces are the place of experience of multi-stakeholders and multi-faceted issues (Kuismin et al., 2024) : diverse interests and practices animating such spaces can compete or overlap to defined unexpected ways through which space can be renewed and can renew shared meanings (Cnossen & Stephenson, 2022).

The empirical context of this study is an Italian music organization, anonymized as the "Orchestra" devoted to the democratic and open dissemination of high-quality classical music, and its ecosystem of stakeholders. Data were collected through 22 in-depth interviews with audience members, partners, and organizational staff, field observations, research notes and archival data.

This setting is particularly suitable and meaningful for the research purpose, since cultural organizations must negotiate competing and overlapping expectations when redefining their spaces: cultural spaces are places of aesthetic, artistic, economic, educational, political and social interests (De Molli et al., 2020), where artistic intervention have the potential to illustrate unexplored patterns of interaction and work among its stakeholders (Michels & Steyaert, 2017; Holm & Beyes, 2022).

The findings highlight how the deconstruction of traditional concert spaces generate new mechanisms through which the space of cultural production is re-signified and re-enacted. This re-signification illustrates in the findings how the space for classical music production can be

[1] Ph.D., ECON-08/A, Università Cattolica del Sacro Cuore; benedetta.lui@unicatt.it – corresponding author

[2] Professoressa associata, ECON-08/A, Università Cattolica del Sacro Cuore; chiara.paolino@unicatt.it

renamed, relabeled, and re-reexperienced as a space to break away from traditions, to build unity, to conceive the periphery as central in music production and dissemination. Furthermore, the findings shed light on the mechanisms that shape this opportunity to generate and attribute to meanings to a space, illustrating how stakeholders enact new practices of identity negotiation, of collaboration enlargement, of enhancement of music accessibility for all. By staging performances in unconventional venues, the Orchestra, its audience, partners and stakeholders engage in a form of work, where spaces are strategically deconstructed and reassembled to challenge established field structures, foster new audiences, and reshape the cultural field itself.

This study contributes to extant research by illustrating a process model explaining how space re-signification occurs and it is tied to space deconstruction. In such a way, extant knowledge is advanced by clarifying what kind of meaning making processes characterize re-signification (Balogun et al., 2015; Bartunek & Balogun, 2022). In addition, the processes through which stakeholders, with diverse interests and backgrounds converge on re-signification are identified, contribute to illustrate the activities multi-party individuals engage in, when a complex issue of meaning negotiation is at stake. Finally, this study contributes by pinpointing how diverse stakeholders create spaces of encounter where extant logics meet new perspectives, generating collaborative opportunities.

From a management and policy standpoint, implications can be drawn about how space deconstruction broadens access, dismantling the perception of classical cultural genres as an elitist practice and reconfiguring its cultural boundaries. Second, it fosters stronger community belonging by embedding performances in familiar and everyday territories, where repeated interactions strengthen ties between the institution and local residents. By situating music in accessible contexts, outside established concert halls but within lived urban landscapes, the Orchestra create new spaces for dialogue, allowing heterogeneous actors to align around shared cultural experiences.

Deconstructing traditional cultural spaces enables organizations to renegotiate legitimacy, expand participation, and act as mediators between institutional traditions and community needs. In this sense, space becomes both a medium and an outcome of stakeholder engagement: it is appropriated, reappropriated, and transformed through cultural practice, producing new forms of inclusion and collaborative governance.

2. Theoretical background

2.1. Organizational Spatiality in Cultural Contexts

Organizational spaces are defined as "the actual places organizations occupy, such as buildings, office spaces, and factory floors, which represent and embody organizations in the eyes of their stakeholders, be they external (e.g., shareholders or customers) or internal (e.g., employees)" (De Vaujany & Vaast, 2014).

In organization studies, space has progressively moved from being conceived as a static container of activities to being understood as a dynamic and constitutive element of organizing. Earlier managerial and architectural approaches treated space as a neutral backdrop, an objective arrangement of offices, stages, or venues.

The "spatial turn" in the social sciences has challenged this view, showing that space is continuously produced through social practices, power relations, and symbolic interpretations (Lefebvre, 1991; Taylor & Spicer, 2007; Dale & Burrell, 2008).

In this sense, space is something organizations do, not merely something they occupy.

Henri Lefebvre's (1991) triad of spatial practice, representations of space, and spaces of representation remains a foundational analytical lens. It highlights the interplay between how space is physically arranged, conceptually imagined by planners and managers, and emotionally lived by individuals. Within organizations, this triad reveals tensions between designed and experienced space, where everyday appropriation can transform official spatial orders.

Subsequent studies (e.g., de Vaujany et al., 2019) emphasize the performative and political nature of such transformations: spatial configurations materialize hierarchies, enable or restrict participation, and influence how legitimacy is enacted.

From a processual perspective, organizational space is relational, emergent, and contested (Feddersen et al., 2023). It connects people, artefacts, and meanings and is continuously re-made through movement and interactions: a "performative assemblage of subjects, objects, affects, discourses and practices" (Kuismin et al., 2024).

Decisions about where and how to locate activities are thus never neutral but convey ideological and cultural orientations.

Institutional logics become embodied in spatial arrangements, at the conceived, perceived, and lived layers of space, constituting what Preminger and Drori (2017) call spatialized logics.

Through this lens, space is not only a material dimension but also a symbolic and discursive one that shapes how institutional orders are enacted.

Within this framework, unstructured or deconstructed spaces represent a particular form of organizational spatiality that intentionally departs from institutionalized arrangements. Such spaces emerge when organizations relocate their activities beyond formal venues, transforming spatial conventions into arenas for experimentation, inclusion, and relational engagement (Beyes & Holt, 2020). They can be understood as deinstitutionalized organizational spaces, where the absence of formal architecture allows new forms of interaction and meaning making to arise (Bartunek & Balogun, 2022; Cnossen & Stephenson, 2022).

Spatial deconstruction thus becomes a form of "institutional work" which enables field transformation and emergence (Lawrence & Suddaby, 2011; Aliberti & Paolino, 2024): organizations manipulate spatial configurations to challenge established field logics and reconfigure legitimacy. By moving artistic and cultural practices away from "authorized" sites of performance, they open up alternative spaces that mediate between institutional and community domains, fostering new modes of participation and stakeholder engagement (de Vaujany et al., 2019).

In cultural institutions, these dynamics become particularly salient. Concert halls, museums, and theaters are spatial embodiments of cultural legitimacy, often reinforcing boundaries between artists and audiences. When such institutions relocate artistic practices into public or unconventional venues, they engage in a deliberate reframing of organizational space.

Spatial experimentation becomes both a symbolic and practical strategy to democratize access, foster community engagement, and renegotiate the organization's role within the cultural field. Understanding space as an active organizational construct thus provides a crucial lens for analyzing stakeholder engagement in contemporary cultural management.

2.2. Stakeholder engagement in cultural organizations

Stakeholder engagement has become a central concept in the study of cultural and creative organizations, reflecting a broader shift from top-down cultural production to participatory and relational models of value creation (Elsorady, 2018; Bashir & Sawhney, 2021; Snis et al., 2021 Moving beyond instrumental or managerial interpretations, engagement is increasingly conceived as a relational and participatory practice through which diverse actors - artists, audiences, partners, and local institutions- co-construct cultural meaning and organizational identity (Freeman, 2010; Giorgino, 2016). In the cultural field, engagement thus extends beyond transactional exchanges to include affective, symbolic, and spatial dimensions of participation, rooted in reciprocity and dialogue.

Following the contribution of Bonet and Donato (2011), the 2008 financial crisis revealed the limitations of hierarchical governance models and underscored the need for participatory and transparent decision-making processes. Engaging heterogeneous stakeholders becomes a strategic and ethical imperative, fostering institutional resilience and social relevance. Empirical studies

have further shown that participatory arts and heritage projects operate as arenas of co-creation, where community members move from passive consumers to active contributors (Carey & Sutton, 2004; Aas et al., 2005).

Recent work situates these dynamics within the spatial turn of organizational studies: engagement unfolds through spatial and relational practices that enable interaction and shared authorship (de Molli & Vecco, 2021). Festivals, open performances, and community events act as spaces, where artistic, aesthetic, social, and institutional logics converge (Lampel & Meyer, 2008; De Molli et al., 2020; Chang, 2020). In this sense, stakeholder engagement is not a procedural or managerial task, but a generative process through which cultural organizations negotiate legitimacy, foster inclusion, and co-create value. By establishing temporary arenas, such as festivals, open performances, and community events, these organizations enable heterogeneous actors to interact and collaboratively redefine what counts as legitimate cultural participation. Engagement thus unfolds as a spatial and relational practice that binds artistic creation to social dialogue and institutional transformation.

Building on these premises, this study brings together two complementary streams of literature: the spatial turn in organizational studies and the relational turn in stakeholder theory. While the former highlights how space constitutes a dynamic and contested element of organizing, the latter emphasizes the co-production of value and legitimacy through participatory and dialogic practices. Yet, research has rarely examined how spatial configurations themselves function as mechanisms of stakeholder engagement, particularly within the cultural field.

In this study, space is not treated as a neutral backdrop for participation but as an active organizational medium through which relationships are shaped, meanings negotiated, and boundaries redefined. By focusing on the deconstruction of traditional cultural venues and the relocation of artistic practices into unconventional spaces, the paper explores how spatial reconfiguration enables organizations to foster inclusion, renegotiate legitimacy, and mediate among heterogeneous stakeholders. In doing so, it seeks to illuminate the generative interplay between space, participation, and institutional transformation in contemporary cultural organizations.

3. Methodology

3.1. Research context

The empirical setting of the present study is an Italian innovative music organization, (anonymized by the authors as the 'Orchestra') founded in 2018 as a project-based, flexible orchestra, recognized as an "instrumental ensemble" by the Italian Ministry of Culture's General Direction of Performing Arts, with the mission of spreading the value of music by fostering artistic innovation and intergenerational collaboration, pursuing a non-traditional way of making music.

This setting was selected due to its peculiar organizational model, mission and structure: the formation of the ensemble is newly composed each time to fit the characteristics of the project, depending on the specialization of the musicians as related to the specific format and program of the event. To achieve the highest artistic excellence, the Artistic Director of the Orchestra chooses the suitable musicians for the occasion from a rich and diversified set of professionals, which brings together established first-chair musicians, active in the most relevant Italian and international orchestras, alongside excellent emerging talents. Mixing different levels of expertise, backgrounds and specializations, this organization represents a flexible, innovative and creative context for expert musicians to play in, as well as a prestigious stage, rich of opportunities, for young professionals. In addition, the Orchestra holds a strong territorial presence thanks to repeated participations in many relevant festivals and projects around Italy.

Besides its artistic excellence, this music organization was selected as a remarkable empirical setting to shed light on the topics of space deconstruction as a mechanism for leveraging

stakeholder engagement due to its strong social outreach dimension. Indeed, the Orchestra pursues an innovative approach with the public, who is meaningfully engaged in every activity of the orchestra. Prioritizing an open and democratic dialogue with audiences, the Orchestra organizes programs specifically dedicated to the active involvement of diverse publics and communities, playing in the public parks and libraries, especially in the cities' neighborhoods and in the peripheral and liminal metropolitan areas.

It is precisely in the context of the 2025 edition of the Orchestra Summer Festival that the data for this study was collected. Yearly since 2021, the Festival is set in non-conventional venues, usually public spaces, each year in a different district of an Italian city with the aim of reaching each time a new community, of activating various and less-centered areas of the city, and of engaging multiple stakeholders. In its conception, organization, planning, and implementation, the Summer Festival involves other music and cultural organizations of the territory, creating a strong and capillary connection with the district's community.

The festival lasts for a few days, when the Orchestra spreads the beauty of music through concerts, open rehearsals, readings, and lectures, inhabiting the spaces of the neighborhoods with the belief that music and culture in general have the power to make them centers of participation and social enrichment. By transforming everyday places in unusual stages, the Summer Festival strives for bringing people of all ages closer to classical music, meant as a driver of social cohesion and development. The festival was organized thanks to a wide network of partners: public, private, and non-profit entities that inhabit the district daily or that bring a specific and enriching contribution on its cultural proposal.

About the Festival, The Orchestra's President, said: "Now in its fifth year, the project has become a well-established initiative for our city, and citizens have embraced our mission: bringing musical culture in all its forms to the public, as both a tool for knowledge and a source of enjoyment. The success of previous editions, together with the enthusiasm of our local partners, encourages us to do even more in the future."

3.2. Data collection

The qualitative research conducted for the present study was performed through a four-source data collection, including semi-structured interviews, field observations, and archival data, and related research notes. Interviews were transcribed accounting for 120 pages. During and after field observation, meeting and informal discussions, two of the authors took research notes (accounting for 8 pages), 15 pictures and 8 videos.

Semi-structured interviews: After defining the research goals of the study, an interview protocol was developed to build the semi-structured interviews to be conducted during the Orchestra's Summer Festival. When considering the process to build the protocol, a predetermined set of open-ended questions was defined, to allow new queries to emerge from the natural dialogue between the interviewer and the interviewee (DiCicco-Bloom & Crabtree, 2006).

The interview protocol was composed by six open-ended questions revolving around the following topics: clarifying the identity and the relationship that each interviewee had with the Orchestra; exploring the cultural significance - the set of historical, social, aesthetic, and symbolic values that make a place or practice meaningful for individuals and communities (Smith, 2006; Jouan & Hallot, 2024) - to understand how different actors perceive the music organization's role, identity, and social value; investigating the perception of inclusion within the cultural proposals of the festival; inquiring about how the unconventional space was impacting the interviewees' cultural experience while listening to the concerts; clarifying the boundaries between the communities involved, the Orchestra and its stakeholders (the business partners and the local institutions).

This approach was adopted to facilitating the induction of lived experiences and subjective meanings through a flexible, yet focused structure. 22 interviews with members of the audience,

the Orchestra's staff and Board and its stakeholders were collected, both in person and online, between June and August 2025, during the concerts of the festival and during a visit to the Orchestra's headquarters. Table 1 illustrates the features of the interviewee in terms of functions, gender, and their role for the festival.

ID	Function	Gender	Role
Audience			
1	Audience #1	M	Actor and employee of a theatre
2	Audience #2	F	Student of a Master course promoted by one of The Orchestra's partners
3	Audience #3	M	Student of a Master course promoted by one of The Orchestra's partners
4	Audience #4	M	Music amateur, friends with one of The Orchestra's musicians
5	Audience #5	M	Music amateur
6	Audience #6	F	Music amateur
Partners			
7	Business partner #1	M	Content Director for a business partner
8	Cultural administrator	M	President of the Cultural Commission of a partner (territorial public body)
9	Business partner #2	M	CEO, Artistic and Technical Director of a business partner
10	Business partner #3	F	PR manager, employee of one of The Orchestra's partners
11	Business partner #4	F	Communication specialist and employee of a firm that collaborates with The Orchestra
The Orchestra's staff			
12	Staff #1	M	Founder and president
13	Staff #2	M	Artistic director
14	Staff#3	F	Head of production
15	Staff #4	F	Head of organization
16	Staff#5	F	Junior production assistant
17	Staff#6	F	Head of media and communication
18	Staff#7	F	The Orchestra's musician (soprano)
19	Staff#8	M	The Orchestra's musician (pianist)
20	Staff#9	M	The Orchestra's musician (cellist)
21	Staff#10	M	The Orchestra's musician (cellist)

22	Staff#11	F	The Orchestra's musician (cellist)

Table 1. Dataset of the interviewees

Field observations: the dataset of the study included repeated field observations carried out by the first author at the Festival venues and Orchestra headquarters. When at the festival, the author arrived one hour before each concert, stayed during the concert, and another hour after that while the staff was dismantling the setting for the concert, allowing the "unconventional space" created for the performance to return to its "everyday appearance". Interactions and discourses among individuals, spaces and humans, spaces and artistic performance and performers, were at the center of the observation, together with features of the spaces themselves and all the processes surrounding them. Field observation was also carried out, while visiting the offices of the Orchestra's staff. Overall, field observation amounts to 15 hours. The Orchestra staff were aware of the presence of the author on the site of a concert, while other actors could have interacted with them by chance (i.e., sporadic meetings with passengers at the venue). If interviews were carried out on the site of the concert, the interviewee was always made aware of the research goal, process, responsibility, and all the steps for guaranteeing anonymity, confidentiality and opportunity to withdraw were granted, as for all the other interviews.

Archival data: the overall dataset was corroborated through the collection of archival data, including online and print national and international articles, magazines, social media content (posts and stories), and audiovisual materials.

Research notes: research notes were taken (and eventually transcribed) by one of the authors during field observations, specifically on three concerts in summer 2025, where notes were taken before, during and after the concerts; notes were also taken after each interview the sample described above.

3.3. Data analysis

The data collected from all sources, interviews, field observations, archival data, and notes, were treated as a single, integrated dataset. To investigate the process through which the redefinition of space, labelled by the authors 're-signification of space', unfolds, a qualitative analysis was conducted by adopting the Gioia methodology (Gioia et al., 2013), using a bottom-up, inductive and interpretative approach that allowed process theorizing (Yanow & Schwartz-Shea, 2014; Rouse et al., 2025).

This structured data-to-theory approach allows researchers to remain grounded in participants' voices while progressively building conceptual frameworks that are both empirically faithful and theoretically robust, according to the authors of this specific coding process, engaging in a continuous exchange between the themes and the guiding theories, so as to arrive at more abstract concepts and their relationships (Langley et al., 2013). In the present study, the analytical focus was intentionally focused on data exemplars, that were represented by quotes from the interviews, without additional elaboration. This choice allowed to preserve proximity to participants' voices, while still engaging in a structured abstraction process represented by first and second-order themes. This approach was chosen because it captures the experiences, subjectivities, and meanings of the actors involved, while also enabling the identification of broader theoretical patterns in the process of space re-signification.

The analysis followed three iterative steps, where the different sub-dimensions of the codes and the codes themselves unveiled progressively.

First step: in the initial phase of the analysis, an open coding of all the interviews' transcripts, field notes from the researchers, and archival materials , was conducted, remaining close to the participants' words and meanings. At this stage, field observations were particularly helpful in clarifying roles, feelings of inclusion, and the expectations of the various actors involved. This

phase allowed the researchers to clarify and cluster the recurrent themes emerging from the interviews (Braun & Clarke, 2012), producing a large number of first-order codes, which were mapped into different areas according to the questions of the interview protocols.

Second step: the second stage focused on identifying second-order themes, the three mechanisms emerging from the grouping of the first-order codes: 'negotiating identity', 'broadening access' and 'building collaboration'. At this stage, to classify the codes from smaller data units, interviews were attentively matched with research notes and archival data from the music concerts, to ensure a consistent interpretation of the findings.

Third step: the final stage involved moving from descriptive coding to theoretical abstraction, through the investigation of the relationship between the mechanisms emerged in in relation to the research question of the study. The iterative analytical process sought to reach a level of theoretical integration where the relationships among key mechanisms activated could be clearly articulated and visually mapped. The three mechanisms were further integrated into a process model (Rouse et al., 2025) illustrating how spatial deconstruction operates as a trigger for the re-signification of space that represents the interpretive outcome of the process (see Figure 1).

To enhance the robustness of the findings, methodological triangulation was adopted (Denzin, 2012), integrating evidence from interviews, providing individual perspectives and personal narratives; from field observations, offering insights into behaviors, interactions, and atmospheres during the Festival and within The Orchestra's headquarters; from archival data, supplying contextual information on The Orchestra's positioning and audience engagement strategies. This multi-source approach enabled a comprehensive understanding of how spatial practices, organizational processes, and stakeholder interactions converge in giving new meanings to a cultural space which is unconventional and de-structured.

4. Findings

This research investigates how the deconstruction of space operates as a mechanism for fostering stakeholder engagement through the experimentation and re-signification of spatial meanings. The findings reveal that spatial re-signification, that is, the process through which a venue is endowed with new meanings and identities, is triggered by the deconstruction of space, giving rise to three interrelated mechanisms: negotiating identity, broadening access, and building collaboration (Figure 1).

Figure 1. The process of space re-signification

Through spatial re-signification, the organization bridges diverse interests and needs, creating shared arenas where artistic, social, and institutional purposes converge to generate cultural value.

The following sections unpack this process by analyzing each of the three mechanisms in turn: first, identity negotiation; second, broadening access; and third, building collaboration.

4.1. Negotiating identity

Spatial deconstruction functions as a trigger that unleashes the first mechanism in the process: Orchestra's identity negotiation.

By organizing and participating in concerts, talks, and immersive experiences held in unconventional spaces, the various stakeholders engage in a continuous process of renegotiating the Orchestra's identity and its cultural positioning. Rather than imposing cultural offerings from above, this process is characterized by dialogue, reciprocity, and co-creation, through which diverse actors collectively shape the meanings, purposes, and values of the organization. In this sense, spatial deconstruction enables a negotiation of identity from a fixed attribute into an evolving and relational construct.

The sub-mechanism through which this negotiation unfolds, activated by spatial deconstruction, are summarized in Table 2.

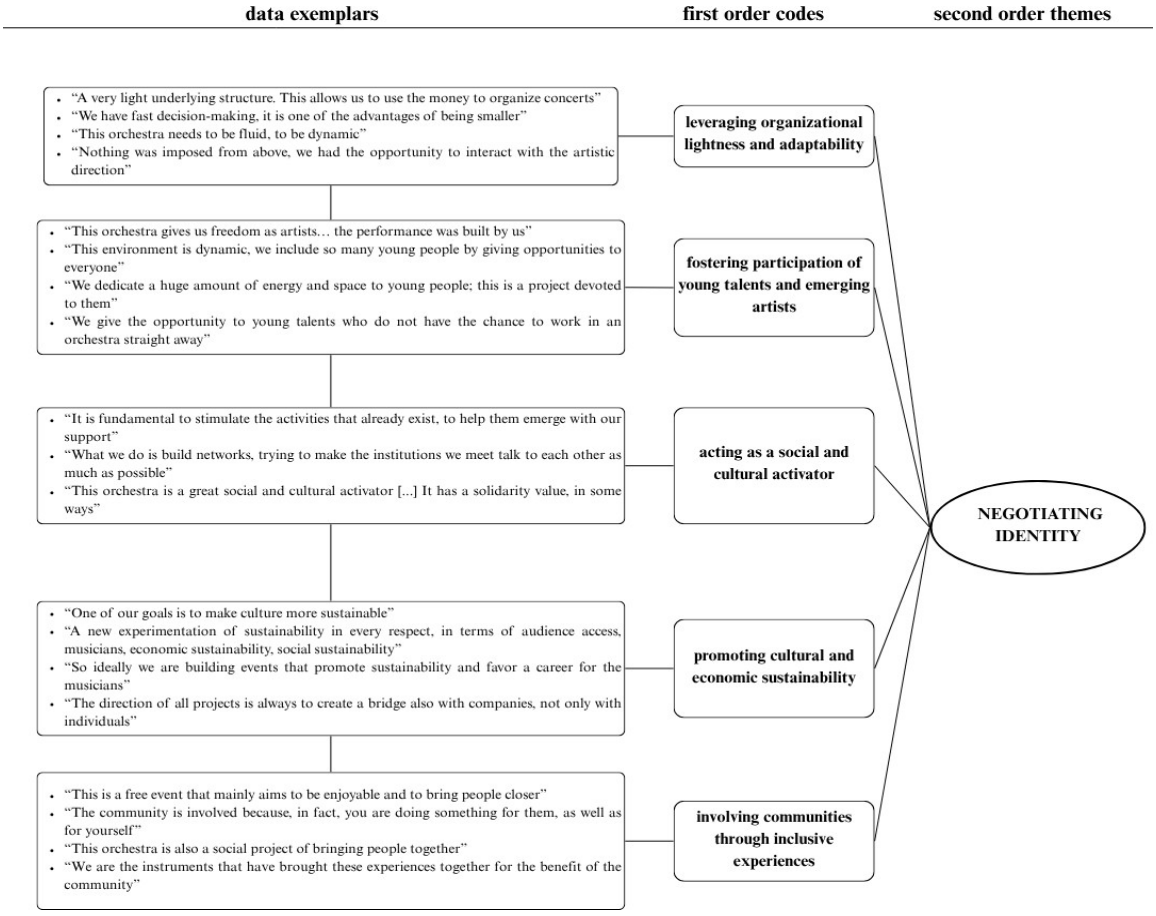

Table 2. Negotiating identity

The organization operates through a lean and adaptive structure, which allows rapid decision-making, creativity, and shared participation among members. This openness fosters collaboration, reflexivity, and responsiveness to contextual needs: We have fast decision-making; it is one of the advantages of being smaller. (Staff #3)

Such participatory dynamics extend to artistic and strategic decisions, which are discussed collaboratively among team members, musicians, and external stakeholders. Rather than following a top-down model, programming and artistic direction emerge through processes of dialogue and co-creation: Nothing was imposed from above; we had the opportunity to interact with the artistic direction. (Staff #8)

Identity negotiation is also enacted through support for emerging musicians, whose integration into professional contexts reinforces the organization's role as an enabler of talent and cultural renewal. By connecting young performers with established artists, mentoring relationships are created that expand both artistic and social capital: We dedicate a huge amount of energy and space to young people; this is a project devoted to them. (Staff #2)

At the same time, the organization acts as a social and cultural activator, fostering inclusive cultural experiences that combine artistic excellence with social awareness: This orchestra is a great social and cultural activator [...] It has a solidarity value, in some ways. (Staff #7)

This mediating role is sustained by a flexible and network-oriented model that encourages collaboration among institutions, partners, and community actors. Initiatives are designed to facilitate dialogue, strengthen territorial networks, and promote shared responsibility for cultural creation: What we do is build networks, trying to make the institutions we meet talk to each other as much as possible. (Staff #4)

Finally, this process of identity negotiation is closely tied to the sustainability of cultural engagement. By avoiding the fixed costs of traditional venues, resources are reallocated to increase accessibility and inclusion, while fostering emotional and social connections with communities. This is a peculiar and unusual identity trait of the music organization, affecting with this feature also its partners, musicians, members of the audience and communities.

A new experimentation of sustainability in every respect, in terms of audience access, musicians, economic sustainability, social sustainability. (Staff #8)

The community is involved because, in fact, you are doing something for them, as well as for yourself. (Staff #6)

Through these intertwined practices, spatial deconstruction enables a continuous redefinition of the Orchestra's identity, organizational, cultural, and social, anchored in openness, collaboration, and relational engagement.

4.2. Broadening access

Spatial deconstruction triggers a second mechanism in the process of re-signifying space: broadening access. As summarized in Table 3, the coding identifies a set of interrelated practices and expectations through which stakeholders experience and enact increased access when concerts are moved outside conventional venues. When those events unfold in unconventional and everyday spaces, they challenge existing hierarchies of participation and open new pathways for inclusion.

By expanding the spatial and symbolic boundaries of cultural experiences, stakeholders collectively contribute to making artistic practices more accessible, participatory, and socially embedded.

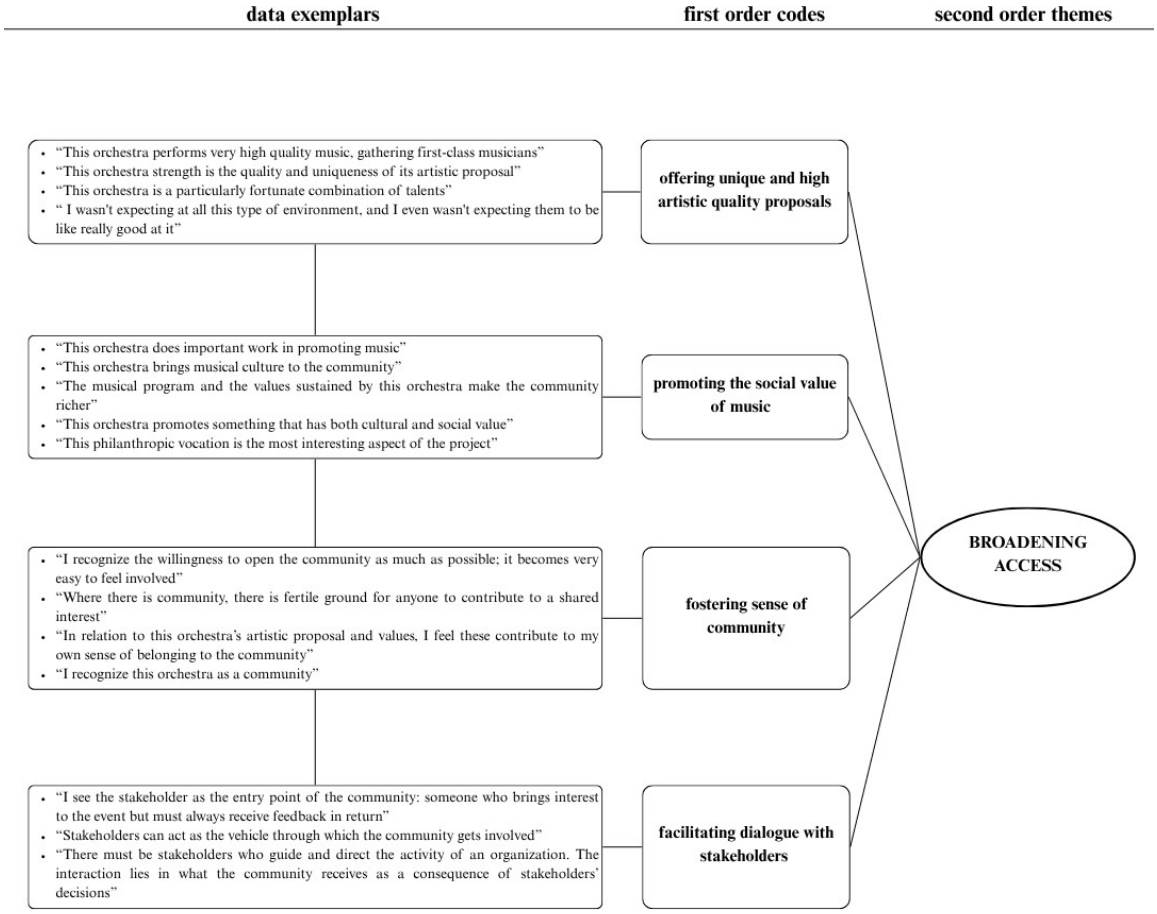

Table 3. Broadening access

This mechanism captures how the relocation of cultural practices into non-traditional spaces transforms both the nature of participation and the relationships among actors. Spaces that depart from institutionalized ones, invite new audiences, partners, and community members to take part in meaning-making, creating shared arenas for dialogue, experimentation, and co-creation of high-quality cultural proposals.

The Orchestra's strength is the quality of its artistic proposal. (Audience #2)

High artistic quality remains a central driver of engagement: participants recognize that excellence and accessibility can be mutually reinforcing. At the same time, reconfiguring spatial boundaries allow culture to move closer to communities.

This orchestra's strength is the uniqueness of its proposal. (Audience #4)

The Orchestra brings musical culture to the community. (Audience #6)

Broadening access also entails social value and community empowerment. Events in familiar places are perceived as catalysts for local enrichment:

The Orchestra promotes something that has both cultural and social value. (Audience #1) The musical program and the values sustained by The Orchestra, in my opinion,

make the community richer. (Audience #5)

Access thus extends beyond physical or economic inclusion to encompass participatory engagement: stakeholders co-design programs, influence cultural directions, and develop a sense of belonging.

In relation to The Orchestra's artistic proposal and values, I feel these contribute to my own sense of belonging to the community. (Audience #3)

Finally, spatial deconstruction facilitates relational access via partnerships: institutions, businesses, and community groups act as mediating channels that connect diverse publics and sustain participation, democratizing roles and distributing agency.

Stakeholders can act as the vehicle through which the community gets involved. (Audience #4)

4.3. Building collaboration

Spatial deconstruction also activates a mechanism of building collaboration, through which relationships among the music organization, its partners, and communities are reshaped.

As summarized in Table 4, the findings show how the reconfiguration of space generates new opportunities for interaction, fostering trust, dialogue and cross-boundary engagement in cultural activities among the diverse actors involved.

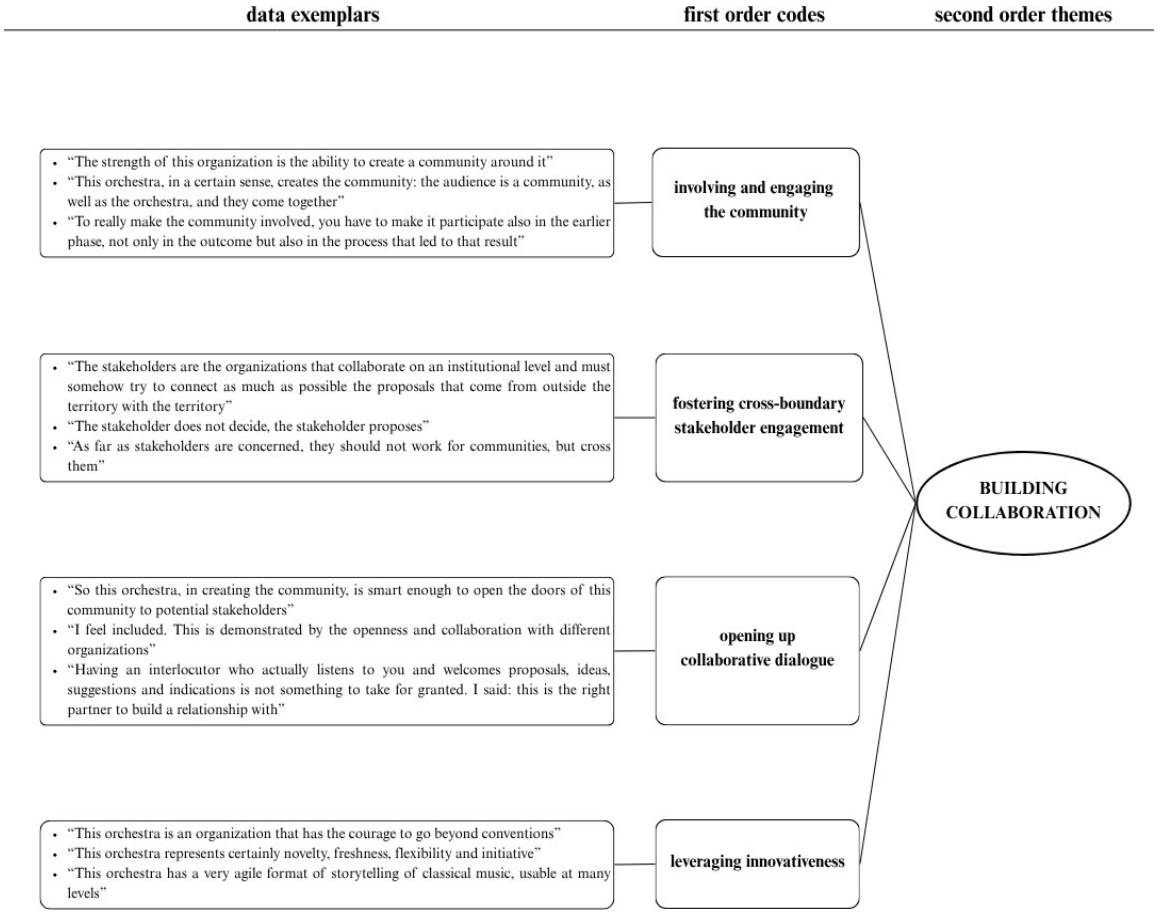

Table 4. Building collaboration

The deconstruction of the space functions as a mediating platform, enabling meaningful engagement with local communities while strengthening cooperation among stakeholders. Events and performances organized in unconventional venues are not merely artistic displays but become relational arenas in which collaboration is initiated, negotiated, and sustained over time.

To really make the community involved, you have to make it participate also in the earlier phase, not only in the outcome but also in the process that led to that result. (Business Partner #1)

The choice of the music concerts' venues plays a critical role in this process. Unstructured or non-traditional spaces foster belonging and shared purpose, inviting both institutional and community actors to engage in co-creative dialogues. Within these spaces, formal hierarchies are flattened, and participants collaborate on equal footing, transforming the event into an arena for collective meaning-making.

As far as stakeholders are concerned, they should not work for communities but cross them. (Cultural Administrator)

These collaborative configurations are perceived as one of the most distinctive outcomes of spatial deconstruction. Stakeholders value openness, reciprocity, and horizontal decision-making, which allow for the co-construction of cultural initiatives that are both socially relevant and contextually grounded.

I feel included. This is demonstrated by the openness and collaboration with different organizations. (Business Partner #2)

Finally, space-driven collaboration is also linked to the innovation of the music proposals. By fostering intersections among institutional logics, artistic and aesthetic experimentation, and social inclusion, the rethinking of performance spaces allows new partnerships and formats to emerge.

The Orchestra is certainly novelty, freshness, flexibility, and initiative. (Business Partner #1)

4.4. Re-signifying cultural spaces

The final mechanism emerging from the analysis represents the outcome of the overall process activated by spatial deconstruction: the re-signification of cultural spaces.

This mechanism materializes when the three dynamics of 'negotiating identity', 'broadening access', and 'building collaboration' intersect and reinforce one another, giving rise to new meanings, uses, and interpretations of space where the cultural performances take place. Through this process, space is no longer a passive backdrop for cultural activity but becomes a symbolic and relational medium through which legitimacy, participation, mutual exchange and collaboration are enacted.

As summarized in Table 5, spatial re-signification unfolds through five interconnected practices: breaking away from traditional venues; democratizing and disseminating classical music; building place-based communities; claiming peripheral and accessible spaces; and widening and educating audiences.

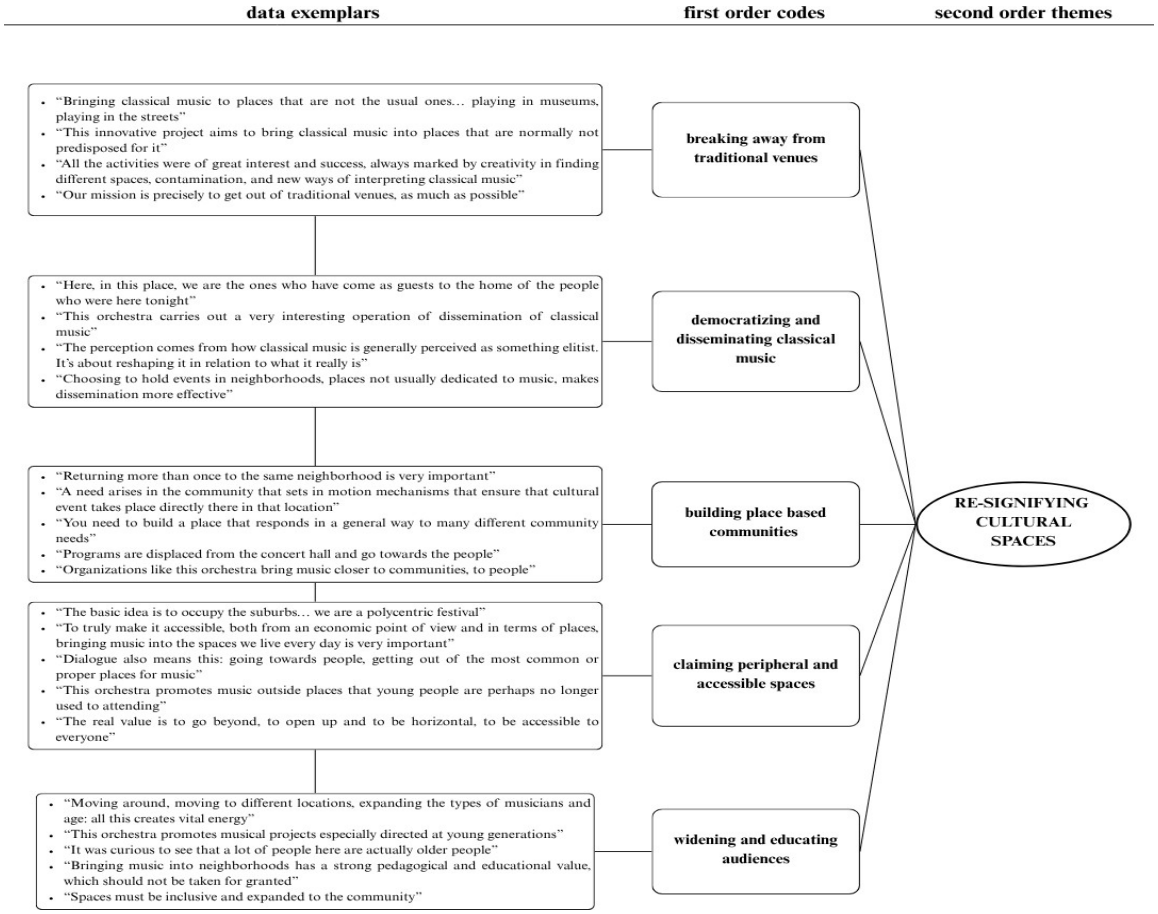

Table 5. Re-signifying spaces

Our mission is precisely to get out of traditional venues, as much as possible. (Staff #1).

All the activities were of great interest and success, always marked by creativity in finding different spaces, contamination, and new ways of interpreting classical music. (Audience #3).

By moving performances into unconventional settings like streets, parks, galleries, and libraries, the music organization and its stakeholders jointly challenge the symbolic hierarchies of classical music and its association with elitist "temples of culture."

Spatial transformation thus becomes a vehicle for democratization and dissemination, enabling broader and more diverse participation and redefining who can access and contribute to cultural life.

The perception comes from how classical music is generally seen as something elitist. It's about reshaping it in relation to what it really is. (Staff #2)

Here, in this place, we are the ones who have come as guests to the home of the people who were here tonight. (Staff #11).

This process also fosters the emergence of place-based communities. By decentralizing performances and returning repeatedly to the same neighborhoods, cultural actors build trust, nurture belonging, and co-produce meaning with local audiences, shaping smaller but loyal communities of classical music amateurs.

You need to build a place that responds in a general way to many different community needs. (Staff #5).

Choosing to hold events in neighborhoods, places not usually dedicated to music, makes dissemination more effective. (Audience #5).

Moreover, spatial deconstruction removes both economic and symbolic barriers that traditionally limit cultural participation. Free or low-cost concerts, held in accessible community-oriented spaces, contribute to inclusion and expand the reach of classical music.

The real value is to go beyond, to open up and to be horizontal, to be accessible to everyone. (Business Partner #2).

Finally, re-signification involves an educational and intergenerational dimension. By engaging young musicians, elderly participants, and marginalized communities, cultural initiatives turn spaces into arenas of learning, dialogue, education and shared creativity.

This orchestra promotes musical projects especially directed at young generations. (Audience #3)

Moving around, moving to different locations, expanding the types of musicians and age: all this creates vital energy. (Cultural Administrator)

In sum, re-signifying space represents the final mechanisms activated by the process triggered by spatial deconstruction, where the three mechanisms previously presented converge. It encapsulates the transformation of cultural venues into shared, participatory, and meaningful environments: spaces where institutional and community boundaries dissolve, allowing new cultural meanings and new forms of engagement to emerge.

5. Discussion and conclusions

This study set out to explore how the deconstruction of space operates as a mechanism for stakeholder engagement within cultural organizations. Building on theories of organizational space (Lefebvre, 1991; Taylor & Spicer, 2007; de Vaujany & Vaast, 2014) and stakeholder engagement (Mainardes et al., 2012; Giorgino, 2016, Reypens et al., 2021; Snis et al.,2021), our research examined how spatial reconfiguration reshapes the relationships among a cultural institution, its partners, and its audiences. Rather than treating space as a static background for cultural activity, we approached it as a dynamic site of meaning-making (Maitlis et al., 2013; Bartunek & Balogun, 2022) where organizational identity, collaboration, and participation are continuously re-negotiated.

Across all stakeholder groups, spatial deconstruction emerges as a shared interpretive frame, a way of rethinking how cultural experiences are produced, accessed, and valued (Beyes & Steyaert, 2011). Deconstructing space activates a process of identity negotiation, when looking at the Orchestra: by performing outside traditional venues, the institution challenges established logics of legitimacy and redefines what it means to be a classical orchestra. Spatial deconstruction translates into expanding participation, fostering accessibility, empowerment, and co-creation with the audience, in places closer to everyday life. It enables collaborative engagement, opening up new forms of institutional mediation and joint cultural production for the partners involved in cultural production.

Spatial deconstruction thus acts not merely as a physical relocation, but as a semantic and relational transformation (Slavich et al., 2020) a way of assigning new meanings (Thomas et al., 2011), identities (Glynn, 2000), and values (Preminger & Drori, 2016) to space. This study contributed to shed light on this re-signification, illustrating how it is a process to discuss, debate, and soften traditional hierarchies among stakeholders, allowing for horizontal exchanges, reciprocal learning, and shared control. This intersection embodies what can be understood as a form of spatial institutional work (Lawrence & Suddaby, 2011; de Vaujany et al., 2019), where actors collaboratively reshape the material and symbolic dimensions of their field to foster inclusion, dialogue, and cultural sustainability. Ultimately, our findings suggest that to deconstruct space shapes its re-signification and illustrate the features and the processes underlying this renewed meaning making process. By challenging the physical and institutional boundaries of where a practice, classical music in our case, “should” happen, stakeholders generate new forms of engagement, collaboration, and negotiation. Spatial deconstruction

therefore operates as both a strategy of organizational renewal and a relational catalyst for community-based cultural value creation.

For practitioners and cultural managers, these findings highlight the strategic potential of spatial experimentation as a lever for engagement and legitimacy. By consciously deconstructing and re-signifying performance spaces, cultural organizations can democratize access, strengthen cross-sector collaboration, and reposition themselves as facilitators of social cohesion rather than as gatekeepers of high culture. Spatial strategies should therefore be conceived not as logistical or aesthetic choices, but as relational practices and tools for cultivating trust, fostering inclusion, and sustaining shared cultural ecosystems in an increasingly fluid and participatory cultural landscape.

Keywords: Spatial deconstruction; space re-signification; organizational space; stakeholder engagement; cultural organizations; meaning-making processes

Le carriere manageriali apicali negli atenei italiani: un'analisi di genere

Alessia Sammarra[1], Manuela Paolini[2]

1. Introduzione

In Italia, le università statali hanno attraversato un progressivo processo riformatore che affonda le sue radici nelle logiche di aziendalizzazione e managerializzazione proprie del New Public Management. Tra le innovazioni più rilevanti, volte a promuovere un modello di governance universitaria orientato ai risultati e alla valutazione delle performance, la Legge 240/2010, nota come 'riforma Gelmini', ha introdotto la figura del Direttore Generale (DG). Con questa scelta il legislatore ha segnato un deciso rafforzamento della dimensione manageriale degli atenei, attribuendo al DG un ruolo centrale nei processi decisionali e nell'attuazione degli indirizzi strategici.

Comprendere come si arrivi a ricoprire questo ruolo diventa essenziale per cogliere gli effetti di tali riforme su dinamiche di carriera e modelli di governance nel sistema universitario. Tale analisi diventa ancora più significativa se letta nella prospettiva di genere. Infatti, analogamente a quanto osservato in altri comparti del settore pubblico e in continuità con le evidenze del settore privato, nelle università persistono barriere culturali e strutturali che ostacolano il raggiungimento dei ruoli apicali da parte delle donne, nonostante le politiche di promozione della parità di genere adottate negli ultimi anni. Sebbene in Europa sia stata in larga misura raggiunta la parità di genere a livello di dottorato, le donne occupano solo il 30% delle posizioni accademiche senior e appena il 26% dei ruoli di leadership alla guida delle istituzioni di istruzione superiore (Commissione Europea, 2025, p. 13).

La ricerca esistente si è concentrata principalmente sulle carriere del personale docente (cfr., Drake e Svenkerud, 2023; Howe-Walsh e Turnbull, 2016; Śliwa et al., 2024), lasciando in ombra quelle del personale amministrativo e, in particolare, i percorsi di carriera che conducono alla Direzione Generale delle università. Rimangono, così, poco esplorati i tempi, le modalità e i fattori organizzativi che caratterizzano il percorso che conduce a raggiungere questo ruolo, nonché le eventuali differenze fra uomini e donne.

Il presente studio si propone, quindi, di analizzare come e in che misura le differenze di genere condizionino la durata e le tipologie di percorsi di carriera dei DG delle università, e quale sia il ruolo delle caratteristiche di ciascun ateneo nell'influenzare tali percorsi.

A tale scopo, è in corso uno studio empirico sulla popolazione dei DG delle 61 università pubbliche italiane, con l'obiettivo di offrire un contributo originale alla ricerca sulle carriere manageriali nel settore pubblico, un ambito ancora poco sviluppato nonostante la sua grande rilevanza (Huang e Villadsen, 2023). La qualità della leadership amministrativa in queste posizioni è infatti cruciale per la performance complessiva del sistema universitario pubblico, che rappresenta una componente strategica della pubblica amministrazione dei Paesi avanzati. I risultati dello studio forniranno nuove evidenze su come le trasformazioni istituzionali ispirate al New Public Management si intreccino con le dinamiche di genere nel plasmare i percorsi di carriera che conducono alle posizioni manageriali apicali nelle università italiane.

2. Quadro teorico

2.1. Riforma universitaria e trasformazione delle carriere amministrative apicali in Italia

A partire dagli anni Novanta, il sistema universitario italiano ha vissuto un profondo processo di riforma, guidato dall'adozione dei principi del New Public Management, che ha progressivamente ridefinito la governance, l'accountability e l'organizzazione delle università pubbliche. Le riforme, culminate nella Legge 240/2010 (c.d. 'riforma Gelmini'), hanno promosso un modello di gestione degli atenei orientato all'efficienza, alla performance e alla competizione tra le università, in linea con le trasformazioni osservate nelle amministrazioni pubbliche a livello europeo (Facchini e Fia, 2021).

La letteratura si è concentrata principalmente sugli effetti di tali riforme sulle carriere del personale docente, analizzando le valutazioni, la mobilità accademica, l'internazionalizzazione e le nuove condizioni di lavoro prodotte dai dispositivi di governance basati sulla performance (Rostan, 2010; Abramo et al., 2015; Facchini e Fia, 2021b). Molto meno indagato risulta, invece, l'impatto di tali cambiamenti sul personale tecnico-amministrativo, nonostante esso costituisca una componente cruciale dei processi di gestione e coordinamento delle attività universitarie.

In particolare, la figura del DG, introdotta proprio dalla riforma Gelmini per sostituire il precedente Direttore Amministrativo, rappresenta un osservatorio privilegiato per comprendere come la managerializzazione dell'università stia rimodellando le carriere amministrative, le competenze richieste nei ruoli apicali e le dinamiche di selezione delle élite amministrative interne agli atenei.

A differenza del precedente Direttore Amministrativo, l'incarico di DG prevede un mandato a termine ed è conferito dal CdA, su proposta del Rettore e previo parere del Senato Accademico. Il DG è responsabile, sulla base degli indirizzi del CdA, della gestione e organizzazione dei servizi, delle risorse strumentali e del personale tecnico-amministrativo, nonché della partecipazione alle sedute del CdA senza diritto di voto. In particolare, la riforma Gelmini, nel delineare la figura del DG, introduce importanti implicazioni sul piano della mobilità e della selezione; infatti, il reclutamento può avvenire anche all'esterno dell'ateneo, favorendo così l'ingresso di manager con expertise specialistica ('lateral entry'), mentre la progressione interna dipende sempre più dal conseguimento di obiettivi misurabili. Ciò riduce la stabilità dei percorsi di carriera, aumenta la competizione interna e ridefinisce le traiettorie di carriera del personale amministrativo, accentuando le differenze tra coloro che possiedono le competenze manageriali richieste e chi invece proviene da percorsi tradizionali. Questo nuovo contesto dovrebbe avvicinare i percorsi professionali dei dirigenti amministrativi delle università a quelli del settore privato, rendendoli più dinamici, meno vincolati all'anzianità e fortemente legati al possesso di competenze manageriali specifiche, aprendo al contempo le carriere apicali universitarie a professionalità provenienti dall'esterno e rendendo così i confini del settore più permeabili.

Un aspetto ancora poco esplorato riguarda le implicazioni di queste trasformazioni sulle differenze di genere. La letteratura evidenzia come l'evoluzione verso modelli di carriera più flessibili, basati su performance e competenze manageriali, possa avere effetti ambivalenti per le donne: da un lato, la valorizzazione delle competenze specifiche e la possibilità di ingresso laterale aprono opportunità per candidate esterne al modello di carriera lineare tradizionale; dall'altro, la ridotta stabilità, la forte competizione interna e la centralizzazione della leadership possono amplificare le barriere strutturali e culturali che limitano l'accesso delle donne alle posizioni apicali (Carli e Eagly, 2016).

2.2. Percorsi di carriera e differenze di genere nei ruoli amministrativi apicali

In questo rinnovato contesto, caratterizzato da una crescente attenzione alle competenze manageriali e alla performance, la teoria del capitale umano (Becker, 1964; 1993) offre un quadro interpretativo utile per analizzare le dinamiche evolutive delle carriere dei DG delle università.

Secondo questa prospettiva, il bagaglio di conoscenze, competenze, ed esperienze costituisce una forma di capitale in grado di influenzare i percorsi di carriera e l'accesso alle posizioni apicali. Tuttavia, numerose ricerche mostrano che il capitale umano non si traduce automaticamente in opportunità di avanzamento lavorativo per uomini e donne in modo simmetrico. Infatti, i ritorni del capitale umano differiscono in base al genere, con penalizzazioni sistematiche per le donne sia in termini di progressione che di valorizzazione delle competenze (Correll, 2004; World Economic Forum, 2024). Le discriminazioni di genere possono incidere sulle traiettorie di carriera, limitando le opportunità di avanzamento professionale delle donne verso posizioni apicali anche in presenza di elevati livelli di qualificazione (Metz e Tharenou, 2001).

Processi di selezione e promozione continuano a essere sovente influenzati da preferenze per i membri dell'ingroup. I decisori tendono infatti a riservare le posizioni più prestigiose ai membri percepiti come più simili, spesso uomini, secondo un meccanismo noto come 'riproduzione omosociale' (Kanter, 1977). La sovra-rappresentazione maschile nei ruoli dirigenziali e negli organi decisionali e di governance contribuisce così a riprodurre asimmetrie che limitano la progressione di carriera delle donne nei ruoli manageriali apicali (Cook e Glass, 2014).

Sebbene la rappresentanza delle donne nei ruoli dirigenziali sia aumentata negli ultimi decenni, queste rimangono ancora sottorappresentate ai livelli più alti della gerarchia in quasi tutti i settori, sia pubblici che privati. Secondo il Rendiconto di genere redatto dall'INPS (2024 pp. 37-40), le donne restano fortemente sottorappresentate nelle posizioni di vertice, che occupano solo per il 20% tanto nel settore privato quanto nel settore pubblico, sebbene in quest'ultimo le donne costituiscano la maggioranza del personale.

La letteratura ha individuato un ampio insieme di barriere interconnesse che contribuiscono alla persistenza del cosiddetto soffitto di cristallo, tra cui le differenze nelle preferenze e negli atteggiamenti di carriera delle donne, gli stereotipi di genere, le difficoltà nel bilanciamento tra responsabilità lavorative e familiari, il limitato accesso a reti di influenza, nonché culture organizzative e pratiche di gestione delle risorse umane connotate dal genere, che impongono alle donne standard più elevati di performance per dimostrare la propria competenza (Ramos et al., 2022). Nel loro insieme, questi fattori intrapersonali, interpersonali, organizzativi e sociali interagiscono in modo sistemico nel determinare disparità retributive, una progressione di carriera più lenta, una maggiore probabilità di occupare posizioni di middle management o ruoli di supporto rispetto agli uomini, una minore rappresentanza nei ruoli apicali (Diehl e Dzubinski, 2016; Lyness e Grotto, 2018; World Economic Forum, 2024).

Alcuni studi suggeriscono, tuttavia, che una maggiore presenza femminile nei ruoli decisionali possa contribuire a ridurre i bias di valutazione e le preferenze di ingroup, favorendo una maggiore equità nei processi di selezione e promozione. L'integrazione delle donne nei centri decisionali e negli organi di governo può attenuare la tendenza degli uomini a preferire candidati dello stesso genere e ridurre i pregiudizi nella valutazione delle candidate (Cook e Christy, 2014).

Nel sistema universitario, che rappresenta una componente importante del settore pubblico, tali dinamiche assumono particola rilevanza. Sebbene il fenomeno delle differenze di genere sia stato studiato ampiamente in relazione alle figure accademiche, resta ancora poco esplorato per il personale amministrativo e, in particolare, per l'accesso ai ruoli apicali come la Direzione Generale. Analizzare l'impatto del genere sulle carriere è, dunque, fondamentale per comprendere i meccanismi che regolano l'accesso ai vertici manageriali del sistema universitario italiano.

3. Obiettivi e domande di ricerca

Sulla base delle considerazioni svolte e delle lacune della letteratura esistente, il presente studio si propone di esplorare le differenze di genere nella durata e nella tipologia dei percorsi di carriera dei DG nelle università pubbliche e i possibili legami tra le caratteristiche organizzative degli atenei e la nomina di una donna alla Direzione Generale. A tal fine, la ricerca intende rispondere alle seguenti domande di ricerca:

RQ1: In che misura si osservano differenze di genere nella durata dei percorsi di carriera che conducono alla posizione di DG nelle università pubbliche italiane?

RQ2: In che modo le carriere che portano alla posizione di DG differiscono tra uomini e donne in relazione alla tipologia di percorso seguito, ad esempio tra carriere prevalentemente interne all'ateneo e carriere caratterizzate da mobilità inter-organizzativa?

RQ3: In che misura le caratteristiche organizzative dell'ateneo (dimensioni, percentuale di donne sul totale del personale, presenza di donne in ruoli di governance) influenzano la probabilità che la direzione generale sia affidata a una donna?

4. Metodologia di ricerca

Al fine di rispondere alle domande di ricerca, lo studio prende in esame l'intera popolazione dei DG delle università pubbliche italiane. Attraverso la consultazione del sito web del Ministero dell'Università e della Ricerca (MUR) sono state individuate tutte le università statali accreditate nell'anno 2025 (n = 61). I DG in carica nell'anno di consultazione ed analisi sono stati identificati consultando il sito web istituzionale di ciascuna università. È interessante notare come le donne rappresentino circa un quarto della popolazione di riferimento, costituendo il 26% dei DG in carica.

Le caratteristiche demografiche dei DG (tra cui genere, età, livello e tipo di istruzione) e dei loro percorsi di carriera (tra cui tipo di carriera – interna versus esterna -, mobilità - funzionale, di settore, di ruolo -, tempo impiegato per raggiungere la posizione di vertice) sono state raccolte dai CV pubblicati nella sezione "Amministrazione trasparente" dei siti web istituzionali delle università. Ove non disponibili, i CV sono stati raccolti dai profili LinkedIn degli stessi DG. Dal sito istituzionale del MUR, inoltre, sono stati raccolti dati secondari sulle caratteristiche degli atenei (area geografica, dimensioni, distribuzione per genere dei dipendenti, presenza delle donne negli organi di governo).

Sulla base dei dati raccolti, lo studio adotta un disegno di ricerca articolato in due fasi analitiche. In una prima fase, vengono condotte analisi descrittive finalizzate a mappare le caratteristiche socio-professionali dei DG e le loro traiettorie di carriera, con particolare attenzione alla durata e alla tipologia dei percorsi, al fine di individuarne pattern ricorrenti, peculiarità e differenze. In una seconda fase, lo studio impiega modelli di regressione per analizzare il ruolo delle caratteristiche organizzative degli atenei nella probabilità di affidare la direzione generale a una donna.

5. Contributo teorico e implicazioni per la pratica

Sotto il profilo teorico, questo studio contribuisce anzitutto alla letteratura sulle carriere nel settore pubblico, un ambito ancora relativamente poco esplorato. La ricerca sulle differenze di genere nei percorsi di carriera verso le posizioni apicali, infatti, si è concentrata prevalentemente sui vertici aziendali (Ackah e Heaton, 2003; Bonet et al., 2020), mentre gli studi dedicati all'accesso delle donne ai ruoli manageriali apicali nelle amministrazioni pubbliche rimangono limitati (McDonald et al., 2005; Cohen e Duberley, 2015; Mouratidou e Grabarski, 2021). Analizzando il percorso di carriera dei DG, il lavoro contribuisce a colmare tale lacuna, offrendo una lettura più articolata delle dinamiche attraverso cui norme organizzative, processi di selezione e modelli di governance possono produrre, riprodurre o attenuare le disuguaglianze di genere nelle carriere amministrative apicali.

Un secondo contributo teorico riguarda la comprensione della carriera come processo sociale situato. La ricerca si colloca nel filone di studi che evidenzia i limiti della decontestualizzazione presente in gran parte della letteratura sulle carriere di matrice psicologica (Cohen e Duberley, 2015). Questo approccio ha privilegiato una prospettiva centrata sull'individuo, concentrandosi sulle risorse personali, competenze, capitale umano, motivazione e strategie di agency, come

determinanti principali del successo professionale. Tuttavia, Spurk e colleghi (2019) evidenziano l'importanza di distinguere tra risorse personali e risorse ambientali, sottolineando come fattori strutturali e contestuali possano influenzare significativamente il successo di carriera e il percorso per raggiungerlo. Le risorse ambientali comprendono elementi quali la dimensione organizzativa, le reti di relazioni, le norme culturali e le politiche istituzionali, che possono facilitare o ostacolare l'accesso a posizioni apicali indipendentemente dalle capacità individuali. Questa distinzione introduce una prospettiva più strutturalista nello studio delle carriere, complementare all'approccio soggettivo tipico della psicologia organizzativa, che si concentra prevalentemente sulle percezioni, le aspirazioni e le scelte individuali. In tale ottica, il contesto organizzativo e sociale non viene più considerato come uno sfondo neutro, ma come un insieme di vincoli e opportunità che modellano le traiettorie professionali e contribuiscono a riprodurre disuguaglianze, in particolare di genere, nella progressione verso ruoli di vertice.

In continuità con questa prospettiva, lo studio mostra come le riforme del sistema universitario italiano e la diffusione dei principi del New Public Management abbiano ridefinito le logiche di avanzamento, i criteri di valutazione e le opportunità di mobilità nei ruoli amministrativi apicali. In tal senso, la ricerca amplia il quadro teorico sulle carriere nel public management, mettendo in luce il ruolo delle trasformazioni istituzionali nella riconfigurazione delle élite amministrative universitarie e nei percorsi professionali che conducono alle posizioni di vertice.

Inoltre, lo studio contribuisce a colmare una lacuna persistente nella letteratura sulle carriere, analizzando le condizioni organizzative a livello macro che, nonostante la loro riconosciuta rilevanza (Ng e Sears, 2017), rimangono tuttora poco esplorate. In particolare, lo studio prende in esame come specifici fattori contestuali, quali la localizzazione geografica, la dimensione organizzativa e la presenza femminile negli organi di governo degli atenei, possano operare come meccanismi abilitanti o, al contrario, come vincoli strutturali nelle carriere apicali delle donne. In questo modo, lo studio si inserisce nel più ampio dibattito sul successo di carriera dei gruppi minoritari storicamente sotto-rappresentati, arricchendo la comprensione delle dinamiche strutturali che modellano le disuguaglianze di carriera (Beigi et al., 2025).

Dal punto di vista pratico, comprendere l'evoluzione delle carriere amministrative apicali consente agli atenei di ripensare le strategie di reclutamento, sviluppo e valorizzazione del capitale manageriale, con particolare attenzione alla promozione dell'accesso delle donne ai ruoli di vertice. Le evidenze emerse offrono indicazioni per progettare percorsi di carriera più trasparenti, competence-centred e coerenti con le nuove esigenze di governance introdotte dalla riforma, favorendo condizioni più eque e inclusive. In questo senso, lo studio supporta la definizione di politiche e pratiche organizzative che contribuiscano agli obiettivi di sostenibilità sociale e di gender equality, rendendo le posizioni apicali non solo più raggiungibili, ma anche più rappresentative.

Inoltre, i risultati possono fungere da guida per i professionisti, e in particolare per le donne, che aspirano alla carica di DG, aiutandoli a individuare le scelte di carriera necessarie per accedere ai ruoli apicali. Lo studio si configura, così, come uno strumento utile non solo per comprendere le trasformazioni in atto, ma anche per orientare politiche di sviluppo manageriale, processi decisionali e interventi di equità di genere nelle università pubbliche.

1. Introduction

Over the past decade, the integration of sustainability into strategic performance management systems (SPMS) has become a central issue in accounting research (Schulte, 2022; Thaher & Jaaron, 2022; Dauerer, 2025). As firms face increasing institutional and stakeholder pressure to align financial performance with sustainability outcomes, ESG is increasingly recognized not merely as a reporting obligation but as a strategic dimension contributing to long term value creation (Adams, 2017). Performance measurement frameworks, historically oriented toward financial and short-term indicators (Pun & White, 2005), are being re-evaluated for their ability to capture the non-financial factors that drive long-term success (Bititci et al., 2012), including environmental impact (Hervani et al., 2005), human capital (Tweedie et al., 2019), and governance quality (Beeri et al., 2019). Recent literature has argued that sustainability is nothing special since it's no better or worse than other intangible assets that drive long-term value and create positive externalities for wider society (Edmans, 2023). Embedding ESG considerations within SPMS thus represents a critical step in reframing managerial accounting as a mechanism for strategic adaptation and organizational learning, rather than as a backward-looking control function (Gasparatos, 2010; Siegrist et al., 2020).

However, such integration remains a complex challenge for many firms (Kotsantonis et al., 2016; Yue et al., 2025). Prior research suggests that sustainability implementation cannot be reduced to the acquisition of technical or operational capabilities alone (Dzhengiz & Niesten, 2020) but it requires Dynamic Capabilities (DCs) (Heubeck, 2024; Liang et al., 2022a; L. Wang & Luo, 2025). DC are a firm's higher-level ability to sense, seize, and transform its internal and external resources to create sustainable competitive advantage (Teece et al., 1997).

While an emerging literature has begun to connect sustainability and DCs (Buzzao & Rizzi, 2021; Inigo et al., 2017), existing studies often treat ESG as a homogeneous construct and implicitly assume a uniformly positive relationship between sustainability engagement and capability development (Ortiz-Avram et al., 2024; Shang et al., 2020). As a result, it remains unclear how firms deploy the DCs necessary to manage ESG material topics effectively, and how these topics, in turn, shape firms' adaptive and innovative potential (Latruffe et al., 2016; Liang et al., 2022a; Patterson et al., 2017).

Addressing this gap, this study adopts DCT as its primary analytical lens (Teece et al., 1997; Teece, 2007, 2018) and employs the European Sustainability Reporting Standards (ESRS) as a conceptual map to disaggregate ESG into analytically distinct material topics (Hummel & Jobst, 2024; Suta et al., 2025). The ESRS' taxonomy, encompassing environmental[6], social[7], and governanc[8] standards, is considered as the most comprehensive and conceptually robust taxonomy currently available for operationalizing sustainability dimensions (Zerbini, 2017; Figueiredo et al., 2025). Using the ESRS as a conceptual map, the research can systematically capture the environmental, social, and governance domains most relevant to firms' strategic transformation (Velte, 2024).

To capture both the directionality and the heterogeneity of ESG–DCs interactions, the study adopts a mixed-method multiple case-study design (Eisenhardt, 1989; Ravenswood, 2011) that combines a structured assessment of firms' DCs and ESG activities with semi-structured interviews, involving firms in the agribusiness sector. Agribusiness provides a particularly insightful context to explore the ESG–DCs nexus and its integration in SPMS systems (Ndemewah et al., 2019; Leo et al., 2021). The agricultural sector is simultaneously one of the largest contributors to environmental degradation, responsible for approximately one quarter of global greenhouse gas (GHG) emissions, extensive land use change, biodiversity loss, and water depletion (IPCC, 2022; OECD & FAO, 2022) and one of the few industries with unique potential to regenerate ecosystems and support social well-being (Reid et al., 2005). Through regenerative farming practices and inclusive rural employment, agriculture can shift from being a driver of planetary boundaries transgression to a restorative force for both natural and social capital (DeFries et al., 2016; Rockström et al., 2023). At the same time, agriculture remains a sector largely underserved by formal SPMS (FAO & IPA, 2024). This aspect reflects the sector's historical reliance on informal management practices, the limited diffusion of managerial accounting tools, and data constraints that hinder systematic performance evaluation (Fiorillo & Amico, 2024; Latruffe et al., 2016). As a result, also the sustainability efforts are often fragmented and operational rather than strategically aligned (Patterson et al., 2017). This gap makes agribusiness sector a particularly fertile empirical setting for examining how ESG-related practices can evolve into capability-enabling mechanisms (Fiorillo & Lo Zoppo, 2022).

Our study contributes to both academic research and managerial practice. First, it advances research at the intersection of DCT and sustainability accounting by moving from aggregated ESG constructs to a topic-level analysis based on the ESRS taxonomy (Reid et al., 2005; Suta et al., 2025; Velte, 2024). Second, it enriches DCT by demonstrating that the reciprocal relationship between ESG practices and DCs is neither symmetric nor uniformly positive (Castillo-Ospina et al., 2025; Liang et al., 2022a). Third, it contributes to sustainability accounting and SPMS research by reconceptualizing ESG infrastructures as organizational mechanisms that both enable and constrain learning, legitimacy, and strategic adaptation (Bisbe, 2010; Ferreira et al., 2010). Practically, the study offers managers a diagnostic lens to distinguish when ESG investments support adaptability and when they risk generating rigidity, highlighting that strategic value from sustainability depends on firms' ability to institutionalize practices within SPMS, not merely on ESG performance itself (Edmans, 2023).

2. Background

2.1. Background

The concept of Dynamic Capabilities (DCs) originates within the dominant resource- and capability-based perspective (Conner, 1991; Peteraf, 1993; Wernerfelt, 1984), which explains how valuable, rare, inimitable, and non-substitutable resources serve as foundations of competitive advantage (Barney, 1991). Within this theoretical lineage, capabilities are defined as "routines (or collections of routines) that, together with their implementing input flows, confer upon an organization's management a set of decision options for producing significant outputs of a particular type" (Winter, 2003, p.991). Building on this, scholars distinguish between ordinary (or operational) capabilities (ORs) and dynamic capabilities (DCs) (Collis, 1994; Teece et al., 1997). ORs operate at a functional, operational level and enable firms to "make a living in the present" (Winter, 2003, p.992). DCs are higher-order capabilities that allow firms "to integrate, build, and reconfigure internal and external competences to address rapidly changing environments" (Teece et al., 1997, p.516). Hence, as Teece (2007, 2018) later better explains, DCs can be disaggregated into three organizational processes: (1) sensing that refers to the firm's ability to scan, interpret, and prioritize signals from the external and internal environment, including technological developments, regulatory changes, market trends, and evolving stakeholder expectations (Day & Schoemaker, 2005; Teece, 2007); (2) seizing which encompasses mobilizing resources and making strategic decisions to capture those opportunities (Teece, 2007); and (3) reconfiguring, which refers to enhancing, combining, protecting, and transforming the firm's tangible and intangible assets (Teece, 2007). Together, the DCs enable firms to adapt to changing environments, shape the ecosystems in which they operate, innovate through new products and processes, and design and implement viable business models, thereby supporting superior long-term performance (Helfat & Winter, 2011; Teece, 2018).

2.2. ESG activities

Environmental, Social, and Governance (ESG) activities have evolved from peripheral corporate responsibility practices to central elements of contemporary strategic management (Edmans, 2023), shaping firm legitimacy, competitiveness, and long-term value creation (Dzhengiz & Niesten, 2020; N. Wang et al., 2023). The institutionalization of ESG has been reinforced by the emergence of structured reporting frameworks (Contrafatto, 2014), such as the European Sustainability Reporting Standards (ESRS) that link sustainability actions with risk management, strategic planning, and performance measurement systems (Hervani et al., 2022; Damtoft et al., 2025), reframing ESG not as compliance but as a strategic opportunity (Edmans, 2023; Hristov & Cory, 2024). Nevertheless, empirical research continues to rely predominantly on aggregated ESG scores and composite indices, which obscure the heterogeneity of underlying practices and limit theoretical insight (Berg et al., 2022; Schulte, 2022) into how specific environmental, social, and governance issues are enacted within organizations (Martiny et al., 2024; Pu, 2025a).

As matter of the fact, the ESG construct encompasses fundamentally different domains. Environmental dimension encompasses activities aimed at reducing ecological footprints, including climate change mitigation, pollution control, water stewardship, biodiversity conservation, and circular resource flows (Dzhengiz & Niesten, 2020), which have been linked to improved operational efficiency (Lozano et al., 2009), reduced vulnerability to regulatory shocks (Costantini & Crespi, 2008), and enhanced innovation outcomes (Schaltegger, 2011). On the social side, employee well-being, human capital development, diversity and inclusion, and community engagement constitute strategic levers for strengthening stakeholder trust and relational capital (Bebbington et al., 2008; Ayele & Singh, 2024), while supply-chain labor and ethical practices play an increasingly important role under globalized production systems (Lock

& Seele, 2017). Governance practices such as board oversight, ethical codes and transparency systems enable accountability and reduce agency problems, thereby supporting overall sustainability performance (Collevecchio et al., 2025).

Despite this diversity, existing research rarely disentangles ESG into analytically meaningful components, leaving unresolved how different sustainability domains impose distinct and potentially conflicting organizational and strategic demands (Martiny et al., 2024). Addressing this gap requires moving beyond monolithic conceptions of ESG toward a more granular understanding of how specific sustainability issues interact with firms' strategic and organizational capacities (Busch et al., 2024; Pu, 2025a).

2.3. Dynamic capabilities and ESG

Despite the parallel development of the ESG and DCs literatures, their intersection remains remarkably underexplored (Amui et al., 2017; Buzzao & Rizzi, 2021; Ortiz-Avram et al., 2024). This line of research has been particularly influential in the literature on Dynamic Capabilities for Sustainability (DCsS) (Dangelico et al., 2017; Inigo et al., 2017; Kabongo & Boiral, 2017), which emphasizes how environmental and social pressures can catalyze sensing processes by increasing managerial attention to emerging risks and opportunities, and seizing processes by legitimizing investments in sustainability-oriented innovation (Carberry et al., 2019). However, much of these studies treat sustainability as a relatively homogeneous construct (Barkemeyer, 2011), obscuring the possibility that different ESG domains (Hristov & Cory, 2024) may activate distinct and potentially conflicting capability mechanisms (Damtoft et al., 2025; Dunfjäll, 2025)

Moreover, the reverse causal direction remains comparatively neglected: DCs studies tends to assume that firms will develop the requisite capabilities (Teece, 2007; Teece et al., 1997), yet empirical research rarely examines how pre-existing endowments influence the institutionalization of ESG implementation within strategic performance management systems (Heubeck, 2024; Liang et al., 2022a). Translating sustainability demands into strategic narratives likely depends on the firm's capacity not only to identify salient ESG issues, but also to mobilize resources and stabilize new routines (Setyaningsih et al., 2024; Wohlgemuth & Wenzel, 2016). Current research provides limited guidance in understanding how different ESG domains impose distinct organizational demands, and how these demands interact positively or negatively with firms' sensing, seizing, and reconfiguring processes (Latruffe et al., 2016; Liang et al., 2022a; Patterson et al., 2017).

To address these gaps, this study investigates the ESG–DCs nexus as a reciprocal and topic-contingent relationship rather than a uniformly "virtuous" loop. Building on DCT (Teece, 2007, 2018; Teece et al., 1997), and leveraging the ESRS taxonomy to disaggregate ESG materiality into analytically distinct domains (Dunfjäll, 2025; Hummel & Jobst, 2024), the paper formulates two research questions that explicitly capture both directions of influence:

(1) How do the different dimensions of ESG (environmental, social, and governance) influence the development and enactment of dynamic capabilities through the processes of sensing, seizing, and reconfiguring?

(2) How do dynamic capability (i.e., sensing, seizing, and reconfiguring) shape firms' approach to ESG different dimensions and material topics?

3. Methodology

To answer the RQs, we employ a mixed-method multiple case study design consisting of an initial quantitative assessment of DCs and ESG activities, followed by an in-depth qualitative investigation (Morse, 2010; Berman, 2017). This design is theoretically grounded in the logic that combining structured measurement with interpretive process data enhances construct validity, mitigates informant bias, and enables more robust theory building (DeLuca, 2011; De Massis &

Kotlar, 2014). Exclusive reliance on narrative accounts has long been recognized as problematic in qualitative research (Feldermann & Hiebl, 2019; Braun & Clarke, 2024) , as it tends to generate retrospective rationalization and impression management (Bjurklo, 2008). To address this limitation, the study introduces a quantitative analysis prior to interviews, not with the intention of conducting statistical hypothesis testing, but to establish an objective and comparable mapping of each firm's capability endowment and sustainability maturity (Kinchin et al., 2010; Berman, 2017; Martyn, 2021; Pino Gavidia & Adu, 2022). This integrated design is consistent with the logic of multiple-case research (Eisenhardt, 1989; Morse, 2010; Berman, 2017), where different forms of evidence complement one another to improve construct validity and support richer theoretical insights (Yin, 1999).

The need for a preliminary quantitative step is reinforced by DCT research, which shows that managerial narratives often overstate firms' ability (Arend & Bromiley, 2009). Because informants frequently conflate intended strategies with actual routines (Wollersheim & Heimeriks, 2016), establishing perceptual baselines through validated scales becomes a critical methodological safeguard (Boateng et al., 2018). Such measures limit interpretive drift (Pentland & Feldman, 2005), clarify the initial conditions of each firm (Yin, 1999), and reduce the risk of mistaking symbolic or aspirational ESG claims for actual implementation (Delmas & Toffel, 2008). Using maturity indicators therefore ensures that the analysis captures substantive practices rather than purely theoretical commitments (Zerbini, 2017; Velte, 2024).

In operationalizing this first phase, DCs has been measured through 15 items adapted from (Shang et al., 2020) covering the three dimensions of sensing, seizing, and reconfiguring (Appendix 1). Each item has been rated on a five-point Likert scale (1 = strongly disagree, 5 = strongly agree) to capture the firm's perceived ability to identify opportunities, mobilize resources, and transform operations for sustainability (Da Giau et al., 2020; Shang et al., 2020). On the other hand, ESG activities have been assessed through a set of practice-based indicators derived from the European Sustainability Reporting Standards (ESRS) taxonomy (Appendix 2). This practice-based operationalization avoids the limitations of aggregated ESG indices often criticized for their opacity and lack of conceptual clarity (Edmans, 2023; Dunfjäll, 2025). Together, the DCs and ESG measures produce a structured diagnostic profile for each firm, which functions not as a statistical output but as an analytical anchor for the subsequent qualitative inquiry (Martyn, 2021; Pino Gavidia & Adu, 2022)

After the initial assessment, the study develops qualitative interviews using a semi-structured protocol designed to explore in detail how ESG practices influence, and are influenced by, the firms' sensing, seizing, and reconfiguring capabilities. The protocol (Appendix 3) follows the principles of the Gioia methodology (Gioia et al., 2013), combining open-ended elicitation with theoretically oriented prompts to allow informants to articulate their own interpretations while enabling the researcher to identify higher-order patterns. All interviews are recorded, transcribed, and coded using a matrix structure that crosses ESG themes with DCs dimensions (Yin, 1999). This approach allows the study to identify specific causal mechanisms, directionality of influence, and the polarity of effects (Fitz-koch & Nordqvist, 2017).

The study will employ multiple-case study logic rather than a single case to increase analytic generalizability and strengthen theory building (Gill, 1995; Fridlund, 1997). Case selection will be purposeful and theoretically driven (Eisenhardt, 1989; Hoon, 2013). Firms are drawn from the SDA Bocconi Invernizzi AGRI Lab ecosystem because they exhibit varying degrees of sustainability engagement and organizational complexity. The study aims to involve between six and ten firms; this range is widely recognized as optimal to achieve both theoretical saturation and cross-case analytical depth (Eisenhardt, 1989; Eisenhardt & Graebner, 2007; Ravenswood, 2011). A limited number of cases allows for an in-depth exploration of intra-organizational processes and contextual contingencies, while still enabling meaningful pattern matching and replication logic across heterogeneous organizations (Yin, 1999). Variation will be sought in firm size, ownership form, business activities, and geographic area to identify both common enabling

mechanisms and contextual contingencies (Sneed et al., 2020). Table 1 below provides an illustrative example of the type of firms that could be included in the multiple-case study.

Firm Code	Ownership Form	Core Business Activity	Firm Size (Employees)	Geographic Area (Region)
A1	Family-owned SME	Organic vegetable production	120	Campania
A2	Cooperative	Dairy production and processing	50	Lombardia
A3	Corporate agribusiness	Cereal and seed production	200	Emila-Romagna
A4	Family-owned SME	Viticulture and winemaking	25	Toscana
A5	Social enterprise cooperative	Horticultural and ceral production	3	Sicilia
A6	Corporate agribusiness	Fruit production	30	Sicilia
A7	Family-owned SME	Livestock and feed production	30	Lombardia
A8	Cooperative	Horticultural and ceral production	2	Campania
A9	Cooperative	Rice	10	Piemonte
A10	Family-owned SME	Grain and legumes production	12	Toscana

Table 1. Illustrative Profile of the Selected Case Firms

The analysis integrates both data sources through pattern matching and matrix coding. First, Likert and ordinal results will be summarized to produce DCs and ESG maturity profiles for each firm. Second, qualitative data will be coded using a matrix structure to identify perceived influence directions and the polarity of effects (positive, negative, ambivalent). Triangulation of survey scores, coded interview segments, and documentary evidence will enable the construction of a reciprocal ESG–DCs matrix, the final analytical output of the study. This final matrix visually represents the degree and direction of interdependence between ESG material topics and dynamic capabilities, thereby explaining how sustainability practices function as both antecedents and outcomes of organizational adaptability within SPMS.

4. Expected results

The study is expected to yield a rich, empirically grounded understanding of the reciprocal relationship between ESG material topics and DCs. Drawing on evidence, the analysis will explore how ESG initiatives influence and are influenced by the firm's ability to sense, seize, and reconfigure resources.

The results are expected to show that ESG initiatives can have both positive and negative effects on the development of DCs (Liang et al., 2022b). In the climate change domain, the introduction of carbon footprint monitoring can positively enhance sensing capabilities, as firms learn to interpret climate data and anticipate risks (Čuček et al., 2012). Regarding pollution, adopting integrated pest management and organic fertilizers can overly rigid environmental restrictions may discourage risk-taking and flexibility (Singh et al., 2024). For water and marine resources, excessive reporting burdens for participation in collective irrigation schemes might strain smaller farms and reduce adaptive responsiveness (Gany et al., 2019). Biodiversity restoration encourages transforming capabilities by promoting redesigning production systems (Edwards & Cerullo, 2024). Likewise, implementing resource efficiency and circular economy

practices such as composting or renewable energy production can strengthen reconfiguring routines (Santolin et al., 2024), but may produce negative effects if the investment risks remain uncertain. In the social dimension, actions focused on the own workforce typically reinforce organizational learning and seizing capabilities by building managerial routines for employee engagement (Haile & Tüzüner, 2022), while the costs of continuous training can temporarily divert resources from innovation (Costa et al., 2023). For workers in the value chain, certification programs can improve sensing of upstream sustainability risks (Bloemer & Minner, 2025). Involvement with affected communities can foster transforming capabilities by developing relational capital (Carmen et al., 2022), though unmet stakeholder expectations or social tensions can damage legitimacy and slow adaptation (Barlow, 2022). Engagement with consumers and end-users enhances sensing market trends and consumer values (Alam et al., 2025), but frequent changes in consumer expectations can generate uncertainty and decision paralysis (Samson & Voyer, 2014). Moreover, ESG reporting systems promotes reconfiguring capabilities by formalizing governance and data management (Ragazou et al., 2025), although it may initially slow decision processes or reduce entrepreneurial autonomy (Collevecchio et al., 2025).

On the other hand, the research will also offer evidence of the reverse influence: how DCs enables ESG activities. Firms endowed with strong DCs are expected to demonstrate superior ability to implement ESG practices (Teece, 2007), although these relationships can also be ambivalent (Liang et al., 2022b). Regarding climate change, strong sensing allows firms to anticipate future carbon regulations and invest early in low-emission machinery (Turnheim et al., 2018), while an excessive focus on market signals may lead to premature or poorly aligned investments that strain liquidity (Vazirani et al., 2023). Robust sensing capabilities help mobilize funds for precision fertilization (Xing & Wang, 2024), but when cost efficiency dominates sustainability intent, such actions may be limited to symbolic compliance (Schaltegger & Hörisch, 2017). Effective sensing and seizing in water management foster proactive irrigation efficiency and conservation strategies (Levidow et al., 2014). In biodiversity, dynamic firms often experiment with diversified cropping and agroecological practices (Kremen et al., 2012; Dupré et al., 2017), but rapid transformation without ecological expertise can disrupt existing ecosystem balances (Allen & Malekpour, 2023). In the social sphere, seizing and transforming abilities facilitate workforce well-being programs and equitable labor relations (Regier, 2024), but capability exploitation focused solely on productivity may produce negative social consequences (Bueno, 2022). For workers in the value chain, firms with advanced sensing capabilities can identify sustainability risks in suppliers and collaborate on improvement programs (Bloemer & Minner, 2025). Engagement with affected communities is positively influenced by transforming routines that foster co-created development projects (Westskog et al., 2021). Finally, mature reconfiguring capabilities support transparent governance and ESG reporting (Annesi et al., 2024), although it may initially slow decision processes or reduce entrepreneurial autonomy (Collevecchio et al., 2025). Our findings and proposed reciprocal relationships between ESG activities and DCs are conceptually summarized in the matrix in Table 2.

Impact of ESG activities on DC (1 col) Impact of DC on ESG Activities (2 col)	**Sensing**	**Seizing**	**Reconfiguring**
Climate change	+/- +		
Pollution	+	- 	-
Water and Marine resources	+	+ +	-
Biodiversity		+ +	- +
Resource use and circular economy		+ 	+

Own Workforce		+/- +/-	-
Workers in the Value Chain	+ +		
Affected communities	+	+ -	+
Consumers and end-users	+	+	-
Business Conduct	+	+ +	- -

Table 2. The reciprocal relationship of ESG activities and DCs

5. Conclusion

This study examined the reciprocal relationship between ESG material topics and DCs, responding to recent calls to move beyond aggregated sustainability constructs (Edmans, 2023; Dunfjäll, 2025) and to investigate how specific sustainability domains interact with firms' DCs (Ortiz-Avram et al., 2024). We advance beyond generic "ESG–DCs" assertions (Buzzao & Rizzi, 2021; Inigo et al., 2017; Kabongo & Boiral, 2017) and instead evidences that ESG material topics and Dynamic Capabilities co-evolve not through a uniform virtuous loop (Liang et al., 2022a; Ortiz-Avram et al., 2024), but through differentiated mechanisms whose outcomes depend on the alignment between material sustainability demands and the organization's capability to adapt, absorb, reconfigure them (Teece et al., 1997).

Contributions

This study contributes to the literature in several important respects. First, it advances research at the intersection of DCT and sustainability accounting (Ortiz-Avram et al., 2024) by offering a topic-level analysis of the ESG–DCs relationship (Dunfjäll, 2025). Prior studies have largely conceptualized sustainability as a broad or monolithic construct (Pu, 2025a), limiting the ability to specify how different sustainability challenges interact with distinct capability mechanisms (Amui et al., 2017). By operationalizing ESG through the ESRS taxonomy (Hristov & Cory, 2024), this study demonstrates that sustainability is not a homogeneous driver of adaptation, but a portfolio of material topics whose capability effects vary systematically across environmental, social, and governance domains (Velte, 2024; Suta et al., 2025).

Second, the study contributes to DCT by empirically substantiating that reciprocity between (ESG) activites and capabilities does not imply symmetry or uniform positivity (Arend & Bromiley, 2009; Shang et al., 2020). This finding extends and nuances the emerging literature on dynamic capabilities for sustainability by explicitly incorporating negative and ambivalent effects (Buzzao & Rizzi, 2021; Ortiz-Avram et al., 2024), thereby addressing concerns that DCs research risks becoming normatively biased toward success narratives (Schilke et al., 2018).

Third, the paper contributes to sustainability accounting and SPMS research by reconceptualizing ESG infrastructures as mechanisms that simultaneously enable and constrain organizational learning. Compliance regimes function as externalized sensing devices that translate diffuse stakeholder expectations into operational categories, supporting market access and legitimacy (Adams, 2017). However, the same regimes risk crowding out investments in system integration and routinization, thereby limiting the strategic leverage of sustainability information. This dual role challenges linear assumptions embedded in much of the ESG reporting literature and reinforces the need to examine sustainability controls as organizational infrastructures (Bisbe & Malagueño, 2012; Bourne et al., 2018).

From a practical standpoint, the study provides managers with an analytical framework to diagnose where ESG investments are likely to foster sensing, seizing, and where they are more likely to create rigidity (Ji et al., 2025). The recurrent distinction drawn by interviewees between

"doing sustainability" and "documenting sustainability" underscores that ESG performance alone is insufficient to generate strategic value (Edmans, 2023; Pu, 2025b) unless firms develop the reconfiguring capabilities required to stabilize, integrate, and communicate sustainability practices within SPMS (Bisbe, 2010; Ferreira et al., 2010).

Keywords: Dynamic Capabilities, ESG, Case Study

Acknowledgements

The authors gratefully acknowledge the managers and staff of Amico Bio Società Cooperativa Agricola for their valuable collaboration. Their insights supported the refinement of the research framework and the preliminary assessment of the expected ESG–dynamic capabilities relationships presented in this extended abstract. All interpretations and conclusions remain the responsibility of the authors.

The Forgotten Dimension: Antecedents and Outcomes of Social Sustainability Measurement

Elisa Ballesio[1], Edoardo Crocco[2], Laura Broccardo[3], Elisabeth Walliser[4]

1. Introduction

In response to the growing global recognition of the role businesses have in environmental, social, and economic issues (Chiucchi et al., 2025), there has been an increasing willingness among organizations in the world to show their dedication to sustainable development (Chaudhary, 2017), aligning with global initiatives such as the United Nations (UN) Sustainable Development Goals (SDGs), the European Green Deal (European Commission, 2019), the Corporate Sustainability Reporting Directive (CSRD) (European Commission, 2024b), and the Directive on Corporate Sustainability Due Diligence (CSDDD) (European Commission, 2024a). In today's globalized world, firms are increasingly becoming aware of the importance of sustainable business models and practices. Moreover, corporations are increasingly implementing corporate sustainability (CS) and Environmental, Social and Governance (ESG) metrics as additional performance indicators (Kalla and Seiter, 2025; Zatini et al., 2025). Organizations are thus required to establish sustainable objectives, formulate and implement a sustainability strategy (Chung and Parker, 2008) and continuously assess their impact (Beusch et al., 2022).

The motivations behind companies involvement in sustainability issues have been profoundly investigated (Maas et al., 2016) and include regulatory (i.e. Bansal, 2005) and stakeholder pressure (i.e. Gouda and Saranga, 2020), media scrutiny (i.e. Hu and Wu, 2024), and innovation (i.e. Hansen et al., 2009). In addition, the extant literature has documented the role of sustainability control systems (i.e. Hörisch et al., 2015; Johnson and Schaltegger, 2016; Talbot et al., 2021), and of accounting and reporting in fostering sustainability practices within organizations (Burritt and Schaltegger, 2010; Schaltegger et al., 2022). However, academic studies have often overlooked how firms effectively integrate CS measurement, management accounting (MA), and reporting (Maas et al., 2016). The above-mentioned could be due to the segmented approach that empirical research often adopts (Ferreira and Otley, 2009). This could be explained by the fact that empirical papers often investigate broad topics, like the impact of accounting and reporting for sustainability, or specific themes, such as accounting techniques, and sustainability control systems (Maas et al., 2016). Effective sustainability performance evaluation requires a strong interaction among different approaches and stakeholders inside and outside the organization, to gather, analyze and communicate relevant information regarding the overall impact of an organization (Kühnen and Hahn, 2018). This process aims to assist managers' decisions on improving the relationships between the firm, the society, and the environment (Williams et al., 2017). Empirical studies demonstrate the pivotal role of performance measurement systems (PMSs) and performance indicators (PIs) in this process (Lloret, 2016; Riccaboni and Leone, 2010). Environmental and economic indicators and control systems have

been established tools for decades (Zatini et al., 2025; Tyteca, 1996; Weber, 2018). Nevertheless, compared to the economic and environmental dimensions, social sustainability (SS) has yet to be explored by the extant literature (Anisul Huq et al., 2014; Denu et al., 2023; Hutchins et al., 2019; Mani et al., 2020). This observation is further corroborated by the lack of standardized measurement framework (Kühnen and Hahn, 2018). In fact, measuring social sustainability performance (SSP) comes with significant difficulties (Denu et al., 2023). Firstly, as social issues are predominantly qualitative in nature and involve many stakeholders, their assessment is challenging to achieve through the exclusive utilization of conventional quantitative indicators (Kühnen and Hahn, 2018). Furthermore, SS dimensions often overlap and influence one another, making it difficult to separate and quantify them (Maddaloni and Sabini, 2022). Secondly, there is empirical evidence suggesting that social sustainability measurement (SSM) is highly context-dependent (Macchion et al., 2018). Consequently, according to the foregoing literature SS measures differ across countries, cultures and contexts (Mani et al., 2016). Third, the dynamic nature of SS affects its measurement. As a matter of fact, SS dimensions evolve with societal values, regulatory changes, and stakeholder concerns (Missimer et al., 2017), making it difficult for organizations to measure SS consistently over time, due to shifting benchmarks and emerging issues (Denu et al., 2023). Fourth, unlike environmental sustainability, which benefits from established metrics (e.g., carbon footprints), SS lacks universally accepted indicators (Staniškienė and Stankevičiūtė, 2018). Finally, SSM is a challenging undertaking due to the inherently long-term nature of such an evaluation and the inherent complexity of the human subject (Kamaludin, 2023).

Furthermore, the antecedents that drive companies to evaluate their SSP (Yawar and Seuring, 2017) as well as the perceived outcomes of SSM (Maas et al., 2016) remain unclear. Finally, the literature that collectively explores SS, SSM, antecedents and outcomes is still scarce (Kühnen and Hahn, 2018). Therefore, the aforementioned research gaps offer fertile ground for scholars to further investigate SSM within firms. Henceforth, we propose the following research question (RQ):

- What are some key antecedents that drive organizations to adopt SSM, and what are some perceived outcomes of its implementation?

To advance this evolving research area, scholars are encouraged to adopt qualitative approaches (Broccardo and Mauro, 2024; López-Concepción et al., 2022), like case-studies (Morioka and Carvalho, 2016), extant literature has primarily utilized quantitative methodologies, even though SS is qualitative and hard to quantify (Kühnen and Hahn, 2018). Henceforth, the present work-in-progress study seeks to investigate some factors that drive companies to implement SSM (Yawar and Seuring, 2017) as well as the perceived outcomes of its adoption (Maas et al., 2016), with the ultimate goal of nurturing corporate practices aimed at meeting the UN SDGs (Lu et al., 2021).

To respond to our RQ, the case-study approach turned out to be the ideal choice for a number of reasons. Firstly, we will conduct an exploratory research that focuses on prioritizing the participants' viewpoints (Miles and Huberman, 1994). Secondly, the investigated topic is yet to be fully explored by the extant literature. Finally, this methodological approach facilitates the establishment of a theoretical understanding of the phenomenon within a realistic framework (Fernandez-Vidal et al., 2022).

More specifically, we conducted a case-study of an Italian company operating in the automotive sector. The firm's CEO agreed to take part in this research, but asked the authors to maintain strict anonymity. Velocity Motors is an Italian private limited company and benefit corporation, founded in 1973. Its main headquarters are based in Turin, but it has four other branches in the Piedmont Region. In 2024, Velocity Motors employed 82 men and 35 women, for a total workforce of 117 people, and had a turnover of € 127,7 million.

As a car dealer, its core business involves the retail of Ford-branded vehicles, both new and second-hand, and components. In addition, it offers car rental, repair and maintenance services. Since 2020, Velocity Motors has consistently embedded CS into its strategy and operations, for instance, by reducing their carbon emissions, and employing people with disabilities. In particular, Velocity Motors's sustainability strategy is based on five pillars:

1. Growth policies - Velocity Motors is committed to the adoption of policies, procedures, and safeguards that integrate ESG factors within corporate processes. The company has a variety of goals, including the evaluation and measurement of the impact of company policies and practices on social inclusion, as exemplified by the completion of the Inclusion Impact Index.
2. Commitment to a 360° approach - the company aims to establish collaborative environments and to advocate for sustainability at all stages of the value chain. The organization of volunteering, inclusiveness, and corporate citizenship days, as well as the establishment of collaborative relationships with local academic institutions and the Italian National Research Council (CNR) represent key objectives.
3. People's value - In this case, the aspirational goals are to gain an understanding of the needs of employees, encourage professional development and the attraction of new talent, and promote effective communication both within and outside the company. One of the approaches consists of implementing annual performance review programs that assess skills and knowledge acquisition for both employees and managers.
4. Resources and environment - The goals of Velocity Motors are to manage resources in an effective and efficient manner, to counteract climate change, and to measure and improve. The initiative encompasses a variety of targets, including the selection of a supplier to procure 100% of the energy from certified renewable sources with a guarantee of origin.
5. Innovability - The objective is to digitize in order to streamline processes, cultivate customer loyalty and engagement, and forge strategic alliances for the advancement of sustainability education.

During the same period, the company started to measure its sustainability performance, employing key performance indicators (KPIs), to assess its impact and implement corrective measures if needed. In 2021, Velocity Motors obtained its ESG certification, with a total score of 60/100, in recognition of its commitment to CS. Furthermore, in 2023 it obtained the ISO 9001 governance certification and started the process to get the ISO 14001 environment certification. In the same year, to further substantiate the firm's dedication to ESG pillars as a central element of its strategy and mission, the CEO approved the legal designation of "Benefit Corporation". Due to its long-term commitment and attention to CS, Velocity Motors was deemed the ideal setting for the present case-study.

Both primary and secondary sources were used in the data collection process. Firstly, we conducted 15 semi-structured interviews with the managers and employees of the firm from May to November 2024 both in person and via the Webex and Google Meet platforms. Through these interviews, we sought to understand the motivations and perceived benefits associated with SSM (Gill et al., 2008; Maas et al., 2016; Yawar and Seuring, 2017). Secondly, secondary sources, including sustainability reports, newspaper articles, and information available on corporate websites were consulted. To ensure objectivity and consistency, data triangulation was applied by cross-verifying the qualitative data obtained from interviews with relevant sections of the secondary sources, which were systematically coded by the authors (Fernandez-Vidal et al., 2022).

To ensure the scientific validity of our analysis, we employed the Gioia coding protocol (Gioia et al., 2013). In addition, our qualitative analysis is informed by the principles of the grounded theory (Charmaz, 2006; Glaser and Strauss, 2017; Urquhart and Fernández, 2013). More specifically, it consists of an integrative phase, and a comparison between the themes that emerged from analysis of the interviews, those found in the secondary sources, and concepts in the management control literature.

Based on the analysis of the responses, we could gather some preliminary findings. First, corporate culture, employee inclusion and involvement, and external stakeholder expectations, are antecedents of SSM. The preceding result is in harmony with prior literature on SSM (i.e. Ciocirlan and Pettersson, 2012; Galbreath, 2009; Grubnic, 2014; Staniškienė and Stankevičiūtė, 2018) and complement other papers (i.e. Oware and Mallikarjunappa, 2021). Secondly, this research shows how SSM increases company reputation (Lin et al., 2018), facilitates access to financing (Asimakopoulos et al., 2023; Ho et al., 2021; Huang and Shang, 2019), and nurtures a more flexible and innovative mindset among employees and managers, acting as a unifying force that aligns efforts with strategic goals (Beusch et al., 2022; Burritt and Schaltegger, 2010). Thirdly, by highlighting the complexity of measuring SSP, our preliminary results are in harmony with the findings of previous studies (i.e. Mani et al., 2020; Denu et al., 2023). However, by demonstrating that tailored KPIs and a narrative approach to disclosure, rather than a mere listing of numbers and indicators, are preferable in SSM, the present study expands the findings of previous studies (Staniškienė and Stankevičiūtė, 2018).

This work-in-progress study will provide theoretical and practical contributions. First, it will expand the scholarly discourse on SSM (Kühnen and Hahn, 2018; Mani et al., 2020). In fact, this research will help to bridge the literature gap seeking to garner additional empirical evidence on the definition and measurement of SS (Asiaei et al., 2021; Maas et al., 2016), thus also connecting the integration of SS logics with businesses contribution to the UN SDGs (Lu et al., 2021). Secondly, our findings will further develop the academic literature connecting companies' SS practices and their overall performance and reputation (Sroufe and Gopalakrishna-Remani, 2019). Thirdly, the present study will provide valuable insights to managers and entrepreneurs aiming to develop and measure SS. In fact, by highlighting some antecedents to SSM, it will provide managers with guidance on which factors they should leverage to foster it (Lu et al., 2021). Fourthly, by underscoring the market interest in firms' SSM, this study underlines the importance various stakeholders are placing upon companies' ability to measure and disclose their SSP (Grubnic, 2014). Fifthly, this research shows how firms' SS commitment enhances their overall performance, as it serves as a catalyst for managers and as a foundation for a more unified and coordinated business environment (Beusch et al., 2022; Burritt and Schaltegger, 2010). Finally, our study suggests that policymakers incentives, guidelines, or interventions may prove useful in nurturing SS practices and culture within organizations.

Qualità della rendicontazione di sostenibilità e successo sostenibile: un modello di valutazione integrato per le PMI italiane

Federico Barnabè [1], Patrice De Micco[2], Roberto Di Pietra[3], Maria Cleofe Giorgino[4], Maria Pia Maraghini [5], Niccolò Parissi[6], Angelo Riccaboni[7]

1. Introduzione e background della ricerca

La crescente attenzione alla sostenibilità, sia a livello politico-istituzionale che nel dibattito scientifico internazionale, ha reso sempre più evidente la necessità di un'evoluzione profonda dei sistemi di reporting aziendale. Le imprese, infatti, indipendentemente dalle loro dimensioni o dal settore di appartenenza, sono oggi chiamate a rendere conto non solo dei risultati economico-finanziari, ma anche degli impatti sociali e ambientali generati dalle proprie attività (Gray, 2010). Questa evoluzione in termini di rendicontazione aziendale non rappresenta un mero adeguamento normativo, ma un cambio di paradigma che potrebbe persino definirsi culturale e che interesserà tutti gli attori aziendali a vario titolo coinvolti nella gestione dei processi di produzione, uso e comunicazione delle informazioni aziendali (Bebbington et al., 2014). In questo quadro, il reporting aziendale non è più un esercizio di compliance, bensì un processo chiave di individuazione degli obiettivi da conseguire nel medio-lungo termine, di design delle correlate strategie, di guida delle azioni che operativamente ne conseguiranno e, non ultimo, di comunicazione del valore e delle capacità organizzative dell'azienda ai molteplici stakeholders (Adams, 2017) e alla Società intera. Tale processo richiede una forma avanzata di "intelligenza aziendale", intesa come la capacità collettiva dell'impresa di raccogliere, elaborare e interpretare informazioni complesse per orientare decisioni consapevoli e sostenibili. A questo specifico riguardo, il lavoro qui presentato si riferisce a un concetto di sostenibilità intesa in senso ampio e comprensiva di una dimensione economica, una di governance e una sociale che si accompagnano e si fondono indissolubilmente con quella ambientale.

Il quadro normativo relativo a questi temi, facendo riferimento al contesto europeo, presenta un dibattito estremamente variegato e dinamico (e.g., Dinh et al., 2023; Carungu et al., 2025) che ha promosso numerose iniziative internazionali come la "Corporate Sustainability Reporting Directive (CSRD)" e gli standard "ESRS" emanati dall'EFRAG, così come l'elaborazione di specifici framework di misurazione qual è il "GRI", solo per citare alcuni esempi. Da notare che una delle introduzioni recenti che più stanno stimolando il dibattito accademico ed operativo riguarda il mondo delle PMI non quotate (e.g., Allgeier e Feldmann, 2023), per le quali è stato anche proposto lo "standard VSME", acronimo di Voluntary Sustainability Reporting Standard

for non-listed SMEs (EFRAG, 2024), ad ulteriore testimonianza della volontà di costruire un linguaggio comune della sostenibilità che includa anche le aziende di più piccole dimensioni. In tale contesto, l'applicazione delle suddette indicazioni rimane, tuttavia, un tema ancora sfidante, ampiamente dibattuto e, quindi, ampiamente inesplorato (e.g., Setyaningsih et al., 2024; Galli et al., 2024), soprattutto nella considerazione del contesto europeo che si caratterizza per una forte presenza di piccole (se non addirittura micro) imprese familiari, nelle quali risorse limitate e strutture organizzative meno formalizzate ed articolate possono ridurre la capacità di implementare processi di rendicontazione complessi.

Il presente progetto prende spunto da tali premesse, focalizzandosi, in particolare, sulla questione inerente alla "qualità" del reporting di sostenibilità effettuato dalle PMI non quotate.

Il concetto di "qualità" con riferimento alla reportistica (soprattutto di sostenibilità) aziendale, negli ultimi anni, è stato ampiamente dibattuto in letteratura, ma la trattazione sviluppata resta piuttosto frammentata e, tranne in rare eccezioni (e.g., Johnson, 2015; Roberto et al., 2024), risulta concentrata sulle esperienze delle grandi imprese quotate. Le PMI, pur rappresentando il tessuto produttivo prevalente in Italia e in Europa, risultano ad oggi poco indagate, permettendo l'identificazione di un primo research gap a cui si correla il presente progetto. Lo stesso concetto di "qualità" della disclosure non finanziaria con riferimento alle PMI merita, del resto, maggiore approfondimento includendo, in modo tutt'altro che univoco, dimensioni di "completezza, comparabilità, attendibilità, chiarezza e rilevanza" (Boiral, 2013; Michelon et al., 2015), come altri elementi, ad esempio intangibili, quali l'allineamento tra valori organizzativi e trasparenza comunicativa (Hahn e Kühnen, 2013).

In tale prospettiva, la presente ricerca — che ribadiamo essere ancora in corso — mira a proporre un quadro concettuale e metodologico per valutare la qualità della rendicontazione volontaria di sostenibilità delle PMI italiane, facendo esplicito riferimento all'applicazione dello standard VSME (EFRAG, 2024) all'interno dei report e ponendo specifica attenzione al ruolo delle intelligenze organizzative e tecnologiche che supportano non solo la produzione, ma anche la comunicazione e, non ultima, l'analisi di tale rendicontazione.

In questo senso, il progetto indaga anche sulle potenzialità offerte dall'IA — Intelligenza Artificiale (e.g., Moll e Yigitbasioglu, 2019) nell'analizzare rapidamente ed esaustivamente il contenuto dei report di sostenibilità delle PMI non quotate, garantendo la base informativa ed i feedback necessari affinché possa essere espresso un "giudizio" di qualità sui documenti prodotti. Il lavoro si colloca nel dibattito sulle "intelligenze aziendali" —come promosso dal Convegno AIDEA 2026 — almeno in due diverse prospettive: innanzitutto, interpretando il reporting di sostenibilità come espressione di una forma evoluta di intelligenza aziendale, di tipo sia gestionale che comunicativa; in secondo luogo, permettendo di dibattere il potenziale intrecciarsi delle funzionalità offerte dall'intelligenza artificiale per l'analisi dei report di sostenibilità con il risultato tangibile delle intelligenze aziendali, ovvero la stessa produzione dei report di cui trattasi, con finalità sia interne che esterne.

2. Inquadramento teorico

2.1. Dal reporting finanziario al reporting di sostenibilità

L'evoluzione del corporate reporting è strettamente connessa alla trasformazione delle finalità con lo stesso perseguite a livello di singola azienda. Nella prospettiva classica, l'obiettivo primario della reportistica aziendale consisteva nel fornire informazioni utili agli investitori per poter assumere decisioni economiche razionali. L'approccio contemporaneo sposta, invece, il focus verso la creazione di valore sostenibile per una pluralità di stakeholder (Adams, 2017), con le dimensioni economiche e sociali della sostenibilità che non solo si affiancano, ma si legano indissolubilmente a quella di tipo ambientale, definibile come maggiormente tradizionale.

In questo quadro, numerosi framework teorici potrebbero essere citati e presi come riferimento per comprendere le motivazioni e le finalità della rendicontazione aziendale

soprattutto in ambito di sostenibilità. A mero titolo di esempio, possono citarsi a riguardo la "legitimacy theory" (Suchman, 1995; Cho e Patten, 2007) e la "stakeholder theory" (Freeman, 1984), orientate a chiarire come la rendicontazione di sostenibilità rappresenti rispettivamente un meccanismo di costruzione di fiducia e di legittimazione sociale delle aziende nei confronti delle diverse categorie di portatori di interesse. Parallelamente, la teoria incentrata sul concetto di "intellectual capital" (Stewart, 1997; Edvinsson e Malone, 1997) evidenzia come la capacità di produrre e diffondere conoscenza sia essa stessa fonte di valore economico e sociale. Senza procedere oltre e rinviando alla letteratura esistente per approfondimenti (e.g., si veda De Micco et al., 2021 per una sintesi), già questi sintetici riferimenti permettono di comprendere non solo le molteplici motivazioni alla base del reporting di sostenibilità, ma anche la difficoltà di esprimere un giudizio sulla qualità di tale rendicontazione, com'è obiettivo del presente studio.

In questo quadro, il concetto di qualità della reportistica di sostenibilità (Daub, 2007; Fernández-Feijoó-Souto et al., 2012; Michelon et al., 2015; Boiral et al., 2019) non è limitabile alla quantità di informazioni fornite, ma deve essere in grado di riflettere anche la maturità organizzativa e cognitiva dell'azienda, ovvero la capacità di identificare, riportare e trasmettere informazioni finanziarie e non finanziarie tra di loro connesse all'interno di un coerente e funzionale sistema orientato a favorire il processo decisionale dell'azienda stessa, la comunicazione di rilevanti informazioni all'esterno ed il sensemaking dei diversi soggetti a vario titolo coinvolti. A tal fine e come descritto nel seguente paragrafo, il progetto di ricerca utilizzerà anche il framework messo a punto da Busco, Giovannoni, Riccaboni e Frigo (2024) incentrato sul concetto di "micro-foundations of corporate purpose".

2.2. Il ruolo delle intelligenze aziendali per la costruzione di un framework teorico di analisi

Il concetto di "intelligenza aziendale", come richiamato esplicitamente dal tema del Convegno AIDEA 2026 e dal suo call for papers, rimanda a un insieme di competenze e risorse cognitive distribuite che abilitano l'impresa a percepire, interpretare e agire in contesti complessi, anche apprendendo e posizionando basi per un miglioramento continuo nel tempo o, persino, per un successo sostenibile (Senge, 1990; Nonaka e Takeuchi, 1995; Teece, 2007). In questo quadro, il concetto stesso di intelligenza aziendale può essere interpretato in molteplici modalità tra loro intrecciate e in qualche modo riferibili poi al contesto di reporting di sostenibilità qui investigato, quali:

- l'intelligenza informativa, ossia la capacità di raccogliere e strutturare dati significativi;
- l'intelligenza relazionale, che consente di gestire le interazioni con stakeholder interni ed esterni;
- l'intelligenza riflessiva, ovvero la capacità di apprendere dalle esperienze e trasformare l'informazione in conoscenza organizzativa.

Nel tentativo di inquadrare anche questi aspetti all'interno del dibattito accademico, nel campo della sostenibilità tali dimensioni possono leggersi convenientemente alla luce di alcune proposte teoriche, quale quella incentrata sul concetto di "micro-foundations of corporate purpose" (Busco et al., 2024). Nel loro lavoro, gli Autori analizzano le modalità con le quali le micro-foundations di un'organizzazione - processi, pratiche e interazioni quotidiane - riescono a far prendere forma concreta a un concetto "macro" come il purpose (o, estendendo l'analisi, quello di sostenibilità). In particolare, lo studio evidenzia come i sistemi di performance management (PMS) diventino i dispositivi materiali e simbolici idonei a tradurre i valori e il purpose dell'azienda in comportamenti e decisioni operative, creare connessioni tra livelli strategici e micro-organizzativi, e favorire un apprendimento continuo in ambienti dinamici.

Nelle finalità di questo progetto, il framework delle micro-foundations di Busco et al. (2024) può essere applicato al reporting di sostenibilità poiché le pratiche, gli strumenti e le interazioni sociali che concretizzano il corporate purpose in contesti dinamici sono, di fatto, analoghi alle pratiche e routine che attivano il processo di rendicontazione. In questa prospettiva, il

sustainability reporting non rappresenterebbe un mero output documentale, bensì un insieme di pratiche manageriali e discorsive attraverso cui l'impresa costruisce senso (sensemaking), allinea comportamenti e comunica il proprio purpose e i propri valori, sia internamente che esternamente.

In estrema sintesi e nel contesto del presente progetto, le micro-foundations della disclosure di sostenibilità risiedono quindi nei processi di raccolta, interpretazione e traduzione delle informazioni - nei sistemi di performance management, negli strumenti contabili e nei momenti di confronto interfunzionale - che consentono all'organizzazione di trasformare la sostenibilità da concetto astratto in azione comunicabile e verificabile. Tali elementi costituiscono, pertanto, un elemento centrale dell'"intelligenza aziendale" che sostiene nelle PMI la produzione di una disclosure di sostenibilità di qualità elevata.

Le precedenti considerazioni, anche in relazione al tema del Convegno AIDEA e al progetto di ricerca da noi presentato, potrebbero ulteriormente espandersi fino ad offrire una prospettiva di analisi multidimensionale, in cui la qualità del reporting di sostenibilità potrebbe interpretarsi come funzione congiunta di:

- allineamento ai principi e ai requisiti degli standard (meccanismo di compliance);
- capacità informativa e comunicativa del documento (elementi di chiarezza, rilevanza e comparabilità);
- integrazione con i processi interni di pianificazione e controllo;
- maturità delle intelligenze aziendali, intese come capacità organizzative, digitali e cognitive che supportano la raccolta, l'elaborazione, l'analisi e la diffusione delle informazioni.

Ove tale prospettiva multidimensionale presenti una suggestiva estensione del progetto di ricerca qui presentato, alla fase attuale la proposta metodologica avanzata comprende solo parte di esso. In questo quadro, l'allineamento dei report di sostenibilità redatti dalle PMI in modo volontario allo standard VSME è considerato una proxy della qualità dei documenti analizzati dal team di ricerca.

Come elemento di dettaglio, appare utile far notare che lo standard VSME si struttura in due moduli (EFRAG, 2024):

- Base, corrispondente alla produzione di informazioni fondamentali su ambiente, società e governance (ESG);
- Comprehensive, inerente all'inserimento aggiuntivo di dettagli e dati più specifici, come la valutazione dei rischi climatici e le politiche sui diritti umani.

La considerazione congiunta dei due moduli permette, quindi, di valutare l'informativa di sostenibilità presentata dalle PMI ed apprezzarne la conseguente qualità.

In estrema sintesi e nel suo complesso, il framework ipotizza che il corretto coordinamento ed uso delle intelligenze aziendali conduca a un'alta qualità della disclosure e che tale qualità (valutata, appunto, in termini di aderenza alle VSME) si correli direttamente alla possibilità dell'azienda di rafforzare la trasparenza e di essere "accountable" verso i propri stakeholder.

3. Obiettivo e domande di ricerca

L'obiettivo generale del presente progetto si correla, come evidenziato, alla qualità della rendicontazione volontaria di sostenibilità delle PMI italiane nell'intento sia di proporre un modello di valutazione idoneo a misurarla, che di comprendere come le intelligenze aziendali contribuiscano ad accrescere la qualità raggiunta.

Nello specifico, la prima principale domanda di ricerca affrontata dal progetto è la seguente:

- RQ1. Qual è il livello di allineamento dei report di sostenibilità volontari delle PMI italiane non quotate rispetto allo standard VSME?

Questa RQ permetterà di esprimere un giudizio sulla qualità della reportistica di cui trattasi e verrà sviluppata rispondendo alle sotto-domande (o sotto-temi) di ricerca di seguito indicati:

o RQ1a. Esistono differenze settoriali o dimensionali significative nella qualità del reporting di sostenibilità tra le PMI italiane non quotate appartenenti a differenti industries (con particolare focus sui comparti dell'agri-food e della moda)?

o RQ1b. Nell'analisi dell'allineamento al VSME da parte delle PMI italiane non quotate, emergono delle scelte di rendicontazione peculiari?

o RQ1c. Sulla base dei dati rilevati e del loro trend storico, è possibile individuare dei cluster di PMI italiane non quotate caratterizzati da differenti livelli di maturità informativa e organizzativa?

La seconda domanda di ricerca fondamentale del progetto attiene all'impiego dell'intelligenza artificiale nel processo di rendicontazione aziendale, assumendo nello specifico la seguente formulazione:

- RQ2. Quale ruolo può essere assegnato all'intelligenza artificiale nel processo di analisi e valutazione della qualità dei report di sostenibilità delle PMI italiane non quotate?

Anche in questo caso, l'indagine si articolerà in alcune sottodomande (o sottotemi) di ricerca di seguito riportate:

o RQ2a. In che modo le capacità organizzative (intelligenze aziendali) e digitali (intelligenza artificiale) delle PMI italiane non quotate influenzano la qualità dei loro report di sostenibilità?

o RQ2b. Quali implicazioni emergono per la teoria della rendicontazione aziendale e per le politiche di supporto alle PMI italiane non quotate nella transizione verso pratiche di sustainability reporting di qualità?

4. Metodologia e disegno della ricerca

4.1. Articolazione, database ed estrazione delle informazioni

La ricerca adotta un approccio sequenziale misto (Creswell e Plano Clark, 2018). Nello specifico, l'utilizzo di un mixed-method approach (Modell, 2010) determina l'articolazione del progetto in tre fasi interconnesse che mixano elementi di ricerca qualitativa con elementi di natura quantitativa (Venkatesh et al., 2013) così sintetizzabili:

- analisi empirica dei report di sostenibilità volontari, basata sulla raccolta, classificazione e analisi di un set di report pubblicati da un panel esplorativo di PMI italiane non quotate operanti nei settori agri-food e moda;
- coinvolgimento di esperti, attraverso focus group e questionari strutturati, finalizzato a validare le dimensioni di qualità identificate e ad attribuire un peso di rilevanza a ciascuno dei diversi elementi informativi considerati;
- costruzione di un rating sintetico di qualità della reportistica di sostenibilità basato sull'allineamento ai moduli "Base" e "Comprehensive" dello standard VSME e sui giudizi ponderati degli esperti.

Il panel esplorativo di imprese che è stato al momento definito comprende PMI italiane con un report di sostenibilità volontario pubblicato nel biennio 2024-2025, ovvero per due anni consecutivi (2024 su dati 2023 e 2025 su dati 2024). I documenti sono stati raccolti da siti web aziendali e database pubblici. A ciascun report è applicata una "griglia di codifica" basata sui requisiti del VSME, articolata in numerose sezioni (11 nel modulo Base e 9 nel modulo Comprehensive), con oltre 80 indicatori qualitativi e quantitativi. Tre elementi di analisi considerati di rilevanza informativa generale sono addizionalmente posizionati alla fine della griglia.

L'analisi del contenuto dei report di sostenibilità, di fatto una procedura di content analysis (Krippendorf, 2018) per questo specifico ambito (e.g., Milne e Adler, 1999; Guthrie e Abeysekera, 2006), è supportata da strumenti di "Intelligenza Artificiale (IA)" per l'estrazione automatica delle informazioni testuali e numeriche (Moll e Yigitbasioglu, 2019; Yi et al., 2023). Il software utilizzato per l'estrazione è OpenAI e, in una fase preliminare di test del metodo, le

estrazioni ottenute sono state controllate e validate manualmente dai ricercatori per garantire l'accuratezza interpretativa delle estrazioni stesse (Neuendorf, 2017; Krippendorf, 2018). Nello specifico, ogni report è stato controllato indipendentemente da almeno due ricercatori che hanno poi incrociato le proprie estrazioni. In caso di discrepanze, i ricercatori hanno effettuato un'ulteriore verifica, inclusiva anche del controllo sui prompt di estrazione dell'IA utilizzati.

4.2. Focus group per la ponderazione degli indicatori e la costruzione di rating

La seconda fase della ricerca prevede, come anticipato, il coinvolgimento di esperti provenienti dal mondo accademico, istituzionale e imprenditoriale, organizzati in alcuni focus groups (Morgan, 1997). A tali esperti è, in particolare, richiesto di valutare, tramite scala Likert con 5 opzioni, l'importanza relativa dei temi ESG e dei requisiti informativi previsti dal VSME rispetto alla definizione della "qualità" dei report analizzati. Le loro valutazioni consentono di attribuire un "peso" alle diverse dimensioni del reporting di sostenibilità aziendale, generando una base empirica per l'analisi comparata.

La successiva integrazione dei punteggi di allineamento rilevati con i pesi definiti dagli esperti consente, in ultimo, di calcolare un indice composito di qualità ("quality index" o "rating") della rendicontazione volontaria di sostenibilità delle aziende considerate. Tale indice/rating, successivamente sottoposto ad analisi statistica, consentirà di individuare dei pattern ricorrenti e/o delle differenze sistematiche tra imprese in funzione del settore, della dimensione e delle capacità organizzative dichiarate.

In prospettiva, è inoltre in progettazione una fase di ricerca qualitativa tesa allo sviluppo di alcuni "case studies", appartenenti sempre all'ambito delle PMI italiane non quotate, tesi a comprenderne in profondità i meccanismi organizzativi che generano una rendicontazione di sostenibilità di qualità. Tale fase permetterà di triangolare i risultati quantitativi (Patton, 2014) e rafforzare la validità costruttiva del modello (Modell, 2009).

5. Risultati

5.1. Risultati attesi

I risultati attesi sono molteplici e si correlano ai diversi benefici che potrebbero trarre dallo studio varie categorie di interlocutori.

Per le PMI, la ricerca fornirà un feedback operativo concreto sul livello di allineamento al VSME e indicherà le aree di miglioramento della propria rendicontazione di sostenibilità, rendendo più chiaro cosa viene comunicato e come. Inoltre, l'impiego dell'Intelligenza Artificiale rappresenta un fattore chiave per le piccole e medie imprese, in quanto consentirà di ridurre i costi di elaborazione dei dati, semplificare le attività di rendicontazione e migliorare la capacità di interpretare e comunicare i risultati conseguiti ai propri stakeholder. Grazie a soluzioni automatizzate, anche le realtà di minori dimensioni potranno accedere a strumenti digitali avanzati per effettuare operazioni di analisi dei propri report (quindi di autovalutazione e di eventuale benchmark) che altrimenti richiederebbero risorse non disponibili.

Per i regolatori, emergeranno evidenze empiriche sulle prassi di rendicontazione di sostenibilità in atto, sulle aree coperte e su quelle ancora deboli, con utili indicazioni per l'implementazione della normativa correlata.

Per il mondo accademico, il progetto offre un contributo scientifico originale, riportando al centro del dibattito il tema della reportistica volontaria delle PMI e del suo ruolo nella trasparenza e nella creazione di valore. Il ruolo delle intelligenze aziendali e digitali sarà in tal senso discusso. Per gli esperti coinvolti nei focus groups sarà l'occasione di influenzare il dibattito,

contribuendo a definire non solo lo stato attuale della reportistica, ma anche ciò che "dovrebbe" essere comunicato dalle imprese. Inoltre, il progetto offrirà un momento di confronto unico tra accademici, practitioners, aziende e regolatori.

In aggiunta alle precedenti considerazioni, si evidenzia che il progetto intende offrire contributi anche su altri due fronti tra loro connessi.

Da un punto di vista teorico, questo progetto sviluppa e propone all'attenzione del dibattito un framework integrato atto a coniugare le teorie sulla qualità dell'informazione aziendale con la prospettiva delle intelligenze (organizzative e artificiali) di cui al Call for Papers del convegno AIDEA. In aggiunta, il progetto fornisce una base concettuale utile per definire cosa si intenda per qualità della disclosure di sostenibilità nelle PMI, ambito finora non particolarmente trattato dalla dottrina.

Da un punto di vista metodologico, il progetto sviluppa e testa un approccio operativo composito atto all'analisi della qualità dei report di sostenibilità delle PMI, articolando la proposta in molteplici parti. Innanzitutto, il progetto elabora una griglia di analisi dei report di sostenibilità delle PMI prendendo avvio da quanto previsto dallo standard VSME (EFRAG, 2024). In secondo luogo, il progetto introduce e successivamente discute le potenzialità di un approccio metodologico "ibrido" uomo-macchina (ovvero uso dell'IA congiuntamente al controllo ed alla validazione esperta da parte del team di ricerca umano) per la valutazione dei report, auspicabilmente migliorando efficienza e replicabilità del processo così avanzato. Infine, il progetto permette di elaborare un indice sintetico di qualità (o rating) del sustainability reporting aziendale, atto anche a supportare analisi longitudinali e comparazioni settoriali.

5.2. Risultati preliminari

Essendo un work-in-progress, i risultati al momento disponibili non possono che definirsi parziali. Le prime analisi, condotte su un sottoinsieme limitato di report, indicano un livello di allineamento ai requisiti VSME definibile medio, con maggiore aderenza per quanto riguarda gli elementi inseriti nel modulo Base rispetto a quello Comprehensive.

In merito all'uso dell'Intelligenza Artificiale come metodo di indagine, i risultati preliminari forniscono diversi feedback. Il primo è relativo alle potenzialità dell'IA come metodo di esplorazione dei report di sostenibilità delle aziende: senza dubbio, lo strumento si rileva potenzialmente di interesse, in primis, per le aziende e, poi, per le diverse categorie di stakeholders interessati. La seconda riflessione attiene ad eventuali problematiche legate direttamente all'uso dell'IA, tra le quali richiamiamo la necessità di prompts estremamente specifici e dettagliati e una variabilità non trascurabile nei record estratti.

Nel loro complesso, pur ribadendo ancora che si tratta di output intermedi e suscettibili di cambiamento futuro, i risultati sinora disponibili evidenziano che il metodo qui presentato ha potenzialità di utilizzo non indifferenti, per di più con vantaggi che possono essere chiaramente distinti per tutte le diverse categorie di attori coinvolti e/o interessati a questo processo.

Il prosieguo del progetto permetterà certamente di ottenere risultati maggiormente dettagliati e di approfondire tutte le considerazioni appena menzionate.

6. Conclusioni

6.1. Considerazioni conclusive

Nel suo complesso, la ricerca intende stimolare una riflessione più ampia sul ruolo delle aziende nella transizione verso modelli sostenibili. In questo quadro, il reporting aziendale, lungi dall'essere un mero adempimento burocratico, diventa attore primario del processo, configurandosi come un processo cognitivo che permette all'organizzazione di "conoscere se stessa" e, quindi, di autovalutarsi, allo stesso tempo aprendosi al confronto ed al giudizio esterno per dialogare attivamente con il contesto socio-economico di riferimento e la Società nel suo insieme.

In questa chiave, e riprendendo il tema del Convegno AIDEA, l'intelligenza aziendale è interpretabile come una consapevole capacità riflessiva e comunicativa che deve essere

patrimonio delle nostre aziende. Se presente (o creata e successivamente allenata), tale capacità si concretizzerà nella qualità dell'informazione prodotta, preziosa a fini sia interni che esterni.

La qualità del reporting, in tal senso, non è solo il risultato finale - ovvero l'output desiderato - del processo di analisi, autovalutazione e comunicazione delle informazioni, bensì la variabile chiave di esso, eventualmente esprimibile anche in modo aggregato e diretto tramite l'utilizzo di appositi indicatori sintetici o rating.

In sintesi, il lavoro qui presentato si propone di contribuire al dibattito accademico incentrato sulla trasformazione del reporting aziendale in ambito di sostenibilità. I potenziali benefici per una serie di soggetti (PMI, regolatori, mondo accademico, esperti coinvolti) che abbiamo richiamato in una precedente sezione sono testimonianza della rilevanza di questo tema, da un punto di vista sia teorico che operativo.

6.2. Limitazioni e ricerca futura

Essendo un "work-in-progress", la ricerca presenta alcuni limiti, ad iniziare dal fatto che alcune sue fasi sono ancora in corso di svolgimento.

In aggiunta a questo, va rilevato che il panel esplorativo di imprese attualmente analizzato, ancora ridotto, non consente di ottenere inferenze statistiche robuste, ma solo delle indicazioni che potrebbero definirsi sostanzialmente qualitative.

Ulteriormente, va notato che il tema della valutazione della "qualità" dei report di sostenibilità rimane tuttora aperto al dibattito accademico ed operativo: anche questo progetto conferma che tale valutazione rimane in parte soggettiva, pur se mitigata dall'uso di pesi e dal supporto fornito da esperti. Lo stesso standard VSME risulta, del resto, ancora in parziale discussione e, come di consueto nel richiedere ed identificare ampi set di indicatori di sostenibilità (e.g., Roca e Searcy, 2012), alcune modifiche al set di informazioni e KPIs suggeriti potrebbero aggiungersi in futuro.

Essendo il progetto ancora in corso, una parte delle sue fasi deve ancora essere conclusa. In particolare, l'uso dei pesi e lo sviluppo del rating sono due step al momento in via di realizzazione. Aggiuntivamente, e come ricordato in una precedente sezione, in prospettiva può prevedersi anche un'ulteriore fase di analisi qualitativa tesa allo sviluppo di alcuni case studies su un sottoinsieme di imprese, così da comprendere in profondità i meccanismi organizzativi che generano una disclosure di qualità, nonché per triangolare i risultati quantitativi e rafforzare la validità costruttiva del modello (Yin, 2009; Patton, 2014). Questa estensione del progetto sarà anche fondamentale per comprendere il ruolo giocato dalle micro-foundations (Busco et al., 2024) citate in questo paper.

Sintetizzando, alcune ipotesi di sviluppo futuro della ricerca comprendono i seguenti aspetti:

- l'estensione del dataset utilizzato per le analisi, eventualmente tramite la considerazione di settori di attività aggiuntivi a quelli finora considerati (ovvero, agri-food e moda);
- l'approfondimento qualitativo tramite lo studio di case studies longitudinali, eventualmente anche in ottica comparativa;
- la verifica del modello di analisi qui presentato in contesti internazionali;
- la costruzione di una piattaforma digitale per la valutazione automatizzata della disclosure di sostenibilità aziendale in collaborazione con enti di ricerca, software house e/o associazioni di categoria.

Parole chiave: Sostenibilità; reporting; VSME; qualità

Sostenibilità e management accounting: evoluzioe dei sistemi di controllo nel Gruppo Ferrovie dello Stato Italiane (2014–2023)

Marialuigia Di Giampietro[1], Barbara Iannone[2]

1. Introduzione

In un contesto caratterizzato da conflitti armati, cambiamenti climatici, pandemie e crescenti disuguaglianze sociali, le imprese sono chiamate a sviluppare competenze capaci di sostenere apprendimento organizzativo, reattività e capacità di mitigazione. In tale scenario, risulta fondamentale investire in sistemi di performance management solidi ed efficienti, in grado di supportare le strategie aziendali (Broccardo et al., 2024) e orientare le organizzazioni verso una gestione più consapevole e attenta alle dinamiche di medio-lungo termine.

Negli ultimi decenni, la ricerca nel campo del management accounting ha subito una trasformazione significativa. L'approccio tradizionale, focalizzato sul controllo dei costi e sul supporto alle decisioni economico-finanziarie, è stato progressivamente superato, spostandosi verso una prospettiva strategica e multidimensionale, nella quale la sostenibilità ha assunto un ruolo sempre più centrale (Varma et al., 2024; Mancini et al., 2016). Storicamente, la contabilità direzionale si concentrava su costi, efficienza produttiva e redditività, supportando la pianificazione e il controllo di breve periodo (Anthony & Govindarajan, 2007). Con il passare del tempo, tuttavia, tale approccio si è rivelato insufficiente nel rappresentare in modo adeguato gli impatti ambientali, sociali e di governance (ESG – Environmental, Social and Governance), i quali incidono in maniera significativa sulla capacità delle imprese di generare valore sostenibile nel lungo periodo (Gibassier & Schaltegger, 2015). Parallelamente, le crescenti pressioni di natura normativa, sociale e di mercato hanno incentivato le organizzazioni ad adottare forme di contabilità direzionale sostenibile, finalizzate a integrare indicatori non finanziari e metriche ESG all'interno dei processi di pianificazione, controllo e decisione strategica (Bebbington & Larrinaga, 2014; Schaltegger et al., 2019).

In questo contesto si è affermato il paradigma del Sustainable Management Accounting (SMA), inteso come l'insieme di pratiche, strumenti e processi contabili volti a supportare decisioni strategiche che integrano, in modo sinergico, le dimensioni economica, ambientale e sociale (Burritt & Saka, 2006). Il SMA rappresenta, pertanto, un'evoluzione del tradizionale management accounting, orientato non solo alla misurazione della performance interna, ma anche alla creazione di valore condiviso (Kramer & Porter, 2011) attraverso una gestione responsabile delle risorse ed un monitoraggio continuo degli impatti generati dalle attività aziendali. Esso consente una maggiore integrazione tra performance economico-finanziarie ed ESG, rafforzando la governance della sostenibilità e migliorando trasparenza e accountability (Johri et al., 2024; Naciti et al., 2022). In questa prospettiva, la contabilità direzionale assume un ruolo proattivo, supportando la transizione verso modelli di business sostenibili (Contrafatto & Burns, 2013; Mancini et al., 2023; Zhen & Rahman, 2024; He et al., 2023; Karim et al., 2023; Nguyen et al., 2023). La crescente attenzione alla sostenibilità ha inoltre portato a ripensare i sistemi di misurazione della performance, includendo indicatori non finanziari e orizzonti temporali più

ampi: linee guida internazionali, come i Global Reporting Initiative (GRI) Standards, hanno consolidato il principio di trasparenza nella rendicontazione. Il modello GRI si è affermato come standard di riferimento predominante, in quanto offre un quadro sistematico, completo e comparabile per la comunicazione delle performance di sostenibilità (Afolabi et al., 2023; van Oorschot et al., 2024). Il Sustainability Reporting costituisce uno strumento essenziale per informare le parti interessate sulle attività e le politiche aziendali in materia ambientale, sociale e di governance (ESG), consentendo di comunicare in modo trasparente e strutturato l'impegno dell'organizzazione nella creazione di valore sostenibile (Broccardo et al., 2025). Dunque, l'uso di strumenti multidimensionali assolve l'arduo compito di creare valore sostenibile attraverso l'allineamento tra obiettivi economico-finanziari, ambientali e sociali.

Il presente lavoro si concentra sul settore dei trasporti, con particolare riferimento al comparto ferroviario, ritenuto un contesto empirico rilevante per analizzare la transizione verso modelli di gestione sostenibile. Il Gruppo Ferrovie dello Stato Italiane (FS), principale operatore nazionale, rappresenta un caso di studio significativo. Attraverso il proprio Report di Sostenibilità, pubblicato annualmente, il gruppo rende disponibili dati strutturati e comparabili relativi alle performance ambientali, sociali ed economiche. L'analisi longitudinale di tali informazioni consente di osservare l'evoluzione delle performance, degli impatti e delle pratiche di rendicontazione. Inoltre, permette di comprendere come i principi di sostenibilità siano stati progressivamente integrati nei sistemi di governance, nei processi decisionali e nelle attività operative. Il caso FS offre quindi un esempio concreto di applicazione del SMA in un settore ad alta intensità infrastrutturale, contribuendo alla comprensione del ruolo dei sistemi di controllo nell'istituzionalizzazione della sostenibilità.

Nonostante i progressi teorici, la letteratura presenta ancora alcune lacune empiriche. In primo luogo, molti studi adottano approcci cross-sectional o coprono periodi limitati, trascurando una prospettiva longitudinale capace di cogliere i processi evolutivi di integrazione degli ESG (Schaltegger & Burritt, 2017). In secondo luogo, risultano ancora limitate le evidenze relative a settori ad alta intensità infrastrutturale e a forte rilevanza pubblica, come quello del trasporto pubblico ferroviario italiano. Infine, il legame tra sviluppo del sustainability reporting e trasformazione dei sistemi interni di pianificazione e controllo rimane poco esplorato, soprattutto in termini di integrazione effettiva degli indicatori ESG nei processi decisionali e, ancor più sentitamente, nei collegamenti tra dichiarazioni, decisioni e azioni (Larrinaga & Bebbington, 2021; Cho et al., 2015).

Alla luce di tali criticità, emerge la necessità di studi empirici longitudinali che analizzino come le organizzazioni integrino progressivamente la sostenibilità nei sistemi di management accounting, evidenziando eventuali disallineamenti tra strategie dichiarate e performance reali.

2. Obiettivi e domande di ricerca

L'obiettivo del presente studio è quello di analizzare l'evoluzione dei sistemi di rendicontazione ed in particolare, in ottica di sostenibilità, per il Gruppo FS nel periodo 2014–2023, con particolare riferimento alla capacità dell'organizzazione di adattarsi alle sfide del periodo. Attraverso l'esame dei trend decennali di specifici indicatori riportati nei report di sostenibilità, la ricerca mira a fornire una valutazione empirica dell'integrazione progressiva di indicatori riferiti alle dimensioni ambientali, sociali ed economiche nei meccanismi di misurazione e controllo aziendale. È importante precisare che si tratta di un primo studio, limitato a un numero iniziale di variabili analizzate, ma che costituisce il punto di partenza per futuri approfondimenti.

In particolare, lo studio si propone di:

- analizzare l'evoluzione delle performance sociali, ambientali ed economiche del Gruppo FS nel periodo considerato;

- esaminare la relazione tra tali cambiamenti e lo sviluppo dei sistemi interni di pianificazione e controllo, con l'obiettivo di comprendere come il requisito della sostenibilità sia stato incorporato nei processi gestionali;
- indagare il ruolo della contabilità direzionale quale strumento di integrazione strategica nella creazione di valore economico e sostenibile, contribuendo alla transizione verso modelli di corporate governance orientati alla sostenibilità.

Alla luce di tali considerazioni, il presente studio si prefigge di rispondere alle seguenti domande di ricerca:

RQ1: in che modo evolvono nel tempo i principali indicatori di sostenibilità (ambientali, sociali ed economici) del Gruppo FS nel periodo 2014–2023??

RQ2: in che misura i cambiamenti osservati negli indicatori ESG riflettono un progressivo processo di integrazione della sostenibilità nei sistemi di pianificazione e controllo, in linea con i principi del SMA?

RQ3: quali evidenze emergono, dall'analisi congiunta dei dati quantitativi e delle disclosure narrative, in merito al grado di allineamento tra strategie di sostenibilità dichiarate e performance effettivamente conseguite?

Queste domande di ricerca guidano lo studio verso una riflessione più ampia sul ruolo del management accounting quale leva strategica per la sostenibilità e l'innovazione organizzativa.

3. Metodologia

La presente ricerca adotta un approccio longitudinale, basato sull'analisi sistematica dei Report di Sostenibilità pubblicati dal Gruppo FS nel periodo 2014–2023. Tale impostazione metodologica si ispira al paradigma della content analysis applicata alla disclosure di sostenibilità, strumento largamente utilizzato negli studi di management accounting e di corporate sustainability reporting per indagare l'evoluzione dei modelli informativi aziendali (Gray et al., 1995; Guthrie et al., 2006; Michelon et al., 2015). L'adozione di un approccio longitudinale consente di esaminare la traiettoria temporale dei principali indicatori ESG, evidenziando la coerenza e la progressiva integrazione delle dimensioni ambientali, sociali ed economiche nel sistema di controllo direzionale (Bebbington et al., 2001; Burritt & Schaltegger, 2010). L'analisi dei dati quantitativi e qualitativi, finalizzata a individuare pattern evolutivi ed eventuali discontinuità, consente di interpretare l'evoluzione ESG come riflesso dell'apprendimento organizzativo e dell'integrazione progressiva del management accounting sostenibile (Cho et al., 2012).

I risultati quantitativi sono stati triangolati con le informazioni narrative dei report (policies, strategie, obiettivi) per valutare la coerenza tra le dichiarazioni strategiche ed i risultati di performance: viene dunque adottata una qualitative content interpretation (Bouten et al., 2011; Adams & McNicholas, 2007). Inoltre, tale impostazione metodologica è coerente con la prospettiva del SMA, secondo cui la contabilità direzionale deve supportare la pianificazione e la misurazione delle performance sostenibili nel medio-lungo periodo (Schaltegger & Burritt, 2017).

La scelta di un caso singolo (Gruppo FS) si fonda sull'approccio di case study research (Yin, 2018; Eisenhardt, 1989), poiché consente di approfondire il legame dinamico tra strumenti di controllo e processi di sostenibilità in un contesto complesso e strategicamente rilevante per l'economia nazionale. Il focus su un arco temporale decennale permette di cogliere l'evoluzione non solo delle metriche, ma anche del linguaggio contabile e dei modelli di governance sostenibile (Ahrens & Chapman, 2006) negli studi di management accounting. Gli autori hanno analizzato, in questa prima fase dello studio, solo alcuni dei principali indicatori rappresentati all'interno delle tre dimensioni della sostenibilità:

- Area ambientale (focus su efficienza energetica e gestione dei rifiuti):
  - emissioni totali di CO2 (dirette e indirette);
  - rifiuti prodotti.
- Area sociale (focus sullo sviluppo del capitale umano, l'inclusione ed il benessere organizzativo):

- giornate di formazione dei dipendenti;
- presenza delle donne nei vari incarichi lavorativi;
- tasso di assenteismo.

- Area economica (focus sulla performance finanziaria e "redistributiva"):
  - valore economico generato;
  - valore economico distribuito.

I dati sono stati estratti e normalizzati, ove necessario, per consentire la comparabilità nel tempo. La ricerca è stata suddivisa in tre fasi:

- ricostruzione dei trend temporali: mediante analisi grafica si sono valutati i tassi di crescita o calo;
- interpretazione qualitativa dei trend: mediante le strategie e le politiche aziendali dichiarate nei report;
- discussione integrata dei risultati: valutazione del grado di allineamento con i principi del SMA.

In definitiva, questo approccio metodologico è stato guidato da ragioni legate alla disponibilità continua nel periodo analizzato, alla loro rilevanza rispetto alla letteratura sul sustainability reporting ed infine alla capacità di rappresentare dimensioni chiave del SMA.

4. Principali risultati

4.1. Performance ambientale

L'analisi dell'area ambientale restituisce un quadro caratterizzato da un'evoluzione non pienamente lineare. Le emissioni complessive di CO_2 del Gruppo FS, sia dirette che indirette, mostrano in effetti una riduzione non costante nel tempo. In numerosi esercizi, in particolare negli anni più recenti, si rileva una dinamica di sostanziale stabilità o di lieve incremento, riconducibile in parte all'ampliamento dei volumi operativi, all'estensione dei servizi offerti e alla crescita della domanda di mobilità. Tale andamento evidenzia come, pur in presenza di interventi di efficientamento energetico e di iniziative orientate alla decarbonizzazione, il Gruppo non abbia ancora conseguito risultati strutturali nella diminuzione delle emissioni totali.

In altri termini, la transizione ecologica è effettivamente in atto, ma gli effetti delle politiche ambientali implementate si manifestano in modo più graduale rispetto ai progressi conseguiti in altri ambiti. Alcuni indicatori disaggregati mostrano comunque lievi segnali di miglioramento: la quota di energia elettrica da fonti rinnovabili appare in crescita e, parallelamente, si registra un incremento della produttività energetica (misurata, ad esempio, in emissioni per ricavo o per passeggero-chilometro). Ciò testimonia l'esistenza di progressi riconducibili ad una maggiore efficienza operativa complessiva.

Per quanto concerne la gestione dei rifiuti, i dati disponibili delineano un'evoluzione tendenzialmente più favorevole: la quota di rifiuti avviati a recupero o riciclo risulta in crescita, mentre si riduce il ricorso alle tradizionali modalità di smaltimento. Tale andamento riflette una maggiore attenzione verso la circolarità dei materiali e l'adozione di procedure di monitoraggio più rigorose, in coerenza con gli obiettivi descritti nel Piano Industriale e con gli indirizzi della normativa ambientale europea. Nonostante ciò, la produzione complessiva di rifiuti si mantiene su livelli rilevanti, anche in ragione della complessità infrastrutturale e dell'impatto generato dai numerosi interventi di manutenzione e di nuove costruzioni.

Nel complesso, la performance ambientale del Gruppo FS evidenzia l'esistenza di un sistema di rilevazione e controllo solido, pur mostrando la necessità di tradurre più compiutamente le strategie delineate in risultati concreti e strutturali di riduzione delle emissioni. Dal punto di vista del management accounting, tale situazione mette in luce l'opportunità di integrare in modo ancor più stringente gli obiettivi ambientali nei sistemi di pianificazione e controllo, affinché la

sostenibilità ambientale si configuri come una reale variabile di performance e non soltanto come un obiettivo programmatico.

4.2. Performance sociale

L'analisi dei dati ha evidenziato un progressivo consolidamento dell'impegno sociale del Gruppo FS, come dimostrato da alcuni trend significativi, ad esempio: l'aumento delle giornate di formazione, la crescita della presenza femminile nei diversi livelli organizzativi e la graduale, seppur non del tutto lineare, riduzione del tasso di assenteismo. Particolarmente rilevante è l'incremento medio annuo delle giornate di formazione pro capite, che segnala la volontà del Gruppo di investire sul capitale umano quale leva strategica di competitività e sostenibilità. A partire dal 2018, è emersa un'accelerazione riconducibile all'implementazione di programmi orientati alla digitalizzazione, alla sicurezza e alla sostenibilità ambientale. Questo andamento suggerisce che il sistema di management accounting del Gruppo FS abbia progressivamente integrato "nuovi" indicatori nei meccanismi di misurazione e reporting, nello specifico sulla formazione, consentendo un monitoraggio più accurato sia della quantità sia della qualità degli interventi formativi realizzati.

Parallelamente, la presenza femminile ha registrato un miglioramento progressivo, sia nelle posizioni operative sia, in misura crescente, nei ruoli dirigenziali e di maggiore responsabilità. Tale andamento sottolinea un processo di inclusione strutturale all'interno del Gruppo, in linea con i contenuti del Piano Industriale e con le politiche europee in materia di parità di genere. Inoltre, l'aumento della rappresentanza femminile costituisce un indicatore della più ampia trasformazione culturale e organizzativa associata ai principi della sostenibilità, capace di valorizzare la diversità come risorsa strategica, sia sul piano economico sia su quello sociale.

Infine, il tasso di assenteismo mostra un miglioramento progressivo lungo l'intero decennio, con una flessione leggermente più pronunciata a partire dalla fine del 2017. Tale dinamica può essere ricondotta a condizioni di sicurezza più elevate, a un aumento della soddisfazione lavorativa e all'implementazione di politiche di welfare aziendale maggiormente inclusive. La riduzione dell'assenteismo risulta inoltre coerente con una crescente attenzione del management al benessere organizzativo, ormai divenuto un elemento imprescindibile nelle organizzazioni. Nel complesso, i trend sociali analizzati delineano un'evoluzione verso un modello gestionale che riconosce le variabili umane come componenti fondamentali della performance aziendale.

Alla luce di quanto è emerso, il management accounting si è progressivamente evoluto nell'includere indicatori sociali tesi ad orientare le decisioni strategiche in ambito formativo, inclusivo e di welfare, contribuendo così a una visione più integrata e sostenibile della gestione d'impresa.

4.3. Performance economica

L'analisi del valore economico generato mostra una crescita complessiva nel periodo considerato, con un'unica flessione significativa nel biennio 2020-2021, attribuibile chiaramente all'impatto della pandemia da Covid-19 e alle conseguenti restrizioni, tra cui la riduzione della domanda di mobilità ferroviaria. A partire dal 2022, il trend ha ripreso un andamento crescente, sostenuto sia da investimenti infrastrutturali sia dall'attuazione di strategie di diversificazione.

Per quanto riguarda il valore economico distribuito agli stakeholder, quali dipendenti, fornitori, azionisti, comunità e Stato, si è potuto appurare che esso si sia mantenuto coerente con la dinamica crescente del valore generato, con una quota progressivamente più elevata destinata a salari e benefit per i lavoratori, nonché a imposte ed a investimenti in infrastrutture pubbliche. Tale distribuzione evidenzia una gestione orientata a criteri di equità e di condivisione del valore, in linea con i principi della shared value theory, secondo cui la creazione di valore economico risulta sostenibile soltanto se accompagnata da benefici diffusi per la collettività.

Sotto il profilo contabile, la correlazione positiva tra valore generato e valore distribuito indica che il Gruppo ha progressivamente incorporato logiche di value-based management accounting, nelle quali la performance finanziaria è interpretata non più esclusivamente in termini di redditività per l'azionista, ma anche in relazione al contributo complessivo fornito agli stakeholder.

5. Conclusioni e valore della ricerca

L'analisi dei report di sostenibilità del Gruppo FS nel periodo 2014–2023 consente di formulare considerazioni conclusive relative alle tre domande di ricerca inizialmente formulate, delineando un percorso di sostenibilità in consolidamento, seppur ancora caratterizzato da margini di miglioramento, soprattutto sotto il profilo ambientale.

Rispetto alla RQ1, i principali indicatori di sostenibilità esaminati rivelano che la performance del Gruppo FS si è evoluta in modo significativamente positivo nelle dimensioni sociali ed economiche, mentre l'area ambientale rivelerebbe una dinamica più eterogenea. Sul piano sociale, si registra un rafforzamento strutturale nella gestione del capitale umano: l'aumento delle giornate di formazione pro capite, la progressiva crescita della presenza femminile nei diversi livelli organizzativi e la riduzione dell'assenteismo indicano un processo di maturazione verso modelli gestionali più inclusivi e orientati al benessere dei lavoratori. L'area economica presenta un andamento stabile e crescente, con un valore economico generato e distribuito che mostra resilienza anche nei periodi di shock (come la pandemia), confermando la capacità dell'impresa di sostenere la rete di stakeholder attraverso politiche redistributive coerenti e continuative. L'area ambientale, invece, fa emergere le maggiori criticità: le emissioni di CO_2 mostrano un andamento altalenante e non testimoniano un processo di riduzione sistematica. Questo risultato evidenzia le difficoltà intrinseche nel decarbonizzare un settore infrastrutturale complesso e ad alta intensità energetica. Tuttavia, segnali positivi emergono negli ambiti della gestione dei rifiuti e dell'efficienza energetica, dove si osservano miglioramenti progressivi, sebbene non ancora sufficienti a generare un impatto complessivo significativo.

In relazione alla RQ2, i cambiamenti osservati confermano che il Gruppo FS stia gradualmente evolvendo verso un modello di SMA, sebbene tale processo risulti maggiormente consolidato nelle dimensioni sociali ed economiche rispetto a quelle ambientali. In effetti, nelle prime due aree, gli indicatori di performance sono chiaramente integrati nei sistemi di pianificazione e controllo, con evidenze di monitoraggio continuo, rendicontazione strutturata e misurazione dell'impatto. La presenza di KPI relativi a formazione, inclusione, welfare e valore economico redistribuito testimonia un livello avanzato di maturità degli strumenti di accounting sociale ed economico. La dimensione ambientale, tuttavia, evidenzia una distanza ancora significativa tra intenzioni strategiche e risultati conseguiti. La difficoltà nel tradurre le iniziative ambientali in metriche contabili solide, omogenee e integrabili nei sistemi di controllo sottolinea una delle sfide cardine del SMA. È evidente la necessità di sviluppare sistemi informativi in grado di rappresentare in modo più accurato i trade-off tra obiettivi economici, riduzione delle emissioni e investimenti in tecnologie pulite. L'attuale livello di integrazione è dunque promettente, ma ancora in fase di consolidamento.

Rispetto alla RQ3, dall'analisi condotta si evidenziano significative implicazioni per la governance aziendale e per la rendicontazione integrata. I risultati mostrano che il Gruppo FS gode, senza dubbio, di una struttura di governo che riconosce la sostenibilità come elemento strategico, ma la piena integrazione nei processi decisionali richiede ulteriori sviluppi. Il rafforzamento dei meccanismi di accountability, l'allineamento tra strategia e misurazione dell'impatto e la trasparenza nei confronti degli stakeholder emergono come elementi centrali per garantire un'effettiva creazione di valore sostenibile. Per consolidare tale percorso, parrebbe necessario:

- includere sistematicamente KPI ambientali nei sistemi di budgeting e controllo;

- misurare gli impatti reali (e non solo potenziali) delle politiche di sostenibilità;
- integrare maggiormente indicatori ESG nei processi di valutazione delle performance manageriali;
- rafforzare la rendicontazione integrata come strumento di comunicazione e di accountability strategica.

Questo studio contribuisce alla letteratura sul SMA evidenziando che l'integrazione degli indicatori ESG nei sistemi di controllo non segue un percorso lineare, ma presenta dinamiche differenziate tra dimensioni ambientali, sociali ed economiche. Il contributo appena enunciato può essere meglio illustrato soffermandosi su tre principali direttrici. In primo luogo, offre un contributo empirico originale mediante un'analisi longitudinale decennale (2014–2023) dei report di sostenibilità del Gruppo FS, consentendo di osservare l'evoluzione degli indicatori ESG (seppur solo di alcuni) ed il loro grado di integrazione nei sistemi di controllo. In secondo luogo, contribuisce alla letteratura sul management accounting evidenziando come l'adozione di pratiche di sustainability reporting si traduca, in misura differenziata, in cambiamenti nei meccanismi di pianificazione e controllo. In altri termini, si mette in luce un percorso di maturazione non lineare, caratterizzato da asimmetrie tra dimensioni ambientali, sociali ed economiche. In terzo luogo, lo studio fornisce implicazioni teoriche e manageriali, mostrando come, in contesti infrastrutturali complessi, la transizione verso modelli di accounting sostenibile richieda non solo l'introduzione di nuovi indicatori, ma anche una profonda riconfigurazione dei sistemi informativi e dei processi decisionali, al fine di integrare efficacemente la sostenibilità come driver strategico di creazione di valore nel lungo periodo. Nel complesso, la ricerca mostra che la sostenibilità nel Gruppo FS è un processo graduale, in continua evoluzione. Gli strumenti di accounting e controllo stanno modificandosi per incorporare dimensioni non finanziarie, ma la piena maturità del sistema richiede un ulteriore allineamento tra strategia, operatività e misurazione. La vera sfida che emerge da questo studio è che occorrerà non solo ridurre le emissioni di CO_2, ma trasformare la sostenibilità in un driver decisionale, capace di influenzare scelte economiche, investimenti e strutture organizzative. I risultati suggeriscono che l'integrazione delle dimensioni ESG nei sistemi di controllo di gestione si sviluppa in modo non uniforme, evidenziando differenze tra le diverse dimensioni della sostenibilità. Tali evidenze indicano la necessità di ulteriori sviluppi nei modelli di Sustainable Management Accounting, al fine di favorirne una più piena integrazione nei processi decisionali aziendali.

Il disegno di ricerca presenta alcune limitazioni. In primo luogo, l'adozione di un caso singolo limita la generalizzabilità dei risultati, sebbene consenta un'analisi approfondita del contesto studiato. In secondo luogo, l'utilizzo esclusivo di dati secondari, derivanti dai report aziendali, può riflettere logiche di disclosure strategica e non necessariamente rappresentare in modo completo le dinamiche interne ai processi decisionali. Infine, la selezione di un numero limitato di indicatori, seppur rappresentativi, non consente di cogliere l'intera complessità delle dimensioni ESG.

Alla luce di tali limitazioni, futuri studi potrebbero ampliare il perimetro empirico attraverso analisi comparative multi-caso e l'integrazione di dati primari, nonché adottare prospettive longitudinali più estese e set di indicatori ESG più articolati, al fine di colmare le lacune evidenziate e approfondire i meccanismi di integrazione del Sustainable Management Accounting nei processi decisionali aziendali.

Parole chiave: Sustainable management accounting; ESG performance; sustainability reporting; management control systems; longitudinal analysis

Ringraziamenti

Le autrici desiderano esprimere il proprio sincero ringraziamento agli organizzatori del XLI Convegno Nazionale AIDEA – 2026, svoltosi a Milano nelle giornate del 22 e 23 gennaio 2026, nonché ai revisori anonimi ed ai discussant che hanno preso parte all'evento, in generale, e alla sessione di presentazione del presente lavoro, nello specifico. I preziosi commenti e suggerimenti ricevuti hanno contribuito in modo significativo al miglioramento del contributo, offrendo al contempo nuovi spunti di riflessione e di approfondimento. Alcune di tali indicazioni sono state già recepite nella versione attuale del lavoro, mentre altre costituiranno oggetto di futuri sviluppi di ricerca sul tema.

Incompletezza e uso abilitante delle misure di Customer Accounting: evidenze da un'impresa del largo consumo

Armando Della Porta [1], Giacomo Zatini[2], Luca Ianni[3]

1. Introduzione

Le misure di performance sono dispositivi selettivi: rendono alcune dimensioni comparabili e quindi agibili per decidere, valutare e coordinare. Proprio perché parziali e contestabili, possono sostenere apprendimento oppure alimentare gaming, a seconda di come vengono introdotte, rese trasparenti, discusse e collegate ai meccanismi di controllo. La letteratura su enabling/coercive control mostra infatti che la stessa infrastruttura di misurazione può sostenere un'esecuzione intelligente della strategia oppure trasformarsi in un dispositivo coercitivo quando la pressione valutativa è elevata e la misura viene trattata come verità non negoziabile (Adler e Borys, 1996; Jordan e Messner, 2012; Wouters e Wilderom, 2008).

Questa ambivalenza diventa particolarmente visibile nell'attuale transizione customer-centric, che spinge le imprese a quantificare il cliente e a tradurre relazioni, canali, servizi e condizioni commerciali in performance misurabile per cliente o segmento (Vaivio, 1999). In molti contesti la risposta dominante è stata aumentare la granularità e la complessità del calcolo per avvicinarsi a una customer profitability "completa". Tuttavia, dove l'interdipendenza tra canali e servizi è alta e la pressione competitiva e promozionale è intensa, la completezza resta un orizzonte problematico: crescono convenzioni allocative discutibili, opacità, instabilità delle regole e conflitti interpretativi, con il rischio che la metrica diventi base di giudizio punitivo più che supporto al giudizio.

La customer accounting (Bonacchi e Perego, 2019) rappresenta così un setting rivelatore di un problema più generale dei sistemi di performance measurement e management. Non perché l'incompletezza sia peculiare di questo dominio, ma perché qui il trade-off tra "calcolo" e "governo" emerge con particolare forza. La letteratura più orientata alla customer profitability analysis ha mostrato che la CPA può aiutare a identificare clienti non profittevoli e a riallocare risorse verso segmenti più promettenti (Shapiro et al., 1987; Cooper e Kaplan, 1991; McManus e Guilding, 2008), e che il suo grado di sofisticazione varia in funzione di caratteristiche dei clienti, strutture di costo e relazioni di supply chain (Lind e Strömsten, 2006; Holm et al., 2012; Lueg e Ilieva, 2024). In questa prospettiva, la domanda implicita è quando convenga aumentare la sofisticazione del calcolo.

Una linea più critica mette invece in luce cosa accade quando misure inevitabilmente incomplete vengono usate sotto forte pressione valutativa. Da un lato, possono legittimare decisioni miopi, come l'esclusione di clienti che risultano "non redditizi" nei numeri ma restano strategici per accesso al mercato, economie di scopo o apprendimento. Dall'altro, possono innescare resistenze culturali e politiche, conflitti interfunzionali e progetti di customer profitability analysis che si arrestano prima di diventare strumenti di gestione (Boyce, 2000; Lind e Strömsten, 2006; Fish et al., 2017). Queste evidenze chiariscono il rischio, ma lasciano meno

sviluppata un'altra domanda: non quanto raffinare la CPA, bensì come progettare le condizioni del suo uso in modo che l'incompletezza resti governabile e non si trasformi né in coercizione né in motivo per rinviare l'adozione.

In questo lavoro spostiamo dunque l'attenzione dal perfezionamento tecnico della misura al design istituzionale del suo uso, cioè a diritti, regole, trasparenze e livelli di pressione valutativa che rendono governabile l'incompletezza nelle routine decisionali (Bonacchi e Perego, 2019; 2024). Per rispondere a questa domanda adottiamo il framework di Adler e Borys (1996). Un indicatore è abilitante quando la sua formalizzazione incorpora proprietà che ne rendono possibile comprensione, contestazione e adattamento nell'uso. E' coercitivo quando si impone come standard opaco e unilaterale. A supporto di questa lettura, attingiamo a contributi che mostrano perché gli indicatori funzionano nella pratica: come visualizzano tensioni, come diventano persuasivi nelle arene di review, e come misure deliberatamente parsimoniose possano mobilitare conoscenza locale proprio perché restano contestabili (Catasús e Gröjer, 2006; Catasús et al., 2016; Goretzki et al., 2016; Vaivio, 2004).

Empiricamente, studiamo un singolo caso in una consociata del largo consumo che, sotto forte pressione promozionale, riprogetta la propria architettura di KPI. Invece di avviare una CPA completa, l'impresa introduce una proxy verificabile, il fatturato unitario per cliente/canale, affiancata da quota di mercato e da un set minimo di indicatori sentinella, e investe soprattutto nelle condizioni d'uso: alfabetizzazione economico-contabile, diritti procedurali di contestazione, finestre di stabilità delle regole e un collegamento agli incentivi intenzionalmente moderato. L'analisi non mira a validare la proxy come misura esaustiva della redditività del cliente, ma a chiarire i meccanismi che rendono una misura incompleta una base praticabile di decisione e, simmetricamente, le condizioni che limitano una deriva coercitiva. Il contributo consiste quindi nel proporre un modello trasferibile di customer accounting in action, in cui non è la completezza la risposta, ma il governo istituzionale dell'incompletezza che segnala una precondizione di intelligenza decisionale.

2. Disegno di ricerca e selezione del caso

Il caso, che chiamiamo "Pharmastore", è stato selezionato intenzionalmente come caso critico e strumentale (Eisenhardt, 1989; Scapens, 1990; Pettigrew, 1990; Yin, 2018; Lukka e Modell, 2010). Si tratta di una consociata italiana del largo consumo caratterizzata da tre condizioni che la rendono teoricamente feconda: forte esposizione alla pressione promozionale della GDO, transizione esplicita da KPI volumetrici a KPI customer-centrici, e riconoscimento ex ante dei rischi di deriva coercitiva e gaming connessi alla quantificazione del cliente. In questo contesto, la customer accounting è usata come setting rivelatore non perché "speciale" in sé, ma perché rende immediatamente osservabile un problema più generale: come misure inevitabilmente parziali diventino basi praticabili di decisione e coordinamento senza irrigidirsi in dispositivi punitivi.

Il caso singolo è coerente con l'obiettivo del paper di ricostruire processualmente come una metrica viene prodotta, messa in circolazione e ricevuta nelle arene decisionali, cioè la dinamica production–transmission–reception che spesso resta inesplorata quando gli indicatori vengono trattati come output tecnici (Catasús e Gröjer, 2006). La generalizzazione perseguita è analitica, non statistica (Yin, 2018): ciò che intendiamo rendere trasferibile è un insieme di meccanismi di design e uso che governa l'incompletezza, non la configurazione contingente dell'impresa.

Il framework di Adler e Borys (1996) è utilizzato come ossatura per distinguere formalizzazione abilitante e coercitiva. Le quattro proprietà sono trattate come criteri empiricamente osservabili nel redesign dei KPI. La riparabilità riguarda la possibilità di correggere errori e controversie senza dover aggirare la regola. La trasparenza interna riguarda l'intelligibilità della logica del calcolo, cioè assunzioni, driver, confini e status della misura. La trasparenza globale riguarda invece la comprensione del contesto più ampio in cui la misura opera,

quindi le interdipendenze con altri obiettivi, vincoli e trade-off. Infine, la flessibilità riguarda la possibilità di adattare la misura e le sue regole di uso senza arbitrarietà, preservando al tempo stesso credibilità e confrontabilità.

Coerentemente con Jordan e Messner (2012), trattiamo l'incompletezza come condizione strutturale delle misure. L'oggetto empirico non è stabilire se la proxy sia "vera", ma come la formalizzazione costruisca o eroda contestabilità e credibilità, e quindi quando la misura resti infrastruttura di giudizio invece di diventare autorità non negoziabile. Accanto a questa ossatura, impieghiamo alcuni concetti sensibilizzanti per interpretare perché certe scelte di formalizzazione contino nella pratica: la hope of action e l'ambivalenza riflessiva/ingenua degli indicatori (Catasús et al., 2016), la persuasiveness come esito situato nelle arene di valutazione (Goretzki et al., 2016), la provocativeness delle misure non finanziarie (Vaivio, 2004), e le dinamiche di visualizzazione, classificazione e drammatizzazione degli indicatori (Catasús e Gröjer, 2006).

La raccolta dati, sviluppata nell'arco di circa due anni, copre le fasi di diagnosi, progettazione e implementazione della nuova architettura di misure. Combiniamo interviste semi-strutturate con soggetti chiave della funzione commerciale, del trade marketing, del controlling e della direzione; osservazioni dirette di workshop e percorsi formativi; fonti documentali, come regole di calcolo, materiali di training, reportistica, minute operative e output di dashboard; e dati quantitativi interni, usati non per testare relazioni causali ma per corroborare la ricostruzione processuale e gli esiti organizzativi osservati. Questa pluralità di fonti è coerente con l'obiettivo di osservare non solo la metrica, ma il lavoro organizzativo che la rende utilizzabile nelle routine (Ahrens e Chapman, 2006; Yin, 2018).

L'analisi è stata iterativa, con un continuo andirivieni tra dati e quadro teorico (Pettigrew, 1990; Lukka e Modell, 2010). In una prima fase abbiamo codificato episodi relativi alle criticità dei KPI tradizionali, alle scelte di produzione della proxy, alle modalità di trasmissione e alle modalità di ricezione. In una seconda fase tali codifiche sono state rilette sistematicamente alla luce delle quattro proprietà della formalizzazione abilitante per identificare configurazioni specifiche di diritti, regole e pressioni valutative che stabilizzano un uso orientato a giudizio e apprendimento, oppure innescano derive verso coercizione e gaming. La credibilità dell'inferenza è sostenuta da triangolazione tra fonti, ricostruzione processuale della sequenza di cambiamento e focalizzazione sulle arene in cui i numeri vengono discussi e resi operativi, più che sulla sola architettura tecnica (Scapens, 1990; Ahrens e Chapman, 2006; Yin, 2018).

3. Il caso Pharmastore

Il caso riguarda la filiale italiana di un gruppo multinazionale del largo consumo, attiva sia in GDO/drugstore sia nel canale farmacia/specialty. Negli ultimi anni la pressione promozionale nella GDO si intensifica: sconti fuori fattura, fee crescenti, allestimenti dedicati e consegne frazionate aumentano i volumi ma comprimono il prezzo medio e aggravano i costi di servizio. Nel canale farmacia, invece, pur con volumi più contenuti, si osservano maggiore disponibilità a pagare, processi più lineari e minori costi di assistenza. In un workshop interfunzionale svolto a fine 2023 emerge in modo netto una tensione che incrina il framework volumetrico e che tornerà nelle review successive: a fronte di volumi spediti in crescita, il margine netto resta quasi piatto. L'aumento dei volumi è ottenuto tramite sconti e contributi promozionali che abbassano il prezzo medio e fanno crescere i costi di servizio. Continuare a governare la performance con KPI centrati sui volumi significa quindi legittimare azioni che fanno crescere solo consumando valore.

Da qui la decisione di riprogettare l'architettura dei KPI e, soprattutto, il regime d'uso con cui la performance viene interpretata e discussa. Il punto decisivo non è introdurre semplicemente un nuovo numero, ma costruire una misura capace di rendere visibile un trade-off ricorrente: la crescita che crea valore versus la crescita che lo distrugge. In questo senso, il caso consente di osservare non soltanto la nascita di una proxy, ma anche le condizioni organizzative che ne rendono l'uso praticabile.

La filiale sceglie deliberatamente di non partire da una customer profitability analysis completa per singolo cliente. Una CPA completa richiederebbe una tracciabilità e convenzioni allocative non ancora disponibili, soprattutto per sconti off-invoice, contributi promozionali, fee, costi di servizio e materiali POP imputati a livelli aggregati. Ancora più importante, una CPA completa rischierebbe di diventare subito una base di giudizio individuale, aumentando la probabilità di uso coercitivo e gaming. Il trade-off, quindi, non è tra "misura precisa" e "misura approssimativa", ma tra una sofisticazione tecnica innestata in un contesto ancora centrato sui volumi e ad alta pressione valutativa, e una proxy incompleta ma verificabile, capace di riorientare la lettura del portafoglio dai volumi ai clienti e di creare i prerequisiti per governare una maggiore granularità futura.

L'impresa introduce così una proxy parsimoniosa e controllabile: il fatturato unitario per cliente/canale, inteso come prezzo medio effettivamente realizzato per unità, cioè come effetto combinato di sconti, contributi e mix. La proxy è presentata come dispositivo diagnostico, non come profitto del cliente. Serve a rendere discutibile una domanda ricorrente nelle review: stiamo espandendo quota di mercato erodendo valore? Per evitare l'aura di esaustività, vengono esplicitati da subito assunzioni, componenti economiche e limiti di validità, e nella fase iniziale si esclude un uso individualizzante sotto forma di ranking. Questa scelta costruisce trasparenza interna in senso abilitante: la metrica viene trattata come convenzione leggibile, non come output tecnico autoevidente.

La proxy è letta congiuntamente ad altri indicatori: la quota sul mercato di riferimento e un set ristretto di indicatori sentinella, come resi, time-to-cash, proxy dei costi di servizio e livelli di servizio logistico. Le sentinelle non completano la profittabilità: impediscono piuttosto che la proxy venga ottimizzata contro il sistema. Una promozione può far salire quota di mercato e volumi ma comprimere il prezzo medio; se nello stesso periodo aumentano i resi o si allungano gli incassi, il miglioramento apparente dei volumi nasconde un deterioramento della qualità del ricavo. La lettura integrata non blocca l'azione, ma rende il trade-off non eludibile e obbliga a una discussione informata sulle conseguenze.

Per rendere la proxy una base praticabile di decisione, la direzione avvia la "Value Academy", un percorso formativo stabile per vendite, trade marketing e finance. L'obiettivo non è semplicemente spiegare un numero, ma costruire un linguaggio comune su cosa costituisce il ricavo effettivo, dove si collocano nei conti materiali POP, fee digitali e contributi volantino, e quali costi di servizio siano strutturali oppure dipendano da richieste specifiche del cliente. Il training lavora su documenti reali, come fatture, note di addebito e report resi, e su micro-casi che mostrano come promozioni ad alta visibilità aumentino i volumi ma comprimano il prezzo medio, mentre lanci premium in canali meno promozionati riducano leggermente i volumi ma migliorino il ricavo unitario mantenendo sotto controllo le sentinelle.

Questa fase è centrale per la trasparenza globale. La metrica non viene isolata, ma inserita in un quadro di interdipendenze tra promozione, prezzo medio, servizio, incasso e resi, che consente agli attori di collegare il proprio segmento di performance agli effetti sul sistema più ampio. Le esercitazioni sono progettate per usare quota e fatturato unitario anche ex ante, nelle negoziazioni, nei piani promozionali e nelle decisioni di assortimento, spostando l'uso del numero da pagella ex post a strumento di progettazione e coordinamento.

Parallelamente vengono definite regole d'uso pensate per stabilizzare la persuasività della proxy senza trasformarla in autorità indiscutibile. Tre scelte risultano decisive. Primo, i dati sono visibili a livello cliente/canale, ma si evita la trasformazione immediata in classifiche individuali. Secondo, viene istituzionalizzato un diritto procedurale di contestazione dei dati, con tempi, modalità e responsabilità codificati e con risposta attesa da parte di Sales Finance. Terzo, vengono introdotte finestre di stabilità delle regole di calcolo: eventuali modifiche entrano in vigore solo dall'inizio del periodo successivo, per evitare che la metrica diventi un bersaglio mobile.

Queste scelte operazionalizzano il repair. Quando la misura non torna, il sistema non costringe gli attori ad aggirare la regola o a difendersi informalmente, ma offre canali e procedure

per correggere errori, gestire eccezioni e trasformare controversie in apprendimento organizzativo. Un episodio è particolarmente istruttivo. In un trimestre il fatturato unitario riferito a una grande catena GDO scende nettamente. Il responsabile vendite attiva la contestazione allegando un piano promozionale approvato ex ante che prevedeva un prezzo più basso in cambio di esposizione a scaffale. Sales Finance quantifica l'effetto atteso e il comitato interfunzionale formalizza una regola generale per trattare promozioni analoghe nei report futuri. In questo modo il segnale non viene né spento né trasformato in colpa: viene reso interpretabile e generalizzabile, riducendo lo spazio sia per difese opportunistiche sia per gaming.

Solo dopo avere costruito linguaggio comune, contestabilità e stabilità delle regole, la filiale collega quota e fatturato unitario al sistema incentivante. Il peso del nuovo KPI sul bonus individuale è limitato e introdotto per gradi. Eventuali incrementi sono subordinati ad alcuni trimestri di apprendimento e a una lettura congiunta con le sentinelle. Questa gradualità operazionalizza la flessibilità in senso abilitante: la metrica può essere adattata e incorporata nel controllo senza arbitrarietà, preservando comparabilità e credibilità e riducendo il rischio che l'indicatore diventi una leva forte capace di incentivare distorsioni.

Nel confronto tra GDO e farmacia, l'architettura produce esiti distinti e discussioni più informate. In GDO, strategie basate su forti sconti possono alzare la quota ma abbassare il fatturato unitario e peggiorare resi e incassi. La parte variabile non premia automaticamente il risultato apparente, perché viene filtrato dalle sentinelle e dalle regole di interpretazione. Nel canale farmacia, anche in assenza di crescita dei volumi, l'aumento del fatturato unitario e il controllo delle sentinelle rendono visibile la qualità del ricavo, legittimando scelte commerciali orientate al valore. L'indicatore struttura l'attenzione e la conversazione manageriale, ma non è usato in modo così forte da rendere convenienti comportamenti distorsivi.

A circa diciotto mesi dall'avvio, le misure che avevano reso visibile la frattura iniziale restituiscono un quadro diverso. Volumi e margini si muovono in modo più coerente, il divario tra margine a budget e margine effettivo si riduce e gli scostamenti risultano più spiegabili lungo l'anno. Il controllo del margine diventa un processo continuo: monitorando mensilmente quota e fatturato unitario per cliente/canale, l'erosione del prezzo medio viene intercettata in corso d'opera, non solo a posteriori. Inoltre, la lettura del portafoglio cambia. Il contributo del canale farmacia, marginale nella narrazione per soli volumi, emerge come rilevante in termini di valore grazie a prezzi meno esposti alla pressione promozionale, minori richieste di servizi extra e mix più alto di gamma, inducendo un riequilibrio dei piani commerciali tra GDO e farmacia. In parallelo, marketing, vendite e finanza lavorano sugli stessi numeri e spostano il confronto dalla legittimità del KPI alle conseguenze economiche delle alternative decisionali, usando la proxy come base comune di argomentazione.

In sintesi, pur senza disporre ancora di una CPA completa per singolo cliente, una misura intenzionalmente semplice e incompleta, ma resa leggibile, contestabile, collegata alle interdipendenze di sistema e adattata in modo controllato, produce tre esiti rilevanti: maggiore tempestività nella gestione del margine, emersione di aree di valore sistematicamente trascurate dalla lettura per volumi, e cooperazione interfunzionale più efficace. Solo a valle di questo percorso vengono affrontati i mattoni informativi necessari per eventuali evoluzioni verso una customer profitability più raffinata, evitando di anticipare una sofisticazione tecnica che, in assenza delle condizioni istituzionali costruite, rischierebbe di attivare dinamiche coercitive.

4. Discussione e conclusioni

Il caso Pharmastore mostra che il miglioramento della qualità decisionale non dipende dall'introduzione di un conto economico esatto per cliente, ma dalla costruzione di regole e pratiche che rendono utilizzabile una proxy parziale: comprensibile nelle sue assunzioni, contestabile quando non torna, e capace di orientare le decisioni senza ridursi a una pagella. Questa lettura è coerente con l'idea che gli indicatori non descrivano semplicemente la realtà, ma

la rendano selettivamente visibile e quindi gestibile attraverso pratiche di visualizzazione e classificazione. Il valore informativo non è solo nella formula, ma anche nel modo in cui il numero viene prodotto, diffuso e interpretato nelle arene decisionali (Catasús e Gröjer, 2006).

Un primo risultato teorico consiste nello spostare l'attenzione dall'accuratezza alla teoria dell'indicatore in uso. Nel caso Pharmastore, la forza della proxy non deriva dalla completezza, ma dal suo disegno come dispositivo euristico e revisionabile. Il numero orienta, ma resta correggibile quando non torna, comprensibile nelle sue assunzioni, collegabile ai trade-off di sistema e sufficientemente stabile da preservare confrontabilità e credibilità nel tempo. Ne deriva che la qualità di una misura non può essere valutata solo in termini di fedeltà rappresentativa: conta anche la sua capacità di sostenere un uso intelligente sotto condizioni di incertezza e di incompletezza.

Un secondo risultato riguarda la persuasività dei numeri e la hope of action. I numeri diventano influenti non quando sono veri in astratto, ma quando risultano persuasivi per gli attori in una specifica situazione. Nel caso, la persuasività del fatturato unitario non è data: viene costruita attraverso alfabetizzazione, regole di visibilità, procedure di contestazione e una stabilità sufficiente delle regole di calcolo. Questo sposta l'attenzione dalla metrica come output alla metrica come *framing device*. Allo stesso tempo, il caso mostra che l'ambivalenza degli indicatori non va eliminata inseguendo un verdetto definitivo, ma governata progettando condizioni che rendano produttiva la speranza di azione associata al misurare: sentinelle, uso incentivante moderato, diritti di contestazione e finestre di stabilità.

Un terzo risultato riguarda la capacità delle misure di mobilitare conoscenza locale e coordinamento interfunzionale. Alcuni indicatori sono utli non perché chiudono il giudizio, ma perché rendono espliciti assunti, trade-off e causalità operative, inducendo gli attori a portare nel confronto informazioni che altrimenti resterebbero disperse o tacite (Vaivio, 2004). Nel caso Pharmastore, quota e fatturato unitario non sono solo strumenti di monitoraggio: diventano basi comuni di coordinamento nelle review, mettendo in relazione decisioni promozionali, condizioni commerciali, costi di servizio e tempi di incasso. In questo senso, l'impresa non si limita ad adottare un KPI customer-centric, ma riorganizza il lavoro interpretativo e le regole del confronto nelle arene decisionali.

Il lavoro presenta naturalmente alcuni limiti. I risultati provengono da un singolo caso in un contesto specifico, segnato da alta pressione promozionale e dualità di canale. La trasferibilità è quindi analitica: riguarda i meccanismi osservati, non la performance numerica né una particolare architettura di KPI. Ricerche future potrebbero confrontare contesti in cui la contestazione degli indicatori è più o meno legittimata; identificare condizioni di confine, come peso degli incentivi, turnover manageriale o qualità dei dati, che spostano l'uso verso forme più abilitanti o più coercitive; e seguire nel tempo la sostituzione di proxy semplici con misure più complete, osservando se e quando riemergono derive coercitive. In sintesi, il contributo del paper è spostare il focus dalla ricerca di completezza alla progettazione dell'uso: non basta misurare; occorre rendere l'informazione comprensibile, contestabile e azionabile nei luoghi in cui orienta le decisioni.

Parole chiave: Customer accounting; enabling control; performance measurement; incomplete performance indicators; customer-centricity

Exploring Human–AI Collaboration for Managerial Control in the Italian Healthcare Sector

Riccardo Camilli [1], Gaia Buttaroni[2], Vincenzo Sforza[3]

1. Introduction

Over the past decade, the Italian healthcare system has faced increasing pressures to improve efficiency, transparency, and responsiveness in the use of resources (Boffardi, 2022; De Belvis et al., 2024; Ricciardi and Tarricone, 2021). The growing complexity of healthcare data—ranging from clinical records to administrative and financial information—has made managerial control an increasingly knowledge-intensive activity (Abbas, 2025; Brescia et al., 2025; Bose, 2003). Within this scenario, Artificial Intelligence (AI) is emerging as a transformative tool capable of supporting controllers by automating data analysis, detecting anomalies, and generating predictive insights (Brescia et al., 2025; Camilli et al., 2024; Jarrahi, 2018). The integration of AI tools, however, does not simply entail technological innovation but calls for a redefinition of roles, competencies, and collaboration patterns between human controllers and intelligent systems (Bankins et al., 2024; Berente et al., 2021; Lämmermann et al., 2024). Indeed, despite the potential of AI to improve decision accuracy and speed, its integration into managerial control systems within healthcare remains limited and fragmented (Abbas, 2025; Broccardo et al., 2024; Roppelt et al., 2024). Traditional control processes often rely on retrospective data and manual interpretation, leading to delays and inconsistencies, especially in contexts where information is incomplete or ambiguous (Camilli et al., 2024; Jarrahi, 2018; Li et al., 2024). Nevertheless, controllers in healthcare management must frequently operate under uncertainty, facing both data scarcity and interpretive conflicts between clinical and administrative perspectives (Conrad, 2011; Han et al., 2011; Shi et al., 2025). These challenges reveal a gap between the availability of AI-based analytical tools and their actual use in supporting managerial reasoning. The adoption of AI thus raises critical questions about the boundaries of human judgment, the reliability of algorithmic insights, and the ability of controllers to leverage these systems without losing interpretive authority or contextual understanding (Busuioc, 2021; Wubineh et al., 2024).

The relevance of studying AI in healthcare managerial control extends beyond technological efficiency: it touches upon the governance, accountability, and sustainability of healthcare systems (Brescia et al., 2025; Shi et al., 2025). The healthcare sector is characterized by both high informational density and institutional complexity, making it a prime context to observe how human–AI collaboration can shape organizational learning and decision quality (Jarrahi et al., 2023; Kolbjørnsrud, 2024; Nair et al., 2024).

Furthermore, the strategic role of controllers— as mediators between data and decisions— makes them key actors in determining how AI tools are integrated into existing control architectures (Berlinski and Morales, 2024; Granlund and Lukka, 1998; Szukits, 2022).

[1] Ricercatore, ECON-06/A, Università degli Studi della Tuscia; riccardo.camilli@unitus.it – corresponding author

[3] Professore ordinario, ECON-06/A, Università degli Studi della Tuscia; vincenzo.sforza@unitus.it

Understanding the opportunities and risks of AI-supported control is thus essential to ensure that technological innovation reinforces, rather than undermines, professional judgment and value creation (Abbas, 2025; Kolbjørnsrud, 2024; Meijerink and Bondarouk, 2023).

However, studies on AI adoption in management control have largely focused on private and industrial organizations or have examined the topic through a technical lens (Agostino et al., 2022; Broccardo et al., 2024; Makarius et al., 2020). Few empirical works have explored how healthcare controllers perceive and interpret AI in their daily activities, particularly when operating under conditions of uncertainty, complexity, and equivocality (Koufteros, et al., 2005; Petersson et al., 2022; Shi et al., 2025). Moreover, current models of digital transformation often assume rational and data-driven decision processes, underestimating the interpretive and relational dimensions of controllers' work (Jarrahi, 2018; Lindebaum et al., 2020). This gap substantiates a need to understand how AI can complement, rather than substitute, humans in healthcare control functions. Addressing this gap requires a qualitative, context-sensitive approach capable of capturing both the technical and organizational implications of human–AI collaboration in judgment and decision-making environments typical of healthcare.

To address this gap, this study investigates how controllers of an Italian regional healthcare system perceive the advantages and limitations of AI across three distinct judgment and decision-making scenarios: uncertainty, complexity, and equivocality. Specifically, the research seeks to answer the following overarching question:

RQ: How can human–AI collaboration support managerial control in healthcare?

The study operationalizes this question through three sub-questions aligned with each scenario: (1) how AI supports controllers when data are incomplete or inconsistent; (2) how AI supports controllers when data are complex; and (3) how AI supports controllers in negotiation and consensus when multiple interpretations of the same data coexist. These questions guide both data collection and thematic analysis of open-ended responses from healthcare controllers.

To explore these research questions, the study employs a qualitative approach based on open-ended questionnaires administered to thirty managerial controllers across the Veneto healthcare system. The respondents were invited to reflect on specific scenarios corresponding to uncertainty, complexity, and equivocality, and to describe the perceived benefits and risks associated with AI tools in each case. Thematic analysis is used to identify patterns of reasoning and common perceptions across the sample (Braun and Clarke, 2006). Preliminary interpretations suggest that AI is viewed as a promising but ambivalent ally— capable of improving data reliability and analytical capacity, yet also raising concerns about interpretive transparency, contextual understanding, and professional autonomy. These emerging findings will form the basis for a more extensive discussion on the design of collaborative intelligence in healthcare control systems.

The expected contribution of this study lies in articulating how AI can reshape the epistemic and organizational boundaries of managerial control in healthcare. By analyzing how controllers interpret AI's role in uncertain, complex, and ambiguous contexts, the research provides theoretical insights into human–AI collaboration and practical guidance for digital transformation strategies. The study also aims to inform policymakers and regional authorities on the governance conditions necessary to foster responsible AI adoption in health systems. In doing so, it contributes to a broader reflection on how automation and human judgment can coexist productively, ensuring that technological innovation strengthens accountability, decision transparency, and the quality of healthcare service delivery. These implications highlight the potential of AI as both a technical and institutional driver of change.

2. Methodology

This study adopts a qualitative, exploratory design aimed at capturing the perceptions and expectations of managerial controllers regarding the integration of AI tools in the Veneto

healthcare system. The choice of an open-ended questionnaire, rather than structured interviews or surveys, is motivated by the need to allow respondents to express their reasoning freely, using their own professional language and examples (Brancato et al., 2006; Hansen and Świderska, 2024). This approach aligns with the study's interpretive objective: understanding how human actors make sense of technological possibilities and constraints in their everyday control activities.

The questionnaire includes three open-ended questions, each corresponding to a distinct judgment and decision-making scenario (as in Jarrahi, 2018): uncertainty, complexity, and equivocality.

- Scenario 1 (Uncertainty): Respondents reflect on how AI tools—such as real-time analytics, machine learning, and estimation algorithms—can assist controllers' analysis when data are incomplete, delayed, or inconsistent.
- Scenario 2 (Complexity): Respondents reflect on how AI tools can assist controllers' analysis when integrating and interpreting complex data and diverse data sources (clinical, administrative, and financial).
- Scenario 3 (Equivocality): Respondents consider how AI tools, such as sentiment analysis or decision-support systems, might facilitate controllers' work to build dialogue and consensus when different stakeholders interpret data differently.

Participants are 30 controllers employed in various healthcare units and local health authorities within the Veneto region, selected through purposive sampling to ensure representation across organizational levels and functions. Participation is voluntary and anonymized, in line with ethical research standards (World Medical Association, 2001).

The regional context provides an appropriate empirical setting, given Veneto's advanced digital infrastructure and its active experimentation with data-driven management practices.

Firstly, themes will deductively group controllers' responses around the three scenarios of uncertainty, complexity, and equivocality (Jarrahi, 2018). Secondly, the answers are deductively split into two halves for each scenario, enabling a comparison of perceived key value drivers and critical issues associated with AI tools implementation (Alhakami and Slovic, 1994). Finally, the open-ended responses will be analyzed through thematic content analysis, following the structured coding process of Braun and Clarke (2006). The textual data will be examined inductively to identify recurring patterns, key concepts, and salient metaphors used by participants.

This dual inductive–deductive approach allows the researcher to balance openness to emergent insights with the interpretive guidance of the theoretical framework. The analysis will focus on identifying both instrumental and interpretive dimensions of AI adoption. Instrumental dimensions include perceived efficiency gains, improved accuracy, and data accessibility. Interpretive dimensions, instead, concern issues such as trust in AI-generated outputs, role redefinition, accountability, and the preservation of professional judgment (Busuioc, 2021). By comparing these two dimensions across the three scenarios, the study aims to capture how controllers negotiate the balance between automation and human oversight in decision processes. While qualitative and exploratory, this methodology offers valuable insights into how practitioners conceptualize and anticipate AI's impact before its full implementation. The open-ended nature of the questionnaire ensures that respondents' reflections are grounded in concrete managerial experiences while remaining flexible enough to reveal cognitive and emotional undercurrents in their reasoning. The thematic synthesis will be presented in the form of scenario-based narratives, highlighting both convergent and divergent views among participants. Ultimately, this methodological design enables the study to contribute to the understanding of AI adoption not merely as a technological process but as an interpretive, organizational, and cultural phenomenon. The findings will thus inform both academic debates on human–AI collaboration and practical discussions on the governance of AI in healthcare control systems.

3. Expected findings

Although data collection and analysis are ongoing, several expected patterns can be anticipated based on preliminary readings and the theoretical framework. The study is expected to reveal that controllers perceive AI as a conditional enabler rather than a universal solution. In contexts of uncertainty, AI tools are likely viewed as useful in providing estimates and early signals when traditional reporting is unavailable, yet controllers may express concern about the opacity of algorithmic logic and the risk of overreliance on incomplete data (Busuioc, 2021; Jarrahi, 2018; Lindebaum et al., 2020). This suggests that AI is valued for its capacity to expand informational reach, but not necessarily to replace human inference.

Under conditions of complexity, controllers are expected to emphasize AI's potential to integrate heterogeneous data flows—such as clinical performance indicators, cost accounting data, and resource utilization metrics. They may perceive this integration as improving analytical coherence and facilitating cross-departmental coordination. However, anticipated concerns include data interoperability, standardization issues, and the difficulty of validating AI-generated patterns against domain expertise (Li et al., 2024). In this scenario, AI is seen as a catalyst for analytical depth but still dependent on human contextualization.

In situations of equivocality, where multiple interpretations coexist, AI is expected to play an ambiguous role. Controllers may anticipate that tools like sentiment analysis or natural language processing could help identify differing viewpoints or highlight underlying consensus areas. Yet they may also question whether algorithmic mediation could depersonalize dialogue or reinforce existing biases (Camilli et al., 2024; Hristov et al., 2022; Li et al., 2024). Hence, AI might be perceived as both a facilitator and a potential disruptor of organizational communication.

Overall, the expected findings suggest that AI's legitimacy in managerial control depends on its perceived alignment with professional values such as transparency, accountability, and interpretive flexibility. Controllers are likely to frame AI not as a replacement for human decision-making, but as a cognitive partner that extends human capabilities in processing and framing information. The anticipated outcomes will thus offer a nuanced understanding of how controllers envision human–AI collaboration within the constraints of healthcare governance.

4. Potential implications

The potential implications of this study should be understood as emerging possibilities rather than definitive outcomes. Since data collection and analysis are ongoing, the discussion focuses on how the anticipated findings could inform theory, practice, and policy once empirical validation is completed. The exploratory nature of this research allows the identification of potential trajectories for how AI might reshape managerial control in healthcare—without presuming that such transformations will necessarily materialize in the short term.

From a theoretical perspective, this study has the potential to enrich ongoing debates on human–AI collaboration by offering a scenario-based framework that differentiates between uncertainty, complexity, and equivocality. While existing research tends to treat AI as a homogeneous enabler of decision quality, the proposed approach could demonstrate that its contribution varies according to the informational conditions under which decisions are made (Haesevoets et al., 2025; Kleinberg et al., 2015; Li et al., 2024). This analytical distinction may help refine conceptual models of managerial control, suggesting that collaboration between human judgment and algorithmic analysis is context-dependent rather than universally beneficial. Such theoretical refinement could pave the way for a more contingent understanding of AI use in management control systems, integrating technological affordances with interpretive and institutional logics (Broccardo et al., 2024; Seidel et al., 2025).

Furthermore, the study could stimulate new research directions on the cognitive and organizational mechanisms underlying human–AI interaction. By observing how controllers

articulate trust, skepticism, or ambivalence toward AI, future research might examine how perceptions of technological agency evolve as systems become more embedded in daily routines. These insights could contribute to theories of sensemaking, professional identity, and control by revealing how individuals negotiate meaning when confronted with algorithmic partners. The anticipated findings might thus inspire longitudinal or comparative studies across sectors, exploring whether similar interpretive dynamics arise in other public or private contexts (Haesevoets et al., 2025; Shi et al., 2025).

From a managerial and organizational standpoint, several potential implications emerge. If the expected findings confirm that controllers perceive AI as a conditional enabler, organizations could explore ways to design collaborative decision environments where human and algorithmic inputs are balanced. This might include developing hybrid control dashboards that combine quantitative analytics with qualitative annotations, enabling controllers to contextualize AI-generated insights. Moreover, organizations could consider introducing decision protocols that explicitly define the boundaries of human oversight versus automated recommendation, thereby clarifying accountability in AI-supported processes (Haesevoets et al., 2025; Jarrahi et al., 2023; Kolbjørnsrud, 2024). While these ideas remain speculative, they illustrate how the insights generated by this research could inform the practical governance of AI in healthcare control systems.

The study could also highlight potential skill transformations within the profession of healthcare controllers. The anticipated reflections may suggest that successful AI adoption depends not only on technical competence but also on interpretive and communicative skills. This points to the possible emergence of a new professional profile—what could be termed the augmented controller—capable of mediating between data science and managerial sensemaking. Future training programs and capacity-building initiatives might therefore emphasize hybrid expertise, ethical awareness, and collaborative problem-solving. While these developments remain hypothetical, they represent plausible directions that organizations and policymakers could explore to prepare the workforce for AI-enabled control environments (Abbas, 2025; Camilli et al., 2024; Makarius et al., 2020).

At a policy level, the potential implications relate to how regional and national institutions might support responsible AI governance in healthcare. If the study's anticipated results confirm that trust, transparency, and interpretability are recurring concerns among controllers, policymakers could consider establishing guidelines or frameworks that promote explainable and ethically aligned AI systems. These frameworks could help organizations maintain accountability and safeguard professional autonomy while embracing data-driven innovation. However, such implications are prospective: they depend on the willingness of institutions to translate professional insights into regulatory or policy measures (Haesevoets et al., 2025; Hudson et al., 2019; Petersson et al., 2022). The study could thus serve as a foundation for dialogue between practitioners and policymakers about how to balance efficiency gains with ethical and social responsibility in AI adoption.

In addition, the research may open potential avenues for organizational learning. The scenario-based analysis could encourage healthcare authorities to view AI not merely as a technological investment but as a catalyst for collective reflection on decision processes. By framing uncertainty, complexity, and equivocality as distinct learning opportunities, organizations might use AI projects to experiment with new forms of cross-functional collaboration between clinicians, administrators, and data analysts. This learning potential could, in turn, foster a more adaptive and resilient control culture within the healthcare sector (Evenseth et al., 2022; Hristov et al., 2022; Shi et al., 2025). While these outcomes are not yet observable, they represent promising implications for institutional development.

Another potential implication concerns the ethical and epistemic dimensions of AI use. The anticipated findings could draw attention to questions about the ownership of knowledge, the boundaries of interpretation, and the legitimacy of algorithmic reasoning in healthcare-sector

judgment and decision-making. If controllers express concern about the opacity of AI or the dilution of human judgment, this could stimulate ethical debates about the nature of accountability in hybrid decision systems. Such reflections might eventually inform the design of educational programs, governance structures, or auditing mechanisms that ensure that AI complements rather than constrains human expertise (Haesevoets et al., 2025; Jarrahi, 2018).

Finally, from a methodological perspective, this study could demonstrate the value of open-ended, scenario-based questionnaires as tools for exploring professional reasoning about emerging technologies. This approach could inspire future scholars to adopt similar designs in different contexts, thereby expanding qualitative research on AI adoption beyond technical and performance-oriented paradigms. The method's potential lies in its capacity to reveal not only what professionals think about AI but also how they construct meaning around its role in their work. This interpretive richness could complement quantitative analyses and support the development of mixed-method frameworks capable of capturing the complexity of human–AI collaboration (Jarrahi, 2018; Nair et al., 2024; Shi et al., 2025).

In sum, the potential implications of this study are multidimensional and forward-looking. They do not represent established findings but rather plausible pathways that may emerge from the ongoing analysis. By exploring how AI could support managerial control under varying informational conditions, the research aims to stimulate academic discussion and practical experimentation in healthcare governance. Ultimately, the study seeks to open, rather than close, questions—inviting further inquiry into how human judgment, organizational learning, and technological intelligence can evolve together in shaping the future of managerial control.

Life Cycle Costing: limiti ed opportunità dell'integrazione nel Life Cycle Sustainability Assessment

Paola Vola[1], Giorgio Cantino[2]

1. Introduzione

In ambito economico-aziendale, la sostenibilità si configura come una strategia che, attraverso un approccio integrato, consente di armonizzare diverse dimensioni di performance, creando valore per l'intero insieme degli stakeholder, ovvero azionisti, comunità locali e il territorio, mantenendo una visione orientata all'equilibrio economico nel lungo termine.

Per adottare una condotta realmente sostenibile, le imprese devono sviluppare strategie, scelte organizzative e sistemi manageriali orientati alla sostenibilità che ne favoriscano un'efficace applicazione.

Ciò implica una ridefinizione del purpose aziendale, con un'apertura più marcata verso i diversi interlocutori (stakeholder capitalism) e l'adozione di un nuovo concetto di valore basato sulla prospettiva della condivisione (valore condiviso).

Il cambiamento di paradigma richiesto alle imprese è significativo e va ben oltre una lettura superficiale di temi ambientali, sociali e di governance (riassunti nel noto acronimo ESG). Esso richiede l'integrazione concreta di tali aspetti all'interno del modello di business aziendale per garantire la continuità nel tempo.

Il concetto di crescita economica, la quale presuppone un incremento della quantità di risorse consumate, lascia sempre più spazio al concetto di sviluppo sostenibile.

Il termine "sviluppo sostenibile", seppur molto diffuso, non presenta in letteratura una definizione univoca; Gibson (2010) ne sottolinea il carattere trasversale osservando come molte discipline abbiano influenzato e contribuito alla sua definizione, anche in maniera divergente.

Nel corso del tempo, questo concetto ha subito un'evoluzione significativa, adattandosi alle sensibilità della collettività emerse nel dibattito internazionale. Alcuni studiosi, (tra cui Bruynickx et al. 2012), lo descrivono come un contested concept, ovvero un'idea caratterizzata da una definizione ambigua e aperta a interpretazioni diverse.

Esso è strettamente connesso al concetto di sostenibilità, che frequentemente viene considerato come sinonimo.

Nell'ambito della presente analisi, lo sviluppo sostenibile può essere definito come un processo di cambiamento in cui l'utilizzo delle risorse, la direzione degli investimenti, lo sviluppo tecnologico e i mutamenti istituzionali risultano armonizzati rispetto alle esigenze future oltre che presenti. La sostenibilità, invece, rappresenta la capacità di un sistema di mantenersi nel tempo. In un contesto orientato allo sviluppo sostenibile, essa diventa l'elemento imprescindibile che caratterizza non solo il sistema economico, ma anche il suo interfacciarsi con i contesti sociali e ambientali in cui opera.

In tale contesto, lo studio dello sviluppo sostenibile richiede di affrontare questioni complesse associate a una vasta gamma di sistemi dinamici e interdipendenti (Boardman, and Sauser, 2008; Sanneh, 2018; Manioudis and Meramveliotakis, 2022).

[1] Professoressa associata, ECON-06/A, Università del Piemonte Orientale; paola.vola@uniupo.it – corresponding author

[2] Ricercatore, ECON-06/A, Università del Piemonte Orientale; giorgio.cantino@uniupo.it

Concetti quali interconnessione, resilienza, capacità di adattamento, auto-organizzazione e feedback sono centrali negli sforzi verso la sostenibilità globale (Williams at al., 2017).

Di conseguenza, i sistemi basati sulla misurazione della sostenibilità e i sistemi di supporto alle decisioni sono essenziali per la trasformazione verso una produzione e un consumo più sostenibili.

A tale fine è opportuno adottare un approccio integrato, "integrated thinking", in cui, gli obiettivi di creazione di valore vengono individuati coinvolgendo i vari stakeholder, la governance formula strategie aziendali che contemplano la sostenibilità, traducendo il tutto in coerenti modelli di business.

Questo passaggio è fondamentale per fare sì che la sostenibilità sia integrata a partire dalle decisioni strategiche, per poi essere incorporata nelle politiche aziendali e nei processi operativi.

La nozione di approccio integrato riprende quella di pensiero sistemico (Senge et al., 2010), in quanto individua nelle interdipendenze e nelle relazionali causali le ragioni di esistenza delle tensioni e dei trade-off.

Alcuni studiosi (Gray, 1992, 2010) hanno evidenziato come l'integrated thinking possa rappresentare uno strumento per gestire le tensioni tra i vari capitali in relazione alla strategia, all'allocazione delle risorse, alla misurazione e al controllo dei risultati.

Pertanto, in ottica di integrazione della sostenibilità nell'ambito del business, la performance deve essere considerata da tre punti vista, quello economica, ambientale e sociale. Si tratta, in sostanza, di una performance che si può definire integrata (Vola, 2025).

La prospettiva della performance integrata presuppone un'analisi accurata della catena del valore per identificare le aree di impatto, raccogliere dati e informazioni e tradurli in indicatori che possano essere utilizzati per definire le priorità e prendere decisioni strategiche.

Il Life Cycle Thinking (LCT) è un approccio che valuta gli impatti di un prodotto o servizio (ambientali, sociali ed economici) lungo l'intero suo ciclo di vita, dall'estrazione delle materie prime fino allo smaltimento.

Questo approccio considera gli impatti lungo l'intero ciclo di vita del prodotto o servizio in esame, tenendo conto di molteplici indicatori di sostenibilità che facilitano l'identificazione dei trade-offs; la metodologia LCT è ben consolidata nel contesto della sostenibilità (Pelletier et al., 2018).

Dal punto di vista operativo, la Life Cycle Sustainability Assessment (LCSA) (Kloepffer 2008) rappresenta un quadro di riferimento completo che integra le dimensioni ambientale, economica e sociale della valutazione di sostenibilità.

L'approccio tradizionale alla LCSA prevede che si combinino diverse tecniche di valutazione dell'impatto per tenere conto degli aspetti ambientali, sociali ed economici; in particolare si tratta di combinare Life Cycle Assessment (LCA), Life Cycle Costing (LCC) e la Social Life Cycle Assessment (SLCA) (Luthin et al., 2024) (Arulnathan et al., 2022).

Una delle principali sfide nella combinazione dei diversi approcci risiede nell'integrazione della valutazione in presenza di requisiti e scale di dati differenti.

L'obiettivo del presente lavoro è discutere l'integrazione della metodologia LCC nell'ambito della LCSA.

Per fare questo, si effettuerà una duplice analisi: nella prima parte del lavoro, si discuteranno i punti di forza e di debolezza della LCC come strumento adatto a valutare la dimensione economica in un contesto di performance integrata, mentre, nella seconda parte del lavoro, tale metodologia sarà testata empiricamente attraverso l'analisi di case study.

La metodologia di ricerca adottata sarà dunque mista, prevedendo l'analisi della letteratura in tema di LCC e LCSA, ed empirica, per quanto riguarda l'analisi dei casi studio.

La finalità del presente lavoro è, quindi, quella di fornire indicazioni teoriche circa l'utilizzo della LCC in ambito LCSA e suggerimenti pratici, relativi alla sua integrazione nella LCSA.

Lo studio condotto è organizzato come segue: una prima sezione è dedicata all'analisi della letteratura in tema di LCSA, nell'ambito della quale si evidenziano punti di forza e di debolezza

della LCC. Successivamente vengono valutate le possibili integrazioni al modello LCC tradizionale, mediante l'individuazione di misure più idonee a valutare la creazione di valore.

Una volta sintetizzato il framework di lavoro adeguato per la misurazione dell'aspetto economico della sostenibilità, intesa come creazione di valore, vengono definiti i parametri di scelta dei casi di studio nell'ambito dei quali valutare l'implementazione della LCC.

La parte successiva del lavoro propone le principali evidenze empiriche e teoriche rispetto all'implementazione della LCC nella LCSA.

Le conclusioni riconducono le evidenze discusse ai contributi teorici evidenziati, mettendo in luce il contributo della ricerca.

Di seguito si riportano le principali evidenze emerse dalla letteratura che rappresenta la base di partenza del lavoro di ricerca.

2. Literature review

Se è vero che i principali studiosi concordano circa il fatto che la LCC rappresenti il metodo di riferimento per la valutazione economica nella LCSA, è altrettanto riconosciuto il fatto che il suo focus esclusivo sui costi sia inefficace nel rappresentare i molteplici aspetti della sostenibilità economica (Arulnathan et al., 2022).

In particolare, le ricerche hanno evidenziato che il costo, considerato come indicatore isolato, non è in grado di rappresentare le complessità e le sfumature delle prestazioni economiche (Arulnathan et al., 2022), portando a richieste di framework di valutazione economica più completi (Wood and Hertwich, 2013).

In sostanza, si evidenzia il fatto che il costo del ciclo di vita non è, di per sé, un indicatore sufficiente per la dimensione economica nelle valutazioni di sostenibilità.

Allo stesso modo in cui l'impronta di carbonio deve essere integrata con la valutazione di altri impatti nella valutazione della sostenibilità ambientale, il LCC e l'aggregazione dei costi richiedono indicatori complementari per fornire una valutazione più completa della sostenibilità economica nella LCSA, inclusa l'identificazione di potenziali compromessi.

Sviluppi recenti sono andati oltre gli approcci tradizionali di LCC per incorporare molteplici categorie di impatto economico.

Secondo Heijungs et al. (2013), infatti, è necessario andare oltre la mera aggregazione di costi, valutando una varietà di impatti da punto di vista economico.

Alcuni lavori, i principali si ricordano quelli di Wood and Hertwich (2013) e Neugebauer et al. (2016), propongono di considerare sei principali categorie di impatto economico da integrare nella LCSA: redditività, continuità, produttività, innovazione, clienti e autonomia, ognuna delle quali rappresenta un aspetto significativo della sostenibilità economica.

Questa visione si propone di superare il limite principale della LCC, la quale, nella sua versione più tradizionale, non ha il respiro necessario per rappresentare accuratamente i vari fattori legati sia alla prosperità sia alla resilienza dei sistemi economici.

Redditività

Indicatori individuati:

- Cost efficiency
- Indicators of profit
- Net Present Value (NPV)
- Internal Rate of Return (IRR)
- Payback Period (PP)
- Return on Investment (ROI)
- Return on assets, costs and sales
- Gross operating surplus

Gli indicatori di redditività rappresentano gli indicatori economici più ampiamente utilizzati nella letteratura esaminata. Ciò riflette la priorità che le organizzazioni attribuiscono alla redditività in un sistema di mercato orientato alla crescita. Gli indicatori di redditività sono generalmente indicatori quantitativi, lagging, e qualsiasi indicazione sulla performance futura deriva dalla stima dei ricavi futuri.

Tutti gli otto indicatori di redditività sopra elencati sono relativamente adatti all'inclusione nell'LCSA rispetto alle altre categorie di impatto.

Tutti richiedono dati sui costi che possono essere raccolti nella fase di inventario di un LCC.

Un altro aspetto importante degli indicatori di redditività è la capacità di considerare l'impatto degli investimenti a lungo termine come infrastrutture, macchinari, ecc.

Indicatori in grado di fornire informazioni sulla redditività di tali investimenti possono essere molto utili nel processo decisionale. Quando si valutano progetti di miglioramento della sostenibilità, un indicatore come il rapporto costo-efficacia risulta più significativo rispetto al confronto tra costi.

La maggiore debolezza nell'utilizzo degli indicatori di redditività rimane l'incapacità di distribuire i ricavi tra attività specifiche all'interno di un processo produttivo o tra flussi specifici.

Continuità

Indicatori individuati
- Risk aspects
- Contribution to GDP/GNP
- Diversification
- Employee satisfaction
- Reliance on imports and contribution to exports

La continuità si riferisce alla capacità di un'azienda di rimanere in attività.

Gli indicatori si riferiscono agli aspetti legati al rischio, alla diversificazione, al contributo al PIL e alla soddisfazione dei dipendenti.

I rischi in questo contesto sono generalmente rischi economici. Questi includono i rischi di investimento (tassi di interesse, ecc.), rischi associati alla regolamentazione governativa (tasse, politiche salariali, ecc.), e rischi di mercato (saldi di consumo, comportamento dei consumatori, ecc.). Tuttavia, non sono non solo i rischi economici che le imprese affrontano, dal momento che esse sono esposte anche a rischi tecnici come cambiamenti nella tecnologia, nella sicurezza e nell'accesso alle risorse.

La varietà dei possibili rischi per qualsiasi attività economica significa che è impossibile evitarli. Di conseguenza, l'enfasi è posta sull' identificazione del maggior numero possibile di elementi di rischio utilizzando metodi di valutazione del rischio strutturati (Andersen, 2008; Sandøy et al., 2005).

Una delle strategie più comuni per affrontare i rischi è la diversificazione. Ciò include la diversificazione dei prodotti, delle fonti di reddito, dell'accesso ai mercati e delle tecnologie utilizzate.

Gli altri due indicatori di stabilità considerati sono il contributo al PIL/PNL e la soddisfazione dei dipendenti. Il monitoraggio del contributo al PIL è stato considerato come una misura di prestazioni stabili, mentre la soddisfazione dei dipendenti è legata a una maggiore fidelizzazione e produttività. La soddisfazione dei dipendenti, in particolare, è stata fortemente correlata alla performance e alla sostenibilità.

Produttività

Indicatori individuati:
- Capital productivity

- Labor productivity

Sono stati identificati due indicatori di produttività: la produttività del capitale e la produttività del lavoro.

Nella letteratura esaminata, il termine si riferisce costantemente al capitale fisso, rappresentato, per esempio, dalle infrastrutture e dai macchinari.

La produttività del capitale è un fattore importante nelle prestazioni economiche a diversi livelli economici ed è influenzata da fattori quali i cambiamenti tecnologici e la manutenzione.

Anche il legame tra produttività del lavoro e performance economica è estremamente affidabile e dipende da fattori quali la soddisfazione dei dipendenti, l'autonomia e gli investimenti nella crescita tecnologica e della conoscenza.

Tutti i dati per la misurazione della produttività del lavoro sono probabilmente disponibili dagli inventari di LCA, LCC e SLCA, mentre la produttività del capitale richiederà un'ulteriore raccolta di dati (Thomassen et al., 2009).

Innovation

Wood e Hertwich (2013) definiscono due tipi di innovazione: (1) innovazione che porta ad un aumento della produzione di un processo a parità di input (innovazione di processo) e (2) sviluppo di nuovi prodotti (innovazione di prodotto). Entrambi questi tipi di innovazione possono portare ad un miglioramento delle prestazioni economiche.

Questa categoria di impatto non ha un indicatore chiaramente definito, ma è stata ampiamente citata nella letteratura esaminata. L'indicatore dell'innovazione sembra essere in gran parte un numero (numero di brevetti, ecc.) che rappresenta le pratiche innovative implementate/sviluppate dall'organizzazione.

L'aspetto più interessante dell'innovazione è la sua connessione con gli altri impatti economici qui definiti. L'innovazione può portare a una crescita della soddisfazione dei clienti e a un aumento della quota di mercato. L'innovazione può portare alla diversificazione dei prodotti e dei mercati che, a sua volta, porta a una maggiore resilienza economica. È anche un motore consolidato della produttività, sia a livello microeconomico che macroeconomico (Howell and Picking, 2017).

L'innovazione può anche portare a una maggiore soddisfazione dei dipendenti grazie alla creazione di conoscenza e ai cambiamenti tecnologici nei luoghi di lavoro.

Di conseguenza, nonostante la mancanza di un indicatore definito, l'innovazione rappresenta una delle categorie di impatto economico più importanti (ed è un indicatore principale).

Se il numero di innovazioni/pratiche innovative viene utilizzato come indicatore, esso può essere applicato lungo tutto il ciclo di vita e a livello di attività o flussi specifici in un processo unitario.

Clienti

Indicatori individuati:

- Market share
- Customer satisfaction

Per questa categoria sono stati identificati due indicatori: la soddisfazione dei clienti e la quota di mercato.

Oltre ad aumentare la redditività, i clienti soddisfatti sono considerati sempre più fedeli, migliorando la redditività e la stabilità futura. Mentre la quota di mercato è un indicatore diretto, la misurazione della soddisfazione dei clienti offre informazioni prospettiche

La quota di mercato non viene utilizzata come misura assoluta, ma le variazioni della quota di mercato sono considerate indicative delle variazioni della soddisfazione dei clienti.

Autonomia

Indicatori individuati:
- Reliance on imports and contribution to exports
- Subsidies
- External finance
- Invested Operating Capital
- Capital productivity

L'autonomia si riferisce all'autosufficienza dei sistemi economici sia dal punto di vista fisico (risorse, beni) che monetario. I quattro indicatori di questa categoria riguardano la dipendenza dalle importazioni, dai sussidi, dai finanziamenti esterni e dal capitale investito operativo.

L'indicatore della dipendenza dalle importazioni (o della bilancia commerciale quando utilizzato con i contributi alle esportazioni), che si riferisce agli input dell'attività produttiva ottenuti attraverso le importazioni, è utilizzabile su scala settoriale.

I sussidi e il loro impatto sia sulle prestazioni economiche che sulla sostenibilità rappresentano un argomento controverso; essi sono considerati parte integrante della promozione di pratiche sostenibili, dell'innovazione e dell'autonomia tecnologica.

Nel complesso, il ricorso ai sussidi è considerato un indicatore di scarsa performance economica nella letteratura esaminata.

Gli indicatori di autonomia individuati sono generalmente indicatori anticipatori di prestazione.

Keywords: Purpose; integrated thinking; life cycle costing; performance integrate; sostenibilità

Diritti umani e competitività globale: la rendicontazione come leva strategica dell'internazionalizzazione

Elisa Gerbasi[1], Ilaria Mastrorocco[2], Michele Rubino[3]

1. Introduzione

L'internazionalizzazione delle attività economiche ha accresciuto l'esposizione delle imprese a contesti istituzionali eterogenei, caratterizzati da differenti standard normativi e livelli di tutela dei diritti fondamentali. Tale espansione ha incrementato la complessità dei processi di governance e la pressione esercitata dagli stakeholder affinché le imprese adottino comportamenti responsabili e trasparenti (Wettstein, 2009). In questo scenario, la tutela dei diritti umani è divenuta una componente imprescindibile della condotta aziendale e un elemento determinante per la legittimazione delle imprese nei mercati globali (Rubino e Mastrorocco, 2025).

Il consolidamento di tale prospettiva trova fondamento nei United Nations Guiding Principles on Business and Human Rights (UNGPs, 2011), che, a partire dal Protect, Respect and Remedy Framework (Ruggie, 2008), hanno definito la distinzione tra il dovere degli Stati di proteggere i diritti umani e la responsabilità delle imprese di rispettarli mediante adeguati processi di human rights due diligence (Lopatta et al., 2023). La crescente articolazione delle catene globali del valore rende tuttavia complessa la verifica della conformità agli standard sociali e ambientali, generando rilevanti sfide di governance e di coordinamento (Bernaz, 2016).

In tale contesto, la rendicontazione sui diritti umani rappresenta uno strumento attraverso il quale le imprese comunicano il proprio impegno etico e gestionale, rafforzando la trasparenza e l'accountability nei confronti degli stakeholder. Lo sviluppo di tali pratiche è stato favorito sia dall'azione di meccanismi di soft law, come standard volontari e iniziative multi-stakeholder, sia dall'affermarsi di requisiti di hard law che hanno reso più vincolanti gli obblighi informativi in materia sociale (Sikka, 2011; Islam e McPhail, 2011). La disclosure in materia di diritti umani assume pertanto una duplice valenza: da un lato, costituisce una risposta alle pressioni istituzionali generate dall'espansione internazionale; dall'altro, può configurarsi come una leva strategica di legittimazione e di posizionamento competitivo nei mercati esteri (Schrempf-Stirling e Wettstein, 2017).

La letteratura ha ampiamente indagato il modo in cui l'internazionalizzazione influisca sulle pratiche di sostenibilità e di rendicontazione non finanziaria, evidenziando come l'esposizione ai mercati globali accresca le pressioni istituzionali e le aspettative degli stakeholder, incentivando livelli più elevati di trasparenza informativa (Kolk e Fortanier, 2013; Yang et al., 2020; Garanina e Aray, 2021; Raimo et al., 2025). Tuttavia, le evidenze sul ruolo della disclosure come leva strategica a supporto dei processi di internazionalizzazione risultano ancora eterogenee e frammentate, mostrando effetti contingenti al contesto istituzionale, al tipo di disclosure considerata e ai meccanismi attraverso cui essa opera (Pesqué-Cela et al., 2024; Chen e Zhang, 2025). In particolare, la maggior parte degli studi si concentra su misure aggregate di corporate social responsibility o di disclosure ESG, dedicando un'attenzione limitata al contributo specifico

[1] Dottoranda di ricerca, ECON-06/A, Università LUM Giuseppe Degennaro; gerbasi.phdstudent@lum.it – corresponding author

[2] Ph.D., ECON-06/A, Università del Piemonte Orientale; mastrorocco@lum.it

[3] Professore ordinario, ECON-06/A, Università del Piemonte Orientale; rubino@lum.it

della rendicontazione sui diritti umani. Inoltre, rimangono ancora poco esplorati i meccanismi attraverso cui le diverse dimensioni della human rights disclosure contribuiscono a rafforzare la legittimità e la competitività delle imprese nei mercati esteri.

Alla luce di tali limiti, il presente studio contribuisce alla letteratura esaminando il ruolo della rendicontazione sui diritti umani nei processi di internazionalizzazione delle imprese, adottando una concettualizzazione coerente con il framework dei United Nations Guiding Principles on Business and Human Rights. In particolare, l'analisi distingue tra le principali dimensioni della human rights disclosure al fine di valutare il contributo differenziato di tali pratiche alla costruzione della legittimità istituzionale e al rafforzamento della competitività nei mercati esteri.

2. Background teorico

La relazione tra la rendicontazione in materia di diritti umani e i processi di internazionalizzazione delle imprese può essere interpretata in modo efficace attraverso un approccio multi-teorico che integra i contributi della Resource-Based View (RBV) (Wernerfelt, 1984; Barney, 1991) e della Legitimacy Theory (Suchman, 1995). Tale prospettiva congiunta è stata già applicata nella letteratura sulla rendicontazione dei diritti umani (Lopatta et al., 2023) e, più in generale, negli studi relativi alla responsabilità sociale d'impresa e al business internazionale (Kolk e Fortanier, 2013; Ellimäki et al., 2021; Ma e Sambharya, 2024).

Secondo la Legitimacy Theory, le imprese intraprendono pratiche di rendicontazione non finanziaria, inclusa quella sui diritti umani, per allineare le proprie attività ai valori e alle aspettative sociali, assicurandosi in tal modo la propria "license to operate" nei diversi contesti istituzionali. L'espansione internazionale espone infatti le imprese a una pluralità di quadri regolatori e pressioni da parte degli stakeholder, incrementando la necessità di dimostrare conformità agli standard etici e normativi riconosciuti a livello globale. In tale prospettiva, la disclosure sociale rappresenta uno strumento fondamentale attraverso cui le imprese, in particolare quelle operanti in paesi in via di sviluppo o in contesti caratterizzati da elevata dipendenza da stakeholder internazionali, cercano di soddisfare le aspettative globali di responsabilità e trasparenza (Azizul Islam e Deegan, 2008). In tale prospettiva, la comunicazione chiara e verificabile delle politiche sui diritti umani e dei processi di human rights due diligence si configura come un meccanismo strategico per preservare la legittimità e mitigare i rischi reputazionali nei mercati esteri.

Oltre alla funzione di legittimazione, la Resource-Based View evidenzia come la rendicontazione sui diritti umani possa generare vantaggi strategici e competitivi di lungo periodo. In questa prospettiva, la trasparenza informativa in materia di diritti umani può essere considerata una risorsa strategica in grado di creare valore e differenziazione, poiché contribuisce allo sviluppo di asset intangibili difficilmente imitabili. In particolare, le pratiche di responsabilità sociale e disclosure favoriscono la costruzione di risorse immateriali - quali capitale reputazionale, fiducia degli stakeholder e competenze organizzative - che rispondono ai requisiti di valore, rarità, inimitabilità e non sostituibilità individuati dalla RBV (Branco e Rodrigues, 2006). L'integrazione del rispetto dei diritti umani nei sistemi di governance e la comunicazione trasparente di tale impegno consentono alle imprese di consolidare relazioni di lungo periodo con interlocutori chiave, riducendo i costi di transazione, agevolando l'accesso ai mercati e facilitando i processi di espansione internazionale.

Su tali basi teoriche, il presente studio analizza l'impatto della rendicontazione sui diritti umani sull'internazionalizzazione delle imprese, considerando sia l'effetto complessivo del fenomeno sia l'influenza specifica delle diverse dimensioni che compongono la disclosure sui diritti umani.

3. Sviluppo delle ipotesi

La letteratura esistente evidenzia come le imprese maggiormente impegnate in attività di corporate social responsibility (CSR) tendano a interagire più intensamente con un'ampia gamma di stakeholder esterni, sviluppando così competenze non di mercato e conoscenze istituzionali più avanzate (Zheng et al., 2015). Tali interazioni rafforzano la capacità delle imprese di operare in contesti globali complessi e di costruire legittimità in ambienti regolatori e culturali eterogenei, condizione cruciale per il successo dei processi di internazionalizzazione (Yin e Zhang, 2012). Inoltre, la trasparenza informativa, in particolare nell'ambito ambientale, sociale e di governance (ESG), contribuisce a ridurre le asimmetrie informative tra le imprese e gli stakeholder esteri. Le evidenze empiriche mostrano che una disclosure più articolata in materia ESG attenua gli svantaggi informativi degli investitori stranieri, favorendo maggiori flussi di investimento e una più ampia partecipazione ai mercati internazionali (Chauhan e Kumar, 2019). Al contrario, pratiche di disclosure deboli possono scoraggiare gli investitori e i partner commerciali internazionali, poiché le imprese vengono percepite come controparti meno affidabili o più rischiose (Aggarwal, Klapper e Wysocki, 2005). Recenti evidenze empiriche indicano che la rendicontazione non finanziaria contribuisce a sostenere la crescita delle esportazioni e la penetrazione nei mercati esteri, rafforzando la fiducia e la visibilità delle imprese presso i partner internazionali (Chen e Zhang, 2025).

In questa prospettiva, la rendicontazione sui diritti umani rappresenta una componente cruciale della trasparenza aziendale. Oltre a soddisfare gli obblighi normativi, segnala la consapevolezza etica dell'impresa, la solidità della governance e l'impegno verso pratiche di business responsabili, rafforzando così la legittimità e la fiducia degli stakeholder nei mercati internazionali. Pertanto, è ragionevole formulare la seguente ipotesi:

H1. Livelli più elevati di rendicontazione sui diritti umani sono positivamente associati al grado di internazionalizzazione delle imprese.

La crescente attenzione verso la condotta etica delle imprese multinazionali ha accresciuto le aspettative degli stakeholder internazionali sull'integrazione dei principi di responsabilità sociale e tutela dei diritti umani nelle strategie e nelle strutture di governance (Engle, 2007). Per mantenere legittimità e fiducia nei diversi contesti istituzionali, le imprese devono non solo adottare comportamenti responsabili, ma anche formalizzare tali impegni attraverso politiche e meccanismi di controllo specifici. L'istituzionalizzazione dei valori etici e degli standard internazionali rappresenta una forma di leadership strategica che segnala integrità, accountability e conformità alle norme globali. Evidenze empiriche confermano che livelli più elevati di impegno e formalizzazione delle pratiche di responsabilità sociale favoriscono la capacità delle imprese di penetrare nei mercati esteri, rafforzando la fiducia dei partner e riducendo i rischi percepiti da investitori e regolatori (Morteza Khojastehpour e Md Abu Saleh, 2020; Martos-Pedrero et al., 2023). In questa prospettiva, la disclosure trasparente degli impegni in materia di diritti umani e delle relative strutture di governance costituisce un segnale di gestione responsabile che accresce la legittimità aziendale nei mercati globali.

L'internazionalizzazione espone inoltre le imprese a rischi sociali, ambientali e reputazionali lungo catene del valore sempre più estese e complesse. La gestione di tali rischi richiede l'adozione di processi strutturati di human rights due diligence e la comunicazione trasparente delle modalità di identificazione e mitigazione degli impatti negativi (Lundan e Muchlinski, 2012). La rendicontazione di tali attività rafforza la resilienza e la percezione di affidabilità dell'impresa presso gli stakeholder (Bissoondoyal-Bheenick et al., 2023) e contribuisce a ridurre la liability of foreignness nei mercati esteri (Hunter e Bansal, 2001).

Infine, le imprese multinazionali sono sempre più chiamate a dimostrare un impegno attivo nel dialogo con gli stakeholder e a predisporre meccanismi di rimedio efficaci in caso di violazioni dei diritti umani. Tali pratiche, in linea con il terzo pilastro dei United Nations Guiding Principles on Business and Human Rights - Access to Remedy (Ruggie, 2013), accrescono l'accountability e la legittimità delle imprese nei mercati di destinazione (Gallhofer et al., 2011). Inoltre, la partecipazione a iniziative multi-stakeholder orientate alla tutela dei diritti umani rafforza la

reputazione e la legittimità relazionale, generando risorse intangibili fondamentali per l'ingresso e la permanenza nei mercati internazionali (Damert et al., 2021).

Coerentemente con il quadro teorico di riferimento e al fine di analizzare in modo distinto le principali dimensioni della rendicontazione sui diritti umani, si propongono le seguenti sotto-ipotesi di ricerca:

H1a. La formalizzazione e la disclosure degli impegni e delle strutture di governance in materia di diritti umani sono positivamente correlate all'internazionalizzazione delle imprese.

H1b. La disclosure dei processi di human rights due diligence e di gestione dei rischi è positivamente associata alla capacità di espansione internazionale delle imprese.

H1c. La trasparenza riguardante i meccanismi di rimedio e il coinvolgimento degli stakeholder contribuisce a consolidare la legittimità e la presenza delle imprese nei mercati esteri.

4. Metodologia

4.1. Sample e modello

L'analisi empirica sarà condotta su un campione globale di imprese quotate del settore manifatturiero, riconosciuto per il suo rilevante impatto ambientale e sociale derivante dall'intenso utilizzo di risorse, dai consumi energetici e dalla complessità delle catene globali di fornitura (Palea et al., 2023). La scelta di questo comparto è particolarmente pertinente per lo studio della human rights disclosure (HRD), in quanto le imprese manifatturiere sono spesso soggette a un attento scrutinio da parte degli stakeholder in merito alle pratiche lavorative, alle condizioni di lavoro e alla gestione dei fornitori (Kaeb, 2007; Islam e McPhail, 2011).

Il campione includerà le imprese appartenenti ai gruppi industriali Industrials, Materials, Consumer Staples, Consumer Discretionary (Cyclical Goods), Hardware Manufacturing e Utilities, secondo la classificazione Refinitiv Business Classification (TRBC), offrendo così una rappresentazione ampia e diversificata dell'economia manifatturiera globale. I dati, riferiti all'esercizio 2024, garantiranno la comparabilità e l'aggiornamento delle informazioni in linea con i principali framework di rendicontazione, tra cui gli GRI Standards e, per le imprese europee, la Corporate Sustainability Reporting Directive (CSRD).

Per testare le ipotesi di ricerca, verranno stimati modelli di regressione lineare (OLS) volti ad analizzare la relazione tra la rendicontazione sui diritti umani e il grado di internazionalizzazione delle imprese.

4.2. Definizioni delle variabili

La variabile dipendente dello studio è l'internazionalizzazione, definita come il grado in cui le attività e i ricavi di un'impresa provengono da mercati esteri (Sullivan, 1994; Lu e Beamish, 2004; Kolk e Fortanier, 2013). In linea con la letteratura in tema di international business e sustainability disclosure, essa è misurata attraverso la variabile International Sales, che rappresenta la percentuale di ricavi realizzati all'estero sul totale dei ricavi consolidati dell'impresa.

La variabile indipendente principale è la rendicontazione sui diritti umani, misurata attraverso un Indice di Rendicontazione sui Diritti Umani (HRDI) sviluppato mediante un'analisi manuale del contenuto dei report di sostenibilità e delle dichiarazioni non finanziarie. L'indice è costruito in coerenza con i principali framework internazionali, in particolare i United Nations Guiding Principles on Business and Human Rights (UNGPs, 2011) e la serie GRI 400 del Global Reporting Initiative, e con la letteratura accademica in materia (Kolk e Fortanier, 2013; Raimo et al., 2025).

L'HRDI comprende 30 indicatori di disclosure, suddivisi in tre dimensioni: (1) Commitment & Governance, (2) Due Diligence & Risk Management, e (3) Remedies & Stakeholder Engagement, in linea con il processo di human rights due diligence delineato dagli UNGPs

(Ruggie, 2013). Ogni elemento dell'indice sarà valutato su scala binaria, assegnando un punteggio pari a 1 se l'informazione è presente nel report e 0 in caso contrario (Raimo et al., 2025). Tale approccio consente di rilevare in modo oggettivo la presenza di pratiche di disclosure rilevanti, escludendo affermazioni generiche o prive di evidenza empirica (Islam et al., 2017).

Il punteggio massimo raggiungibile è pari a 30 punti, corrispondente al livello più elevato di completezza e qualità della disclosure, così distribuiti: Commitment & Governance (8 punti), Due Diligence & Risk Management (12 punti) e Remedies & Stakeholder Engagement (10 punti). Il punteggio complessivo dell'indice HRDI per ciascuna impresa sarà calcolato come somma dei punteggi ottenuti nei singoli item, mentre i sotto-indici dimensionali verranno analizzati separatamente per cogliere differenze di enfasi e maturità nella rendicontazione sui diversi ambiti della tutela dei diritti umani.

La Tabella 1 presenta la struttura e le componenti dell'Indice di Rendicontazione sui Diritti Umani impiegato per l'analisi empirica.

Item	Reference	Descrizione	Score
Commitment and Governance			
1. Policy aziendale sui diritti umani	UNGP 16(a)(d)(e)	Esistenza di una dichiarazione formale sui diritti umani, approvata ai massimi livelli, pubblicamente disponibile e comunicata internamente ed esternamente.	0-1
2. Ambito e aspettative verso terze parti	UNGP 16(c)	Indicazioni su come la politica definisce le aspettative nei confronti di dipendenti, fornitori e partner commerciali collegati alle operazioni dell'impresa.	0-1
3. Riferimento a diritti riconosciuti a livello internazionale	UNGP 12	Esplicito riferimento alla Dichiarazione Universale dei Diritti Umani e alle Convenzioni fondamentali dell'ILO.	0-1
4. Esistenza di programmi di formazione	GRI 412-2/ UNGP 16(d)	Presenza di programmi strutturati di formazione o sensibilizzazione sui diritti umani.	0-1
5. Copertura e partecipazione	GRI 412-2/ UNGP 16(d)	Informazioni su gruppi destinatari (dipendenti, management, fornitori) o dati quantitativi (sessioni, partecipanti, ore di formazione).	0-1
6. Contenuti della formazione	GRI 412/ UNGP 16(d)	Inclusione di temi fondamentali (es. due diligence, non discriminazione, salute e sicurezza, libertà sindacale).	0-1

7.	Ruoli di governance e supervisione	UNGP 19(a), 23–24 / GRI 412-2	Descrizione delle responsabilità interne e dei flussi di reporting in materia di diritti umani.	0-1
8.	Coerenza in contesti complessi	UNGP 23(b)(c)	Informazioni su come l'impresa gestisce i rischi nei contesti affetti da conflitti	0-1
Due diligence and risk management				
9.	Quadro formale due diligence	UNGP 17 / GRI 412-1	Presenza di un processo strutturato per l'identificazione, valutazione e gestione dei rischi e impatti sui diritti umani.	0-1
10.	Integrazione e azioni di follow-up	UNGP 17 / GRI 412-1	Descrizione delle modalità con cui i risultati della due diligence vengono integrati nelle decisioni manageriali.	0-1
11.	Coinvolgimento degli stakeholder	UNGP 18	Evidenze di consultazioni con lavoratori, comunità o soggetti potenzialmente impattati.	0-1
12.	Reattività e integrazione del feedback	UNGP 18	Indicazione di come i contributi degli stakeholder influenzano le risposte e il monitoraggio aziendale.	0-1
13.	Integrazione operativa	UNGP 19(b)	Evidenza dell'inserimento dei risultati della due diligence nelle politiche e procedure operative.	0-1
14.	Priorità e azioni di mitigazione	UNGP 19(b)	Informazioni sulla priorità assegnata ai rischi più rilevanti e sulle misure preventive adottate.	0-1
15.	Sistemi di monitoraggio e indicatori	UNGP 20	Descrizione di meccanismi o KPI utilizzati per valutare la performance in materia di diritti umani.	0-1
16.	Clausole e valutazioni della catena del valore	UNGP 13 (b) / GRI 412-3	Presenza di clausole contrattuali sui diritti umani o procedure di audit sui fornitori.	0-1

17.	Non discriminazione e parità di trattamento	UNGP 11-12/ GRI 406-1	Informazioni su casi di discriminazione e azioni intraprese per prevenirli.	0-1
18.	Libertà sindacale e contrattazione collettiva	UNGP 12-13/ GRI 407-1	Identificazione di operazioni o fornitori a rischio in materia di libertà di associazione.	0-1
19.	Lavoro minorile	UNGP 12/ GRI 408-1	Presenza di rischi significativi di lavoro minorile nelle operazioni o nella catena di fornitura.	0-1
20.	Lavoro forzato o obbligatorio	UNGP 12/ GRI 409-1	Informazioni su rischi o casi di lavoro forzato o coatto.	0-1
Remedies and stakeholder engagement				
21.	Meccanismi di reclamo a livello operativo	UNGP 29	Esistenza e caratteristiche generali dei meccanismi di reclamo disponibili per dipendenti, fornitori o comunità.	0-1
22.	Procedure di reclamo o rimedio	UNGP 22	Presenza di processi interni o esterni per la gestione dei reclami.	0-1
23.	Risultati delle azioni di rimedio	UNGP 22	Informazioni sui casi gestiti, le modalità di risoluzione o la cooperazione con organismi giudiziari/non giudiziari.	0-1
24.	Comunicazione e riservatezza	UNGP 21 (c)	Modalità di comunicazione dei casi nel rispetto della confidenzialità e della tutela delle parti coinvolte.	0-1
25.	Valutazioni o audit sui diritti umani	GRI 412-1	Evidenza di audit o valutazioni sui diritti umani e relativi risultati.	0-1
26.	Rischi per comunità locali o indigene	UNGP 18, 22 / GRI 411-1	Identificazione di rischi o impatti che coinvolgono comunità locali o indigene.	0-1

27. Consultazioni o azioni di rimedio	UNGP 18, 22 / GRI 411-1	Informazioni sulle attività di consultazione e sulle misure di rimedio adottate.	0-1
28. Coinvolgimento strutturato degli stakeholder	UNGP 18	Descrizione di processi strutturati di dialogo con le comunità e i gruppi di stakeholder.	0-1
29. Partecipazione e integrazione del feedback	UNGP 18	Evidenza della frequenza delle consultazioni e del modo in cui il feedback influenza le decisioni aziendali.	0-1
30. Gestione della sicurezza e relazioni con le comunità	UNGP 23/ GRI 410-1	Descrizione dell'approccio aziendale alla gestione delle pratiche di sicurezza e ai rapporti con le comunità locali.	0-1

Tabella 1. Human Rights Disclosure Scoring Framework

Al fine di migliorare la bontà del modello saranno inserite le seguenti variabili di controllo. Nel dettaglio, dimensione aziendale (SIZE), misurata come logaritmo naturale del totale attivo, per la redditività (ROA), data dal rapporto tra utile netto e totale attivo, e per la leva finanziaria (LEV), calcolata come rapporto tra debiti totali e totale attivo, al fine di considerare l'effetto delle risorse, della performance economica e della struttura del capitale sull'internazionalizzazione. È inoltre inclusa la performance ESG complessiva (ESG_SCORE), fornita da Refinitiv, per distinguere l'impegno generale di sostenibilità dalla disclosure sui diritti umani, nonché il rapporto Market-to-Book (MTB), che cattura le opportunità di crescita e le aspettative del mercato nei confronti dell'impresa.

5. Risultati attesi, implicazioni e conclusioni

L'analisi empirica è attesa confermare una relazione positiva tra la rendicontazione sui diritti umani e il grado di internazionalizzazione delle imprese. Le aziende che comunicano in modo più ampio e sostanziale le proprie pratiche in materia di diritti umani dovrebbero mostrare una maggiore capacità di penetrazione e stabilità nei mercati esteri, grazie al rafforzamento della legittimità, della trasparenza e della fiducia da parte degli stakeholder internazionali. In tal senso, la HRD contribuirebbe a ridurre le asimmetrie informative e i rischi percepiti nelle operazioni transfrontaliere, fungendo da leva strategica per la competitività globale.

Dal punto di vista teorico, lo studio intende ampliare il dialogo tra la letteratura sull'international business e quella sulla responsabilità sociale d'impresa, evidenziando come la disclosure sui diritti umani possa essere interpretata sia come risorsa strategica, coerente con la Resource-Based View, sia come meccanismo di costruzione della legittimità, in linea con la Legitimacy Theory. La HRD si configura dunque come un fattore proattivo, capace di sostenere la crescita internazionale attraverso il consolidamento del capitale reputazionale e l'allineamento alle norme e ai valori istituzionali globali.

Le implicazioni manageriali attese indicano che investire in strutture di governance dedicate ai diritti umani, in processi di due diligence e in pratiche di coinvolgimento degli stakeholder può

generare benefici strategici concreti, favorendo l'ingresso nei mercati esteri, la fiducia degli investitori e la solidità delle partnership internazionali. In questa prospettiva, la HRD contribuisce a consolidare la percezione di affidabilità dell'impresa e a ridurre la liability of foreignness nei contesti globali, rafforzando la sua legittimazione presso stakeholder e partner internazionali.

Dal punto di vista manageriale, l'entrata in vigore della CSRD rende ancora più evidente la necessità di integrare la tutela dei diritti umani nei sistemi di governance e nei processi operativi. Le imprese che si adeguano in modo sostanziale ai requisiti della direttiva possono trasformare un adempimento regolatorio in un vantaggio strategico, migliorando il proprio posizionamento presso stakeholder globali, facilitando l'accesso ai mercati internazionali e rafforzando la capacità di stringere partnership transfrontaliere basate sulla fiducia e sulla trasparenza.

Sul piano delle politiche pubbliche e regolatorie, i risultati previsti sottolineano l'importanza di includere indicatori specifici sui diritti umani nei principali framework di rendicontazione obbligatoria. Una disclosure strutturata in tale ambito può infatti contribuire a promuovere la responsabilità d'impresa e a migliorare la comparabilità e la qualità delle informazioni a livello internazionale.

Pur offrendo un contributo innovativo alla letteratura e alla pratica manageriale, lo studio riconosce alcune limitazioni. La natura trasversale dell'analisi non consente di trarre conclusioni causali di lungo periodo, mentre la codifica manuale delle informazioni, sebbene più accurata, può introdurre elementi di soggettività. Futuri approfondimenti potranno adottare approcci longitudinali o multisettoriali per indagare ulteriormente il ruolo della HRD nei processi di internazionalizzazione e nelle strategie di sostenibilità globale. Infine, il rapido sviluppo dell'intelligenza artificiale apre scenari promettenti per lo studio della sostenibilità e dei diritti umani. L'adozione di sistemi avanzati di analisi del linguaggio e di apprendimento automatico potrebbe consentire non solo un monitoraggio più tempestivo dei rischi nelle catene globali del valore, ma anche una valutazione più fine e comparabile della qualità dell'informativa aziendale. L'integrazione di tali tecnologie potrebbe dunque arricchire gli approcci metodologici tradizionali e offrire nuove chiavi interpretative per comprendere come la HRD si configuri all'interno dei processi di internazionalizzazione

Parole chiave: Human Rights Disclosure (HRD); internazionalizzazione delle imprese; orporate Social Responsibility (CSR); human Rights Due Diligence

The Role of the Sustainability Balanced Scorecard in Shaping Sustainability Integration: A Configurational Perspective

Daria Iakovleva[1], Ivo Hristov[2], Gianmarco Manzo[3], Michele Pisani[4], Antonio Chirico[5]

1. Introduction

Over the past decades, organizations have experienced profound institutional pressures as sustainability practices have increasingly become a central dimension to consider at a business level (Engert et al., 2014). From the compliance point of view, sustainability practices are gradually evolving from a voluntary management initiative to a regulatory requirement demanded by institutional pressures (Postaire et al., 2024; Sundin & Brown, 2017; Contrafatto, 2014; Länsiluoto & Järvenpää, 2010; Pérez et al., 2007; DiMaggio and Powell, 1983). In this context, one of the latest transformative requirements, adopted in the European Union, is the Corporate Sustainability Reporting Directive (CSRD) (Coronella, 2025; CSRD 2022). The Directive expands the scope of sustainability reporting by requiring disclosure of the environmental, social and governance (ESG) matters, influencing in this way organizational strategies and business models. Regardless of how recent the CSRD is, it has already impacted major corporations in Europe and will gradually extend to small and medium enterprises (SMEs) with potential global effects. Such coercive pressures promote isomorphic organizational behaviours by demanding compliance with sustainability reporting standards (Helfaya et al., 2019).

To assure such a compliance, organizations shall integrate sustainability into their strategic planning and control systems (Arjalies and Mundy, 2013; Schaltegger and Burritt, 2010; Malmi and Brown, 2008; Adams and Frost, 2008). This integration process, however, requires a clear view on how sustainability practices can be addressed in the management control systems (Gond et al., 2012). One of the most studied tools that enables integration of sustainability into organizational strategies, is the Sustainability Balanced Scorecard (SBSC) (Figge et al., 2002). Several scholars have underlined through years its key role in strategic sustainability integration (Hristov and Searcy, 2024; Mio et al., 2022; Journeault, 2016; Hansen and Schaltegger, 2016) confirmed by empirical evidence from practitioners (Suarez-Gargallo et al., 2023; Huang et al., 2014).

Although the SBSC has been conceptually developed for more than two decades, the literature remains fragmented and lacks an overall comprehension on how the framework has been designed, implemented, used and evolved (Searcy, 2012). Thus, discovering the status of related research by summarizing and synthetizing the existing literature will help to fill the literature gap across different organizational contexts. To achieve this aim, the Systematic Literature Review (SLR) was conducted by considering the research articles published between 2002 and 2025. Using a reproducible process of database search, the bibliometric analysis was

performed on 100 peer-reviewed publications. By analysing two decades of SBSC literature, the research article contributes to the sustainability management control literature by identifying and classifying the main research streams, methodological approaches and thematic evolutions surrounding the SBSC, offering in this way an integrative understanding of its theoretical and practical contributions to sustainability management control literature.

While this mapping provides an updated understanding of research patterns, our review also highlights a second, more fundamental gap: although many studies examine specific design features or implementation processes, far less attention has been paid to why organizations develop and use SBSCs in distinct ways. Existing research, in other words, insufficiently theorizes the motivational logics that shape the role played by the SBSC in sustainability integration. Building on the insights emerging from the thematic analysis, this study advances the literature by conceptualizing three distinct configurations of SBSC use: compliance-driven, legitimacy-driven, and value-driven. These configurations illustrate how different underlying motivations influence the design of the SBSC, the purposes it serves, the way it is mobilized in practice, and how it evolves over time.

In doing so, the paper not only provides an integrative overview of two decades of SBSC research but also introduces a novel configurational perspective that explains the varied roles the SBSC can assume in shaping sustainability integration. This dual contribution offers a conceptual foundation for future empirical research seeking to unravel how sustainability control tools respond to institutional pressures, stakeholder expectations, and strategic value creation processes.

2. Methodology

2.1. Article collection process

A SLR was conducted to identify relevant contributions. The SLR method was chosen because, unlike traditional narrative reviews, it "locates existing studies, selects and evaluates contributions, analyses and synthesizes data, and reports the evidence in such a way that allows reasonably clear conclusions to be reached about what is and is not known" (Denyer and Tranfield, 2008, p. 671). To guarantee the accuracy and transparency of the research, the chosen protocol is based on Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) 2020 statement, a guideline for selection and analysis of a literature research sample (Page et al., 2021). The PRISMA 2020 framework ensures that the protocol has a standardized structure to allow the future users to replicate the research by guaranteeing transparency and methodological rigor in all the stages. Specifically, the framework provides precise documentation on inclusion and exclusion criteria and a detailed reporting on how the research develops from initial set to the research eligible sample. The process is represented by the PRISMA diagram in Figure 1 to allow the identification of the sample and the replication for future research. In particular, the selection of the research articles was performed by using Scopus database, identifying two main areas of research: sustainability and Balanced Scorecard (BSC). The research articles must include in their abstract, title or keywords the following keywords: "green," "ecology*," "sustainab*," "environment*," "sustainability balanced scorecard," "SBSC," "balanced scorecard," "BSC". The filters used to exclude the publications were the following: subject area – business, management and accounting; document type – article; language – English; publication stage – final, journal ranking – ABS 2024.

The initial sample, based on the presence of the keywords in the title, abstract or keywords was composed of 3.173 research articles. The screening phase of PRISMA process started by refining the sample with document type, excluding 1.023 articles, resulting in a sample of 2.150 papers to analyse. Next, the publications were excluded based on the subject area of business, management and accounting, resulting in 565 articles. The following exclusion criteria was to consider the articles published only in English language, reducing the research sample to 534

publications. Additional screening was performed by leaving in the sample only the already published articles, leaving behind 5 papers. Finally, the last part of the screening process was based on the ABS 2024 ranking by only including papers that have been published within the ranking, resulting to be 371 research publications. The following phase of the protocol was to identify the eligible articles based on the research question by screening the title and abstract of each publication, resulting in 127 related articles. Additionally, by reading the entire set, the final sample of 100 articles was identified.

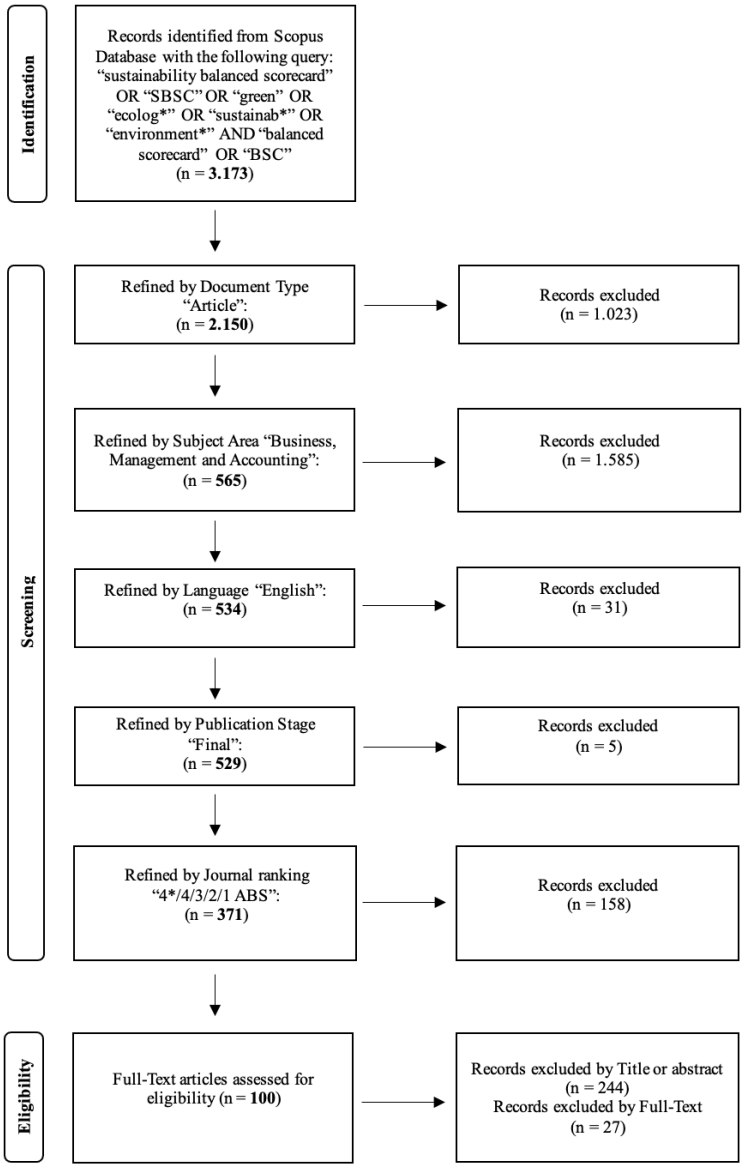

Figure 1. Research protocol for systematic literature review

2.2. Data coding and analysis

The resulting sample was analysed in two ways: i) by adopting a bibliometric analysis for the descriptive statistics, and ii) a text analysis of the final sample of 100 papers for the content analysis.

In terms of bibliometric analysis, we used Bibliometrix software (Aria and Cuccurullo, 2017), widely recognized in the academic research for its ability to provide customized graphical outputs (Camilli et al., 2024). In particular, the Bibliometrix enables science-mapping techniques, such as co-occurrence keyword plus network, which allows to examine the thematic evolution, essential for exploration of the current state of literature.

In terms of content analysis, all articles were carefully read and systematized into an Excel data extraction sheet (Rashman et al., 2009). To examine how SBSC has been addressed and conceptualized in the literature, we employed a thematic analysis (TA) as the core analytical technique. TA was selected for its capacity not only to synthesize heterogeneous and fragmented findings across studies, but also to reveal the underlying assumptions, blind spots, and tensions that characterize the field (Alvesson & Sandberg, 2011; Braun & Clarke, 2006). We developed deductive themes by reading the papers to capture recurring concepts, mechanisms and practices related to design, used, implementation and evolution (see, for instance, Searcy, 2012). The six-phase protocol by Braun and Clarke (2006) was followed:

- Familiarization with the data. All papers were read in full by the authors to gain a comprehensive understanding of their theoretical positions, methodological approaches, and findings related to SBSC.
- Initial coding. We identified recurring codes by reading the papers of the sample to identify significant elements related to design, use, implementation and evolution. Codes were iteratively refined as patterns emerged across studies.
- Searching for and refining themes. Codes were grouped into subthemes that represented coherent clusters of meaning within four macro-level themes (i.e., design, used, implementation and evolution).
- Reviewing and synthesizing. We compared findings across themes to detect overlaps, contradictions, and blind spots. We also ensured consistency in coding and interpretation through peer debriefing sessions among the authors.
- Writing and contextualizing. The thematic map resulting from this process was translated into an analytical narrative that connects empirical findings with broader theoretical frameworks, but crucially also interrogates the implicit assumptions underlying current conceptualizations of SBSC.

3. Findings analysis

3.1. A bibliometric analysis

This section shows descriptive statistics of the sample analysed with Bibliometrix software (Aria and Cuccurullo, 2017) to provide an overview of the SBSC. It presents the annual development (Figure 2), the most relevant sources (Figure 3) and the thematic analysis, through co-occurrence network based on Keywords Plus (Figure 4), of the research articles published within the field.

As the study represents a work in progress, these descriptive results provide only the first phase of the analysis. In the following stage, the research will be expanded through a qualitative content analysis of the selected sample to examine in depth how the SBSC framework is designed, used, implemented and evolved in the past two decades. This approach will allow a more comprehensive interpretation of the quantitative results obtained and will support the filling of the literature gap identified.

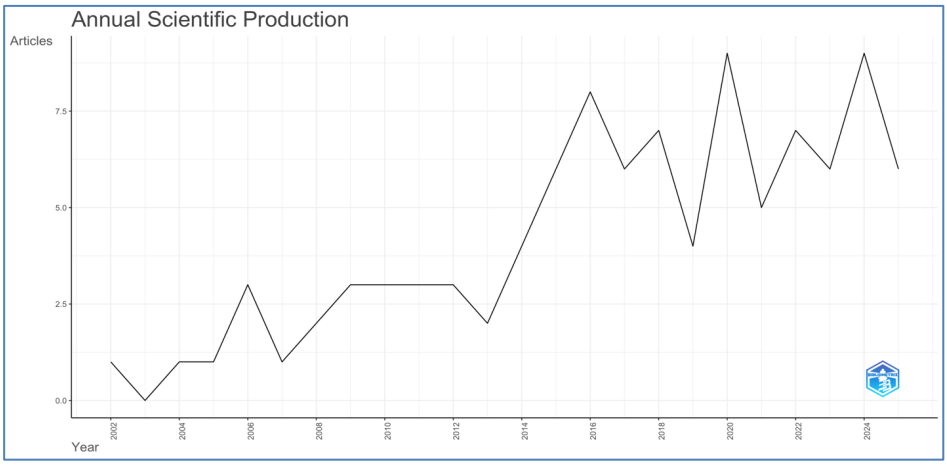

Figure 2. Sustainability Balanced Scorecard articles published over the years

The Figure 2 represents how the academic interest towards the SBSC has evolved in the past twenty-three years. In 2002 Figge et al. elaborate the framework, which provokes a moderate academic interest for the next six years, forming an emerging phase for the SBSC. The next stage of the framework's temporal development goes from 2009 to 2014, establishing a so-called early consolidation stage, where the scholars start to show a consistent interest towards the topic. The third stage (2015 – 2019) comes with a peak in 2016, a year after the Paris Agreement adoption in 2015 through the United Nations' Agenda 2030 about the Sustainability Development Goals (United Nations, 2015). The final and more recent stage of the academic interest falls in the Covid-19 and post Covid-19 periods. In particular, the first peak takes place in 2020 by showing a sharp increase in interest conveyed by the pandemic spread. The second peak of the last stage comes in 2024, which is driven by the institutional pressures for the sustainability reporting with the CSRD introduction.

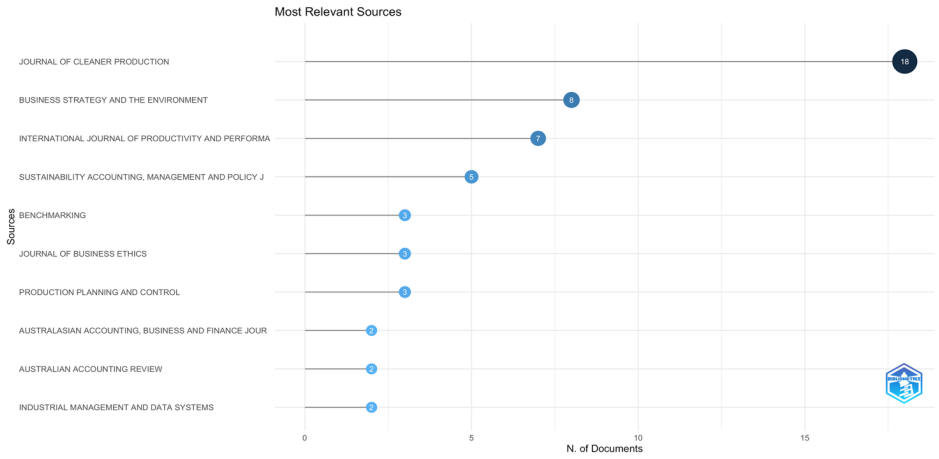

Figure 3. Most relevant sources

The Figure 3 represents the most relevant sources where the research articles were published. The leading journal in publications is the Journal of Cleaner Production with 18 research articles regarding the SBSC framework. Such concentration of publications suggests that the SBSC is primarily considered in the sustainability and environmental management fields, rather than management control and accounting. However, the following two journals, Business Strategy and the Environment and International Journal of Productivity and Performance Management suggest

strong ties with strategic management field. Thus, the SBSC is considered to be a framework for execution of the sustainable strategy rather than a conventional management control tool. The remaining journals in the Figure 3 have far less research articles related to the SBSC than the first three journals, which demonstrates the fragmentation of the discipline and shows that the field is still in its evolving interdisciplinary stage.

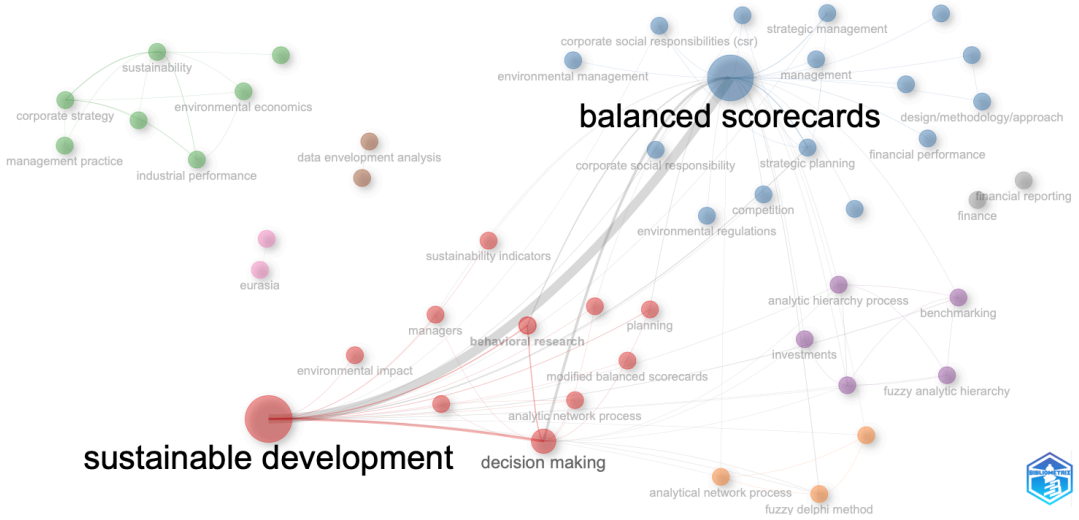

Figure 4. Co-occurrence network of SBSC keywords plus

The Figure 4 shows the thematic analysis based on a co-occurrence network by using Keywords Plus to demonstrate the main topics associated with the analysed research articles. The two main strongly connected keywords are "sustainable development" and "balanced scorecards", which form in the current structure two main clusters. The blue cluster includes terms "strategic management", "strategic planning", "corporate social responsibility", "performance", which indicates a strong connection with the performance management field. The red cluster mainly includes terms such as "sustainability indicators", "environmental impact", "decision making", which reflects sustainability performance management themes. Thus, the strong tie between two main clusters shows that the SBSC sits at the intersection of performance management and sustainable strategy fields, building a bridge for translating sustainable practices into the strategic management. However, there are also smaller clusters that appear in the Figure 3, which illustrate weak connections to the main clusters, emphasising the fragmentation of the research on the SBSC and the context-specific applications.

Taken together, the descriptive statistics represent the status of the research, highlighting the need for a comprehensive and consolidated view for the sustainability management control field.

3.2. Content analysis

Although the content analysis is still ongoing, preliminary insights already point to a key pattern anticipated in the abstract: organizations do not adopt a single, uniformed model of SBSC, but rather mobilize it through three distinct configurations—compliance-driven, legitimacy-driven, and value-driven—emerging in response to institutional pressures but shaped by the underlying motivations for integrating sustainability. Early results suggest that these motivations influence not only the purpose of the SBSC but also its degree of integration within the management control architecture.

More specifically, when sustainability is adopted primarily for compliance reasons, the SBSC tends to be treated through a separated architecture, designed as a technical add-on to meet reporting requirements, often limited to a narrow set of indicators. When sustainability is embraced to gain or maintain legitimacy, the SBSC more frequently assumes the form of a parallel architecture, for instance when firms rely on external consultants exclusively for producing sustainability reports without embedding sustainability into long-term planning or internal decision-making. Finally, when sustainability is adopted for value-driven and strategic motivations, the SBSC tends to be fully integrated into existing perspectives and routines, becoming embedded in strategic planning, internal learning processes, and performance evaluations.

These emerging distinctions indicate that the SBSC does not evolve in the same way across firms. Rather, its design, implementation pathway, use patterns, and evolutionary trajectory are contingent upon the motivational logic that guides the organization's approach to sustainability. The forthcoming content analysis will further develop these insights to refine the three configurations and articulate their theoretical implications for sustainability integration.

4. Conclusions and future research directions

As far as this study represents a work in progress extended abstract, the research is yet to be expanded and ameliorated. In fact, the aim of the paper is to provide a comprehensive understanding of how the SBSC has been designed, implemented, used and evolved across different organizational contexts over the past two decades. Through SLR, supported by bibliometric and content analysis, the study intends to analyse the SBSC literature to explore the current state of research and unveil its fragmented nature. Thus, the final scope is to identify, classify and synthesize the main research streams, methodological approaches and thematic evolutions of SBSC, offering in this way an integrative understanding of its theoretical and practical contributions to sustainability management control literature. In doing so, the study does not only map the existing literature but seeks to analyse how the SBSC has evolved with a broader constantly developing sustainability scene, particularly given the current European institutional pressures.

To interpret the results, the analysis will adopt the theoretical lenses proposed by Burritt and Schaltegger in 2010, distinguishing three perspectives: inside-out, twin-track and outside-in to approach sustainability. The inside-out perspective will highlight how sustainability reshapes internal strategies, performance management, controls and decision-making. The twin-track approach seeks to reconcile internal and external demands, although prior research suggests that organizations often lack the routines and structures required to manage such duality systematically. While the outside-in perspective of sustainability will discover how the coercive pressures promote isomorphic organizational behaviours by requiring compliance with sustainability reporting standards potentially leading to a more symbolic and decoupled use of the SBSC as a management control tool. Interpreting the results through these theoretical lenses will contribute to the understanding whether the SBSC supports the substantive strategic integration or rather responds to the external reporting requirements for the compliance purposes.

Ultimately, this study will contribute to sustainability management control literature by mapping where the field currently stands and by highlighting the paths for further exploration. The expected outcomes include the definition of research opportunities, with particular attention to the methodological approaches.

Keywords: Sustainability balanced scorecard; SBSC; performance management system; sustainability management control

Innovazione tecnologica per lo sviluppo sostenibile nelle PMI: una revisione sistematica della letteratura

Matilda Shini[1], Graziana Galeone[2], Mariapia Spadafino[3], Vittorio Dell'Atti[4]

1. Sviluppo concettuale e obiettivi di ricerca

Nell'attuale contesto, le imprese si trovano a fronteggiare una sfida duplice, in cui intelligenza artificiale (IA) e transizione verso modelli di sviluppo sostenibile si intrecciano in modo sempre più stretto, dando vita ad un paradigma conosciuto in letteratura con il termine "digitainability" (Saáry et al., 2022; Varbanova et al., 2025). Questa dinamica assume particolare importanza per le piccole e medie imprese (PMI) che costituiscono circa il 90% del tessuto imprenditoriale globale (Mago & Modiba, 2022) e che sono riconosciute da importanti framework di policy, come il Green Deal europeo, quali attori chiave nei processi di innovazione e sostenibilità (Commissione Europea, 2020).

Tradizionalmente, la sostenibilità è stata collegata alla performance aziendale mediante l'innovazione verde e strategie ambientali consolidate (Khoshnaw et al., 2024). Oggigiorno, tuttavia, tali meccanismi sono oggetto di una profonda trasformazione dovuta all'introduzione di tecnologie digitali, tra cui l'intelligenza artificiale (IA) riveste un ruolo centrale. L'introduzione di questa tecnologia migliora l'efficienza dei processi aziendali e rafforza la capacità di adattamento dell'impresa, elementi strettamente legati al concetto di agilità organizzativa (Mehmood et al., 2025; Sharma et al., 2025). Inoltre, l'impiego dell'IA favorisce l'adozione di approcci proattivi, orientati alla trasformazione dei dati in scenari predittivi, considerati oggi essenziali per sostenere la competitività (Carayannis et al., 2025). Per le PMI, la gestione di questa transizione risulta particolarmente complessa. Da un lato, esse devono integrare nuovi strumenti e processi innovativi nonostante la disponibilità limitata di risorse e competenze rispetto alle grandi aziende (Mick et al., 2024). Dall'altro, si trovano ad affrontare barriere organizzative e strategiche, come la scarsa conoscenza delle tecnologie e la resistenza al cambiamento (Zajac et al., 2025), spesso aggravata da fenomeni di ansia digitale tra i dipendenti (Mihajlović et al., 2025).

Nonostante la letteratura si concentri spesso sulle grandi imprese o proponga approcci generali, studi recenti evidenziano che l'innovazione tecnologica può avere effetti particolarmente significativi nelle PMI, aprendo opportunità uniche di creazione di valore attraverso la digitalizzazione sostenibile (Zheng & Zhang, 2023), spesso in sinergia con un forte orientamento imprenditoriale "verde" (Alwakid & Dahri). Dal 2019, le ricerche che esplorano il legame tra trasformazione digitale e sostenibilità nelle PMI sono cresciute rapidamente, registrando un'accelerazione a partire dal 2022 e un picco di interesse nel 2025. Il campo rimane tuttavia frammentato, caratterizzato da approcci metodologici e prospettive teoriche eterogenee. Alcuni studi analizzano il contributo della digitalizzazione al raggiungimento di obiettivi

strategici come lo sviluppo sostenibile (Philbin et al., 2022) o l'internazionalizzazione (Rosyidah et al., 2023), mentre altri propongono modelli prescrittivi riferiti a contesti specifici come l'Industria 4.0 (Dossou et al., 2022). Questi contributi, tuttavia, si concentrano prevalentemente sui benefici attesi, senza considerare le conseguenze negative non intenzionali che le PMI possono incontrare. Tra queste rientrano l'aumento dei costi legati alla gestione dei talenti digitali e la mancanza di un ritorno economico immediato, dovuta agli elevati investimenti iniziali (Reshma & Selvam, 2025). Si aggiungono, inoltre, la crescente dipendenza dalle grandi piattaforme tecnologiche (Chung et al., 2025) e una serie di sfide etiche e sociali, come la tutela della privacy dei dati, l'evoluzione delle norme etiche e la possibile sostituzione di posti di lavoro (Kittipanya-Ngam et al., 2025). Dall'analisi dei principali studi sulle PMI emergono tendenze rilevanti. Denicolai, Zucchella e Magnani (2021) mostrano che digitalizzazione e sostenibilità sono strettamente correlate, pur potendo entrare in conflitto in contesti complessi come l'internazionalizzazione. Ukko et al. (2019) rilevano che una strategia orientata alla sostenibilità rafforza il legame tra capacità manageriali e performance finanziaria, limitando tuttavia l'efficienza operativa a breve termine. Dutta et al. (2020) evidenziano l'importanza delle competenze digitali per l'implementazione efficace di processi sostenibili, mentre Wang e Esperança (2023) e Zheng e Zhang (2023) dimostrano come strumenti digitali avanzati possano migliorare le performance ESG e l'innovazione tecnologica verde, con effetti particolarmente marcati nelle PMI rispetto alle grandi imprese.

Le analisi bibliometriche mostrano due principali filoni di ricerca. Il primo considera la trasformazione digitale come leva strategica per generare valore economico e sostenibile, concentrandosi su strategia e performance complessiva. Il secondo esplora i processi di innovazione, il ruolo degli attori dell'ecosistema e le barriere alla transizione digitale e sostenibile. Alcuni studi collegano concettualmente i due filoni, suggerendo che la trasformazione digitale debba essere interpretata come un fenomeno complesso e interdipendente, in cui le dimensioni tecnologiche, organizzative e strategiche si influenzano reciprocamente.

Tuttavia, il ruolo dell'IA e della trasformazione digitale come leva strategica per integrare innovazione e sostenibilità nelle PMI non è ancora pienamente esplorato, e mancano mappature sistematiche in grado di identificare i temi principali, le connessioni tra approcci teorici e le traiettorie evolutive del campo.

Alla luce di questo gap che emerge da un'analisi della letteratura condotta sugli studi pubblicati tra il 2019 e il 2025, è stata formulata la seguente domanda di ricerca (RQ):

RQ: In che modo la trasformazione digitale, e in particolare l'intelligenza artificiale, contribuisce all'integrazione tra innovazione e sostenibilità nelle PMI?

Il presente studio si propone di colmare questo vuoto attraverso una revisione sistematica della letteratura seguendo il protocollo di Tranfield et al. (2003), integrata da un'analisi bibliometrica quantitativa. Dal database Scopus sono stati selezionati 105 articoli mediante parole chiave mirate, da cui è stato estratto un campione finale di 91 studi. L'analisi condotta con il software VOSviewer ha considerato reti di co-autorialità per Paese, co-occorrenza delle parole chiave e bibliographic coupling, con l'obiettivo di delineare la struttura concettuale e intellettuale del campo, evidenziando filoni di ricerca principali, connessioni tra studi e traiettorie emergenti. Il lavoro è organizzato in tre sezioni principali. La seconda sezione descrive la metodologia adottata, la terza presenta i risultati delle analisi descrittive e bibliometriche, mentre la quarta discute le evidenze emerse, sottolineando i contributi principali, i limiti dello studio e le prospettive per ricerche future.

2. Metodologia

Il presente studio adotta una revisione sistematica della letteratura basata sui protocolli di Tranfield et al. (2003) e Kraus et al. (2020), con l'obiettivo di esaminare la relazione esistente tra IA e sostenibilità. Tale metodologia è stata scelta per garantire un'analisi obiettiva e replicabile.

Attraverso l'applicazione di criteri chiaramente definiti e non casuali, tale metodologia consente di individuare degli articoli rilevanti, la cui analisi fornisce una visione olistica dello stato dell'arte.

Le principali fasi in cui si articola la revisione sistematica della letteratura sono le seguenti:

- pianificazione della revisione;
- identificazione e valutazione degli studi;
- estrazione e sintetizzazione dei risultati;
- diffusione dei risultati della revisione.

Nella fase iniziale è stata identificata la necessità di condurre una ricerca sulla tematica in esame ed è stato definito un protocollo di ricerca. Una prima indagine sui principali database scientifici (Scopus, Web of Science e Google Scholar) ha confermato l'assenza di analisi sistematiche della letteratura sull'argomento. Data la crescente rilevanza dell'integrazione tra sostenibilità e innovazione tecnologica applicata alle PMI, si ritiene utile offrire un'analisi sistematica dei precedenti studi che hanno indagato la reciproca influenza dei due elementi, anche al fine di proporre nuove traiettorie di ricerca.

Successivamente sono state selezionate le seguenti parole chiave: Digital transformation, AI, Artificial Intelligence, CSR, corporate social responsibility, sustainability, ESG, SME, SMEs.

La selezione delle parole chiave deriva da una analisi preliminare della letteratura di riferimento, la quale ha messo in luce una lacuna di ricerca nell'intersezione tra la trasformazione digitale e la sostenibilità con riferimento al contesto delle piccole e medie imprese (Mick et al., 2024).

Query: "Digital transformation" or "AI" or "Artificial Intelligence" and "CSR" or "corporate social responsibility" or "sustainability" or "ESG" and "SME" or "SMEs".

La ricerca è stata effettuata sul database Scopus (Elsevier), ed è stata circoscritta ai campi titolo, abstract e keywords, come suggerito in letteratura (Massaro et al., 2016). Per garantire pertinenza rispetto agli obiettivi dello studio, il filtro tematico è stato limitato all'area "Business Management and Accounting". Sono stati inclusi solo articoli in riviste scientifiche, scritti in lingua inglese e pubblicati dal 2011 ad ottobre 2025 (data dell'estrazione). Il primo contributo individuato nel database Scopus risale al 2011, tuttavia tale lavoro è stato escluso dall'analisi in quanto ritenuto poco pertinente all'argomento oggetto di studio. Il primo contributo utile, dunque, risale al 2019, e ciò sottolinea l'attualità della tematica e la crescente rilevanza accademica che ha acquisito negli ultimi anni. Da questa prima selezione sono emersi 105 articoli.

Nella seconda fase, con l'ausilio del database MS Excel, è stata valutata la pertinenza degli articoli rispetto all'obiettivo della ricerca, attraverso la lettura del titolo e delle keywords. Successivamente, dopo aver letto in modo approfondito gli abstract, sono stati selezionati 91 articoli scientifici, ritenuti in linea con l'obiettivo di ricerca.

Nella terza fase si è proceduto con l'estrazione e la sintesi dei dati. Dal database Scopus, sono stati esportati i dati bibliografici in formato CSV. Prima di procedere con l'esportazione, sono stati selezionati i campi pertinenti per la ricerca (autori, titolo del documento, rivista, affiliazioni, editori, numero di citazioni, abstract, parole chiave, references).

Successivamente è stata condotta l'analisi dei dati mediante l'utilizzo del software VOSviewer, che consente l'analisi dei cluster utilizzando la co-occorrenza delle parole chiave, le citazioni dei documenti e il bibliographic coupling. Poiché le pubblicazioni selezionate per l'analisi sono molto attuali e quindi prive di un numero significativo di citazioni, la modalità più efficace per la mappatura della letteratura risulta essere il bibliographic coupling, in quanto mette in luce le fonti citate in comune e permette di superare il limite delle citazioni (Boyack & Klavans, 2010). Infine nella quarta fase sono stati analizzati e descritti i risultati.

Fasi della ricerca	Risultati
TITOLO-ABS-KEY ("Digital transformation" or "AI" or "Artificial Intelligence" and "CSR" or "corporate social responsibility" or "sustainability" or "ESG" and "SME" or "SMEs")	471
AREA TEMATICA: Business Management and Accounting	197
TIPO DI DOCUMENTO: Articolo	109
LINGUA: Inglese	105
ARTICOLI SELEZIONATI	105
ARTICOLI ANALIZZATI	**91**

Tabella 1. Processo di selezione degli articoli scientifici

3. Risultati

Nella sezione dei risultati viene presentata un'analisi descrittiva e bibliometrica degli articoli scientifici selezionati dal database Scopus, che esplorano il rapporto tra IA e sostenibilità nelle PMI.

La distribuzione annuale degli articoli presenti nel campione analizzato dal 2019 al 2025 mostra che la produzione scientifica, assente fino al 2019, resta limitata anche fino al 2021. A partire dal 2022 si osserva un primo incremento degli articoli e, sebbene nel 2023 si registri una lieve flessione, negli ultimi due anni l'interesse per la tematica cresce in maniera marcata, raggiungendo nel 2025 un totale di 51 contributi. Questi dati evidenziano un campo di studi in rapida espansione, sottolineando come la rilevanza della tematica nel settore manageriale sia ormai consolidata.

Per quanto riguarda la distribuzione territoriale, la mappa della rete di Paesi che hanno collaborato nella ricerca internazionale (costruita con VOSviewer includendo i Paesi con almeno due articoli e un minimo di 3 citazioni) evidenzia 5 cluster, così suddivisi:

1) Cluster Rosso: Croazia, India, Italia, Arabia Saudita, Emirati Arabi Uniti;
2) Cluster Verde: Brasile, Finlandia, Germania, Sudafrica;
3) Cluster Blu: Canada, Indonesia, Malesia;
4) Cluster Giallo: Cina, Pakistan, Portogallo;
5) Cluster Viola: Francia, Tailandia, Regno Unito.

Dal grafico 1 emerge la posizione predominante e centrale della Cina, seguita da India, Pakistan, Italia e Arabia Saudita.

Grafico 1. Mappa di co-autorialità per Paese

Un ulteriore elemento di indagine riguarda l'analisi delle citazioni per documento (Tab. 2). Tale analisi evidenzia che, tendenzialmente, gli articoli più recenti hanno un minor numero di citazioni, considerata la limitata diffusione nella comunità scientifica rispetto ad altri articoli più remoti. Dato il ristretto arco temporale (2019-2025), l'elevato numero di citazioni di alcuni

articoli evidenzia l'interesse e l'attualità per le tematiche trattate nello studio da parte della comunità accademica.

Tabella 2. Numero di citazioni autore/documento

L'analisi successiva si è concentrata sullo studio degli articoli più influenti in termini di impatto accademico.

Su un totale di 65 documenti con almeno una citazione, i lavori più rilevanti, con oltre 100 citazioni, risultano essere quelli di Denicolai, Zucchella, Magnani (2021), Dutta, Kumar, Sindhwani, Singh (2020), Ukko, Nasiri, Saunila, Rantala (2019), Wang e Esperança (2023), El Hilali, El Manouar, Janati Idrissi (2020), Zheng e Zhang (2023).

Nello specifico, lo studio di Denicolai, Zucchella, Magnani (2021), oltre alla digitalizzazione e alla sostenibilità, include anche l'internazionalizzazione come percorso chiave di crescita per le aziende. Dal loro studio emerge che digitalizzazione e sostenibilità sono correlate positivamente, ma entrano in conflitto nel momento in cui l'azienda si internazionalizza. Questa evidenza viene spiegata come una conseguenza della responsabilità della piccolezza, cioè dei limiti delle PMI in termini di risorse e capacità (Freeman et al., 1983).

Ukko, Nasiri, Saunila, Rantala (2019) hanno studiato la relazione esistente tra digitalizzazione, sostenibilità e performance finanziaria. Premettendo che la strategia digitale si debba basare sulla capacità manageriale e sulla capacità operativa, i risultati dimostrano che una strategia di sostenibilità funge da promotrice nella relazione tra capacità manageriale e performance finanziaria; tuttavia, inibisce la relazione tra capacità operativa e performance finanziaria.

Lo studio di Dutta, Kumar, Sindhwani e Singh (2020) si pone l'obiettivo di analizzare, nel contesto delle PMI manifatturiere indiane, in che modo possono essere sfruttate le tecnologie

dell'Industria 4.0. La tematica dell'Industria 4.0 rappresenta una limitazione poiché è relativamente nuova per l'India; pertanto, non si dispone ancora di sufficiente letteratura accademica. Inoltre, l'attuale livello di competenza delle PMI indiane rispetto alle tecnologie digitali rappresenta un ostacolo alla valutazione della maturità delle imprese. Nonostante queste barriere, dalla ricerca emergono le priorità per la trasformazione digitale e prevede che tale processo possa supportare le iniziative di sostenibilità. Studi più recenti (Sawaean & Aburumman, 2025) dimostrano che tali competenze digitali hanno un ruolo di mediazione tra la leadership digitale e la performance innovativa delle PMI. L'adozione di pratiche digitali rafforza l'ecosistema imprenditoriale e accresce la capacità delle PMI di innovare e operare in un'ottica sostenibile (Ramakrishna et al., 2025), specialmente se guidata da una forte imprenditorialità verde (Sklavos et al., 2022).

Wang e Esperança (2023), nel loro lavoro, si pongono l'obiettivo di esaminare il grado di influenza della trasformazione digitale sul mercato e sulle performance di sostenibilità delle PMI cinesi. Nello studio emerge che l'implementazione di strumenti digitali dovrebbe essere una priorità, soprattutto se legata agli obiettivi ESG poiché, in questo modo, la trasformazione digitale può essere sfruttata in maniera strategica per migliorare le performance di sostenibilità. Anche El Hilali et al. (2020) hanno analizzato la relazione tra trasformazione digitale e sostenibilità attraverso uno studio empirico su 41 PMI marocchine. I risultati mostrano che la trasformazione digitale può influenzare positivamente la sostenibilità aziendale se le imprese si concentrano su tre aspetti chiave, ovvero migliorare l'esperienza del cliente – anche attraverso strategie mirate di digital marketing (Bennacer et al., 2025) innovativo e sostenibile (Jibril et al., 2024), e l'integrazione di servizi basati sull'intelligenza artificiale (Hwang et al., 2025) – sviluppare le capacità di analisi dei dati e orientare l'innovazione al livello del modello di business, fattori riconosciuti nel contesto attuale come determinanti per la competitività digitale delle PMI (Touijer & Elabjani, 2025).

Zheng e Zhang (2023), esaminando oltre 2600 aziende manifatturiere cinesi, hanno evidenziato che la trasformazione digitale può stimolare l'innovazione nelle tecnologie verdi. Gli autori sottolineano che la sostenibilità rappresenta il principale meccanismo attraverso cui la digitalizzazione favorisce lo sviluppo di soluzioni tecnologiche ecocompatibili, specialmente se supportate da un adeguato capitale intellettuale verde che moderi l'adozione di strumenti di IA (Crocco et al., 2025). Tuttavia, è necessario un forte orientamento strategico che allinei gli obiettivi digitali a quelli ambientali (Zaki et al., 2025; Shaik et al., 2024), mediante la conversione delle competenze tecnologiche in innovazione di business, mediatrice cruciale per le performance green (Khanh & Cuong, 2025). Di particolare interesse per questo studio è il fatto che le PMI traggono vantaggi più significativi da questa dinamica rispetto alle grandi aziende, come evidenziato anche nello studio di Añón Higón & Torrent-Sellens (2025), in cui emerge che anche le imprese di minori dimensioni possono agire come agenti di cambiamento se possiedono, o sono supportate nello sviluppo di, capacità appropriate.

Successivamente, per approfondire la struttura concettuale del campo di ricerca e individuare i temi portanti della letteratura, è stata condotta un'analisi di co-occorrenza delle parole chiave che ha portato all'individuazione di tre cluster (Grafico 2). Tale analisi permette di visualizzare le relazioni semantiche tra i concetti attraverso il raggruppamento in cluster, che rappresentano i principali filoni di studio.

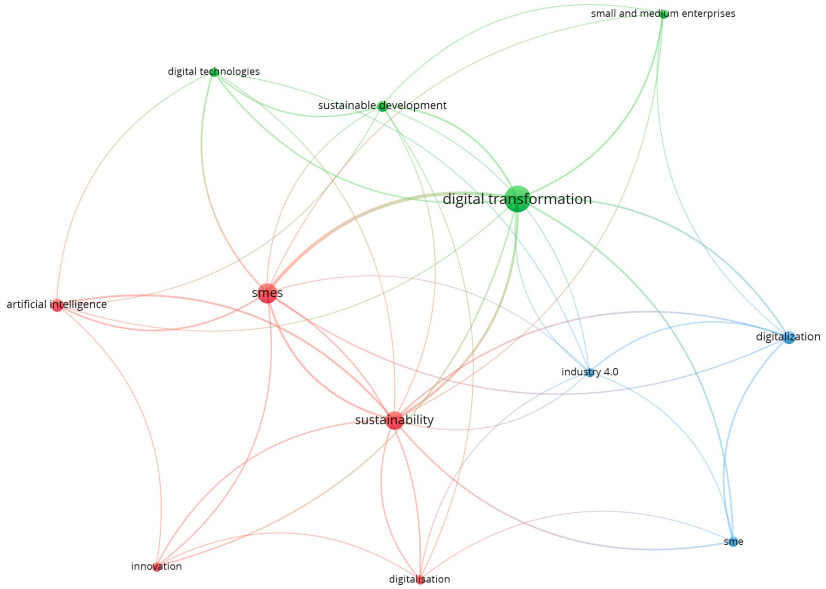

Grafico 2. Mappa di co-occorrenza delle parole chiave per autore

Il primo filone tematico, Innovazione sostenibile (cluster rosso), affronta il tema dell'implementazione dell'innovazione sostenibile e digitale nelle PMI. Le parole chiave predominanti in questo cluster sono smes (24 occorrenze, 32 TLS) e sustainability (19 occorrenze, 28 TLS). L'elevata forza dei collegamenti indica che l'innovazione tecnologica sia ormai inscindibile dagli obiettivi di sostenibilità per le PMI. In questo contesto, l'intelligenza artificiale emerge come uno strumento essenziale per implementare pratiche avanzate, come ad esempio la Green AI (Hacker, 2023; Ul Haq et al., 2025), che rappresenta un'evoluzione della tradizionale intelligenza artificiale attraverso l'integrazione di principi di sostenibilità (Ul Haq et al., 2025). Il secondo filone, Sviluppo strategico (cluster verde), è dominato dal nodo digital transformation, che rappresenta il tema più discusso, essendo sia il termine più citato sia quello con i collegamenti più forti. In questo cluster la trasformazione digitale è interpretata come una leva strategica necessaria per riconfigurare i modelli di business e garantire la crescita a lungo termine delle piccole e medie imprese (Denicolai et al., 2021; Ukko et al., 2019).

Infine, l'Evoluzione industriale (cluster blu), si distingue per il focus tecnico su Industry 4.0 e digitalization. Questo filone analizza l'automazione e l'efficienza dei processi produttivi come base infrastrutturale necessaria per sostenere la transazione sostenibile (Dutta et al., 2020). Il cluster, dunque, definisce un ambito più specifico, centrato sull'Industria 4.0 (Sarango-Lalangui et al., 2023), paradigma che la letteratura più recente sta già evolvendo verso l'Industria 5.0, con una crescente attenzione verso il fattore umano e la resilienza operativa (Latino, 2025; Takawira & Pooe, 2025).

Filone tematico	Cluster	Focus principale	Principali attori / concetti chiave
Innovazione sostenibile	Rosso	Implementazione dell'innovazione sostenibile e digitale nelle PMI, integrazione di pratiche di sostenibilità ambientale	PMI (SMEs), sostenibilità (sustainability), Intelligenza Artificiale, Green AI (Hacker, 2023; Ul Haq et al., 2025)

Sviluppo strategico	Verde	Trasformazione digitale come leva strategica per riconfigurare modelli di business e garantire crescita a lungo termine	Digital transformation, PMI, strategia aziendale, crescita sostenibile (Denicolai et al., 2021; Ukko et al., 2019)
Evoluzione industriale	Blu	Automazione e digitalizzazione dei processi produttivi come base per sostenibilità; Industria 4.0 verso Industria 5.0, con attenzione a resilienza e fattore umano	Industry 4.0, digitalization, automazione, efficienza operativa, resilienza, Industria 5.0 (Dutta et al., 2020; Sarango-Lalangui et al., 2023; Latino, 2025; Takawira & Pooe, 2025)

Tabella 3. Tabella dei cluster tematici delle parole chiave

Per mappare le relazioni tra gli studi più recenti, è stata condotta un'analisi di bibliorgaphic coupling. Questo approccio permette di raggruppare gli articoli in base alle referenze condivise, al fine di evidenziare le diverse scuole di pensiero.

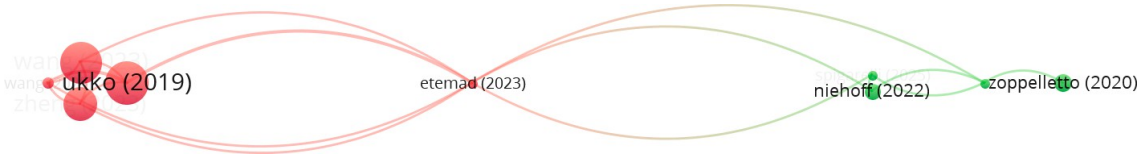

Grafico 3. Mappa di bibliographic coupling per documento

Dall'analisi sono emersi due principali approcci interpretativi, rappresentati dai due cluster. All'interno del cluster rosso sono inclusi gli studi che interpretano la trasformazione digitale come un fenomeno strategico orientato alla sostenibilità e alla creazione di valore, in particolare valore strategico (Etemad, 2023) – generato dalla capacità di convertire le risorse tecnologiche in innovazione digitale attiva (Abdelwaheed et al., 2025) – e di performance (Wang & Esperança, 2023; Valdez-Juárez et al., 2024; Jassem & Abdelfattah, 2025).

Il cluster verde, invece, raccoglie studi che si soffermano maggiormente sulla comprensione dei processi, del ruolo degli attori presenti nell'ecosistema, delle barriere che ostacolano la transizione verde e digitale (Sklavos et al., 2024), intesa come twin transformation (Burtscher et al., 2025). Gli studi evidenziano un approccio più pragmatico alla trasformazione digitale, in quanto viene analizzata come un processo di innovazione continua, talvolta supportato da strumenti operativi di autovalutazione (Latino, 2025), misurabile attraverso item specifici che collegano l'adozione tecnologica alle performance di sostenibilità (Jamwal et al., 2025; Abedin et al, 2024; Pylaeva et al., 2022, Ferraro et al., 2025, Degregori et al., 2025).

4. Discussione dei risultati e conclusioni

L'analisi condotta ha avuto l'obiettivo di rispondere alla domanda di ricerca iniziale (RQ), indagando il ruolo della IA nell'integrazione tra sostenibilità e l'innovazione nelle PMI. La risposta che emerge dalla letteratura non è univoca, ma complessa e multidimensionale, e delinea un panorama in cui convergenza tecnologica e sostenibilità definiscono il nuovo paradigma della digitainability (Saáry et al., 2022; Varbanova et al., 2025). I risultati dell'analisi bibliometrica permettono di scomporre questo ruolo in tre dimensioni principali. La prima, di natura strategico-manageriale, interpreta la trasformazione digitale come un paradigma finalizzato al raggiungimento dello sviluppo sostenibile, con particolare attenzione agli aspetti di sostenibilità ambientale. La seconda, focalizzata sull'implementazione pratica e sull'innovazione nelle PMI, analizza le modalità con cui le PMI adottano strumenti digitali e pratiche innovative. La

trasformazione digitale è vista come una leva per l'innovazione sostenibile a livello di singola impresa, con un forte legame a tecnologie specifiche come, ad esempio, l'intelligenza artificiale e le sue recenti applicazioni nella Green AI (Ul Haq et al., 2025). Infine, la terza area, di carattere tecnologico-industriale, riguarda il contesto dell'Industria 4.0 e le tecnologie abilitanti che supportano la digitalizzazione dei processi produttivi nelle piccole e medie imprese.

Successivamente, attraverso l'analisi di bibliographic coupling è stato possibile approfondire l'architettura intellettuale del campo. Questo studio ha evidenziato la presenza di due principali approcci interpretativi della trasformazione digitale, diversi ma complementari.

Il primo approccio considera la trasformazione digitale come una leva misurabile per le performance aziendali. In questa prospettiva, studi come quelli di Ukko et al. (2019) e Akbari et al. (2022) evidenziano il complesso trade-off tra capacità manageriali e operative necessario per ottenere risultati ottimali. Il secondo approccio interpreta invece la trasformazione digitale come un processo contestuale e collaborativo, ponendo l'attenzione sui processi di adozione, sulle barriere sistemiche e sul ruolo degli attori dell'ecosistema, come intermediari dell'innovazione (Zoppelletto et al., 2020; Niehoff, 2022; Spigarelli et al., 2025). In questa prospettiva, la trasformazione digitale abiliterebbe nuove forme di governance e collaborazione, permettendo di affrontare sfide collettive. Dalla sintesi delle evidenze emerse dai due filoni, è possibile rispondere alla domanda di ricerca (RQ). La trasformazione digitale, integrando sostenibilità e innovazione, agisce come catalizzatore all'interno delle PMI. In primo luogo, assume un ruolo operativo, poiché tecnologie come l'intelligenza artificiale forniscono strumenti avanzati per misurare e tradurre i principi di sostenibilità in pratiche aziendali efficienti. In secondo luogo, riveste un ruolo strategico di connessione: le piattaforme digitali consentono alle PMI di superare i vincoli legati alle dimensioni aziendali, di inserirsi in ecosistemi collaborativi e di garantire la trasparenza necessaria per competere nei mercati globali. Infine, l'efficacia della trasformazione digitale dipende dalla capacità dell'impresa di allineare l'adozione tecnologica con la propria cultura della sostenibilità, creando sinergie tra strumenti, processi e valori organizzativi.

I risultati di questo studio hanno importanti implicazioni sia per la teoria sia per la pratica. Dal punto di vista teorico, lo studio evidenzia la necessità di superare i modelli tradizionali, spesso focalizzati sulle grandi imprese. Il contributo principale risiede nel dimostrare che, per le PMI, le dimensioni della performance interna (tipica di una prospettiva orientata all'efficienza) e della governance esterna (legata alla collaborazione con l'ecosistema) non possono essere considerate separatamente. Pertanto, è necessario sviluppare approcci teorici integrati di "digitainability" che riconoscano le specificità e le differenze nei percorsi di adozione delle pratiche digitali e sostenibili (Arroyabe et al., 2024).

I risultati evidenziano che, per i manager delle PMI, la transizione verso modelli verdi e digitali richiede un approccio duplice. Prima di investire in tecnologie avanzate, è fondamentale sviluppare una leadership in grado di combinare intuizione imprenditoriale e capacità di analisi dei dati (Jaboob et al., 2025). Inoltre, la leadership deve essere in grado di integrare la sostenibilità all'interno della strategia aziendale come componente essenziale del modello di business (Amjad et al., 2024), superando una visione puramente normativa e riconoscendole un ruolo centrale nei processi decisionali, con l'obiettivo di renderla una leva strategica per un'innovazione di valore. Contemporaneamente, è essenziale rafforzare le competenze collaborative e mantenere un ruolo attivo nell'ecosistema di riferimento, così da compensare le limitazioni delle risorse interne. A livello organizzativo, per colmare il divario di competenze digitali e ridurre la resistenza al cambiamento, è importante investire nella formazione continua del personale (Afan Torres et al., 2025; Abedin et al., 2024). Invece, in merito all'interazione con l'ambiente esterno, le tecnologie digitali permettono alle PMI di costruire relazioni più solide e trasparenti con i clienti e i partner, pertanto, la digitalizzazione può essere sfruttata per migliorare il coinvolgimento degli stakeholder, ad esempio attraverso l'uso di piattaforme di co-creazione che facilitano la creazione di valore e la condivisione della conoscenza, la condivisione trasparente dei dati di impatto ambientale che incoraggia la responsabilità condivisa verso obiettivi sostenibili, o l'adozione di

strumenti di comunicazione interattiva per creare esperienze personalizzate che promuovano abitudini sostenibili (Alsafran et al., 2025). In questo modo, la tecnologia assume il ruolo operativo necessario per misurare le performance di sostenibilità e superare il trade-off tra efficienza e innovazione. L'analisi evidenzia per i policy maker l'importanza di promuovere politiche mirate a ridurre il divario tra grandi e piccole imprese (Niehoff, 2022) e a rafforzare il ruolo degli intermediari dell'innovazione, facilitando il trasferimento di tecnologie e competenze all'interno degli ecosistemi aziendali (Spigarelli et al., 2025). Parallelamente, è essenziale che i policy maker garantiscano infrastrutture digitali robuste e accessibili, in grado di permettere la trasformazione dei modelli di business (Afan Torres et al., 2025). È fondamentale che l'adozione di tecnologie digitali sia funzionale al raggiungimento di obiettivi ambientali e sociali (Anón Higón & Torrent-Sellens, 2025), per rafforzare la capacità delle imprese di adattarsi e prosperare anche in scenari futuri incerti (Carayannis et al., 2025).

Lo studio presenta alcune limitazioni. L'analisi bibliometrica si è concentrata esclusivamente sul database Scopus, il che assicura un elevato standard qualitativo dei contributi considerati, ma potrebbe aver escluso lavori rilevanti presenti su altre piattaforme.

Tali limiti indicano diverse direzioni per la ricerca futura. La letteratura ha evidenziato un trade-off iniziale tra innovazione tecnologica ed efficienza operativa (Ukko et al., 2019); pertanto, studi longitudinali sulle PMI potrebbero chiarire se e come questo trade-off venga superato e se i profili di adozione identificati da Arroyabe et al. (2024) rappresentino stadi evolutivi o condizioni più stabili. Inoltre, la ricerca attuale si concentra prevalentemente sulla sostenibilità ambientale, trascurando aspetti legati alla sostenibilità sociale e all'etica. Nuovi filoni potrebbero approfondire l'impatto dell'intelligenza artificiale sui processi decisionali e sui dilemmi etici, nonché sul benessere dei lavoratori nelle PMI, al fine di integrare pienamente la tecnologia all'interno di un approccio complessivo alla sostenibilità.

Parole chiave: Innovazione tecnologica; trasformazione digitale; sostenibilità; PMI; analisi sistematica della letteratura

L'evoluzione dei sistemi informativo-contabili in risposta alle sfide della sostenibilità

Domenica Lavorato[1], Rita Lamboglia[2], Daniela Mancini[3]

1. Introduzione

Negli ultimi anni, la crescente centralità della sostenibilità, intesa sia come requisito normativo sia come priorità strategica, ha portato le aziende ad un ripensamento dei propri sistemi informativi, dei processi di controllo e dei meccanismi decisionali. L'Unione Europea ha progressivamente definito un articolato quadro normativo volto a integrare la sostenibilità nei processi aziendali e nei sistemi di rendicontazione, introducendo obblighi informativi sempre più estesi e standardizzati. Iniziative quali la Corporate Sustainability Reporting Directive (CSRD, Direttiva UE 2022/2464), gli European Sustainability Reporting Standards (ESRS) e il Regolamento Tassonomia (Regolamento UE 2020/852) mirano a integrare sistematicamente le dimensioni ambientali, sociali e di governance (ESG) nella gestione aziendale, nella pianificazione strategica e nei processi di informativa esterna (Bini e Giunta, 2023; EFRAG, 2023). Tali interventi normativi richiedono alle organizzazioni di integrare gli obiettivi di sostenibilità nei processi decisionali, rendendoli misurabili attraverso la progettazione di adeguati sistemi di controllo, lo sviluppo di infrastrutture informatiche e di monitoraggio e l'adozione di solidi meccanismi di governance. In questo contesto, le imprese sono chiamate a dotarsi di sistemi informativi in grado di generare informazioni ESG affidabili, verificabili e integrabili con i dati economico-finanziari, così da supportare la qualità e la rilevanza delle decisioni aziendali. Ne derivano significative implicazioni organizzative, procedurali e tecnologiche, che incidono direttamente sull'evoluzione dei sistemi informativo-contabili e dei sistemi di management accounting.

Diversi studi evidenziano il ruolo centrale dei sistemi informativo-contabili nel promuovere la sostenibilità e nel garantire la conformità a quadri normativi in continua evoluzione (Goni et al., 2017; Puroila e Mäkelä et al., 2019; Lavorato et al., 2025). Tradizionalmente concepiti come infrastrutture di rendicontazione finanziaria, tali sistemi sono oggi sempre più interpretati come sistemi socio-tecnici in grado di integrare informazioni finanziarie e non finanziarie, al fine di supportare i processi decisionali interni e la rendicontazione esterna (Troshani e Rowbottom, 2024). Pertanto, riprogettare questi sistemi può risultare rilevante al fine di rendere operativa la rendicontazione di sostenibilità, garantire la tracciabilità dei dati e collegare gli obiettivi ESG alle pratiche manageriali (de Villiers et al., 2021). Le tecnologie digitali come piattaforme cloud, strumenti di data analytics, blockchain e Internet of Things, agiscono come fattori abilitanti di questo processo, contribuendo a migliorare la trasparenza e la verificabilità delle informazioni di sostenibilità (Arnaboldi et al., 2017; Lardo et al., 2020; Galeotti et al., 2022).

Nonostante la crescente attenzione al tema, la maggior parte degli studi si è finora concentrata sul reporting di sostenibilità (Gray, 2010; Bebbington et al., 2012; de Villiers et al.,

2014; Higgins et al., 2015; Talbot e Boiral, 2018) e sui sistemi di sustainability management control (Söderström et al., 2017; Wijethilake, 2017), mentre pochi Autori hanno indagato come integrare la sostenibilità nei sistemi informativi aziendali (Gond et al., 2012; Maas et al., 2016; Schaltegger e Hörisch, 2017). In particolare, studi recenti suggeriscono che il sistema informativo-contabile svolge un ruolo chiave nell'integrazione della sostenibilità nei processi aziendali (Gond et al., 2012; Schaltegger e Hörisch, 2017; Lavorato et al., 2025), ma le prove empiriche rimangono ancora scarse e frammentate (Dagilienė e Šutienė, 2019; Troshani e Rowbottom, 2024).

2. Obiettivi e metodologia della ricerca

Alla luce del gap individuato in letteratura, il presente studio si propone di indagare l'evoluzione del sistema informativo-contabile in risposta ai nuovi requisiti di rendicontazione introdotti dal framework normativo europeo sulla sostenibilità, con particolare riferimento alla CSRD, agli ESRS e al Regolamento Tassonomia. L'analisi si focalizza sui cambiamenti organizzativi, procedurali e tecnologici attivati da tali pressioni normative, con riferimento alle modalità di raccolta, elaborazione, integrazione e controllo delle informazioni di sostenibilità.

Dal punto di vista teorico, lo studio muove dal presupposto che le recenti normative europee in materia di sostenibilità rappresentano una forma di pressione coercitiva che destabilizza le pratiche di reporting esistenti e impone alle aziende una profonda revisione dei propri sistemi informativo-contabili. Tale cambiamento , tuttavia, non può essere interpretato come un mero adeguamento tecnico, ma deve essere letto come un processo di trasformazione orientato al conseguimento di conformità normativa, legittimità e credibilità nei confronti degli stakeholder.

Per comprendere come le organizzazioni rispondono a queste pressioni e come il cambiamento si traduce operativamente nella riconfigurazione dei sistemi informativo-contabili, lo studio adotta la socio-technical theory (Bostrom e Heinen, 1977; Fischer e Herrmann, 2011) quale principale lente interpretativa. Secondo questa prospettiva, un sistema informativo può essere interpretato come una configurazione integrata di sottosistemi interdipendenti che co-evolvono nel tempo (Troshani e Rowbottom, 2024). In linea con le più recenti elaborazioni teoriche, il sistema informativo-contabile viene interpretato come l'interazione dinamica tra tre sottosistemi principali: ambientale, sociale e tecnico. Il sottosistema ambientale include il contesto istituzionale e normativo entro cui l'organizzazione opera. Il sottosistema sociale comprende gli attori organizzativi coinvolti, nonché le relazioni, le competenze, i ruoli, le strutture organizzative e le pratiche operative attraverso cui il lavoro viene svolto. Il sottosistema tecnico riguarda invece gli artefatti informativi e le infrastrutture digitali, inclusi software, database, piattaforme, moduli di raccolta dati e strumenti di reporting.

In questa prospettiva, il cambiamento del sistema informativo-contabile indotto dalla regolamentazione sulla sostenibilità è interpretabile come un processo di riallineamento socio-tecnico, in cui le organizzazioni sono chiamate a riconfigurare simultaneamente persone, tecnologie e pratiche operative per rispondere alle nuove esigenze informative. Un principio centrale della socio-technical theory è quello della joint optimisation (Pasmore et al., 2019), secondo cui l'efficacia complessiva del sistema dipende dalla capacità di raggiungere un adeguato equilibrio tra le componenti sociali e tecniche, in relazione alle pressioni ambientali. Tale equilibrio non è statico, ma si sviluppa in modo iterativo nel tempo, soprattutto in contesti caratterizzati da elevata incertezza normativa e da requisiti informativi in rapida evoluzione, come quello della rendicontazione di sostenibilità.

Dal punto di vista metodologico, lo studio adotta il metodo del case study (Yin, 2017), ritenuto particolarmente appropriato per indagare in profondità fenomeni complessi e fortemente contestualizzati, quali i processi di riconfigurazione dei sistemi informativo-contabili in risposta a contesti normativi in rapida evoluzione. L'analisi empirica si concentra su Alfa, un grande

gruppo italiano operante nel settore dei trasporti, attivo nelle infrastrutture ferroviarie e stradali, nei servizi passeggeri e merci e nella mobilità urbana.

La scelta del caso appare particolarmente significativa in quanto il gruppo, negli ultimi anni, ha progressivamente rafforzato il proprio impegno nella gestione e nel monitoraggio delle performance ESG, integrando la rendicontazione di sostenibilità nella Relazione Finanziaria Annuale, predisposta in conformità agli ESRS, in quanto soggetto ai requisiti della CSRD. Un passaggio rilevante di tale evoluzione è rappresentato dall'ampliamento della relazione sulla gestione con sezioni dedicate alla governance di sostenibilità, alla valutazione dei rischi, al coinvolgimento degli stakeholder e agli indicatori di performance ESG, strutturate secondo il framework ESRS. In linea con il nuovo quadro normativo, sia la capogruppo sia le società consolidate partecipano ai processi di reporting e controllo della sostenibilità: la capogruppo presidia gli aspetti trasversali, mentre le controllate rendicontano temi e indicatori settoriali rilevanti per i rispettivi ambiti di attività. Inoltre, Alfa ha integrato nel bilancio consolidato anche le informative richieste dal Regolamento Tassonomia, che introduce un sistema di classificazione delle attività economiche sostenibili e richiede la disclosure di indicatori quali la quota di fatturato, CapEx e OpEx allineati alla tassonomia. Tale adempimento assume particolare rilevanza in settori ad alto impatto, come quello dei trasporti, poiché consente agli stakeholder di valutare il contributo dell'impresa alla transizione ecologica. Per rispondere a tali obblighi, Alfa ha avviato già nel 2022 un progetto dedicato alla mappatura e alla rendicontazione dei costi, ricavi e investimenti associati alle attività sostenibili ai fini tassonomici, con l'obiettivo di costruire un processo strutturato e replicabile di raccolta, valutazione e consolidamento delle informazioni.

Al fine di garantire triangolazione e solidità interpretativa, i dati sono stati raccolti attraverso fonti multiple (Yin, 2017), tra cui documenti aziendali interni, materiali pubblicamente disponibili sui siti web del gruppo, presentazioni e report di progetto, nonché interviste semi-strutturate. In particolare, sono state condotte due interviste pilota con il Responsabile Bilancio e Amministrazione Fiscale, svolte rispettivamente nel luglio 2023 e nel gennaio 2024, della durata di circa 40 minuti ciascuna. Tra ottobre e novembre 2025 sono state inoltre realizzate interviste con il Responsabile del Reporting di Sostenibilità, il Responsabile Accounting Policy e Analisi Partecipate e il Responsabile dei Sistemi Informativi. Gli intervistati, direttamente coinvolti nel progetto di adeguamento del sistema informativo, hanno fornito contributi rilevanti per ricostruire l'evoluzione delle pratiche informative e organizzative nel tempo.

I materiali raccolti sono stati integralmente trascritti e sottoposti a un'analisi qualitativa del contenuto (Strauss e Corbin, 1990; Patton, 2014). Le evidenze emerse sono state interpretate alla luce della socio-technical theory, al fine di analizzare l'interazione tra pressioni normative, attori organizzativi e infrastrutture tecnologiche nel processo di cambiamento del sistema informativo-contabile.

3. Risultati attesi

La ricerca è attualmente in corso, pertanto, lo studio non consente ancora di formulare risultati conclusivi; tuttavia, l'analisi preliminare delle fonti documentali e delle evidenze empiriche raccolte permette di delineare alcune prime traiettorie interpretative.

Per rispondere ai requisiti del Regolamento Tassonomia, Alfa ha avviato nel 2022 un progetto strutturato volto a sviluppare un processo sistematico di raccolta, analisi e rendicontazione delle informazioni richieste. Tale iniziativa è scaturita dalla necessità di integrare nel sistema informativo aziendale un insieme di dati tecnici e contabili che, fino a quel momento, non risultavano adeguatamente monitorati e tracciati nei sistemi esistenti.

Il progetto si è articolato lungo tre direttrici principali. La prima ha riguardato un assessment tecnico, volto a identificare le attività economiche del gruppo rientranti nell'ambito della Tassonomia e potenzialmente riconducibili agli obiettivi di mitigazione o adattamento climatico. La seconda ha interessato un assessment contabile, finalizzato a garantire la corretta

individuazione, classificazione e riconciliazione di ricavi, costi operativi e investimenti associati alle attività sostenibili con i dati finanziari del gruppo. La terza ha riguardato una gap analysis dei processi informativi e dei sistemi IT, orientata a individuare le principali criticità in termini di tracciabilità, raccolta, analisi e integrazione delle informazioni necessarie al reporting di sostenibilità.

Per governare la complessità del progetto, Alfa ha costituito un gruppo di lavoro interfunzionale composto da diverse strutture organizzative. In particolare, Sustainability Reporting & Compliance ha assunto il coordinamento del processo; Amministrazione e Bilancio ha contribuito con competenze relative ai principi contabili e alla riconciliazione dei KPI; Climate Risk Resilience ha curato le valutazioni tecniche connesse all'adattamento climatico. A tali strutture si è affiancata, per gli aspetti informativi e contabili del processo di "disclosure tassonomico" a livello consolidato, la funzione Bilancio Consolidato, Gestione e Coordinamento Controllate. Le società controllate hanno assunto un ruolo attivo nella raccolta dei dati e nella valutazione delle attività, seguendo un approccio di tipo bottom-up. Ciascuna società controllata ha individuato referenti interni incaricati dello screening tecnico, della raccolta documentale e della predisposizione dei KPI richiesti.

La prima fase operativa ha riguardato la definizione di linee guida di gruppo, finalizzate a formalizzare metodi, responsabilità e procedure per la valutazione delle attività, la verifica del rispetto dei criteri ambientali e sociali previsti dal regolamento e il calcolo dei KPI richiesti (turnover, CapEx, OpEx). Ciò ha consentito di introdurre un linguaggio comune, uniformare le pratiche e ridurre la discrezionalità operativa tra le diverse società del gruppo. Successivamente, ciascuna controllata ha condotto un processo di screening delle proprie attività economiche, identificando quelle eleggibili e valutandone l'eventuale allineamento ai criteri tecnici della Tassonomia. Le informazioni raccolte sono state quindi trasmesse alla capogruppo per le attività di validazione e consolidamento.

La gap analysis dei sistemi informativi ha fatto emergere una marcata dipendenza da procedure manuali, in particolare template Excel e scambi informali di documenti, evidenziando limiti rilevanti in termini di standardizzazione, affidabilità, verificabilità e capacità di integrazione con il sistema informativo-contabile. Tali criticità sembrano aver favorito l'avvio di un percorso di evoluzione digitale, articolato nell'estensione della piattaforma utilizzata per il reporting di sostenibilità (ESGeo), nello sviluppo di moduli dedicati nel sistema di Enterprise Performance Management (EPM) per l'automazione del calcolo e del consolidamento dei KPI tassonomici e nella progressiva integrazione tra le diverse piattaforme informative.

La fase finale del progetto ha riguardato la predisposizione delle informative di gruppo incluse nella Relazione Finanziaria Annuale, consolidate attraverso le nuove maschere di data entry EPM e processate mediante i sistemi di reporting centralizzato.

Alla luce della socio-tehnical theory, tali evidenze preliminari suggeriscono che l'evoluzione del sistema informativo-contabile di Alfa, osservata nel contesto dell'implementazione del nuovo quadro normativo europeo sulla sostenibilità, può essere letta come un processo di riallineamento socio-tecnico. Tale processo appare innescato da pressioni istituzionali di natura coercitiva, che hanno messo in discussione l'adeguatezza delle configurazioni informative preesistenti e reso necessario un ripensamento congiunto delle componenti organizzative, tecnologiche e procedurali del sistema.

In questa chiave interpretativa, l'adeguamento ai requisiti della CSRD e del Regolamento Tassonomia non si configura come un mero intervento tecnico sui sistemi informativi, bensì come un più ampio percorso di trasformazione, nel quale la riconfigurazione delle infrastrutture digitali si accompagna alla ridefinizione dei ruoli, responsabilità e pratiche operative connesse alla produzione delle informazioni di sostenibilità.

Con riferimento al sottosistema ambientale, le evidenze preliminari indicano che l'introduzione di requisiti informativi standardizzati e verificabili ha ridefinito le aspettative istituzionali nei confronti dell'organizzazione, imponendo nuovi criteri di legittimità basati sulla

capacità di produrre informazioni ESG tracciabili, confrontabili e integrabili con i dati contabili. Tali pressioni sembrano aver generato una discontinuità rispetto alle pratiche precedenti, stimolando l'avvio di un progetto strutturato volto a formalizzare il processo di disclosure tassonomica.

Per quanto concerne il sottosistema sociale, l'analisi preliminare suggerisce che le pressioni normative hanno comportato una riconfigurazione dei ruoli, delle responsabilità e delle modalità di coordinamento. L'istituzione di un gruppo di lavoro interfunzionale e il coinvolgimento attivo delle società controllate indicano un tentativo di ridistribuire le competenze informative e di costruire nuove pratiche operative condivise. In questa prospettiva, il cambiamento del sistema informativo-contabile assume i tratti di un processo collettivo e distribuito, nel quale la produzione delle informazioni di sostenibilità richiede l'integrazione di competenze contabili, tecniche e manageriali.

Con riferimento al sottosistema tecnico, i risultati attesi evidenziano una fase iniziale caratterizzata dal ricorso a strumenti manuali e non integrati, che sembrano aver svolto una funzione transitoria di adattamento alle nuove richieste informative. Tali soluzioni, pur avendo consentito una prima operatività del reporting, hanno messo in luce limiti strutturali in termini di standardizzazione, affidabilità e integrazione con il sistema informativo-contabile. In linea con i principi della socio-technical theory, tali criticità sembrano aver favorito l'avvio di un percorso di evoluzione tecnologica orientato allo sviluppo di soluzioni più strutturate, quali l'estensione delle piattaforme ESG, l'implementazione di moduli dedicati nei sistemi di EPM e la progressiva integrazione tra le diverse infrastrutture informative.

Nel complesso, i risultati attesi suggeriscono che il cambiamento del sistema informativo-contabile di Alfa può essere interpretato come un processo dinamico di joint optimisation, in cui l'efficacia del sistema dipende dalla capacità di riallineare simultaneamente componenti ambientali, sociali e tecniche. In un contesto caratterizzato da incertezza normativa e da requisiti informativi in continua evoluzione, tale riallineamento appare iterativo e graduale, riflettendo un percorso di apprendimento organizzativo volto a stabilizzare nuove pratiche di rendicontazione della sostenibilità.

4. Conclusioni e valore scientifico potenziale

I risultati attesi dello studio consentono di delineare un potenziale contributo alla letteratura sul management accounting e sui sistemi informativo-contabili nel contesto della sostenibilità.

Dal punto di vista teorico, il contributo principale risiede nell'applicazione della socio-technical theory per interpretare i processi di cambiamento dei sistemi informativo-contabili indotti dalle pressioni normative ESG. Tale prospettiva consente di cogliere in modo integrato la dimensione istituzionale, organizzativa e tecnologica del cambiamento, mostrando come le pressioni coercitive si traducono in processi di riallineamento dei sottosistemi ambientale, sociale e tecnico. In tal senso, lo studio contribuisce potenzialmente a colmare il gap evidenziato in letteratura, rendendo più visibili i meccanismi attraverso cui la sostenibilità viene tradotta in pratiche informative e contabili concrete e come queste influenzano la governance, i processi e le infrastrutture informatiche delle organizzazioni (Dagilienė e Šutienė, 2019; Troshani e Rowbottom, 2024).

Dal punto di vista manageriale, lo studio offre prime indicazioni utili per la progettazione di sistemi informativo-contabili in grado di supportare efficacemente la compliance ESG. In particolare, la ricerca consente di mettere in luce le principali criticità e le condizioni abilitanti per l'integrazione dei dati non finanziari, suggerendo possibili linee guida e assetti operativi per le imprese chiamate a confrontarsi con le richieste introdotte dalla CSRD e dal Regolamento Tassonomia. Trattandosi di una ricerca ancora in corso, tali implicazioni si fondano su evidenze preliminari e richiederanno ulteriori approfondimenti empirici. Le successive fasi di analisi saranno pertanto orientate ad ampliare e consolidare il quadro interpretativo mediante ulteriori

interviste, focus group e analisi sistematiche delle evidenze raccolte, al fine di approfondire le dinamiche evolutive dei sistemi informativo-contabili e la loro capacità di supportare la rendicontazione di sostenibilità in contesti normativi complessi.

Parole chiave: Sistemi informativo-contabili; normativa di sostenibilità; teoria socio-tecnica

Riprogettare i programmi di incubazione per la transizione circolare: evidenze da un caso italiano

Antonio Sonetto[1], Patrizia Pastore[2], Antonio Ricciardi[3], Silvia Tommaso[4]

1. Introduzione

L'Economia Circolare (EC), ampiamente riconosciuta quale leva strategica nel processo di transizione verso lo sviluppo sostenibile (Bourdin e Jacquet 2025), rappresenta una trasformazione profonda dei modelli economici tradizionali. Essa promuove un sistema rigenerativo volto a minimizzare la produzione di rifiuti e ad aumentare l'efficienza nell'uso delle risorse tramite pratiche quali il riuso, la riparazione, la rigenerazione e il riciclo (Blomsma e Brennan, 2017; Geissdoerfer et al., 2017; Kirchherr et al., 2017). Riducendo la dipendenza da risorse naturali finite, l'EC non solo evita che i rifiuti confluiscano in discarica o negli ecosistemi naturali, ma consente anche il recupero del valore latente incorporato nei materiali scartati (Siskos e Van Wassenhove 2017; Aranda-Usón et al. 2020). In tal modo, essa contribuisce alla conservazione del valore generato dai beni comuni ambientali (Ostrom 1990) e alla prevenzione della "tragedia dei commons" (Hardin 1968), fenomeno connesso al sovrasfruttamento di tali tipi di beni (Becchetti et al., 2025; Pomoni et al., 2024). L'EC è inoltre in grado di generare consistenti benefici macroeconomici (MacArthur et al. 2015; Geissdoerfer et al. 2017), contribuendo allo sviluppo di infrastrutture resilienti, alla diffusione di pratiche industriali sostenibili, alla stimolazione dell'innovazione e alla creazione di nuove opportunità occupazionali (MacArthur et al. 2015; Morgan e Mitchell 2015; Rossi et al. 2020). In questo contesto, le start-up circolari rappresentano un attore chiave nel promuovere la transizione verso la circolarità e il raggiungimento degli obiettivi di sviluppo sostenibile (SDGs) (Henry et al. 2020). Queste imprese affrontano significative difficoltà nella pianificazione strategica (PS) dei propri business model (Gaurav et al., 2019; Sharma et al., 2024); al riguardo, gli incubatori d'impresa possono svolgere un ruolo cruciale nel rafforzare tali capacità, offrendo servizi mirati, competenze e reti specialistiche in grado di supportare efficacemente la transizione verso modelli di business circolari (Millette et al., 2020). Tuttavia, la letteratura sul ruolo degli incubatori orientati all'EC rimane scarsa e frammentata (Kambanou et al., 2025; Klofsten et al., 2024). Pertanto, questa ricerca si propone di analizzare, attraverso uno studio di caso, il modello operativo di un incubatore orientato all'EC per comprendere come esso supporti la PS del business model circolare delle start-up incubate. I risultati attesi offriranno indicazioni utili per migliorare i programmi di incubazione e contribuiranno all'avanzamento delle conoscenze sulle modalità con cui gli incubatori possono facilitare la transizione verso modelli imprenditoriali sostenibili e circolari.

2. Background teorico e obiettivi della ricerca

2.1. Start-up circolari: motori della transizione verso la circolarità

Nel contesto dell'EC, le start-up emergono come attori chiave nel promuovere il passaggio verso un'EC e, più in generale, verso obiettivi di sostenibilità (Henry et al. 2020). Sviluppando soluzioni innovative che possono essere scalate o integrate dagli incumbent, queste start-up rappresentano un abilitatore della transizione circolare. Un caso emblematico è rappresentato da "Bioenutra", nata come start-up circolare con sede in Puglia ed evolutasi successivamente in PMI innovativa. L'impresa ha sviluppato un processo avanzato di valorizzazione dei sottoprodotti della produzione dell'olio d'oliva, in particolare delle acque di vegetazione, tradizionalmente trattate come rifiuto oneroso da smaltire. Attraverso un approccio circolare, Bioenutra separa tali acque in tre frazioni: (i) una componente solida utilizzabile per la produzione di biogas o per il compostaggio; (ii) acqua depurata riutilizzabile nei cicli irrigui; ed (iii) estratti di polifenoli ("Momast") di elevato valore per applicazioni nutraceutiche, farmaceutiche, cosmetiche e alimentari. Queste tipologie di start-up sono fondate su principi di circolarità (Sharma et al. 2024; Maaßen e Urbano 2024) e adottano strategie orientate a restringere i flussi di risorse (riduzione degli input), rallentarli (prolungamento della vita utile dei prodotti), chiuderli (recupero e riutilizzo dei materiali) e rigenerarli (ripristino dei sistemi naturali) (Konietzko et al. 2020; Bocken e Geradts 2022). Henry et al. (2020) individuano cinque archetipi di start-up circolari: (i) design-based, che introducono prodotti a ridotto impiego di risorse; (ii) waste-based, che trasformano scarti in input produttivi; (iii) platform-based, che favoriscono la condivisione o i mercati dell'usato; (iv) service-based, che sostituiscono la proprietà con l'accesso; e (v) nature-based, che valorizzano i sistemi naturali senza comprometterne l'integrità. Capaci di adattarsi rapidamente alle condizioni mutevoli del mercato e di adottare modelli di business circolari, queste imprese si distinguono dagli incumbent (Henry et al. 2020; Han et al. 2023) e possono trarre vantaggio competitivo da tali capacità, con rilevanti prospettive di crescita (Klofsten et al., 2024).

2.2. La pianificazione strategica nelle start-up circolari

La PS costituisce un processo gestionale fondamentale per il successo delle start-up orientate ai modelli di EC. Essa può essere definita come uno strumento direzionale volto a guidare le decisioni organizzative attraverso l'elaborazione di strategie competitive di lungo periodo. Tali strategie mirano a valorizzare i punti di forza interni e le opportunità provenienti dal contesto esterno, riducendo al contempo l'impatto delle debolezze organizzative e delle minacce ambientali (Nolan et al. 2008; Hitt et al. 2021; Thompson et al. 2021). Nonostante ciò, la sostenibilità risulta ancora scarsamente integrata nei processi di PS (Valentine 2010; Galvão et al. 2022). Di conseguenza, le imprese tendono ad adottare pratiche sostenibili in modo reattivo o frammentato, senza disporre di un orientamento chiaro su come trasformarle in un vantaggio competitivo. Tale criticità è particolarmente accentuata nel caso delle start-up circolari, che si trovano ad affrontare numerose difficoltà nella definizione e nello sviluppo di modelli di business circolari scalabili, replicabili ed economicamente sostenibili, nonché nella loro effettiva implementazione (ad esempio, Gaurav et al., 2019; Sharma et al., 2024). La loro crescita è infatti ostacolata dalla scarsità di risorse e competenze (Baldassarre et al. 2020), così come dalle difficoltà di accesso a finanziamenti. Infatti, gli investitori mostrano spesso scetticismo nei confronti di tali imprese, aggravando i già presenti gap di investimento nelle transizioni circolari (Kahupi et al. 2021; Kanda et al. 2024). Ulteriori barriere derivano da ostacoli settoriali, dalle caratteristiche del modello di business e dallo stadio di sviluppo dell'idea (Van Opstal e Borms 2023; Kanda et al. 2024; Kasana et al. 2024). Anche la domanda di mercato può risultare limitata, in quanto condizionata da scarsa consapevolezza ambientale, dipendenza da incumbent dominanti e cornici normative deboli o inadeguate (Suchek et al. 2022; Van Opstal e Borms 2023; Von Kolpinski et al. 2023; Kanda et al. 2024; Kasana et al. 2024; Engzell e Kambanou 2024). Il successo delle start-up circolari dipende, quindi, dalla capacità di superare questo insieme

articolato di ostacoli interni ed esterni (Von Kolpinski et al. 2023; Engzell e Kambanou 2024) e di valorizzare le risorse e competenze disponibili. In questo senso, adattando lo Strategic Planning Decision Framework for Circular Business Models (SPDF-CBM) proposto da Puglieri et al. (2022), le start-up circolari dovrebbero pianificare strategicamente il proprio modello di business seguendo cinque fasi: (i) Analisi dei trend circolari: la start-up è chiamata a riconoscere la rilevanza dei principi dell'EC e a identificare, analizzando l'ambiente esterno e le dinamiche politiche, economiche, sociali e tecnologiche, nonché le aspettative degli stakeholder, potenziali opportunità di business circolari non ancora colte dal mercato (ad esempio, una risorsa sottoutilizzata, un costo ambientale nascosto); (ii) Visione circolare e definizione degli obiettivi: la start-up deve integrare la circolarità con la crescita, definendo un modello di business born-circular supportato da una vision di successo di medio-lungo periodo; (iii) Valutazione della fattibilità del modello di business: la start-up deve valutare rigorosamente la propria idea di business e le competenze possedute dal team; (iv) Definizione della strategia competitiva: la start-up deve individuare la strategia competitiva più appropriata al modello di business, considerando la sostenibilità come una fonte di vantaggio economico-competitivo; (v) Prioritizzazione delle strategie: la start-up avvia la realizzazione dell'idea innovativa attuando sperimentazioni e dando priorità a quelle maggiormente aderenti al modello di business circolare.

2.3. Gli incubatori di impresa come attori a supporto della pianificazione strategica delle start-up circolari

Tra i diversi attori coinvolti nel sostegno alle start-up circolari, gli incubatori d'impresa rivestono un ruolo particolarmente significativo nel rafforzare la loro capacità di PS. Il processo di incubazione è stato definito come "an interactive development process where the aim is to encourage people to start their own business and to support start-up companies in the development of innovative products. (…) Besides accommodation, an incubator should offer services such as hands-on management, access to finance (…), legal advice, operational know-how and access to new markets"[5] (Aernoudt 2004, p. 127). Seguendo Abduh et al. (2007), i servizi offerti dagli incubatori possono essere raggruppati in tre categorie: (i) servizi basati sulle strutture; (ii) servizi di consulenza e supporto manageriale; (iii) accesso a reti interne ed esterne. Tra le varie tipologie presenti in letteratura, Grimaldi e Grandi (2005) individuano quattro principali forme di incubatori: (i) Business Innovation Centers (BICs), creati nel 1984 su iniziativa della Commissione Europea, forniscono prevalentemente servizi di base come spazi, informazioni su finanziamenti, assistenza amministrativa e visibilità; (ii) University Business Incubators (UBIs), istituiti all'interno delle università, mirano a sviluppare, integrare e diffondere conoscenza scientifica e tecnologica, offrendo servizi specifici quali consulenza da parte dei docenti, accesso a biblioteche e laboratori, infrastrutture scientifiche avanzate, programmi di R&S e trasferimento tecnologico (Mian 1996); (iii) Independent Private Incubators (IPIs), fondati da investitori privati o gruppi di investimento, spesso assumono partecipazioni nelle start-up con l'obiettivo di accelerarne la crescita. Essi sono spesso identificati come acceleratori; (iv) Corporate Private Incubators (CPIs), promossi da grandi imprese, nascono per sviluppare nuove linee di business derivanti da iniziative interne non altrimenti realizzabili all'interno delle strutture aziendali esistenti. BICs e UBIs operano generalmente come enti non profit, coerentemente con la loro origine pubblica o istituzionale e con la missione di promuovere lo sviluppo economico regionale. IPIs e CPIs, invece, sono orientati al profitto. Inoltre, UBIs e CPIs tendono a sostenere idee di

[5] Nostra traduzione: "un processo di sviluppo interattivo volto a incoraggiare l'avvio di nuove imprese e a sostenere start-up nella realizzazione di prodotti innovativi (...). Oltre a fornire spazi, un incubatore dovrebbe offrire servizi quali management operativo, accesso ai finanziamenti (...), consulenza legale, know-how operativo e accesso a nuovi mercati"

business generate all'interno delle proprie istituzioni di appartenenza, mentre BICs e IPIs supportano prevalentemente progetti imprenditoriali provenienti dall'esterno.

Gli incubatori di impresa possono svolgere una funzione chiave nel supportare le start-up circolari nell'affrontare le molteplici sfide legate alla pianificazione, sviluppo e scalabilità dei loro modelli di business (Millette et al. 2020). Tuttavia, data la specificità dei principi e dei processi della circolarità, i metodi di incubazione tradizionali risultano spesso inadeguati. Gli imprenditori faticano a individuare opportunità circolari e gli incubatori convenzionali spesso non dispongono delle competenze necessarie per supportarli, con conseguenti inefficienze nella valutazione di elementi chiave dei modelli di business circolari, quali flussi di rifiuti, reverse logistics, processi di recupero e modelli di vendita adeguati (Millette et al. 2020; Hull et al. 2021). Per colmare tali lacune, Millette et al. (2020) propongono un modello di incubazione specificamente orientato all'EC (Figura 1).

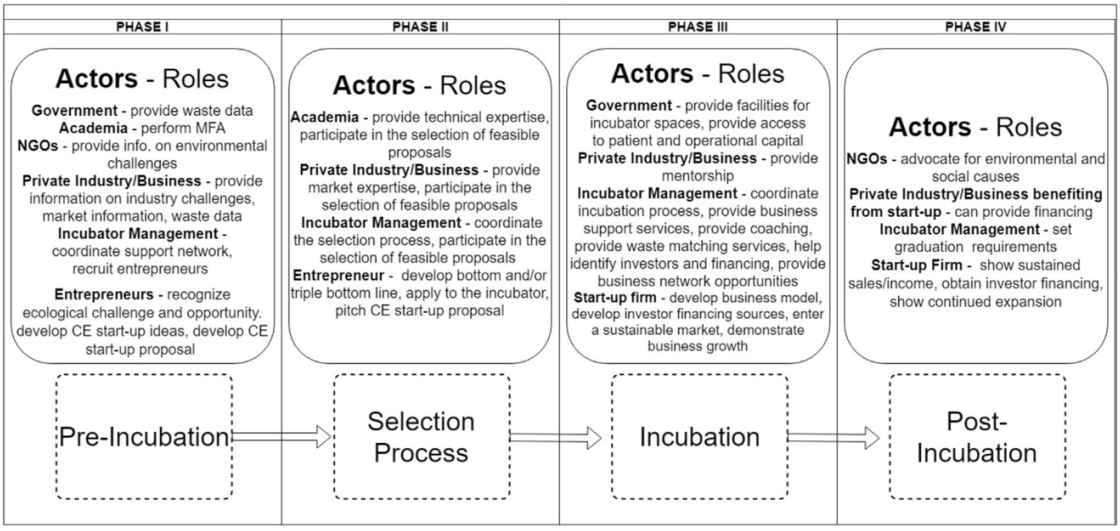

Figura 1. Modello di incubazione orientato alla circolarità, fonte: (Millette et al., 2020, p. 5)

Diversamente dai programmi tradizionali, focalizzati principalmente su idee già sviluppate e sull'accesso ai capitali, questo approccio è proattivo e guida gli imprenditori nel processo di identificazione e creazione di opportunità di business sostenibili. Il modello si fonda su tre pilastri: (i) Material Flow Analysis (MFA): gli incubatori orientati alla circolarità forniscono alle start-up informazioni sui flussi di scarti recuperabili; (ii) Industrial Symbiosis (IS): tali incubatori favoriscono la creazione di reti collaborative tra imprese per ottimizzare l'uso delle risorse e ridurre i costi; e (iii) Entrepreneurial Orientation (EO): gli incubatori selezionano esclusivamente imprenditori capaci di sfruttare i dati sui flussi di materiali per sviluppare soluzioni innovative. Attraverso questi tre pilastri, gli incubatori fungono da ponte tra conoscenze tecniche e opportunità imprenditoriali, sostenendo in modo attivo la crescita di start-up circolari competitive. Alla luce di quanto illustrato, gli incubatori tradizionali devono adattare i propri modelli di business per integrare i principi dell'EC, quali la minimizzazione dei rifiuti, il riciclo delle risorse e il redesign dei cicli di vita dei prodotti (Klofsten et al. 2024). L'offerta di attività di mentorship e coaching da parte di esperti in pratiche di EC, sustainable supply chains, comunicazione con investitori e clienti, riduzione dell'impatto ambientale e rigenerazione delle risorse è di fondamentale importanza (Millette et al. 2020; Kanda et al. 2024). Si raccomanda inoltre l'erogazione di programmi formativi personalizzati per sostenere lo sviluppo di modelli di business innovativi e scalabili, nonché l'offerta di supporto in materia di conformità normativa e strategie di marketing finalizzate ad aumentare la consapevolezza dei consumatori (Bank e Kanda

2016; Klofsten et al. 2024). Analogamente, Surana et al. (2020) suggeriscono di ampliare le attività di incubazione tradizionali allineando i programmi ai SDGs, potenziando il coordinamento tra le iniziative, implementando sistemi di monitoraggio delle performance e promuovendo attività di capacity building multilivello. Nel contesto degli UBIs, Kambanou et al. (2025) evidenziano che l'integrazione della collaborazione con il corpo docente, della formazione orientata alla circolarità, di repository digitali e di specifici incentivi finanziari risulta cruciale per favorire in modo efficace la transizione circolare.

2.4. Domande di ricerca

La letteratura sugli incubatori d'impresa è in continua evoluzione e risulta caratterizzata da numerose lacune conoscitive (Sohail et al. 2023). In particolare, il ruolo degli incubatori nel contesto dell'EC risulta ancora ampiamente inesplorato, con la conseguente necessità di nuovi contributi di ricerca volti a fornire indicazioni per il miglioramento e l'adattamento dei programmi di incubazione (ad esempio, Kambanou et al., 2025; Klofsten et al., 2024). Inoltre, gli studi esistenti si sono concentrati prevalentemente sulla capacità degli incubatori tradizionali di supportare iniziative circolari, mettendo in luce i loro limiti. Analisi approfondite di incubatori specificamente progettati per sostenere iniziative circolari sono ancora scarse. In modo analogo, la letteratura sulle start-up circolari è ancora emergente e necessita di ulteriori approfondimenti (Suchek et al. 2022). Per rispondere a tali gap, il presente studio si propone di analizzare il modello di incubazione di un incubatore orientato alla circolarità, al fine di fornire indicazioni utili ai manager di incubatori tradizionali individuando le leve operative specifiche necessarie per supportare efficacemente la circolarità. In tale prospettiva, sono state formulate le seguenti domande di ricerca:

RQ_1: In che modo gli incubatori d'impresa orientati alla circolarità supportano le start-up incubate nella pianificazione strategica del loro business model?

RQ_2: Quali sono le principali limitazioni e le sfide affrontate dagli incubatori orientati alla circolarità nel fornire supporto efficace alle start-up incubate?

3. Metodologia

Per fornire una risposta alle domande di ricerca sarà adottata la metodologia qualitativa dello studio di caso. Secondo Yin (2018), uno studio di caso costituisce "an empirical inquiry that examines a contemporary phenomenon in depth and within its real-world context, particularly when the boundaries between the phenomenon and its context are not clearly defined"[6] (p. 15). Tale approccio risulta particolarmente idoneo, dato lo scopo esplorativo dello studio e la natura complessa e dipendente dal contesto del fenomeno oggetto di analisi. Inoltre, la ricerca basata sullo studio di caso consente di collegare le osservazioni empiriche ai più ampi dibattiti teorici, contribuendo così a ridurre il divario tra modelli concettuali e fattispecie reali (Gerring 2004; Flyvbjerg 2006; Chiucchi 2015). Più nello specifico, sarà adottato un approccio descrittivo-esplorativo con l'obiettivo di generare una comprensione dettagliata del tema e di fornire una solida base per futuri sviluppi teorici ed empirici, specialmente alla luce della scarsità e frammentazione delle ricerche esistenti sul tema (Chiucchi 2012; Yin 2018). La scelta di basarsi su un singolo studio di caso è appropriata nelle fasi iniziali di indagine di questioni nuove o insufficientemente studiate (Scapens 1990; Otley e Berry 1994) e può offrire un accesso privilegiato a contesti altrimenti difficilmente raggiungibili (De Massis e Kotlar 2014). Tale scelta

[6] Nostra traduzione: "un'indagine empirica che esamina in profondità un fenomeno contemporaneo all'interno del suo contesto reale, in particolare quando i confini tra il fenomeno e il contesto non sono chiaramente definiti"

metodologica risulta inoltre particolarmente adeguata per affrontare domande di tipo "come" e "perché" relative a processi organizzativi dinamici e incerti (De Massis e Kotlar, 2014; Yin, 2018), permettendo al contempo l'analisi di fenomeni sociali complessi all'interno dei loro ambienti naturali e favorendo una comprensione più completa e contestualizzata (Lateef e Keikhosrokiani 2023).

Il caso di studio selezionato è un incubatore italiano presente nell'elenco ufficiale degli incubatori certificati riconosciuti dal Ministero delle Imprese e del Made in Italy e registrati nel Registro delle Imprese alla data del 26 novembre 2025. Tale scelta consente di testare le domande di ricerca su incubatori presumibilmente caratterizzati da standard e servizi di qualità più elevata. In effetti, l'articolo 25, comma 5, del Decreto-Legge italiano n. 179 del 18 ottobre 2012, convertito con emendamenti dalla Legge n. 221 del 17 dicembre 2012, specifica che un incubatore certificato di start-up innovative deve soddisfare una serie di requisiti stabiliti nello stesso articolo: (i) disporre di strutture idonee a ospitare start-up innovative, come spazi dedicati a test, sperimentazioni o attività di ricerca; (ii) possedere attrezzature adeguate alle attività delle start-up, tra cui accesso a Internet ultra-broadband, sale riunioni e macchinari per test, prove o prototipi; (iii) essere gestito o diretto da individui con comprovata competenza in ambito imprenditoriale e innovativo e mantenere una struttura permanente di consulenza tecnica e manageriale; (iv) intrattenere collaborazioni regolari con università, centri di ricerca, istituzioni pubbliche e partner finanziari impegnati in attività e progetti relativi alle start-up innovative; (v) dimostrare un'esperienza adeguata e comprovata nel supportare start-up innovative. La selezione dell'incubatore ha seguito un processo rigoroso. In primo luogo, è stata condotta un'analisi approfondita dei diversi modelli di incubazione offerti da ciascun incubatore certificato, basata su informazioni tratte dai rispettivi siti web ufficiali, documenti interni, report pubblici e articoli di stampa. Tra questi, l'incubatore scelto si è particolarmente distinto sia a livello dimensionale che per il suo forte ed esplicito orientamento ai principi dell'EC. Operando come hub di innovazione industriale, esso supporta iniziative in ambiti strategici quali edilizia sostenibile, energie rinnovabili, EC, sport-tech e biotecnologie, risultando quindi un contesto empirico altamente adeguato ad analizzare pratiche di incubazione orientate alla circolarità. In particolare, esso rappresenta uno dei pochissimi incubatori in Italia con una marcata e dichiarata attenzione ai principi dell'EC. Tale caratteristica lo rende pienamente coerente con gli obiettivi della ricerca, fornendo un contesto empirico solido per l'analisi delle pratiche di incubazione orientate alla circolarità. La raccolta dei dati sarà condotta attraverso una combinazione di metodi al fine di aumentare il rigore dell'evidenza empirica e consentire la triangolazione, mitigando così potenziali bias e rafforzando l'attendibilità dei risultati (Bowen 2009). In particolare, i dati primari saranno ottenuti mediante interviste semi-strutturate con i manager dell'incubatore e con rappresentanti di un gruppo selezionato di start-up incubate. Per i dati secondari si utilizzerà documentazione interna fornita da incubatore e start-up e materiali pubblicamente accessibili, quali siti web ufficiali delle organizzazioni, report pubblici e articoli di stampa pertinenti.

4. Risultati attesi e implicazioni

Questa ricerca si pone l'obiettivo di giungere ad una comprensione sistematica di come un programma di incubazione orientato alla circolarità si differenzi dai modelli di incubazione tradizionali, identificando i principali fattori abilitanti e le sfide nel supporto alle attività di pianificazione delle start-up circolari. L'analisi empirica rivelerà verosimilmente le attività, le competenze, le infrastrutture, gli strumenti operativi e i processi decisionali nonché le principali criticità che caratterizzano un incubatore fondato sui principi dell'EC.

Dal punto di vista teorico, questo studio contribuisce alla letteratura emergente sugli incubatori orientati alla circolarità approfondendo ed estendendo i quadri concettuali sviluppati in precedenza dalla comunità scientifica. Attraverso un'analisi approfondita delle pratiche e dei meccanismi che sorreggono l'incubazione circolare, la ricerca consente l'avanzamento della

comprensione teorica di come i modelli di incubazione possano non solo incorporare e rendere operativi i principi dell'EC, ma anche sostenerli nel tempo all'interno dei processi decisionali strategici delle imprese nascenti. Inoltre, lo studio identifica le principali esigenze e complessità che caratterizzano la PS delle start-up circolari, evidenziando il ruolo degli incubatori di impresa come attori chiave nel supportare tali processi e nel facilitare l'allineamento tra obiettivi strategici, modelli di business circolari e contesto istituzionale.

Dal punto di vista manageriale, i risultati forniranno ai manager di incubatori tradizionali indicazioni operative per progettare, organizzare e affinare i processi di incubazione in modo tale da rispondere alle esigenze specifiche delle iniziative imprenditoriali circolari, consentendo agli incubatori di integrare la circolarità in modo più efficace nei propri modelli operativi, nelle routine, nei meccanismi di governance e nei sistemi di valutazione. In particolare, i risultati offriranno ai manager di incubatori tradizionali indicazioni generali su come erogare servizi fondamentali quali mentoring, formazione, networking (ad esempio, supporto a iniziative di simbiosi industriale) e attività di business support, tutti orientati a sostenere la PS e conseguentemente a favorire la crescita e il successo delle start-up circolari. Inoltre, i risultati potranno offrire rilevanti indicazioni per i manager delle start-up circolari, supportandoli nella comprensione di come adattare e strutturare i processi di pianificazione strategica in funzione delle specificità dei modelli di business circolari, delle interdipendenze di filiera e dei vincoli e opportunità derivanti dal contesto istituzionale.

Dal punto di vista delle politiche pubbliche, lo studio offrirà raccomandazioni su misure in grado di rafforzare il ruolo degli incubatori di impresa come facilitatori chiave dell'innovazione circolare all'interno degli ecosistemi regionali e nazionali, contribuendo così a sostenere la transizione verso l'imprenditorialità circolare su scala nazionale, anche nei settori tradizionali, dove persistono rilevanti criticità legate alla gestione non sostenibile delle risorse naturali. La transizione verso modelli di EC risulta fondamentale per garantire sostenibilità ambientale di lungo periodo, rafforzare la resilienza economica e allinearsi ai SDGs (Donner et al. 2022; Carmona et al. 2023; Ncube et al. 2024; Spada et al. 2025). Nell'ambito dei settori tradizionali, per restare nel comparto di attività della citata Bioenutra, il settore olivicolo-oleario, ad esempio, è ad elevato impatto ambientale (Ncube et al. 2024). L'uso intensivo di acqua, energia e input chimici, nonché la produzione di ingenti quantità di residui e sottoprodotti, tra cui acque di vegetazione e sansa, se non adeguatamente gestiti, possono generare inquinamento idrico, degrado del suolo ed emissioni climalteranti (Enaime et al. 2024; Ncube et al. 2024). In questo contesto, le pratiche circolari, come la valorizzazione dei residui olivicoli in bioenergia, fertilizzanti o bioplastiche, consentono di ridurre la pressione ambientale, diminuire la dipendenza dai combustibili fossili e generare nuove opportunità economiche (Donner et al. 2022; Carmona et al. 2023; Enaime et al. 2024; Ncube et al. 2024). Tale transizione richiede innovazione tecnologica, adeguati investimenti, politiche di sostegno e una maggiore cooperazione tra gli attori della filiera (Donner et al. 2022; Martínez-Moreno et al. 2024). In tale contesto, grazie alla loro capacità di sviluppare soluzioni innovative, le start-up circolari possono fungere da veri e propri catalizzatori della circolarità, trasformando rifiuti e sottoprodotti in risorse e favorendo l'adozione di pratiche ecologicamente sostenibili lungo l'intera catena del valore.

The role of Life cycle Assessment in fostering sustainability in the sea supply chain: a structured literature review

Rosa Staiano[1], Sabrina Pisano[2], Luigi Lepore[3]

1. Introduction

Sustainability has become an indispensable condition for corporate continuity, permeating the systems through which organizations plan, measure, and control their activities (Siebenhüner & Arnold, 2007; Lozano, 2020). This growing attention generates internal informational needs, pushing firms to develop systems capable of capturing and processing environmental data that are increasingly required by evolving regulatory frameworks and stakeholders. Indeed, such informational demands influence the way firms define their sustainability disclosure and respond to external expectations, often driven by regulatory and coercive pressures, according to the institutional theory, and by the desire to satisfy the information needs of stakeholders, according to the stakeholder theory.

In Europe, regulatory pressure started in 2003 with the issuing of Directive 2003/51/EC, but it became effective in 2014 with the issuing of the Non-financial Reporting Directive 2014/95/EU, which required bigger companies to release sustainability information in a specific report called the Non-Financial Statement (NFS). Recently, regulators worked to enhance corporate engagement with sustainability topics and in 2022 issued the Corporate Social Responsibility Directive 2022/2464/EU. These regulatory developments illustrate the external context within which firms build their sustainability disclosure.

Within this landscape, institutional theory (Dimaggio & Powell, 1983) helps frame explain how rules, norms and expectations shape firms' adjustments to demonstrate their performance. Firms have increasingly engaged in sustainability reporting to meet regulatory requirements. According to the KPMG Survey, in 2024 96% of the G250 (the world's 250 largest companies by revenue) published a sustainability report, reflecting the growing diffusion of sustainability information (KPMG, 2024). However, this widespread diffusion does not necessarily imply that disclosed information reflects reality. When the misalignment between sustainability disclosure and sustainability performance is positive, it could be symptomatic of a greenwashing approach (Sauerwald & Su, 2019). Greenwashing, or positive sustainability decoupling, occurs when a company releases more information in comparison to the actions it undertakes, thereby overstating its performance. Aware of this risk, firms need management control tools that translate sustainability commitments into actions.

Sustainability reporting reflects institutional pressures and reinforces for reliable information, thereby increasing the relevance of tools, whose outputs can support management accounting systems (Galleli & Amaral, 2025). Several scholars have emphasized the need for management accounting to evolve through new practices and tools. Traxler and colleagues (2020) sustain that sustainability reporting holds the potential to inform management, planning, and control activities only when it is effectively linked to management accounting through tools and systems. To examine this relationship, the Authors draw on the classification of management control systems

proposed by Malmi and Brown (2008) – namely planning, cybernetic controls, reward and compensation, and administrative and cultural controls. Each category plays a distinctive role: planning helps firms define priorities and future actions; cybernetic controls rely on financial and non-financial performance indicators to support actions; reward and compensation influence behaviors through incentive systems; administrative controls guide procedures, roles and decision-making processes; cultural controls define firms' norms and values. The implementation of management control systems can be seen as a response to the growing need to adopt sustainability reporting systems, which require structured tools to support the information. Advancing sustainability within firms is as much about identifying the sources of environmental impacts as it is about rethinking how resources are used, reinforcing the mechanisms through which sustainability performance is communicated, and progressively redesigning products and services to lower environmental footprint (Siebenhüner & Arnold, 2007; Lozano, 2020). Each stage in the life cycle of products and logistics activities – from resource extraction to production, distribution, and disposal – is associated with environmental, economic, and social impacts. The impacts caused by production and logistics processes need to be controlled through the adoption of measures and strategies that not only quantify "how much impact" is produced but also indicate "how to remedy and reduce it" (Lozano, 2020).

Traditional measurement and control systems, designed to capture financial performance, often fail to capture in the right way the multifaceted and nuanced nature of sustainability. The increasing complexity of challenges requires a rethinking of how organizational performance is defined and evaluated. Such complexity draws attention to a need for management accounting tools that can integrate new forms of environmental data into decision-making processes. Therefore, the path towards sustainability entails aligning strategies, business models, and management tools with environmental, social and economic value creation (Mio et al., 2022). Rather than serving only as a system for financial control, management accounting is increasingly conceived as a platform for translating sustainability objectives into measurable and actionable information (Busco & Quattrone, 2018). By integrating environmental, social, and economic dimensions, management accounting extends its scope beyond internal efficiency toward the evaluation of value creation processes.

This paper focuses on Life Cycle Assessment, a method that can be framed as a non-financial cybernetic control, as it generates structured environmental information and follows a standardized procedure designed to assess the impacts of a product or a service across its entire life cycle. It unfolds on four phases (ISO 14040, 2006): 1. defining the goal, scope and system boundaries of the analysis; 2. compiling the life cycle inventory by gathering data on inputs and outputs; 3. conducting the impact assessment; and 4. interpreting the results in order to define conclusions and identify possible improvements. Once these phases are completed, the dataset provides a foundation for supporting sustainability-related decisions. The information generated through these phases can be used to identify critical challenges along the life cycle, compare alternative options and detect potential trade-offs: in doing so, it offers a transparent view of environmental performance and provides key inputs for managerial decision-making (Bjørnbet & Vildåsen, 2021; Lozano, 2020). Further studies indicate that LCA can also be applied to the analysis of business model configurations, linking environmental effects to the way value is created and delivered (Barbieri and Santos, 2020;Baumann et al., 2022).

Companies employ sustainability tools and initiatives that are often implemented independently of their management and accounting systems, resulting in limited integration and strategic alignment (Lozano, 2020). Among these tools, LCA remains largely linked to technical domain, and the information it generates rarely move into the flows that guide managerial activities. To address this fragmentation, companies need approaches that link environmental assessment and management control practices: combining life cycle thinking with quantitative methods can provide consistent measures of sustainability performance and enhance accountability (Cerchione et al., 2025). The standardized nature of LCA makes its output suitable for evaluating alternative

solutions, identifying trade-offs, and supporting decisions, which are key requirements of management accounting. However, this potential of LCA has not been fully explored (Ascani et al., 2021; Schaltegger et al., 2022) and the integration of life cycle information into planning, cost, and control decisions remains limited.

The significance of this research gap becomes even clearer when considered within the broader transformation of management accounting, which is progressively including environmental, social, and governance dimensions, while the use of new technologies is deeply changing the ways in which information is created, processed, and interpreted.

Although several contributions have examined environmental assessment tools within organization (Ascani et al., 2021; Schaltegger et al., 2022; Cerchione et al., 2025), the integration of life cycle information into management accounting remains limited, raising questions about how environmental data can support firms in decision making and sustainability transition. The aim of this review is to examine how life cycle information has been interpreted and used within management accounting studies. By investigating the role attributed to LCA, this study contributes to a broader debate on the transformation of management accounting and its role in supporting sustainability-oriented business models. It also seeks to discover the way LCA can inform managerial decisions and to identify opportunities for the alignment between environmental assessment and management.

In this perspective, Corporate Social Responsibility (CSR) is a useful interpretive lens to understand how environmental assessments are translated into organizational practices (Arjaliès & Mundy, 2013; Braune et al., 2019), identifying recurring themes and key areas of development (Martins et al., 2023). This adoption makes it possible to understand how the informative role of LCA has been interpreted so far and to outline the conditions under which this tool can effectively support organizational measurement and control systems (Cerchione et al., 2025; Frost et al., 2020). Several studies show a strong connection between CSR, firm performance and the development of performance management and sustainability measurement systems (Martins et al., 2023). CSR is also described as a strategic lever that broadens the scope of managerial decision-making and influences the design of business models (Arjaliès & Mundy, 2013; Braune et al., 2019). The production and sharing of sustainability-related information become central to guiding organizational behavior and supporting transitions (Frost et al., 2020). Methods such as LCA contribute to this process by generating insights that can be embedded into internal decision-making (Cerchione et al., 2025). For this reason, CSR is used as lens useful to discover how firms respond to environmental impacts and how LCA information may contribute to management accounting practices, guiding the analysis of articles by understanding if LCA is used for supporting decision-making processes.

For the purpose of this review, the sea supply chain serves as ideal context in which institutional pressures, decarbonization targets and transition challenges make the demand for life cycle thinking particularly marked. The sea supply chain offers a key setting for observing the potential of life cycle approach, especially given the increasing pressure to reduce environmental impacts and comply with decarbonization targets set by international regulations (IMO, 2023). In 2024, the Marine Environment Protection Committee (MEPC) introduced specific LCA guidelines for assessing greenhouse gas (GHG) emissions “from fuel production to end-use by a ship (Well-to-wake)”, thereby promoting a comprehensive evaluation of maritime systems. The targets for reduction of the emissions set by the International Maritime Organization (IMO) will require the adoption of innovative technologies to mitigate environmental impacts and LCA shows to be a valuable decision-support instrument for guiding technological choices and investment priorities in the sector. Several studies have applied life cycle approach to the assessment of alternative marine fuel and decarbonization strategies (H. Wang et al., 2025; J. Wang, Li, et al., 2025; J. Wang, Yang, et al., 2025), showing that LCA generates evidence that could support technological and investment decisions. However, what is still insufficiently emphasized is that this potential depends on the integration of LCA information into management accounting systems.

2. Methodology

The study is being conducted through a structured review of management accounting literature. This approach offers a systematic way to investigate how a particular topic has been explored, helping to organize current knowledge and highlight topics that require further examination (Massaro et al., 2016). A similar methodological configuration has been used in recent studies adopting structured literature review approaches (Di Vaio et al., 2021). The review aims to understand how the informative role of LCA has been interpreted and framed within management accounting studies. Following Massaro et al. (2016), the structured review is conceived as an empirical study guided by an analytical framework, which ensures transparent and replicable analysis and supports the coding and interpretation of the selected contributions. The framework focuses on the role attributed to LCA and the extent to which life cycle information is connected to management accounting and control systems.

For this review, Scopus was chosen as the primary database because of its broad coverage of peer-reviewed research in the topics involved (Thottoli et al., 2022).

A wide search string combined "life cycle assessment" with "management accounting", other sustainability expressions ("sustainab*", "business model*", "corporate social responsibility"), and specific sector terms ("shipping" OR "sea supply chain" OR "sea logistic*"). The search strategy captures in a targeted way studies referring to maritime and sea logistics activities. This allows the review to consider how LCA approaches are discussed in relation to sectoral characteristics such as environmental regulations, fuel challenges and decarbonization objectives.

The initial search returned 625 records. To enhance the quality and the relevance of the dataset, the results were narrowed by filters to include peer-reviewed articles in English-language in the fields of Social Sciences, Business, Management and Accounting, Economics, Econometrics and Finance, Decision Sciences. After this first screening, 170 articles remained for further analysis (Fig.1).

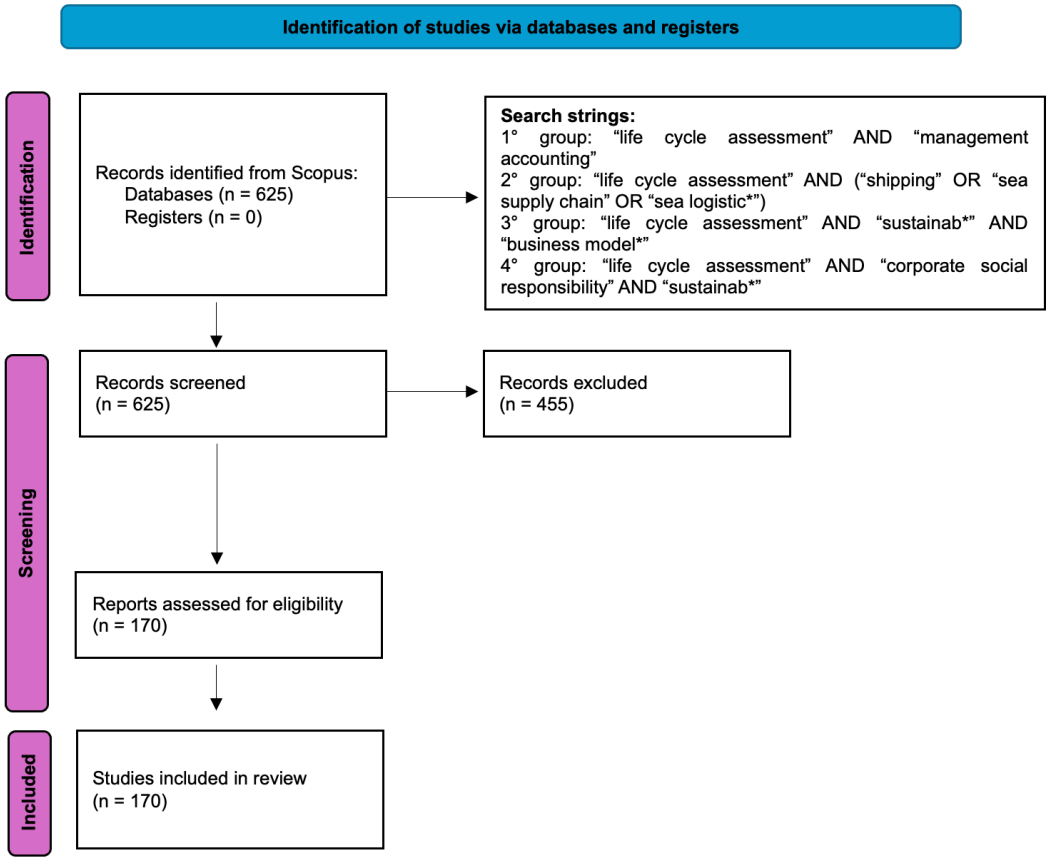

Figure 1. Study selection process

The next text screening aims to verify whether each article fits the scope of the review. This activity is crucial for refining the dataset and ensuring the coherence and quality of the final selection, which will then be used for the data extraction and coding processes. In doing so, two key conceptual definitions were established to support the assessment of the 170 articles: LCA is conceived as "Compilation and evaluation of the inputs, outputs and the potential environmental impacts of a product system throughout its life cycle" (ISO 14040, 2006); management accounting is the set of practices and systems that support firms in generating financial and non-financial information. In line with Schaltegger et al. (2022), management accounting is conceived as a tool that allows organizations to achieve the sustainability transition by linking internal decision processes with wide environmental challenges.

The screening phase is constructed on a protocol for data extraction and classification with an Excel matrix created to function as a systematic repository of all extracted information. Each article is recorded by bibliometric details and content-related analytical variables.

The bibliometric section embraces descriptive data that supports the mapping of the literature and allow comparative analysis across journals, geographical areas and publication type. The variables are title, authors, journal and year, DOI or link, Country and authors' affiliations, citations, keywords, and type of the article (to distinguish between methodological contribution and applicative studies). The second section is a matrix that captures characteristics of each study: aim, country under examination, research questions, methodology and methodological subcategory, sample or empirical context, and results. These variables provide the empirical basis for the analytical framework: bibliographic variables support the descriptive mapping of the field and content variables are used to assess the role attributed to LCA, the purpose for which the life cycle information is used, and its connection with management accounting. Theoretical

perspectives inform the interpretation of the evidence emerging from the studies. In this interpretative phase, the CSR provides the lens through which the collected information is read (Arjaliès & Mundy, 2013). This analysis is complemented by institutional theory (Dimaggio & Powell, 1983) and Malmi and Brown's (2008) framework. The first supports the interpretation of the regulatory and normative context in which LCA adoption is discussed; the second is adopted to identify where LCA is positioned within management systems, distinguishing if its information is mainly employed as a technical tool or an informative input for managerial decisions. The combined use of these lenses provides a complementary framework to examine the spread of LCA and the ways life cycle information is used by firms.

3. Preliminary results

Although the review process is currently ongoing, preliminary results reveal a clear pattern in the way LCA is used within firms. Most contributions adopt LCA as technical assessment tool to quantify environmental impacts or compare alternative scenarios, while few link life cycle information to management accounting practices. The dataset also shows heterogeneity in the way LCA is adopted: some studies apply this tool as technical support in several sectors, such as marine transport, textiles and energy (Böpple et al., 2025; Hou et al., 2025; Lin et al., 2025; Petrescu et al., 2025; Wang H. et al., 2025), while others use the informative role of LCA in decision-making processes (Al-Kuwari et al., 2024; Naranjo et al., 2025) and in the definition of business models (Bjørnbet & Vildåsen, 2021; Koide et al., 2025; Krassnitzer et al., 2025). From a broader perspective, this suggests that, although LCA generates crucial and detailed information about environmental impacts, such information does not circulate into key areas where strategic decisions are made.

The Insights underline the potenti"l us'fulness of life cycle information for firms engaged In sustainability transition. This evidence appears particularly relevant for firms operating along the sea supply chain, where regulatory pressures, fuel-transition choices and decarbonization strategies increase the need for reliable life cycle information.

For these firms the patterns identified so far indicate that LCA is mainly employed to evaluate technological alternatives, where environmental performance and sustainability are increasingly critical, by showing the utilization of LCA information for evaluating alternatives, shaping investments, and aligning operational choices with long-term decarbonization targets. The review also highlights the thematic areas In Ih LCA has been contextualized In MA studies, as well as the research trends that are beginning to take shape. As the review progresses, clarifying these issues will enable to discuss the main theoretical and managerial implications, and to highlight opportunities for further research as well as for the advancement of LCA practices in maritime and logistics firms.

Negotiating Management Control in the AI Era: A Socio-Technical Perspective on Organizational (In)stability

Filippo Gentile[1]

1. Introduction

Digitalization is inevitably transforming our world and the world of business. In particular, in the accounting field, the adoption of digital and AI-based technologies has significantly affected the way companies produce, analyse and use accounting information. In recent years, accounting practices have undergone substantial changes. Inevitably, digitalization has also reshaped the work of management accountants, who in this digital era must face numerous challenges deriving from the interaction with intelligent systems. At the same time, recent developments suggest that AI-based technologies may also reshape how management control is enacted and exercised within organizations.
Indeed, the aspect on which this study focuses is how Management Control is negotiated and shaped through interactions between different organizational actors and AI-based systems.

The objectives of this paper are to investigate how Management Control is reconfigured in the presence of AI, while also considering what new skills may be required for the people involved on it.
The motivation for this study arises from the observation that much of the existing literature has concentrated on the impact of digitalization on accounting practices, whereas only a limited number of studies have examined how AI reshapes Management Control and everyday decision-making processes. Moreover, those that have done so often remain largely conceptual, without addressing how these dynamics unfold in practice.

The study will be carried out through a qualitative approach, using a case study that will enable us to analyze how different organizational actors interact with AI-based technologies, how these interactions are negotiated in everyday practices, and how they contribute to shaping Management Control.
This paper has several implications, as it may be useful for organizations seeking to understand how to integrate AI into decision-making and control processes, for people navigating these transformations, and for universities, since the changes in practices and required skills call for adjustments in accounting education, in order to prepare future professionals to operate effectively in AI-driven environments.

2. Literature Review

2.1. Theoretical framework: Actor-Network Theory

To examine how Management Control is reconfigured in the presence of AI-based technologies, and to understand how professional roles evolve within this process, I adopt Actor-Network Theory (ANT) as the theoretical framework.
ANT offers a distinctive lens capable of analyzing accounting not as a set of static practices performed by individuals, but as an outcome of dynamic networks composed of both human and

[1] Ph.D. Candidate, ECON-06/A, University of Catania; filippo.gentile@phd.unict.it - corresponding author

non-human actors, such as accountants, managers, data, algorithms and AI systems. From this perspective, Management Control itself can be understood as emerging from these socio-technical interactions rather than being a predefined and centralized function.

From an ANT perspective, technologies introduced are not neutral tools but active participants that shape accounting and decision-making processes. This makes ANT particularly suitable for studying AI in management accounting and Control, where automated models, predictive algorithms and digital platforms increasingly influence organizational action and the exercise of control.

Actor-Network Theory originates from the work of Bruno Latour, Michel Callon, and John Law in the 1980s within sociology, where it was developed to investigate how social order emerges through heterogeneous networks and relationships among people, artefacts and knowledge.

ANT has been applied in accounting research, beginning with the work of Justesen and Mouritsen (2011), who examined its implications, and continuing with the critical assessment by Modell (2020). I consider ANT particularly useful in accounting studies, also given its strong tradition of application.

In this study, ANT provides a powerful framework for analyzing how Management Control is negotiated and enacted through interactions with AI-based technologies and other organizational actors, while also shedding light on how the skills of different organizational actors are shaped within these networks.

For these reasons, ANT aligns well with the objectives of this research.

2.2. Identification of Relevant Literature

The literature reviewed and discussed in the following section was identified through a keyword-based search focusing on the relationship between digitalization, Artificial Intelligence, and the fields under investigation (Management Accounting and Management Control).

An initial search included the following terms:

- "Digitalization" or "Digitalisation" or "Digitization" or "Digitisation" or "Digital Transformation" and "Management Accounting" or "Management Control".

The main search process was then refined by combining terms related to AI, Management Accounting and Control, and organizational practices. The keywords used included:

- "AI" or "Artificial Intelligence" and "Management Accounting" or "Management Control";
- "AI" or "Artificial Intelligence" or "Predictive Analytics" or "Machine Learning" and "Management Control" or "Performance Measurement" or "Decision-Making";
- "Management Accounting" or "Management Control" or "Control Systems" and "Social Practice" or "Human Behaviour" or "Organizational Culture";
- "Management Accounting" or "Accounting Practices" and "ERP" or "Enterprise Resource Planning" and "Control at a distance";
- "Actor-Network Theory" or "ANT" and "Management Accounting" or "Accounting" or "Management Control".

This search strategy allowed for the identification of studies addressing the relationship between AI and Management Accounonting and Control, as well as contributions focusing on the social and organizational dimensions of accounting practices, the role of digital systems in shaping control at a distance, and the application of Actor-Network Theory in accounting research.

In addition, it enabled the inclusion of literature examining digitalization from a broader perspective, providing a comprehensive understanding of the phenomenon under investigation.

2.3. Main Contributions from the Literature

The literature identified through the criteria outlined in the previous paragraph highlights several important streams of research addressing the impact of digitalization and AI on Management Accounting and Control.

A first stream of studies focuses on the impact of digitalization and AI on Management Accounting and Control practices. The contribute of Abbas (2025) is a literature analysis on the impact of AI on Management Accounting, highlighting role changes and the new hybrid professional figure. Other contributions such as Fändrich (2023) and Fändrich and Pedell (2025) show how digital technologies are transforming the area of Management Control, influencing its tasks, instruments, organizational processes, and behavioural aspects, also in specific contexts such as SMEs. All this viewing digitalization as a driver of MC transformation.

Empirical studies further highlight how these transformation unfold in practice. For istance, Cinquini et al. (2025), through a case study on IKEA Italy, show how the use of cloud technologies alters the way accounting practices are performed, with new routines and tasks. Similarly, Ruggeri et al. (2023) examine accounting language games in contexts characterized by digitalization, showing how it influences the production of knowledge for decision-making.

More broadly, Kornberger et al. (2025) and Knudsen (2020) highlight the role of data-driven practices in reshaping knowledge production, power relations, and organizational boundaries.

A second stream of literature focuses on Management Control. Anthony (1965) lays the foundations of discipline, conceptualizing Management Control as a formal and structured process aimed at ensuring the strategic effectiveness. Studies such as Dechow and Mouritsen (2005) highlight how ERP systems contribute to shaping control by integrating information and coordinating activities across organizational units. This perspective is further developed by Quattrone (2009) and Quattrone and Hopper (2005), who conceptualize Management Control as a set of practices embedded in organizational processes, rather than as a purely technical system.

A third stream of resesrch focuses on the dynamics of stability and change in Management Accounting and Control. Burns and Scapens (2000) contribute with the conceptualization of Management Accounting change as a process shaped by rules and routines. Granlund (2001) and Lukka (2007) show how Management Control systems is characterized by both stability and change over time, resulting from the everyday interaction between formal structures and practices.

A recent contribution put in evidence the relationship between AI and other actors within organizations. Indeed, Jarrahi (2018) sustains that AI does not replace human in the decision-making process, but it creates a form of human-AI symbiosis, where decisions emerge from the interaction between these two types of subjects, which possess very different characteristics.

Finally, a part of the literature adopts a socio-technical perspective, which finds its theoretical foundation on the Actor-Network Theory, to analyze accounting practices. Alcouffe et al. (2008) use ANT to explain the relationship between the diffusion of Management Accounting innovations and the alignment between human and non-human actors. Instead, the study of McLean and Hassard (2004) is a critical reflection on the use of ANT in accounting, given the complexity and limitations in producing accounts.

Overall, these contributions provide important insights about the transformation of Management Accounting and Control in the digital era. However, the literature review conducted has revealed important gaps that require a futher investigation.

2.4. Gaps identified in the literature

The literature reviewed shows a growing interest in the impact of digitalization and AI on Management Accounting and Control, with an increasing number of studies published in recent years.

Despite this, a significant part of this literature has focused on the impact that digital technologies is having on Management Accounting practices.

Furthermore, some scholars examined the important issue of how new technologies affect

professionals working in the accounting field, particularly the shift in the Management Accountant's role, from the traditional "bean counter" to more hybrid positions such as business partner or data scientist. At the same time, several studies have examined the impact of digital technologies on decision-making.

However, despite these contributions, there are many important limitations. First, much of the existing literature see technology as an external driver of change, rather than as an actor involved in organizational processes. Second, limited attention has been paid to how Management Control is shaped through the everyday interaction between human and non-human actors. In other words, there is a lack of empirical research on how AI-based systems and organizational actors shape control processes. Third, while the literature treated issues of stability and change in Management Control, these dynamics have rarely been examined in relation to AI. Finally, prior research analyzed the impact of digitalization for professional roles and skills, but these aspects are treated as individual rather than as outcomes emerging from socio-technical interactions. By adopting an ANT perspective, this study addresses these gaps by analyzing how Management Control is enacted and negotiated through networks of human and non-human actors, and how skills emerge within these interactions in the presence of AI-based technologies.

3. Research Methodology

Given the exploratory nature of the research questions highlighted above, this study adopts a qualitative approach based on the analysis of a single case study, in order to understand how AI-based technologies are reshaping the role Management Control within organizations. The choice of a case study is motivated by the opportunity to conduct an in-depth analysis within an organization, allowing us to understand how technologies, people and organizational routines interact in practice. These elements, such as individuals, new technologies, and traditional routines, form a rather complex network. This is precisely why Actor-Network Theory is employed; it allows for an understanding of the relationships among these different elements, especially the interactions between human actors (accountants and managers) and non-human actors (AI systems, data, algorithms), and how these interactions contribute to the enactment of Management Control.

3.1. Selection of Company

The selection of the company will follow specific criteria aimed at identifying a context particularly suitable for exploring the research phenomenon in depth. The objective is to select an information-rich case that allows for a detailed understanding of how AI-based technologies are embedded in organizational practices.

- The first criterion concerns the level of AI adoption in Management Accounting and Control processes, in order to ensure that AI systems play an active role in everyday decision-making and control practices. The selected company should therefore have a sufficiently advanced implementation of AI-based tools.
- The second criterion relates to the analytical relevance of the case. Given the adoption of Actor-Network Theory, the aim is to select a context that allows for an in-depth exploration of socio-technical interactions. The focus is therefore on a setting where the network of human and non-human actors can be meaningfully observed, enabling a detailed understanding of how Management Control is enacted and negotiated.
- A final and more practical criterion concerns access to the field. It is essential to identify a company, and in particular organizational actors within it, who are willing to participate in the study and provide access to relevant information.

Based on these criteria, the empirical setting will consist of a single organization that has implemented AI-based systems within its Management Accounting and Control processes,

allowing for an in-depth analysis of the interactions between human and non-human actors. The choice of a single case study is consistent with the theoretical perspective adopted in this research. Given the use of ANT, the objective is not to compare different organizations, but to explore in depth the complex network of interactions through which Management Control is enacted.

3.2. Data Collection

The data and information needed for the case study will be collected through:

- Semi-structured interviews**:** these interviews will be conducted with the various categories of actors relevant to the investigation, such as management accountants, controllers, CFOs, IT specialists and managers. Depending on the interviewee, the interviews will be designed to explore aspects related to the adoption and use of AI systems, their role in everyday decision-making and control processes, perceptions of these technologies, and how AI-generated outputs are interpreted, used and negotiated in practice.
- Document analysis**:** aimed at gathering additional information concerning the organizational structure, roles, and internal processes, providing further insight into how AI is incorporated into Management Accounting and Control practices.

The decision to rely primarily on semi-structured interviews is also consistent with the logic of Actor-Network Theory, as the information collected from different organizational actors makes it possible to trace how human and non-human actors are connected, how they influence each other, and how Management Control is enacted through these interactions.

4. Expected Findings

Based on the literature reviewed, the considerations discussed above, the objectives of this study, and the ANT framework, the expected findings go beyond the description of role change and focus on how Management Control is enacted and negotiated through the interactions with AI-based technologies:

- First, rather than focusing on changes in the role of the management accountant, shifting from the traditional "bean counter" position to more hybrid and strategic roles, the study is expected to show how Management Control emerges from socio-technical networks characterized by the interconnection between AI systems, data, and organizational actors. In this context, control is not centralized but distributed across multiple actors, both human and non-human.
- Second, the findings are expected to reveal that the use of AI reshapes decision-making processes, as AI-generated outputs become central elements around which organizational actors interact, interpret, and negotiate. This may lead to new forms of coordination, but also to potential ambiguities in the attribution of authority and responsibility. Within this context, specific skills become increasingly relevant, particularly those related to the interpretation of AI outputs, as well as relational, interpretation, and negotiation skills needed to engage with other actors and to critically assess algorithmic insights.
- Third, the study is expected to highlight the emergence of tensions and controversies when AI-based outputs conflict with human judgement, requiring ongoing negotiation among actors and contributing to the redefinition of control practices.
- Finally, the study is expected to show that these transformations have implications not only for individual roles, but also for the skills required across different organizational actors. In particular, the ability to interpret, question, and critically engage with AI-generated insights becomes central within these socio-technical systems. These dynamics also raise important implications for accounting education, suggesting the need to move beyond purely technical digital skills and to prepare future professionals to operate within complex, AI-mediated organizational environments.

5. Conclusions

In conclusion, the aim of this study is to investigate how artificial intelligence is reshaping Management Control by analyzing the socio-technical processes through which control practice are produced and enacted. By combining Actor-Network Theory with a qualitative single case study design, the research moves beyond a purely technological or individual perspective and instead examines how accountants, managers, data and AI systems jointly participate in organizational decision-making and control processes.

The case study, conducted through semi-structured interviews with various relevant actors and combined with document analysis, will provide insights into how AI-based technologies are integrated in everyday Management Accounting and Control activities, and how these interactions contribute to the reconfiguration of control practices, roles, responsibilities, and required skills. The study seeks to provide a deeper understanding of how these elements are negotiated and redefined in the presence of intelligent systems.

The findings of the study will have significant implications for several groups, including organizations, professionals involved in Management Control processes, and universities. For organizations, it will offer insights into how to design control systems that effectively integrate human and algorithmic capabilities. For professional, the study will clarify how working with AI reshapes decision-making and control dynamics, highlighting the need to develop new skills, related to the interpretation of AI-generated outputs, as well as relational and negotiation skills required to interact with other actors and engage with algorithmic insights. For universities, it will highlight the need to rethink accounting education in order to prepare future professionals to operate within complex AI-driven socio-technical environments.

Reframing and overflowing auditing decision-making processes through digitalised sociotechnical infrastructures

Antonio Leotta[1], Claudia Presti[2], Carmela Rizza[3], Daniela Ruggeri[4]

1. Theoretical background

The ongoing digitalization of organizational processes is profoundly reshaping the identity and boundaries of auditing professions, spreading out transparency, efficiency, and timeliness associated with digital technologies. In doing so, digital platforms and corporate information systems do not simply mediate the auditing processes but they become constitutive of it, shaping how information is produced, accessed, and interpreted. They delineate what auditors can access, define verification pathways, and legitimize specific forms of data representation, thereby influencing how auditing decision-making processes are enacted.

Scholars outlined that digitalization constitutes a structural discontinuity for the auditing profession, as it progressively favours the reshaping of audit contributing to transforming it in an increasingly interactive, automated, and continuous process (Vasarhelyi et al., 2010; Rahman et al., 2024). Within this context, auditing appears to be lagging behind other professional fields in the adoption of digital technologies (Austin et al., 2021; Samiolo et al., 2024). The causes of this delay are manifold: internal tensions within audit firms, the absence of clear guidelines from regulators, and, not least, the perceived rigidity of clients' information systems.

Despite a growing attention, in the auditing domain digitalization remains slower than in other professional fields (Vitali & Giuliani, 2024). Empirical research highlights internal tensions within audit firms, an absence of clear regulatory guidance (Austin et al., 2021; Dai & Vasarhelyi, 2016; Samiolo et al., 2024), and perceived rigidity in client information systems as key factors constraining technological innovation in auditing practices.

In particular, studies that adopt a sociological perspective consider digital technologies not merely as decision-support tools but technologies that actively shape the form and temporality of the audit decision-making processes. However, this evolution gives rise to new forms of organizational tension. The growing complexity of algorithms reduces the transparency and intelligibility of decision-making processes, placing auditors in a position of technological dependence (Haugh, 2023). This "algorithmic opacity" conflicts with regulatory demands for accountability and traceability, generating a trade-off between automation and interpretation. The promise of transparency and objectivity associated with digital technologies—from ERP systems to Business Intelligence software and artificial intelligence solutions—is accompanied, however, by a set of ambiguities and tensions. On the one hand, these tools appear to offer new opportunities for data access, operational traceability, and real-time control; on the other hand, they introduce forms of rigidity, standardisation, and technological dependence that may constrain auditors' professional discretion and interpretive capacity (Power, 1997; Issa et al., 2016).

2. Theoretical perspective

According to the performativity perspective digital platforms are not a neutral backdrop but an actor that actively participates in shaping auditing decision-making processes, configuring networks of relations among human and non-human actors—auditors, controllers, information systems, algorithms, data—thereby influencing what is visible, accessible, and verifiable. In the auditing context, this performativity emerges through the platforms' capacity to determine the boundaries of evidence: they define which data can be extracted, how such data are displayed, and which analytical pathways are rendered legitimate. In doing so, digital technologies do not merely represent organizational reality; they actively produce it, selecting what becomes knowable and, consequently, controllable. During the auditing decision-making processes spaces of calculability are socio-materially constructed through the interplay of humans and devices, such as auditing practices and digital technologies, which act as performative actors (Callon, 1986; Latour, 2005). Through (re)framing, particular forms of calculative practices are made visible while others are marginalized (Cuckston, 2022; Miller, 1991, 2008). As Callon (1998) argues, framing can produce new forms of marketization in which both human and non-human actors shape auditing decision-making processes. This approach allows examination of overflows emerging when calculative boundaries are challenged (Callon, 1998), particularly in digitalized auditing decision-making processes. Prior research demonstrates that reframing and overflowing processes contribute to diverse marketization outcomes (Christensen & Skaerbaek, 2007; Cuckston, 2013, 2018, 2022; Rana & Cordery, 2024). In this study, digitalization is conceptualized as a reframing device that marketizes decision-making processes (MacKenzie, 2009; Munasinghe et al., 2021). In particular, the interplay between reframing and overflowing renders marketization inherently contingent and indeterminate: as frames are challenged, adjusted, or replaced, markets evolve in diverse and path-dependent ways, producing varied institutional configurations and distributions of authority and value. In this view, marketization produces divergent institutional outcomes shaped by local negotiations, emergent constraints, and the ongoing reconfiguration of both calculative practices and organizational responsibilities.

Adopting a performativity perspective makes it possible to move beyond a deterministic view of digitalization as a mere enabling factor and instead focus on the network of mediations through which accounting knowledge and audit judgement take shape. In this perspective, the auditor is no longer an external observer but a translating actor who continually negotiates meanings, constraints, and possibilities for action within a complex sociotechnical network.

Although the literature on digital auditing (Ackerman, 2023; Lombardi et al., 2015; Vasarhelyi et al., 2010) has highlighted the potential of intelligent technologies to enhance audit efficiency and quality, these studies focus predominantly on the opportunities arising from automation, devoting comparatively less attention to the sociotechnical implications of these control infrastructures.

3. Research aim

Building on this gap, the study adopts a performativity perspective to shed lights on the challenges that digitalization poses to auditing decision-making processes. This requires analysing how digital technologies participate in the constitution of auditing practices, how they reshape the distribution of agency across human and non-human actors, and how these transformations affect professional judgment and organizational control.

Hence, this study questions: How does digitalization (re)frame and overflow auditing decision-making processes?

4. Methodology

The study adopts a qualitative and interpretive approach to explore in depth the interactions between human and technological actors and to understand how digitalization shapes audit practices and boundaries. The methodology is based on the analysis of two Italian case studies selected for their differing levels of digital maturity and the complexity of their information systems. The first case concerns a company characterized by a high degree of ERP integration and an advanced digital audit environment, in which the digital platform is a central node for data collection and verification. The second case examines an organization with fragmented information systems, where digitalization remains partial and audit procedures retain a markedly manual and adaptive character.

Both cases allow for an investigation of the performativity of digitalization in reframing and overflowing auditing decision-making processes: in the first case, system rigidity ensures greater traceability but reduces professional discretion; in the second, higher flexibility results in weaker formal control and lower data reliability.

The case research, which is explanatory in nature, followed a retrospective approach (Scapens, 2004), aiming to grasp subjects' perceptions of the role of digitalization in reframing and overflowing auditing decision-making processes. We collected information from field data such as auditing firm's internal documents. And we conducted semi-structured interviews with auditors and internal control managers. The interviews were not type-recorded due to the confidential nature of the discussion, but were conducted in an informal style and transcribed into a draft-report, which was shared with the interviewees. The in-depth interviews aimed to gather data on the subject matter and ensure a diverse range of perspectives and experiences concerning the use of digital platforms in the auditing decision-making processes.

5. Preliminary findings

Findings were then interpreted and discussed in relation to existing literature. The limitation of relying on a retrospective approach consists of asking interviewees to describe, explain, and reflect on events they had experienced (Nor-Aziah & Scapens, 2007), which we mitigate with through data triangulation. The methodological goal is therefore twofold: to understand how technology shapes and constrains audit practices (performativity), and to analyse how auditors and firms negotiate these rigidities in their daily interactions, thereby redefining the boundaries between external audit and the internal control system.

The analysis develops a critical reflection on the epistemic and organizational assumptions underpinning the deployment of artificial intelligence and business intelligence tools in auditing, challenging deterministic claims about their contribution to audit quality. Such evaluation necessitates closer attention to the underlying digital infrastructures—databases, ERP systems, and reporting architectures—that materialize audit evidence and condition its legitimization.

The case analysis highlights how digital platforms do not merely constitute a technical support for auditing decision-making processes but act as agents capable of shaping auditors' behaviour and decisions. In both contexts examined, technology does more than facilitate the collection and processing of data; it defines their logical and semantic structure, implicitly establishing what can be known, verified, and documented.

In Case 1, characterised by a high level of digital integration, the ERP platform centralises data management and imposes a standardised information flow. Audit procedures are executed according to a predefined sequence, rigidly anchored to digital protocols for data extraction, reconciliation, and validation. This configuration reduces the auditor's discretionary space, who is required to operate within pathways dictated by the system's internal logic. In this sense, the platform translates professional practices into algorithmic sequences, ensuring consistency and traceability while limiting the ability to adapt controls to the specific organisational context. Digitalisation thus produces a form of structured transparency, based on formalised processes and comprehensive visibility of operations, albeit at the cost of increasing procedural rigidity.

In Case 2, by contrast, the fragmentation of information systems and the absence of an integrated digital infrastructure render the audit process more flexible yet more opaque. Auditors must continuously negotiate access to data with company managers and manually construct audit evidence, relying on heterogeneous and not always verifiable sources. This condition restores to auditors a more interpretive and "craft-like" role, but increases informational uncertainty and the likelihood of error. In this context, the platform does not impose rigidity; rather, it is absent as a stabilising actor: the sociotechnical network is more fluid, yet also more fragile.

The two cases clearly reveal the trade-off between flexibility and transparency that characterises the digitalisation of audit processes. In highly digitalised contexts, transparency is ensured through full traceability of information flows, but this comes at the cost of reduced flexibility and diminished professional discretion. In less digitalised contexts, by contrast, auditors' greater interpretive freedom is accompanied by lower standardisation and, consequently, reduced verifiability of audit evidence.

This tension challenges the paradigm according to which digitalisation constitutes a linear progression toward a "more objective" and "more efficient" audit. In reality, the effectiveness of digital auditing depends on the actors' ability to negotiate and balance the two poles of this tension. The platform does not eliminate the subjectivity of professional judgement; rather, it reconfigures it, translating it into configuration choices, access parameters, and validation pathways.

The platform emerges as a hybrid actor: it connects and simultaneously disciplines the relationships among auditors, clients, and internal control systems. Any modification within the network—a software update, a new security policy, a restructured database—can alter the ways in which accounting knowledge is produced and legitimised. The auditor thus ceases to be merely a guarantor of information reliability and becomes a translator between human and machine languages, between technological constraints and professional interpretations.

The empirical analysis confirms that digital auditing cannot be understood merely as a technical process of automation, but rather as a sociotechnical practice in which professional competencies, information tools, and organisational logics are mutually co-constructed. Digital platforms, far from being neutral instruments, introduce a new form of computational rationality that tends to privilege what is quantifiable, traceable, and representable. However, the quality of audit judgement continues to depend on interpretive and contextual dimensions that elude full algorithmic codification.

From this perspective, the auditor does not disappear but instead undergoes a role transformation: from a specialist in document verification to a mediator of meanings and a manager of sociotechnical networks. Digitalisation shifts the centre of gravity of auditing from the "verification of evidence" to the "configuration of information sources," positioning the auditor as a central actor in the translation between technological and organisational worlds.

The comparative analysis of the two cases enables a critical reading of the relationship between digitalisation and auditing decision-making processes. The digital platform emerges as an actor that simultaneously enables and constrains auditing practices: it enables, by offering greater traceability and analytical capacity; it constrains, by reducing interpretive flexibility and limiting the adaptation of audit practices to the specific context.

This dual nature suggests that digitalisation should not be interpreted as a linear process of improvement but rather as a field of tensions that requires new cognitive and relational competencies on the part of auditors. Understanding these tensions is crucial for developing an informed governance of digital technologies in auditing—one capable of preserving the professional dimension of judgement while leveraging the potential of automation.

Ultimately, the digitalisation of auditing does not replace human professionalism but redefines its boundaries, positioning the auditor at the centre of a network in which the value of control depends not only on data accuracy but on the capacity to interpret, mediate, and make sense of the new forms of transparency generated by digital platforms.

6. Contributions

This study examines how reframing and overflowing emerges within digitalized auditing processes and how it reshapes auditors' professional judgment. Drawing on insights from socio-technical systems theory, the analysis highlights the tension between enhanced analytical capabilities offered by advanced audit technologies and the cognitive, organizational, and procedural challenges introduced by data abundance and reconfiguration. The findings suggest that digital tools can both support and destabilize decision-making: while automation and data analytics improve efficiency and precision, they can also obscure accountability, amplify information noise, and require new competencies to manage data saturation.

The paper argues that understanding both reframing and overflowing is essential for designing audit processes that maintain reliability and transparency in an increasingly digitalized landscape.

This study provides a twofold contribution. Theoretically, it foregrounds digitalization as an active sociotechnical actor that participates in redefining the institutional and professional boundaries of auditing decision-making processes. Practically, it argues that addressing the structural rigidities embedded in digital platforms is essential for developing informed, critical approaches to the automation of auditing decision-making processes.

Keywords: Auditing; decision-making; performativity

Stakeholder Engagement under the CSRD: Evidence from Italian Listed Companies

Annalisa Zeni[1], Clara Benfante[2],Valter Gamba[3], Veronica Tibiletti[4]

1. Relevance of the topic

Within corporate processes, stakeholder engagement plays a central role, marking the shift from a responsibility conceived as the exclusive prerogative of the firm to one of a social and shared nature. As early as 1916, economist J. M. Clark laid the foundations of business ethics, social responsibility, and what would later become stakeholder theory, subsequently systematized in Freeman's seminal contribution (Mercier, 2006). In recent decades, managers have had to operate in an environment marked by numerous turbulences arising primarily from two sources: a profound internal change, driven by a paradigm shift in traditional relationships, and an external change—namely the emergence of new actors and groups (public institutions, competitors, non-profit organizations, media, and social interest groups) that are difficult to fit within existing theoretical models. Ignoring the plurality of interest groups can lead to serious negative consequences for corporate governance, such as a loss of legitimacy and trust. It is therefore essential to move beyond the concept of a business led solely by the entrepreneur and embrace the concept of "shared value" (Freeman, 1984). In this perspective, Freeman's (1984) Strategic Management: A Stakeholder Approach introduced-by the standards of the time-an innovative view of corporate governance, conceiving the firm as a central node within a complex network of relationships. It follows that organizations, in defining strategy and conduct, are called upon to consider actors bearing diverse interests (stakes) (Freeman et al., 1990). Freeman thus expanded the classic "input-output" model of managerial capitalism, with the aim of introducing a concept of the enterprise in which the latter was conceived at the centre of a dense network of interdependent relationships, graphically represented by Frooman's (1999) hub-and-spoke model.

Building on these premises, stakeholder theory has contributed to clarifying how firms relate to their various stakeholders. Before defining the modus of dialogue, however, it is necessary to clarify the quid, namely who, operationally, qualifies as a "stakeholder" for a given organization. Identification remains a recurring challenge, as the relationship between stakeholders and firms depends on multiple contingent factors, starting with the context in which the organization operates (Hall & Vredenburg, 2005). Analyzing the operating context in which the firm competes is the starting point for effective relationship management. From this follows the need to manage the relationships among the relevant groups in order to understand their interconnections and subsequently chart their progressive development (Tani, 2020). However, as Greenwood (2007) observes, engagement is not necessarily synonymous with ethical and responsible commitment: it is essential that engagement practices do not devolve into mere window dressing. From this perspective, the engagement process must be interpreted dynamically, and stakeholder mapping represents a crucial step, serving as the foundation for building a long-term strategy aimed at strengthening organizational resilience and legitimacy (Mitchell et al., 1997; Bourne & Walker,

[1] Ph.D Candidate, ECON-06, University of Parma; annalisa.zeni@unipr.it – corresponding author

[2] Ph.D Candidate, ECON-06, University of Parma; clara.benfante@unipr.it

[3] Researcher, ECON-06, University of Tourin; valter.gamba@unito.it

[4] Full Professor, ECON-O6, University of Parma, veronica.tibiletti@unipr.it

2005). Alongside the theoretical debate and definitional efforts aimed at simplifying identification, numerous engagement models have been proposed, which organizations may adopt depending on the degree of dialogue and the relevance attributed to interlocutors: from purely informative approaches (Green & Hunton-Clarke, 2003), to consultative approaches based on the collection of opinions and feedback (Tani, 2020), to collaborative approaches in which stakeholders are actively involved in decision-making (Stocker et al., 2020). The implementation and formalization of these latest approaches pave the way for collaborative governance models (Ansell & Gash, 2008), in which decisions are taken through dialogue and cooperation among stakeholders to pursue common goals and generate long-term positive impacts (Stocker et al., 2020). Building an effective collaborative process requires careful planning and the intentional design of engagement modalities. The literature underscores the importance of transparent communication and authentic, substantive engagement (Morsing & Schultz, 2006). According to Owen and O'Dwyer (2005), organizations that adopt a participatory approach achieve more effective outcomes in terms of trust and shared commitment. A subsequent step entails targeted communication of the firm's social and environmental activities; in this way, communication becomes an indispensable tool for fostering stakeholder loyalty (Deegan & Blomquist, 2006). In this perspective, non-financial reporting enables organizations to meet stakeholder needs, thereby generating long-term value (Buallay, 2022).

In light of these observations, interaction modalities can vary and encompass different approaches:

- Informational approaches, based on one-way transmission from the organization to its stakeholders, without direct involvement;
- Consultative approaches, which collect opinions and feedback useful for decision-making, without creating a shared strategy (Freeman, 1984);
- Collaborative approaches, in which stakeholders are actively involved in decision-making under a shared governance arrangement.

The latter approach is grounded in the notion of collaborative governance, whereby decisions are made through dialogue and cooperation among diverse stakeholders, who are consulted to achieve common goals and create long-term positive impact (Ansell & Gash, 2008).

The engagement process is described in literature as an evolutionary model divided into various phases: starting from the identification of those who are identified as "key stakeholders" for the organization, moving on to the management of relevant issues and, finally, arriving at the construction of a relationship process based on dialogue, cooperation and mutual listening (Svendensen, 1998).

Within this framework, practitioner-oriented tools provide operational guidance. The AA1000 framework by AccountAbility comprises: the AccountAbility Principles (AA1000AP), which guide identification, prioritization, and responsiveness; the AA1000 Stakeholder Engagement Standard (AA1000SES), which structures the phases of stakeholder dialogue; and the AA1000 Assurance Standard (AA1000AS), which enables the independent assurance of disclosures. In particular, AA1000SES was developed specifically to support organizations in conducting stakeholder engagement and provides an internationally recognized operational framework. On these premises, stakeholder engagement takes shape as an intentional and cyclical process: (i) mapping and prioritizing stakeholder groups; (ii) defining dialogue objectives; (iii) selecting engagement tools; and (iv) translating feedback into operational strategies.

2. Research aim

Moving from theoretical foundations to reporting practice, the European regulatory framework has rendered stakeholder engagement indispensable. Directive (EU) 2022/2464, the Corporate Sustainability Reporting Directive (CSRD), transposed in Italy by Legislative Decree

No. 125/2024, introduces mandatory reporting under the ESRS, with first-time application for many firms from financial year 2024 (reports published in 2025). The CSRD places the notion of double materiality at the core of disclosure processes. In the absence of structured stakeholder engagement, it becomes difficult to identify impacts, risks, and opportunities and, consequently, to determine what is material-that is, significant-for the organization.

At the same time, the regulatory framework for non-financial reporting is evolving. In 2025, the European Commission introduced the "Simplification Omnibus" package, and the European Parliament approved the postponement of certain reporting obligations, with proposals that reduce the scope of obligated entities and ease some requirements along the value chain. While intended to simplify reporting, these measures have nonetheless generated uncertainty regarding both scope and application. The current European sustainability regulatory framework is therefore facing a period of high uncertainty and regulatory complexity, further accentuated by the recent "Omnibus" proposal presented by the European Commission in February 2025, whose negotiating mandate was adopted by the Council in June 2025. The "Stop the Clock" proposal provides for a two-year delay in the application of sustainability reporting obligations for certain types of companies and postpones the obligation for listed SMEs to 2029. It is precisely within this context of change and uncertainty that this research takes place; it becomes crucial to investigate the actual behavior of organizations and their adopted strategies in response to a complex regulatory environment.

Despite extensive literature theorizing the various modes of dialogue and collaboration with stakeholders, it remains empirically unclear whether, and for what purposes, these methods are adopted by organizations.

Considering the above, this study pursues a twofold objective. First, it seeks to map the stakeholder engagement practices adopted by Italian listed companies in the first CSRD-compliant reports, classifying approaches according to the typologies delineated in the AA1000 Stakeholder Engagement Standard (AA1000SES). Second, it aims to investigate sectoral differences in engagement modalities, using the ATECO code as the criterion for classifying organizations. In so doing, the study contributes to the stakeholder engagement literature by offering empirical evidence from the Italian context during a phase of profound regulatory and organizational transformation, thereby enriching the scholarly debate through the following research questions:

RQ1: How is the stakeholder engagement process evolving in Italy in light of the CSRD?

RQ2: What are the principal stakeholder engagement practices adopted by Italian companies?

RQ3: Are there significant differences in stakeholder engagement modalities across economic sectors?

3. Theoretical Lens

The study draws on Stakeholder Theory (Freeman, 1984) and Legitimacy Theory (Suchman, 1995) as interpretive frameworks. Stakeholder Theory enables the analysis of how organizations identify, prioritize, and engage different stakeholder groups through varying levels of dialogue. The interaction process between the firm and its stakeholders is conceptualized as stakeholder engagement (Freeman, 1984), and is supported by a convergence of organizational theories addressing the motivations behind such interactions, among which legitimacy theory plays a particularly central role. Legitimacy Theory complements this perspective by framing engagement and disclosure as mechanisms through which firms seek to maintain or strengthen their social legitimacy. Within this framework, legitimacy emerges as a key resource required for achieving organizational objectives; acquiring and maintaining it through social responsibility practices and effective stakeholder communication is indispensable. In this sense, while legitimacy theory conceptualizes the need for social consent as fundamental for long-term

organizational survival (Dowling & Pfeffer, 1975; Suchman, 1995), stakeholder theory translates this requirement into practice by identifying stakeholders as the primary actors through whom legitimacy is pursued and sustained over time (Freeman, 1984; Freeman et al., 2010).

4. Methodology

To achieve the research aim, the study adopts a qualitative methodological approach based on Qualitative Content Analysis (QCA) of secondary sources (Elo & Kyngas, 2008). QCA is a systematic and objective method designed to describe and interpret qualitative data such as written texts, visual, and verbal messages (Downe-Wamboldt, 1992; Sandelowski, 1995; Krippendorff, 1980). This approach is particularly suitable for the present research, as it allows for the identification and categorization of recurring terms and sentences into thematic clusters sharing the same semantic domain, thereby ensuring replicability and transparency of the analytical process.

The initial sample comprised 397 companies operating in the Italian market, retrieved from the AIDA (Bureau van Dijk) database (access date: April 2025). A screening process was subsequently carried out to select only those Italian companies required to disclose sustainability information according to the thresholds established by the CSRD. All companies exceeding at least two of the following three criteria-(i) 250 average annual employees, (ii) €40 million net turnover, (iii) €20 million total assets-must provide sustainability reporting. Following this screening, a sample of 290 firms was identified (873 records in total). However, 107 companies were excluded because no public documentation was available on their corporate websites. Consequently, the final analysis was conducted on 184 companies, which disclosed sustainability reports for the entire period under consideration (2022-2024). In total, 552 reports were analyzed, including Sustainability Reports, Non-Financial Declarations, Consolidated Non-Financial Declarations, and Management Reports, depending on the type of document made publicly available by each company. Finally, in order to accomplish the research objective, the selected companies were clustered according to their ATECO (2077) industry classification code and subsequently analyzed.

The analysis followed a deductive qualitative content analysis approach (Burns & Grove, 2005). Thematic categories (Table 1) were derived from established theoretical frameworks and the AA100SES framework. Specifically:

- From Stakeholder Theory (Freeman, 1984), we extracted categories concerning stakeholder salience and identification;
- From the AA1000 Stakeholder Engagement Standard, we derived categories related to the methodological approaches of stakeholder engagement;
- From Legitimacy Theory (Suchman, 1995), we mapped the categories of standards and practices applied in sustainability reporting.

Theoretical Framework	Category	Sub-Category
Stakeholder Theory (Freeman, 1984)	Stakeholder Identification	- Internal stakeholders (employees, management, shareholders); - External stakeholders (customers, suppliers, local communities, regulators)
	Stakeholder Salience	- High salience (explicit recognition and prioritization); - Low salience (generic mention without prioritization)

Legitimacy Theory (Suchman,1995)	Reporting Standards	- GRI adoption; - ESRS/CSRD compliance; - Other international standards (e.g., SASB, TCFD, <IR>);
AA1000SES	Engagement Approaches	- Information (one-way communication); - Consultation (surveys, interviews, focus groups); - Dialogue (systematic bilateral communication); - Partnership/Collaboration (joint initiatives, co-decision-making);

Table 1. Thematic categories, Source: developed by the authors

Texts from the collected reports were manually coded into dichotomous variables (1 = presence of information; 0 = absence of information) and classified into sub-categories and categories derived from the above frameworks. The coded data were subsequently transferred into an Excel dataset, with variables organized according to the predefined categories. To ensure reliability, the analysis was conducted independently by two authors. Any discrepancies were discussed and resolved through iterative dialogue, thereby enhancing the robustness and trustworthiness of the findings.

5. Expected Results and contributions

We expect that in the first reports prepared under the CSRD, stakeholder engagement processes will predominantly focus on informative and consultative modalities, while collaborative methods will remain only marginally implemented-despite the literature on collaborative governance highlighting their significant potential and long-term effectiveness (Hall & Vredenburg, 2005; Ansell & Gash, 2008). Furthermore, we anticipate sector-specific reporting differences: in high-impact industries, such as utilities and energy, engagement will likely be more structured and continuous, with a still minority presence of collaborative approaches; in light manufacturing and B2B services, we expect a prevalence of informative and consultative practices, mainly directed at clients and suppliers, and less extended to communities and territories. Overall, we argue that the adoption of the ESRS and the emphasis on double materiality have triggered a convergence toward more formalized practices. Yet, within the observed timeframe, collaborative methods are expected to remain the exception rather than the rule.

Keywords: Stakeholder engagement; collaborative approaches; sustainability disclosure

La rendicontazione di sostenibilità negli Enti del Terzo Settore: Barriere e Facilitatori nel contesto dei Banchi Alimentari Italiani

Laura Berardi[1], Vincenzo Pontrelli[2], Diego Valentinetti[3], Maria Lucia Monaco[4]

1. Background

Nell'attuale contesto globale, caratterizzato da profonde sfide di natura sociale, economica, culturale e ambientale, le tematiche connesse allo sviluppo sostenibile e, più in generale, alla sostenibilità hanno assunto un ruolo sempre più centrale nelle agende politiche delle Nazioni (Delgado-Ceballos et al., 2023; Marrone et al., 2024; Annesi et al., 2025). Una tappa fondamentale di questo percorso è rappresentata dall'Agenda 2030, sottoscritta il 25 settembre 2015 dai governi dei 193 Paesi membri delle Nazioni Unite, che delinea un programma d'azione per lo sviluppo sostenibile articolato in 17 Obiettivi di Sviluppo Sostenibile (SDGs) da raggiungere entro il 2030 (Lee et al., 2016).

Nel processo di avanzamento verso il raggiungimento degli SDGs, e dunque verso una transizione sostenibile, un ruolo cruciale è attribuito alle imprese, chiamate a ripensare e riadattare i propri modelli di business al fine di integrare, accanto ai tradizionali obiettivi di profitto, finalità riconducibili alla Corporate Social Responsibility (Zampone et al., 2024; Pontrelli et al., 2025). Sebbene la letteratura scientifica abbia inizialmente focalizzato l'attenzione sulle aziende for profit (Nicolò et al., 2022), uno stream più recente (Meier, 2023; Annesi et al., 2025) ha evidenziato il ruolo degli Enti del Terzo Settore (ETS), oggi considerati partner essenziali nella transizione sostenibile. Gli ETS, oltre a rappresentare la voce organizzata della società civile (Arhin, 2016; Meier, 2023), contribuiscono al raggiungimento degli SDGs attraverso l'erogazione diretta di servizi e svolgendo funzioni di intermediazione tra i diversi settori.

I Banchi Alimentari (BA), istituiti negli Stati Uniti e in Canada diversi decenni fa, sono oggi ampiamente diffusi nei Paesi ad alto reddito, tra cui Regno Unito, Australia, Germania e Italia (Riches, 2002; Oldroyd et al., 2022). In qualità di centri logistici, raccolgono e distribuiscono generi alimentari a enti o organizzazioni di beneficenza di dimensioni più ridotte (c.d. agenzie partner o enti caritativi), che a loro volta forniscono supporto diretto ai beneficiari finali tramite la distribuzione, senza alcun costo aggiuntivo, di pacchi alimentari preconfezionati (Loopstra, 2018; Parker et al., 2020) o somministrazione di pasti caldi (es. mense Caritas). Svolgendo tale funzione, i BA ricoprono un ruolo che va oltre la semplice distribuzione di aiuti alimentari, risultando particolarmente rilevanti nel perseguimento di diversi SDGs (Zainal et al., 2019; Rasteiro et al., 2025), in particolare degli Obiettivi 2, 3, 10, 12.

Considerata la rilevanza del loro impatto attuale e potenziale sulle comunità, risulta essenziale disporre di sistemi di valutazione delle performance che consentano ai BA di rendicontare in modo trasparente, accurato e verificabile il valore generato (Oldroyd et al., 2022). Poiché i BA sono organizzazioni senza scopo di lucro, tali sistemi non si basano su indicatori monetari, ma si concentrano principalmente su efficienza ed efficacia. L'efficienza, intesa come la quantità complessiva, espressa in peso, di prodotti alimentari distribuiti, e l'efficacia, riferita al grado di soddisfacimento dei bisogni nutrizionali degli utenti da parte dei servizi offerti dalle singole BA (Alkaabneh et al., 2021), rappresentano infatti dimensioni fondamentali affinché la rendicontazione possa restituire una rappresentazione fedele dell'operato dell'ente. La loro rilevanza risulta ancora più evidente se si considera che il ricorso al cibo distribuito grazie all'intervento dei BA è più elevato tra disoccupati, genitori soli, famiglie monoparentali e persone con problemi di salute (Bramley, 2021; Oldroyd et al., 2022; Food Bank Canada, 2025), circostanza che rende indispensabile una rendicontazione capace di cogliere non soltanto la quantità di aiuti distribuiti, ma anche la loro capacità di rispondere ai bisogni di gruppi particolarmente vulnerabili. Alla luce di ciò, la rendicontazione di sostenibilità emerge come un elemento imprescindibile per garantire trasparenza, accountability e legittimazione sociale dell'azione collettiva. In un contesto in cui gli ETS sono chiamati non solo a contribuire al raggiungimento degli SDGs, ma anche a dimostrare in modo sistematico e verificabile gli impatti generati sulle comunità e sui territori, il reporting di sostenibilità assume una funzione strategica e diventa uno strumento centrale di comunicazione e governance (Ricket & Goodspeed, 2025). La rendicontazione sociale deve pertanto configurarsi come un processo partecipato e metodologicamente solido, capace di rappresentare l'intera catena di creazione del valore sociale, dagli input agli outcome e agli impatti, così da offrire una visione completa e coerente del contributo degli ETS allo sviluppo sostenibile (GBS, 2020).

In questa prospettiva, essa si configura come un dispositivo relazionale essenziale per rafforzare la fiducia degli stakeholder, migliorare la comunicazione tra organizzazione e comunità di riferimento e orientare le strategie interne in modo coerente con i bisogni sociali emergenti (GBS, 2020; Ricket & Goodspeed, 2025), contribuendo al tempo stesso a incrementare la trasparenza, l'allocazione delle risorse e la maturazione dei modelli di accountability nel settore non profit (OECD, 2021).

L'importanza della rendicontazione assume un significato ancora più marcato nel caso dei BA, i quali, come evidenziato in precedenza, contribuiscono in modo determinante al perseguimento degli SDGs 2, 3, 10 e 12 (Berardi et al., 2021). La complessità delle reti territoriali in cui operano e la natura multidimensionale degli impatti generati rendono la rendicontazione di sostenibilità uno strumento essenziale per descrivere in modo chiaro, verificabile e comprensibile il contributo prodotto sul piano sociale, nutrizionale, ambientale e comunitario (Grünhaus et al., 2019). Ne deriva una concezione della rendicontazione come un'infrastruttura cognitiva e relazionale indispensabile per governare la complessità dei processi di creazione del valore sociale, migliorare la qualità delle decisioni organizzative, rafforzare la legittimazione pubblica e orientare l'azione strategica degli ETS in coerenza con gli obiettivi di sostenibilità.

In questa prospettiva, il reporting non costituisce un mero adempimento regolamentare, ma un dispositivo strategico capace di qualificare il ruolo dei BA nell'ecosistema Paese e di rafforzarne il contributo al benessere collettivo e al perseguimento del bene comune.

Nonostante tale crescente rilevanza, la letteratura presenta un significativo gap, poiché mancano studi che analizzino in modo sistematico il contributo concreto degli ETS al perseguimento degli obiettivi di sviluppo sostenibile (Pizzi et al., 2020; Meier, 2023) e le connesse pratiche di rendicontazione che, per quanto consta agli autori, risultano ancora poco esplorate, in particolare nel contesto dei BA. Sono assenti contributi che esaminino in profondità le difficoltà che queste organizzazioni incontrano nell'implementazione di sistemi strutturati di rendicontazione, una lacuna particolarmente rilevante alla luce della complessità operativa che caratterizza gli ETS e, ancor più, i BA, i quali si confrontano quotidianamente con problematiche

legate alla scarsità di risorse, alla frammentazione informativa, alla misurazione di outcome intangibili e alla gestione di reti multi attore che richiedono elevati livelli di coordinamento e trasparenza. Pertanto, comprendere tali sfide e analizzare i fattori che ostacolano o facilitano la rendicontazione di sostenibilità appare quindi di fondamentale importanza.

Alla luce del quadro sin qui delineato, il presente working paper si propone di investigare i principali fattori ostativi e i principali facilitatori della rendicontazione di sostenibilità nel contesto dei BA, rispondendo alle seguenti domande di ricerca:

- quali sono le principali barriere che ostacolano le pratiche di rendicontazione di sostenibilità nel contesto dei Banchi Alimentari?
- quali sono i principali fattori abilitanti che facilitano le pratiche di rendicontazione di sostenibilità nel contesto dei Banchi Alimentari?

Per rispondere a tali domande di ricerca, lo studio adotta una metodologia di stampo qualitativo articolata in due fasi. La prima, già parzialmente conclusa, ha previsto la somministrazione di un questionario ai 21 BA operanti sul territorio italiano; la seconda prevede la conduzione di alcuni focus group con una selezione degli stessi enti, al fine di investigare, attraverso la metodologia dei multiple case study (Yin, 2003), le specificità connesse alle principali barriere e ai principali fattori abilitanti emersi. Successivamente, le evidenze raccolte saranno analizzate alla luce dei framework teorici della contingency theory (Thomas, 1986) e dell'institutional theory (DiMaggio & Powell, 1983; Zucker, 1987), elaborando un modello interpretativo in grado di connettere i principali ostacoli individuati con le leve più efficaci per superarli.

Le implicazioni derivanti da questo studio si articolano su più livelli. In primo luogo, il contributo alla letteratura risulta significativo poiché colma un vuoto conoscitivo rilevante relativo alla rendicontazione di sostenibilità nei BA, ampliando il dibattito sul ruolo degli ETS nella generazione di valore sociale. Mentre la ricerca pregressa ha spesso privilegiato le imprese for profit o gli ETS considerati nella loro generalità, l'analisi proposta approfondisce una tipologia organizzativa ad alto impatto sociale ma scarsamente indagata, offrendo evidenze empiriche in grado di arricchire la comprensione dei processi di accountability nel settore non profit. Lo studio, inoltre, contribuisce a qualificare la rendicontazione non come mero adempimento bensì come dispositivo strategico, cognitivo e relazionale centrale nei processi di creazione del valore sociale, avanzando dunque un'elaborazione teorica più articolata delle sue funzioni.

Parallelamente, l'applicazione congiunta della contingency theory e dell'institutional theory consente di estendere tali framework al contesto degli ETS e, in particolare, dei BA. L'interpretazione delle pratiche di rendicontazione alla luce della contingency theory mette in evidenza come esse siano strettamente influenzate da risorse disponibili, configurazioni organizzative e condizioni operative, mentre la prospettiva dell'institutional theory permette di comprendere il ruolo delle pressioni coercitive, normative e mimetiche nell'orientare i comportamenti delle organizzazioni. L'integrazione delle due teorie mostra la loro capacità di spiegare dinamiche proprie di un settore altamente normato, caratterizzato da finalità sociali, elevata complessità gestionale e forte dipendenza da reti di collaborazione, ampliandone così la portata interpretativa.

Dal punto di vista applicativo, i risultati offrono numerose implicazioni per i BA e per gli ETS in generale. L'individuazione delle principali barriere e dei fattori abilitanti evidenzia l'importanza di rafforzare i sistemi informativi interni, sviluppare competenze specifiche sulla misurazione del valore sociale e valorizzare il ruolo delle reti di appartenenza quali leve per la standardizzazione delle pratiche e la diffusione di processi di apprendimento organizzativo. Lo studio intende mostrare come la rendicontazione possa fungere da strumento di governance capace di orientare le scelte strategiche, aumentare la trasparenza verso gli stakeholder e sostenere la legittimazione pubblica, superando concezioni che la relegano a un obbligo burocratico.

Le implicazioni sono altrettanto rilevanti per i policymaker, soprattutto alla luce delle linee guida per la redazione del bilancio sociale degli ETS introdotte con il DM 4 luglio 2019. Le

evidenze empiriche emerse potranno favorire un affinamento delle politiche pubbliche in materia di accountability, suggerendo interventi mirati a facilitare l'implementazione della rendicontazione nei BA e negli ETS in generale. Tra tali interventi rientrano lo sviluppo di programmi di supporto tecnico e formativo, la definizione di piattaforme condivise per la raccolta e gestione dei dati e l'introduzione di standard qualitativi più coerenti con le capacità effettive degli enti. Lo studio fornisce dunque una base conoscitiva utile a orientare politiche di accompagnamento e strumenti regolatori capaci di rendere la rendicontazione un processo realmente funzionale alla governance degli ETS e all'allocazione delle risorse pubbliche.

Infine, sebbene condotto nel contesto italiano, lo studio ha una portata internazionale, poiché i BA analizzati appartengono alla rete nazionale affiliata alla Federazione Europea dei Banchi Alimentari e alla Global FoodBanking Network. Tale collocazione inserisce i risultati in un quadro transnazionale, rendendoli rilevanti per realtà simili operanti in altri Paesi e in contesti socio-istituzionali differenti. Le dinamiche individuate, legate alla complessità organizzativa, alle sfide di misurazione dell'impatto e alla crescente pressione per una migliore accountability, risultano infatti condivise all'interno dei sistemi di food banking nei Paesi ad alto reddito. Ne deriva che le evidenze prodotte, pur radicate nel caso italiano, offrono spunti generalizzabili e trasferibili in ambito internazionale, contribuendo a qualificare in modo più approfondito il ruolo dei BA e degli ETS nei processi di sviluppo sostenibile e nella lotta globale all'insicurezza alimentare.

2. Metodologia

Nell'ambito del presente studio, la strategia empirica prevede un disegno metodologico articolato in due fasi, tuttora in corso.

La prima fase ha previsto la somministrazione di un questionario strutturato ai 21 BA operanti sul territorio nazionale e coordinati dalla Fondazione Banco Alimentare. Lo strumento, veicolato tramite piattaforma digitale (google moduli), è stato progettato per indagare in modo sistematico le pratiche di rendicontazione di sostenibilità, i meccanismi adottati per la misurazione dell'impatto sociale e le modalità di gestione informativa e organizzativa all'interno della rete dei BA. Il questionario si inserisce all'interno di un progetto di ricerca di interesse nazionale (PRIN) volto ad approfondire le dinamiche di accountability, di impatto generato e di network dei BA. Esso comprende diverse sezioni dedicate rispettivamente: (i) alla raccolta di informazioni anagrafiche sull'ente e sul rispondente; (ii) alle pratiche di rendicontazione sociale, con particolare riferimento all'adozione del bilancio sociale previsto dalle Linee guida ministeriali, alle motivazioni sottostanti la sua introduzione o alla mancata adozione, e all'utilizzo di specifici standard di rendicontazione, includendo l'analisi delle principali barriere e dei fattori abilitanti che influenzano l'attivazione del processo; (iii) alle modalità di misurazione dell'impatto sociale, indagando sia l'eventuale implementazione di sistemi formali, sia le ragioni dell'assenza di tali processi, includendo dimensioni quali difficoltà nella raccolta dati, carenza di risorse e natura qualitativa degli outcome; (iv) alla gestione dei volontari, esplorando la composizione delle diverse tipologie di volontari, l'esistenza di modelli organizzativi dedicati, gli strumenti impiegati per monitorare l'apporto orario e l'utilizzo dei dati raccolti ai fini gestionali o rendicontativi; e infine (v) ai temi e agli indicatori di sostenibilità ritenuti rilevanti per l'organizzazione, attraverso scale di valutazione che consentono di misurare sia la percezione della rilevanza dei temi ESG, sia l'effettivo utilizzo e l'importanza attribuita a un ampio insieme di indicatori sociali, ambientali ed economici. A oggi, 15/21 BA coinvolti hanno completato la compilazione, con un tasso di risposta pari a circa il 70%. Tale risultato preliminare consente già di disporre di un corpus informativo significativo, utile a delineare pattern ricorrenti, specificità territoriali e prime evidenze riguardanti le barriere e i fattori abilitanti alla rendicontazione di sostenibilità nel settore.

La seconda fase, attualmente in via di definizione operativa, prevede la realizzazione di una serie di focus group che coinvolgeranno la Fondazione Banco Alimentare, in qualità di nodo

centrale di coordinamento, e un campione di BA territoriali, tra cui Abruzzo, Lombardia, Campania, Lazio e Puglia. L'obiettivo è approfondire qualitativamente le principali evidenze emerse dalla fase survey, adottando la prospettiva dei multiple case study per esplorare le specificità organizzative, le dinamiche relazionali e le condizioni contingenti che influenzano l'adozione di pratiche strutturate di rendicontazione.

L'intero processo di raccolta ed elaborazione dati è pertanto ancora in corso. Le evidenze presentate assumono carattere preliminare e saranno ulteriormente arricchite con l'integrazione dei risultati derivanti dai focus group, al fine di costruire un quadro interpretativo più completo e teoricamente fondato sulle barriere e sui facilitatori della rendicontazione di sostenibilità nei BA.

3. Risultati preliminari

I risultati che seguono hanno carattere preliminare, in quanto riferiti alla sola prima fase della ricerca, quella quantitativa basata sulla somministrazione del questionario ai 21 BA operanti sul territorio nazionale. Alla data attuale hanno completato il questionario 15 enti, pari a un tasso di risposta del 71% circa. L'analisi presentata rappresenta pertanto una fotografia parziale dei processi di rendicontazione di sostenibilità in atto nella rete dei BA, destinata a essere arricchita e approfondita nella seconda fase del progetto, che prevede lo svolgimento di più focus group e l'adozione di un approccio di multiple case study.

3.1. Livello di adozione del bilancio sociale e maturità rendicontativa

L'indagine mostra che la rendicontazione sociale rappresenta una pratica già diffusa ma ancora caratterizzata da una significativa eterogeneità interna. 10 BA dichiarano di redigere un bilancio sociale, mentre 5 non hanno ancora adottato tale strumento. Tra gli enti che hanno avviato il percorso, la maggioranza lo porta avanti da diversi anni, mentre una quota più ridotta si trova in una fase iniziale, avendo introdotto il bilancio sociale di recente.

La variabilità dell'esperienza maturata dai BA è particolarmente rilevante. Si osservano organizzazioni con una lunga tradizione rendicontativa, in alcuni casi superiore al decennio, che hanno progressivamente strutturato processi informativi e modelli di *governance* orientati alla misurazione dell'impatto. Al contempo, altri enti mostrano una maturità più contenuta, con un'esperienza ridotta e procedure ancora in fase di definizione. Ne deriva un quadro in cui la rendicontazione sociale si sta consolidando come pratica riconosciuta, pur con ritmi e modalità differenti a seconda delle caratteristiche organizzative, delle risorse disponibili e del grado di formalizzazione interna.

3.2. Benefici attesi e motivazioni all'adozione del bilancio sociale

Le motivazioni che spingono i BA ad adottare il bilancio sociale sono molteplici e compongono un insieme coerente con la letteratura sulla rendicontazione negli enti non profit. La necessità di misurare e rendere comunicabile il valore sociale generato rappresenta il principale driver. I BA rispondenti evidenziano come la crescente complessità delle attività svolte, la molteplicità degli stakeholder coinvolti e la natura multidimensionale degli impatti richiedano strumenti di comunicazione strutturati, in grado di restituire una visione sistematica dell'operato dell'organizzazione.

Accanto a ciò, emerge in modo significativo l'aspettativa che il bilancio sociale faciliti la costruzione di relazioni più solide con la rete dei partner istituzionali e con i finanziatori, pubblici e privati. La rendicontazione viene interpretata come una leva per migliorare la credibilità e la trasparenza dell'organizzazione, aumentando la capacità di attrarre risorse economiche e instaurare partnership strategiche. Molti enti (7 BA) riconoscono inoltre che l'avvio della

rendicontazione risponde anche a obblighi regolatori e a un più generale processo di adeguamento alle linee guida ministeriali e ai modelli proposti dalla rete di appartenenza.
In alcuni casi il bilancio sociale assume una funzione eminentemente interna, poiché favorisce un migliore coordinamento tra le diverse attività dell'organizzazione, supporta la pianificazione strategica e contribuisce a rendere più consapevole la gestione delle risorse, sia materiali sia immateriali. Si delinea così una duplice dimensione della rendicontazione: strumento di posizionamento esterno e, allo stesso tempo, meccanismo cognitivo e organizzativo che accompagna l'evoluzione della struttura gestionale del BA.

3.3. Standard e riferimenti utilizzati nella redazione

La maggior parte dei BA che redige il bilancio sociale dichiara di utilizzare uno o più standard di riferimento. Le Linee guida ministeriali rappresentano il modello più adottato (9 BA), seguite dalle Linee guida predisposte dalla Fondazione Banco Alimentare (7 BA), spesso usate in maniera complementare. Alcuni enti (3 BA) affiancano ai riferimenti nazionali anche standard internazionali come il GRI, segnalando una maggiore attenzione ai sistemi globali di rendicontazione della sostenibilità.

L'utilizzo congiunto di modelli differenti evidenzia la stratificazione di riferimenti che caratterizza il settore. I BA si trovano infatti a operare in uno spazio istituzionale multiforme, nel quale coesistono pressioni normative, logiche di rete e istanze di accountability verso la società civile. Tale pluralità di standard conduce alla costruzione di assetti rendicontativi flessibili, nei quali le organizzazioni combinano strumenti formali e pratiche operative consolidate nella propria esperienza.

3.4. Barriere all'adozione del bilancio sociale

I 5 enti che non hanno ancora introdotto il bilancio sociale riportano una serie di barriere riconducibili principalmente a vincoli di natura organizzativa. La percezione di un processo eccessivamente complesso, che richiede tempi e risorse difficilmente compatibili con le priorità operative quotidiane, rappresenta il limite più frequentemente segnalato. A questo si affianca la mancanza di competenze interne specifiche, soprattutto in relazione alla gestione dei dati e alla capacità di tradurre le attività svolte in modelli di misurazione e indicatori significativi.
In alcuni casi, l'assenza di risorse finanziarie adeguate limita la possibilità di dedicare personale o consulenti alla redazione del bilancio sociale. Altri enti evidenziano difficoltà nella raccolta delle informazioni necessarie, dovute a sistemi informativi poco strutturati o a processi di monitoraggio non ancora consolidati. Vi sono poi barriere di natura più strategica e cognitiva, come la percezione che il bilancio sociale non rappresenti una priorità rispetto ad altre attività considerate centrali per il funzionamento quotidiano del BA o l'idea che strumenti già utilizzati garantiscano un sufficiente livello di trasparenza verso gli stakeholder.
Nel complesso, tali barriere delineano un quadro in cui le criticità non riguardano la rilevanza percepita della rendicontazione, bensì la capacità concreta di implementarla in contesti caratterizzati da risorse limitate, volumi di attività elevati e tensioni costanti tra esigenze operative e necessità amministrative.

3.5. Fattori abilitanti alla rendicontazione

Accanto alle barriere individuate, emergono alcuni fattori che facilitano l'adozione e il consolidamento delle pratiche di rendicontazione nei BA. In primo luogo, il quadro normativo e regolatorio, insieme al ruolo della rete Banco Alimentare, contribuisce a creare aspettative condivise, standard comuni e un orizzonte istituzionale chiaro. Questo contesto esercita una

funzione abilitante, poiché riduce l'incertezza e orienta le organizzazioni verso modelli rendicontativi riconosciuti e comparabili.
Un secondo gruppo di fattori riguarda la dimensione interna e gestionale dell'ente. Gli organismi che dispongono di sistemi informativi più strutturati, come piattaforme ERP o gestionali avanzati (es. SAP), mostrano una maggiore facilità nel produrre dati in maniera sistematica, condizione necessaria per alimentare un processo di reporting credibile e continuativo. Allo stesso modo, l'adozione di tecnologie digitali innovative, come strumenti di tracciamento basati su *blockchain* (Damavandi et al., 2025) o soluzioni di intelligenza artificiale per l'analisi automatizzata dei dati, può rappresentare un importante supporto nei contesti caratterizzati da scarsità di personale e da un'elevata intensità operativa (Berardi & Valentinetti, 2023).
Infine, la consapevolezza del valore strategico della rendicontazione rappresenta un ulteriore fattore abilitante. Gli enti che riconoscono il legame tra bilancio sociale, miglioramento delle pratiche interne e rafforzamento delle relazioni con i partner risultano più propensi a investire energie nel processo rendicontativo. La rendicontazione si configura così come una pratica che, quando percepita come utile sia per l'interno sia per l'esterno, tende a radicarsi più stabilmente.

3.6. Conclusioni preliminari e future fasi di ricerca

I risultati preliminari delineano un quadro in cui i BA stanno attraversando un percorso di progressiva maturazione delle pratiche di rendicontazione, sostenuto da una crescente consapevolezza dei benefici attesi e al tempo stesso frenato da vincoli operativi e strutturali tipici del settore non profit. La diffusione del bilancio sociale e l'interesse verso la misurazione dell'impatto indicano un movimento complessivo verso forme più avanzate di accountability, sebbene persistano difficoltà legate alla disponibilità di risorse, alla carenza di competenze specialistiche e alla limitata capacità di raccolta ed elaborazione dei dati.

In questa fase emergono anche alcuni fattori abilitanti che sembrano facilitare l'adozione del reporting. Tra essi rivestono particolare importanza la presenza di sistemi informativi più strutturati, come gestionali integrati del tipo ERP, e l'introduzione progressiva di tecnologie digitali capaci di semplificare la tracciabilità e il trattamento dei dati, come soluzioni blockchain e strumenti di intelligenza artificiale. Tali elementi risultano particolarmente rilevanti per i BA caratterizzati da organici ridotti e volumi operativi elevati, poiché consentono di rendere la rendicontazione meno onerosa, più affidabile e maggiormente sistematica.

Queste evidenze saranno approfondite nella seconda fase della ricerca, attraverso i focus group che permetteranno di indagare più dettagliatamente le dinamiche organizzative interne, di chiarire le condizioni che favoriscono o ostacolano l'adozione del bilancio sociale e di comprendere come le tecnologie digitali vengano effettivamente integrate nei processi di gestione e monitoraggio. Tale approfondimento qualitativo consentirà di interpretare con maggiore precisione i risultati emersi dalla survey, distinguendo tra pratiche consolidate e prassi emergenti e mettendo in luce la varietà dei modelli organizzativi presenti nei diversi contesti territoriali.

Lo studio presenta alcune limitazioni, legate soprattutto alla fase ancora incompleta della raccolta dati e al fatto che il campione comprende esclusivamente i BA italiani, sebbene il contesto nazionale, come evidenziato in precedenza, risulti pienamente inserito in un quadro internazionale e quindi ampiamente rappresentativo delle dinamiche dei sistemi di food banking nei Paesi ad alto reddito. Inoltre, l'assenza, nella fase attuale, di un'analisi qualitativa impedisce di cogliere appieno la complessità delle motivazioni e delle dinamiche decisionali che orientano le scelte di rendicontazione. Nonostante tali limiti, il contributo offerto da questa prima fase è significativo, poiché fornisce una mappatura sistematica e finora mancante delle pratiche rendicontative dei BA, identifica barriere e fattori abilitanti poco esplorati nella letteratura e mette in evidenza il ruolo della digitalizzazione come leva potenzialmente decisiva per la maturazione dei sistemi di accountability nel settore non profit.

Le fasi successive della ricerca permetteranno infine di integrare questi risultati in un quadro interpretativo più completo, arricchito dalla prospettiva empirica dei focus group e coerente con i riferimenti teorici adottati. Ciò offrirà un contributo utile sia alla letteratura sulla rendicontazione degli ETS sia ai decisori pubblici e privati impegnati nel campo della sicurezza alimentare e della gestione delle reti solidali, consentendo, da ultimo, di superare gran parte dei limiti evidenziati in questa fase preliminare.

Ideologies and institutional logics in the sustainability practices: The Italian steel industry exploration

Laura Rocca[1], Cristian Carini[2], Elisa Mori[3], Matilde Molendi[4]

1. Purpose

In recent years, the growing relevance of sustainability has driven companies to integrate Corporate Social Responsibility (CSR) practices into their business models, strengthening their commitment to social and environmental responsibility (Lozano, 2012). Although CSR has been a recognized concept since the 1950s (Carroll, 1999), its role has expanded significantly, influencing the evolution of corporate business models (Rauter et al., 2017). CSR and sustainability can be seen as expressions of companies' commitment to balancing economic success with stakeholder needs (Freeman et al., 2010) and ensuring political legitimacy in compliance with the social contract (Deegan, 2002). Moreover, CSR can serve as a strategic lever to guide companies toward sustainable development models (Cetindamar, 2007).

The literature presents an ongoing debate regarding the relationship between CSR, value creation, and corporate profitability. While some scholars argue that CSR provides a competitive advantage (Vogel, 2005), others question the actual existence of such a relationship (Kim et al., 2018; Wang & Sarkis, 2017). Several studies also confirm the positive impact of ESG on business performance, including improved stock performance, reduced volatility, and lower risk-adjusted costs (Ahmad et al., 2021; Kim & Li, 2021). However, some scholars report opposite findings arguing that it could negatively impact financial performance. Integrating CSR requires a transformation of business models through a holistic approach that embeds sustainability principles and tools across all operational areas (Geissdoerfer et al., 2018). This transformation aligns with the concept of a Sustainable Business Model (SBM), which integrates sustainability into the company's value proposition, value creation and delivery processes, and value capture mechanisms (Geissdoerfer et al., 2018). Transitioning to a SBM is crucial for addressing the challenges of a rapidly changing environment and society (Neumeyer & Santos, 2018).

One of the main challenges in building a SBM is identifying methods that allow companies to generate economic value while simultaneously providing benefits to society and the environment (Schaltegger et al., 2012).

To support businesses in designing SBMs, research has proposed several frameworks and archetypes. Bocken et al. (2014) identified key SBM archetypes, including maximizing material and energy efficiency, creating value from waste, substituting with renewables and natural processes, delivering functionality rather than ownership, adopting a stewardship role, encouraging sufficiency, repurposing the business for societal or environmental benefit, and developing scalable solutions. Ritala et al. (2018) later expanded this framework to include inclusive value creation.

Beyond academic frameworks, financial institutions play a crucial role in supporting companies in transitioning toward sustainable business models. Collaboration with these institutions can facilitate ESG risk reduction and drive companies toward more resilient and responsible business practices.

However, especially in Europe, we are facing a "pushing" towards a green and sustainable change in organizational practices, reflecting in new rules and laws from the EU Commission that asked for more accountability towards sustainable business models (i.e. CSRD, Taxonomy,..). But nowadays, we are facing some political and societal changes around that sustainability issues (i.e. Trump's positions on climate change, European's national governments' that requested for a revision of the green requirements). Thus, what could be the reactions to those changes within businesses? Are corporations changing their behaviors due to that? If so, to what extent? What is the organizations' approach to this complexity?

In that realm, there could be seen different institutional logics operating at field and societal level but also ideologies that could impact on organizational practices. The work of Mountford & Cai, (2023) discussed about how integrate ideologies and institutional logics in complex system, they underlined that "We go beyond Thornton et al.'s discussions on the relations between institutional logics and ideologies by elaborating on the role of ideologies in harmonizing mingling institutional logics that co-exist and the formation of hybrid logics. Once we clearly separate out logics and ideologies, our review suggests that ideologies are key to the peaceful co-existence or active contestation of multiple logics on the ground. Put simply, ideologies mediate the relationships between logics at the field level." (p. 376). Thus, there is a lack of research that studied these links between ideologies and hybrid logics in the sustainability change, identifying how these institutional logics and ideologies interplay within the organizational behaviors towards CSR's accountability (Mountford & Cai, 2023). The current paper would like to explain, using an exploratory research, what are the field and societal logics and ideologies that influence the organizations behaviors; that could contribute to the call for research (Mountford & Cai, 2023) on "how practices at the organizational or field level impact the relationships between logics at the macro level, and how these are activated or rejected by ideology" (p. 378).

Thus, the current paper would like to answer to the following research questions:

Do ideologies show themselves in the sustainability practices of corporations?

What are the logics and ideologies that interplay for the social and environmental accountability?

Using the call for future research of Mountford & Cai, (2023), the final RQ is:

"Do logics or ideologies ultimately determine the likelihood of success of a [social and environmental] accountability practice? Or is it some combination of the two?" (p. 378)

2. Design/methodology/approach

The study focuses on a specific sector, the Steel one, in the Italian context. Italy, Germany, and Spain are significant players in the European steel industry, contributing substantially to the region's output. Analysing these countries can provide insights into the practices of some of the largest and most influential steel producers. The steel industry is responsible for around 5% of CO2 emissions in the EU and 7% globally. In the European steel industry, Germany is a major producer, accounts for 26% of the EU's total steel output in 2020. Italy follows with a 15% contribution, while France and Spain each contribute 8%, demonstrating a significant dispersion in steel production across the region. Over half of the steel manufactured within the EU in the same year (56%) was produced via the primary route, which involves the conversion of raw materials into steel. However, 44% of steel production was achieved through recycling, underscoring the industry's commitment to sustainable manufacturing practices. The level of environmental pollution and resource consumption are significant factors for those businesses, making the adoption of ESG (Environmental, Social, and Governance) practices and

sustainability reporting essential. This combination led to an interesting exploratory analysis on how Italian Steel companies approach the sustainability accountability and what are the logics and ideologies behind their behaviours.

The cases were selected based on a research project to understand the level of diffusion of sustainability reporting in the Steel sector and the reasons behind the choice of reporting/not reporting on ESG issues. That project provides a survey at national level and a content analysis of all the sustainability reports available on the companies' websites (coded in Nvivo).

The qualitative methodology is two-fold, incorporating both archival analysis and interviews (Brinkmann & Kvale, 2011; Berg & Lune, 2013). Archival analysis is used to examine sustainability reports and assess the evolution of corporate social responsibility (CSR) policies within companies. Additionally, a series of semi-structured interviews were conducted to explore the sustainability strategies adopted by companies, evaluating the change processes implemented in business models and the reporting procedures used, such as sustainability reports. The interviews involved key figures responsible for sustainability, including Strategy Deployment Managers, ESG Managers, ESG Risk Management Officers, and, in some cases, business owners.

The areas of investigation are structured into five main dimensions:

1. Company Profile – Respondent's role, industry, and revenue;
2. Strategies and Governance – Corporate priorities, board involvement, and sustainability reporting decisions;
3. Environment – Actions to reduce environmental impact and green investments;
4. Social Dimension – Employee welfare, inclusion, training, and community engagement;
5. Governance and Reporting – Ethical codes, cybersecurity, sustainability assurance, and ESG impact on financial data.

The interviews provide an overview of corporate sustainability practices, assessing their operational and strategic impact.

Then, the interviews were coded using the theoretical approach of institutional logics and ideologies provided by Mountford & Cai (2023), in NVIVO (draft Figure 1).

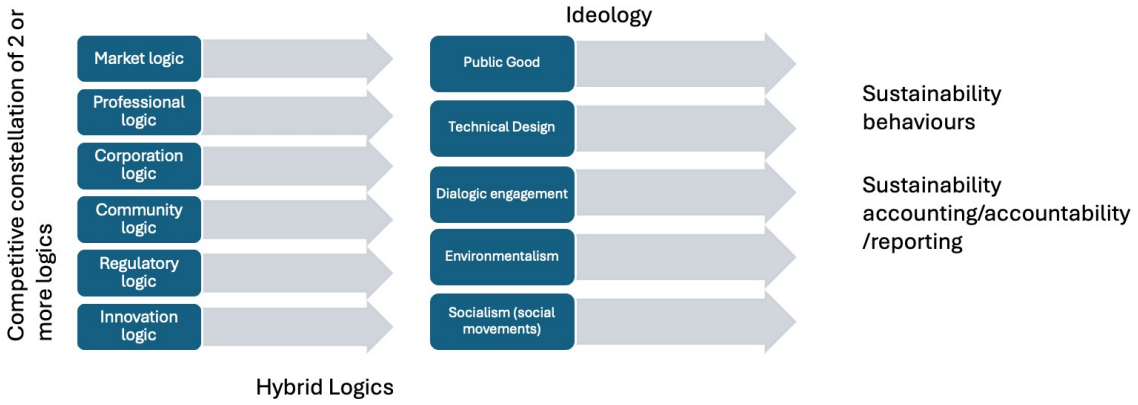

Figure 1. Draft interview coding (authors' elaboration on Mountford & Cai, 2023).

3. Findings

The project is still undergoing, and we have not yet finalized findings to present now.

Our aim is to provide a clear picture of what are the institutional logics and ideologies behind the sustainability accountability practices of different steel companies, and thus suggest that, in a period of political changes, like nowadays, there will be some sustainability practices that will remain and evolve over time – the one based on ideologies (?) – while some other sustainability practices will disappear or will be turn off – the one linked to marked-based or regulatory logic (?).

As a first finding of archival data already coded in Nvivo, here is the description of the content analysis of data reported in sustainability reports by Italian steel companies.

The 2024 and 2025 sustainability reports' analysis offer an increasingly detailed portrait of how Italian steel companies are incorporating sustainability into their strategic operations and reporting practices. The evolution observed across the two years reflects both the intensification of European regulatory requirements and the growing awareness within the sector of the strategic relevance of decarbonisation, circularity and transparent communication to stakeholders. Despite this progress, both years highlight a persistent heterogeneity in the structure, scope and methodology of sustainability reporting, which continues to complicate any attempt at systematic comparison across firms or across years.

The number of companies producing sustainability reports continues to rise. In 2022, 51 reports were identified, compared to 25 in 2021; in 2023 the number increased again to 56, including both Italian and foreign groups. This expansion indicates a clear trend of voluntary alignment with ESG expectations, even before the full implementation of the Corporate Sustainability Reporting Directive (CSRD). Nevertheless, both editions underline several critical issues: non-aligned reporting periods, differences between the consolidation perimeter of financial statements and that of sustainability reports, and frequent use of disclaimers regarding excluded subsidiaries. These inconsistencies significantly reduce the comparability and reliability of KPI benchmarking across the industry. Another recurring issue concerns the definition of material topics. Although materiality analysis is formally acknowledged as a central step, a significant share of reports lacks adequate disclosure of the methodologies applied. In the 2024 edition, 25.5% of reports provide no clear explanation of how material topics were identified, and 31% omit meaningful information on stakeholder engagement practices. The 2025 edition shows some improvement but still finds 15.5% of companies with incomplete methodological descriptions and 22% with insufficiently detailed internal or external stakeholder engagement processes. The growing relevance of "double materiality" is noted, yet only a minority of firms fully apply this approach.

The analysis of KPIs reveals that environmental indicators remain the most consistently reported across the supply chain. Companies routinely provide data on energy consumption, greenhouse gas emissions (Scope 1 and 2, with more sporadic Scope 3 disclosure), waste management and water usage. However, differences in accounting perimeters and methodological choices, especially for Scope 3, continue to limit comparability. Social indicators such as workforce composition, training hours and accident frequency rates are increasingly available, but the depth and granularity of information remain uneven. Governance KPIs are the least standardised, often limited to descriptive statements rather than quantitative measures, particularly in areas such as ethics, anti-corruption and ESG-related risk management frameworks.

Survey findings provided in both years offer an additional lens through which to interpret reporting practices. The majority of companies rely on sector analysis as the primary method for identifying material topics, although in 2023 the analysis of actual and potential impacts gained prominence, signalling a gradual move toward ESRS-aligned practices. Surveys and questionnaires remain the most common tools for internal stakeholder engagement, while workshops and meetings are more widely used for engagement with external stakeholders. These methods provide rapid feedback but present the recurring issue of low response quality and lack of representativeness. Firms also express increasing concern regarding the complexity of EU sustainability regulations; the economic uncertainty linked to the decarbonisation pathway and the growing distance between regulatory expectations and the competitive realities of global steel markets.

Overall, the comparison between the two years shows a sector that is consolidating its ESG practices but still grappling with a structural lack of homogeneity in metrics, methodologies and stakeholder engagement. While sustainability reporting has become more widespread and

sophisticated, the challenge lies in creating coherent, comparable and decision-useful disclosures that can meaningfully guide the sector through the technological and economic transformation required to meet long-term climate objectives.

The empirical evidence emerging from the sustainability reports and survey data can be interpreted through the theoretical lens of institutional logics and ideologies, as presented in the theoretical framework. When viewed semantically, the patterns that recur across firms, such as heterogeneous reporting practices, different materiality assessments, selective stakeholder engagement, and mixed motivations for ESG disclosures, can be understood not simply as technical or procedural outcomes but as manifestations of co-existing and sometimes competing logics shaping organizational behaviour. Trying to identifying some clusters, here is a first attempt to group the archival and survey information.

A first semantic cluster that emerges from the content analysis concerns the predominance of regulatory and compliance-oriented language in sustainability reporting. References to CSRD, ESRS, due diligence, audit assurance, and the need to align reporting with evolving European standards appear persistently across the 2023 and 2024 analyses. This discursive pattern indicates the strong presence of a regulatory logic, which positions sustainability primarily as an external requirement to be met. Such a logic reflects an ideology of procedural conformity, where legitimacy is achieved through demonstrable adherence to formal norms. The observed inconsistencies in reporting perimeters, methodological choices and KPIs, however, suggest that this logic is not yet fully internalized across the field, producing a fragmented landscape in which compliance is uneven and pragmatically negotiated.

A second semantic cluster relates to the market logic, expressed in firms' emphasis on competitiveness, cost pressures, and market positioning in global steel markets. Many companies describe sustainability reporting as a strategic tool for signalling quality, innovation, or risk management to customers and financiers. Such language aligns with the CSR literature linking sustainability to value creation and competitive advantage (Vogel, 2005; Freeman et al., 2010), and mirrors an ideology of instrumental sustainability, where ESG practices are embraced insofar as they enhance the firm's economic performance. This framing also appears in survey responses where firms express concern that regulatory demands may limit global competitiveness. The prominence of this logic helps to explain why environmental KPIs, those most visible to markets, are the most widely reported, in contrast to governance or social indicators that do not yield immediate competitive returns.

A third thematic cluster seems suggesting the presence of an emerging stewardship or environmentalist ideology. References to circularity, decarbonisation as a long-term commitment, or explicit mapping of sustainability goals onto broader societal transitions are visible in a subset of companies, particularly those adopting double materiality or integrating sustainability into strategic planning. These practices resonate with the stewardship and societal value archetypes in sustainable business model literature (Bocken et al., 2014; Geissdoerfer et al., 2018). However, the relatively small number of firms adopting robust impact analysis or long-term environmental targets suggests that this ideology coexists with, rather than replaces, more dominant market and regulatory logics.

Mountford & Cai (2023) argue that ideologies play a crucial mediating role in enabling the coexistence, hybridization or contestation of institutional logics. Applying this lens to the Italian steel sector, a key insight emerges: the observed variability in sustainability practices can be read as evidence of different ideological filters through which firms interpret the pressures and opportunities of ESG transformation. Companies whose sustainability discourse reflects stewardship-oriented language appear to harmonize regulatory and market logics, translating compliance obligations into proactive strategic commitments. Conversely, firms whose discourse remains anchored primarily in cost, compliance or risk aversion appear to experience these logics as competing rather than convergent, resulting in minimalistic or fragmented ESG practices.

Finally, a semantic synthesis across the datasets suggests a possible explanatory hypothesis for future research. Practices that are rooted primarily in the regulatory logic (e.g., assurance statements, formal materiality matrices, KPI disclosures) or the market logic (e.g., energy efficiency, decarbonisation investments linked to competitive positioning) may continue to fluctuate over time, waxing or waning in response to political shifts, regulatory cycles or market conditions. By contrast, practices grounded in ideologically embedded commitments, such as long-term decarbonisation visions, integration of sustainability into corporate purpose, or adoption of double materiality, are more likely to persist and evolve regardless of regulatory uncertainty.

This hypothesis aligns with Mountford & Cai's call to examine whether logics or ideologies determine the success of accountability practices, or whether their interplay shapes organizational behaviour. In the Italian steel sector, the archival and survey data suggest that sustainability practices endure when ideologies stabilize the interaction of multiple institutional logics, whereas practices rooted exclusively in market or regulatory logics could remain susceptible to contextual volatility.

Il ruolo sociale delle imprese: un'analisi dei bilanci sociali e della percezione della Generazione Z

Anna Piergallino[1], Antonella Cammarota[2], Riccardo Resciniti[3]

1. Introduzione

Il ruolo sociale delle imprese si è progressivamente ampliato, passando da una visione centrata sugli obblighi economici e regolatori a una prospettiva che integra responsabilità ambientali, sociali e di governance, ridefinendo il modo in cui le organizzazioni interagiscono con la società (De Villiers et al., 2021; Weber et al., 2023). In questo scenario, la comunicazione della RSI assume una funzione cruciale: attraverso diversi canali, le imprese cercano di rendere visibili i propri impegni, di costruire fiducia e di ottenere legittimità presso stakeholder sempre più esigenti (Manetti & Bellucci, 2016; Tuan et al., 2024).

Tra gli strumenti disponibili, il bilancio sociale rappresenta uno dei mezzi più consolidati e istituzionalizzati per comunicare iniziative e performance socio-ambientali. La letteratura ne riconosce il valore in termini di trasparenza, formalizzazione e capacità di rendicontare azioni concrete in modo sistematico (Cho & Patten, 2007; Du & Yu, 2021; Alhumud et al., 2025).

Tuttavia, questi documenti non sfuggono alle tensioni tipiche della comunicazione responsabile: da un lato devono rassicurare gli stakeholder sulla credibilità dell'impresa (Lock & Seele, 2017), dall'altro si confrontano con un clima diffuso di scetticismo verso dichiarazioni percepite come eccessivamente autoreferenziali o potenzialmente riconducibili a fenomeni di greenwashing (Skard & Thorbjørnsen, 2014; Pizzetti et al., 2021).

Parallelamente, la Generazione Z emerge come uno degli stakeholder più rilevanti nel panorama contemporaneo (Cammarota & Branca, 2025). Questa coorte, cresciuta in un contesto digitale e profondamente esposta a discorsi su sostenibilità, diritti sociali e inclusione, manifesta aspettative etiche elevate nei confronti delle imprese e un atteggiamento critico verso le forme tradizionali di comunicazione corporate (Francis & Hoefel, 2018; Djafarova & Bowes, 2021). Il loro giudizio sulla credibilità della RSI dipende non solo dai contenuti diffusi, ma soprattutto dalla coerenza tra valori dichiarati e comportamenti osservabili, dall'autenticità percepita e dal tono narrativo utilizzato dai brand (Afzali & Kim, 2021; Joo et al., 2019).

La letteratura sulla comunicazione della RSI e percezione giovanile mostra che da un lato, le imprese tendono a enfatizzare nei bilanci sociali azioni riconducibili a macro-aree quali gestione delle risorse umane, innovazione sostenibile, efficienza delle risorse o iniziative filantropiche verso la comunità (Arena et al., 2023; Ferraro & Veltri, 2024); dall'altro, i giovani sembrano attribuire valore soprattutto a dimensioni come coerenza valoriale, autenticità del messaggio, trasparenza lungo la supply chain e presa di posizione su temi sociali rilevanti.

Questa distanza suggerisce l'esistenza di un potenziale disallineamento tra ciò che le imprese scelgono di comunicare formalmente e ciò che la Generazione Z considera realmente significativo per valutare la responsabilità di un'azienda. Esplorare tale divario è essenziale, poiché un allineamento insufficiente può compromettere la credibilità della comunicazione, ridurre

l'efficacia delle iniziative RSI e indebolire la capacità delle imprese di ingaggiare una delle generazioni più rilevanti per il futuro consumo e per l'evoluzione dei valori sociali.

2. Analisi della letteratura

2.1. La comunicazione della RSI e social reporting

Negli ultimi anni le imprese non sono più viste soltanto come attori economici, ma come soggetti chiamati a contribuire attivamente al bene comune, in termini sociali, ambientali e di governance (De Villiers et al., 2021; Weber et al., 2023). Questa trasformazione rende la comunicazione un elemento centrale nei processi di legittimazione, costruzione di fiducia e gestione delle aspettative degli stakeholder (Manetti & Bellucci, 2016; Tuan et al., 2024).

La letteratura sulla comunicazione della RSI ha progressivamente distinto tra attività di RSI e loro narrazione: le imprese non solo implementano iniziative sociali e ambientali, ma devono anche decidere come renderle visibili e comprensibili ai diversi pubblici (Golob et al., 2017; Macca et al., 2024). In questo quadro, i social report, bilanci sociali, report di sostenibilità, integrated report, si sono affermati come strumenti istituzionali chiave per rendicontare impegni e risultati ESG, offrendo una base documentale formalizzata, comparabile e spesso legata a cornici regolatorie (Cho & Patten, 2007; Du & Yu, 2021; Troshani & Rowbottom, 2024).

Diversi lavori evidenziano come il social reporting possa funzionare sia come strumento di responsabilità sia come meccanismo di legittimazione simbolica, talvolta più orientato alla costruzione di una narrativa favorevole che a una rappresentazione bilanciata delle performance (Ashforth & Gibbs, 1990; Kamla & Rammal, 2013; Schoeneborn et al., 2020). In parallelo, il rischio di greenwashing, woke-washing o altre forme di "washing" comunicativo è stato ampiamente discusso (Pizzetti et al., 2021; Warren, 2022; Sterbenk et al., 2022), sottolineando come la distanza tra "talk" e "walk" possa danneggiare reputazione e performance (Bhagwat et al., 2020). Tuttavia, questi studi si concentrano soprattutto su ciò che le aziende decidono di rendicontare, mentre meno attenzione è stata dedicata al confronto con le aspettative specifiche di segmenti di stakeholder particolarmente critici e influenti, come i giovani.

2.2. Generazione Z, percezione della RSI e ruolo sociale delle imprese

La Generazione Z è la prima coorte pienamente digitale, cresciuta in un contesto di crisi ambientali, tensioni socio-politiche e iper-esposizione mediatica (Francis & Hoefel, 2018). La letteratura la descrive come una generazione caratterizzata da elevata sensibilità verso temi di giustizia sociale, sostenibilità e inclusione, ma anche da forte competenza mediale e marcato scetticismo verso le forme tradizionali di comunicazione corporate (Djafarova & Bowes, 2021).

Sul piano valoriale, diversi studi mostrano che Gen Z attribuisce rilevanza alla coerenza tra dichiarazioni e comportamenti aziendali: imprese percepite come responsabili sono quelle che integrano la RSI nei processi core, e non solo in iniziative filantropiche marginali (Kim & Austin, 2019). Le aspettative non riguardano quindi solo il "fare del bene", ma la capacità di dimostrare allineamento strutturale tra modello di business, valori dichiarati e impatti generati.

Dal punto di vista comunicativo, Gen Z valuta la RSI attraverso la lente della credibilità del messaggio. Riprendendo la Source Credibility Theory (Hovland et al., 1953; Ohanian, 1990), i giovani giudicano le comunicazioni sulla base di dimensioni quali affidabilità, competenza e goodwill percepiti della fonte (Kim & Ferguson, 2019). In contesti digitali affollati, l'attenzione si sposta inoltre sulla combinazione tra contenuto, messaggero e piattaforma: i canali e i portavoce diventano segnali di autenticità o opportunismo (Spence, 1973; Rim & Dong, 2018).

La letteratura evidenzia come i giovani privilegino contenuti percepiti come autentici, spesso associati a user-generated content, micro-influencer o testimonianze dirette, rispetto alle comunicazioni altamente istituzionalizzate e controllate (Djafarova & Bowes, 2021). Termini come greenwashing e woke-washing sono ormai parte del vocabolario critico di questa

generazione, che riconosce e sanziona iniziative percepite come puramente reputazionali o scollegate dalle pratiche effettive (Delmas & Burbano, 2011; Cammarota & Branca, 2025). Allo stesso tempo, gli studi mostrano l'esistenza di un value–action gap: pur dichiarando alti standard etici, i giovani non sempre traducono queste preferenze in comportamenti d'acquisto coerenti, a causa di vincoli di prezzo, convenienza o assenza di alternative credibili (Carrington et al., 2010). Ciò non riduce la rilevanza delle loro aspettative, ma suggerisce che la RSI funzioni come una lente di valutazione della legittimità del brand più che come unico driver delle scelte di consumo.

2.3. Potenziale disallineamento tra comunicazione della RSI e le aspettative dei giovani consumatori

La letteratura mostra come le imprese, attraverso i social report, privilegino la rendicontazione di iniziative legate a capitale umano, innovazione sostenibile, gestione delle risorse e attività comunitarie, rispondendo a pressioni istituzionali e regolatorie (Cho & Patten, 2007; Du & Yu, 2021; Arena et al., 2023). Parallelamente, la Generazione Z valuta la responsabilità aziendale sulla base di criteri quali coerenza valoriale, autenticità percepita e trasparenza dei processi, attribuendo importanza a un impegno sociale credibile e riconoscibile (Francis & Hoefel, 2018; Afzali & Kim, 2021).

Queste due prospettive, pur riferendosi allo stesso fenomeno, non necessariamente coincidono. Le attività che le imprese scelgono di comunicare nei report potrebbero infatti non riflettere pienamente i criteri attraverso cui i giovani valutano la responsabilità e l'impegno sociale delle organizzazioni. Ad oggi, questo potenziale scarto non è stato analizzato in modo comparativo.

Il presente studio intende colmare tale vuoto confrontando ciò che le imprese dichiarano nei bilanci sociali con ciò che la Generazione Z considera rilevante e credibile, al fine di identificare eventuali aree di disallineamento.

3. Metodologia

Il presente studio adotta un disegno qualitativo in due fasi con l'obiettivo di confrontare le iniziative RSI comunicate dalle imprese nei bilanci sociali con le percezioni e i criteri interpretativi della Generazione Z. I due studi, sono integrati in un framework interpretativo finalizzato a identificare aree di convergenza e possibili disallineamenti tra comunicazione corporate e aspettative giovanili.

3.1. Studio 1: Content Analysis dei social report

La prima fase si basa su una content analysis manuale dei bilanci sociali di cinquanta imprese italiane, selezionate sulla base delle performance economiche riportate nell'Annual Report Mediobanca 2023. Il corpus è costituito dai report di sostenibilità pubblicati nel 2023, caratterizzati da elevato livello di dettaglio e rappresentativi delle principali pratiche di comunicazione RSI nel contesto italiano, in linea con evidenze precedenti (Arena et al., 2023; Ferraro & Veltri, 2024).

L'analisi ha seguito un approccio qualitativo strutturato (Mayring, 2021), finalizzato a individuare e categorizzare le azioni RSI riportate dalle imprese. Il processo di codifica è stato condotto manualmente e ha portato all'identificazione di specifiche attività implementate dalle aziende, come riportato nella sintesi proposta nella Tabella 1.

La procedura di codifica ha seguito un approccio iterativo. In una prima fase è stata costruita una griglia preliminare di categorie sulla base della letteratura sulla comunicazione della RSI e degli standard di reporting. In una seconda fase, la griglia è stata integrata con categorie emergenti dai testi, in linea con un approccio qualitativo induttivo. Due ricercatori hanno codificato

indipendentemente un sottoinsieme dei report, confrontando le discrepanze e affinando la definizione operativa delle categorie.

3.2. Studio 2: Focus group con giovani appartenenti alla Generazione Z

La seconda fase impiega un approccio qualitativo esplorativo basato su focus group con giovani appartenenti alla Generazione Z. Sono stati realizzati tre focus group, ciascuno composto da 6–8 partecipanti, per un totale di 20 giovani appartenenti alla Generazione Z (18–26 anni). I partecipanti sono stati selezionati attraverso un campionamento eterogeneo volto a includere differenti percorsi di studio, genere e background socio-culturale. I focus group sono stati condotti tramite una traccia semi-strutturata che ha guidato la discussione sui temi della responsabilità percepita, dei criteri di credibilità e delle preferenze comunicative. Le sessioni sono state registrate attraverso la piattaforma per videoconferenze Teams e l'analisi tematica è stata condotta attraverso un processo di codifica aperta e successiva aggregazione dei temi ricorrenti. Questa metodologia consente di approfondire valori, aspettative e criteri valutativi che i partecipanti applicano nella lettura dell'impegno sociale delle imprese, in linea con studi precedenti sulla percezione giovanile della RSI (Francis & Hoefel, 2018; Djafarova & Bowes, 2021). La Tabella 1, offre una sintesi dei risultati.

4. Risultati

L'integrazione tra l'analisi dei bilanci sociali e le percezioni emerse dai focus group con giovani appartenenti alla Generazione Z rivela un panorama complesso, caratterizzato da alcune corrispondenze significative ma, soprattutto, da una distanza strutturale tra ciò che le imprese scelgono di comunicare e ciò che i giovani considerano realmente rilevante per valutare l'impegno sociale di un'organizzazione.

Azioni RSI estrapolate dai bilanci sociali	***Percezione GenZ sul ruolo sociale delle imprese***
Equità salariale, inclusione, supporto lavoratori	Necessaria
Progetti ambientali	Rilevanti
Certificazioni e controllo della filiera	Segnale di autenticità
Filantropia e iniziative comunitarie	Sono considerate marginali
Innovazione tecnologica	Non percepiti come CSR

Tabella 1. Convergenza e disallineamenti tra bilanci sociali e percezioni GenZ

4.1. Convergenze: quando le iniziative riportate risuonano con i valori giovanili

Una prima area di convergenza riguarda la rilevanza attribuita al capitale umano. Nei report analizzati, le imprese dedicano ampio spazio a iniziative di equità salariale, inclusione (ad esempio programmi per persone con disabilità), formazione, flessibilità organizzativa e supporto psicologico. Queste dimensioni trovano piena corrispondenza nei focus group, in cui i partecipanti sottolineano la centralità del trattamento equo dei lavoratori come criterio per distinguere un'impresa responsabile da una che non lo è. Il tema delle condizioni di lavoro, richiamato esplicitamente in riferimento a casi noti nel panorama globale, emerge come uno dei principali indicatori di legittimità sociale.

P1: “Mi viene in mente il caso ****... che si dichiara attenta ai temi sociali però poi si scopre che produce scarpe con condizioni dei lavoratori pessime. Più che la responsabilità sociale dovrebbe pensare alla coerenza sociale.”

P5: “Un'azienda responsabile... cerca di trattare equamente i dipendenti.”

Una seconda convergenza riguarda gli interventi ambientali “hard”: riduzione delle emissioni, efficienza energetica, gestione dei rifiuti, riciclo dell’acqua, decarbonizzazione. Anche i giovani considerano l’impatto ambientale un elemento imprescindibile della responsabilità, pur non attribuendo valore a iniziative percepite come marginali o principalmente simboliche. Ciò che risulta rilevante è la capacità dell’impresa di integrare la sostenibilità nei processi produttivi, più che la comunicazione di singoli progetti.

P10: “Se un’azienda inquinava e poi leggo che si sta impegnando per ridurre le emissioni, mi informo per capire se è vero”

P4: “Vado a cercare su Internet per vedere se quello che dicono sul diventare green è vero.”

Infine, un ulteriore punto di contatto riguarda le certificazioni. Nel reporting formale, molte imprese enfatizzano standard ISO, criteri ESG applicati alla supply chain o schemi di valutazione dei fornitori. Questa attenzione ai meccanismi di controllo trova riscontro nei focus group, dove i partecipanti considerano le certificazioni un segnale concreto di trasparenza e affidabilità, utile per distinguere tra impegno reale e greenwashing.

P6: “Sui social gonfiano i numeri. Ci dovrebbe essere un comitato esterno e imparziale che misura questi temi.”

4.2. Disallineamenti tematici tra imprese e GenZ

L’analisi comparativa mette in evidenza anche aree tematiche che, pur essendo molto presenti nei social report, non risultano significative per i giovani. Le iniziative filantropiche rivolte alla comunità sono percepite come contribuiti utili ma non determinanti per valutare la responsabilità aziendale. Nei focus group, pochi riconoscono valore a queste attività, ritenendole distanti dalla “vera identità” dell’impresa e potenzialmente utilizzate per costruire un’immagine reputazionale.

Un secondo disallineamento riguarda le iniziative di innovazione tecnologica o di formazione specialistica. Pur essendo molto frequenti nei report, tali azioni non emergono come criteri valutativi nelle discussioni dei giovani. L’innovazione viene riconosciuta come rilevante per la competitività, ma non come indicatore diretto di responsabilità sociale.

Oltre alle differenze contenutistiche, il risultato forse più significativo riguarda il diverso modo in cui imprese e giovani interpretano la CSR. Nei social report, la responsabilità è rappresentata attraverso una sequenza di iniziative discrete, organizzate per aree tematiche e progettualità. Per la Generazione Z, invece, la RSI è soprattutto un indicatore identitario: un’impresa è responsabile quando appare coerente nei valori, trasparente nei processi e disposta a esporsi su questioni sociali delicate.

P9: “Più che responsabilità sociale dovrebbe pensare alla coerenza sociale.”

P14: “Per me un’azienda responsabile tiene conto dell’intero processo, dalla produzione, al personale, fino al consumatore finale.”

Nei report analizzati, il posizionamento valoriale è quasi del tutto assente, mentre nei focus group i giovani attribuiscono grande peso alla capacità dell’impresa di prendere posizione su temi sensibili, quali discriminazione, equità sociale o diritti civili.

P2: “Un’azienda responsabile è anche un’azienda che integra volontariamente cause sociali e prende parte a dibattiti, come il conflitto Palestina-Israele o cause di razzismo”

Questa divergenza si collega al tema dell’autenticità: mentre la comunicazione istituzionale privilegia un linguaggio controllato e formale, i giovani richiedono narrazioni più dirette, vulnerabili e capaci di mostrare tensioni, difficoltà e limiti del percorso verso la sostenibilità.

Il confronto sistematico tra le due evidenze mostra quindi che il disallineamento non riguarda solo che cosa viene comunicato, ma come viene comunicato e quale funzione narrativa la comunicazione stessa assume.

5. Discussione

I risultati ottenuti mostrano che la distanza tra ciò che le imprese comunicano nei bilanci sociali e ciò che la Generazione Z ritiene significativo nel valutare il ruolo sociale delle organizzazioni può essere interpretata alla luce delle tensioni già evidenziate nella letteratura sulla comunicazione della RSI. Da decenni, gli studiosi sottolineano come i report di sostenibilità svolgano una funzione di legittimazione, costruendo una narrazione che l'impresa usa per presentarsi come socialmente responsabile agli occhi degli stakeholder (Cho & Patten, 2007; Manetti & Bellucci, 2016). Tuttavia, il dibattito sulla loro credibilità è sempre più centrale: studi come quelli di Lock e Seele (2017) e Du e Yu (2021) mostrano che la comunicazione RSI è percepita come affidabile solo quando appare trasparente, coerente e coerentemente integrata nella strategia aziendale.

Il presente lavoro conferma e amplia questa prospettiva, evidenziando come la credibilità non dipenda soltanto dai contenuti comunicati, ma anche dal modo in cui tali contenuti si connettono ai sistemi di valori degli stakeholder emergenti. Secondo McPhail et al. (2024), le imprese sono sempre più chiamate a fungere da "forze per il bene", andando oltre logiche di mera conformità normativa. Nel nostro studio, la Generazione Z interpreta questo ruolo in modo molto simile: non valuta la responsabilità aziendale come un insieme di iniziative discrete, ma come una manifestazione identitaria che richiede allineamento tra dichiarazioni, valori e comportamenti.

Questa interpretazione è coerente con gli studi sulla RSI authenticity, che mostrano come i pubblici riconoscano la responsabilità aziendale solo quando percepiscono un forte legame tra ciò che l'impresa fa e ciò che rappresenta (Joo et al., 2019; Afzali & Kim, 2021). La nostra analisi conferma che i giovani attribuiscono un ruolo centrale a questa autenticità, mentre notano come i bilanci sociali tendano a offrire una rappresentazione più tecnica, focalizzata sul "fare", e meno sul "perché" e sul "come", riducendo così la percezione di coerenza.

Il disallineamento osservato può quindi essere interpretato come una manifestazione della tensione tra la natura istituzionale del social reporting e il carattere più dinamico e relazionale della percezione giovanile. Gli stessi Mayring (2021) e Lewis et al. (2013) ricordano che i documenti aziendali strutturati rispondono a logiche di formalizzazione che portano a selezionare, organizzare e presentare le informazioni secondo criteri prestabiliti. I giovani, al contrario, applicano una logica interpretativa che, come mostrano Francis e Hoefel (2018), privilegia trasparenza processuale, vulnerabilità comunicativa e integrazione valoriale.

La nostra analisi evidenzia inoltre un disallineamento rispetto ai temi prioritari. Gli studi sulle imprese italiane mostrano che la rendicontazione tende a concentrarsi su capitale umano, innovazione, energie rinnovabili ed efficienza delle risorse (Arena et al., 2023; Ferraro & Veltri, 2024; Maione et al., 2025). Sono temi rilevanti, coerenti con molte cornici normative e con gli standard di reporting, ma rappresentano solo una parte delle dimensioni che la Gen Z considera fondamentali. Nei focus group emergono infatti aspettative orientate a inclusione, equità, giustizia sociale e presa di posizione su questioni sociali complesse, temi che la letteratura riconosce come sempre più centrali per la reputazione contemporanea (Sterbenk et al., 2022; Warren, 2022).

Questo scarto richiama anche il dibattito sui rischi di greenwashing e vicarious greenwashing: Pizzetti et al. (2021) mostrano come la percezione di incoerenza tra dichiarazioni e pratiche operative possa minare profondamente la fiducia nei confronti dell'impresa. Nel nostro lavoro, i giovani non accusano esplicitamente le imprese di greenwashing, ma mostrano una sensibilità simile: ciò che viene comunicato nei bilanci sociali non basta per costruire un senso di affidabilità, soprattutto se la dimensione narrativa non rispecchia i criteri attraverso cui valutano l'autenticità.

Infine, i risultati confermano l'idea, già avanzata nella letteratura sulla comunicazione organizzativa, secondo cui la RSI deve essere interpretata non solo come una pratica gestionale, ma come una pratica discorsiva (Schoeneborn et al., 2020), che richiede l'integrazione di molteplici linguaggi e canali. L'impresa, per risultare credibile, deve dunque saper articolare una narrazione che renda visibile l'intero ecosistema di significati associati alla propria responsabilità sociale. In questo senso, i bilanci sociali rimangono strumenti fondamentali, ma rischiano di risultare insufficienti se non integrati in un sistema comunicativo più ampio, capace di dialogare con codici culturali emergenti e di rispondere alle aspettative di stakeholder sempre più attenti e sofisticati.

Nel complesso, la discussione dei risultati suggerisce che il disallineamento osservato non è dovuto alla mancanza di impegno delle imprese, ma alla mancata corrispondenza tra le logiche comunicative del reporting e i criteri interpretativi della Generazione Z. Per ridurre questa distanza, le organizzazioni dovranno ripensare la RSI come uno spazio di negoziazione narrativa, in cui contenuti, valori e forme comunicative si intrecciano in modo dinamico, trasparente e culturalmente rilevante.

6. Conclusioni

Il presente studio ha esplorato la distanza tra ciò che le imprese comunicano nei bilanci sociali e ciò che la Generazione Z considera significativo per valutare la responsabilità sociale aziendale. Attraverso l'integrazione di una content analysis dei bilanci sociali e di un'analisi qualitativa delle percezioni giovanili, è emersa una dinamica di disallineamento che non riguarda semplicemente la selezione dei temi, ma la natura stessa della comunicazione CSR.

Da un lato, i bilanci sociali riflettono logiche istituzionali e regolatorie che portano le imprese a enfatizzare dimensioni tecniche e operative, quali innovazione sostenibile, capitale umano, efficienza delle risorse e iniziative comunitarie. Questi ambiti rispondono a standard di rendicontazione consolidati (Cho & Patten, 2007; Du & Yu, 2021; Troshani & Rowbottom, 2024) e trovano riscontro in una lunga tradizione di studi che interpretano il reporting come pratica di legittimazione (Manetti & Bellucci, 2016).

Dall'altro lato, i giovani valutano la RSI non come un elenco di azioni, ma come un indicatore identitario, attribuendo valore alla coerenza valoriale, alla trasparenza dei processi, alla presa di posizione su temi sociali rilevanti e alla capacità dell'impresa di comunicare in modo autentico (Francis & Hoefel, 2018; Djafarova & Bowes, 2021; Afzali & Kim, 2021). Questa distanza evidenzia che la credibilità della RSI non si costruisce esclusivamente attraverso la rendicontazione, ma attraverso la capacità dell'impresa di connettere le proprie azioni a un sistema valoriale riconoscibile e culturalmente rilevante.

Le conclusioni suggeriscono quindi che il bilancio sociale rimane uno strumento essenziale per documentare e strutturare l'impegno aziendale, ma non può più essere considerato sufficiente per intercettare la sensibilità delle nuove generazioni. Le imprese sono chiamate a integrare forme di comunicazione più narrative, dialogiche e processuali, capaci di mostrare non solo i risultati, ma anche le motivazioni, le sfide e le tensioni che accompagnano il percorso verso la sostenibilità. In questa prospettiva, la RSI diventa una pratica discorsiva multilivello, in cui documenti formali e comunicazione relazionale devono essere interpretati come elementi complementari di un unico ecosistema narrativo (Schoeneborn et al., 2020; McPhail et al., 2024).

Il contributo principale di questo lavoro risiede proprio nel mettere in relazione le priorità comunicative delle imprese con i criteri valutativi dei giovani, offrendo nuove evidenze sul modo in cui la RSI viene interpretata da una generazione destinata a influenzare in modo crescente consumi, reputazione e dinamiche del mercato del lavoro.

7. Limiti e direzioni future di ricerca

Il presente studio presenta alcuni limiti che suggeriscono possibili sviluppi futuri. La natura qualitativa ed esplorativa della content analysis e dei focus group non consente generalizzazioni, ma offre una base per approfondimenti tramite metodi quantitativi o approcci mixed-method. Inoltre, la composizione del campione aziendale – concentrato su settori fortemente regolamentati – potrebbe aver influenzato la tipologia di iniziative rendicontate; analisi estese ad altri settori o contesti nazionali permetterebbero confronti più ampi.

Un ulteriore limite riguarda la focalizzazione sui soli testi dei report, trascurando elementi visuali che contribuiscono alla costruzione della credibilità, inoltre l'analisi di altri canali di comunicazione utilizzati dalle aziende, potrebbe dare nuovi sviluppi alla ricerca.

Allo stesso modo, i focus group forniscono insight ricchi ma non rappresentativi dell'intera popolazione giovanile; future ricerche potrebbero ricorrere a survey su larga scala o approcci longitudinali per valutare la stabilità delle percezioni nel tempo. Infine, il lavoro si concentra sulla comunicazione RSI senza verificare l'effettiva implementazione delle pratiche dichiarate: studi futuri potrebbero integrare audit indipendenti o dati osservativi per esaminare la coerenza tra talk e walk.

Engaging SMEs in Sustainability: The Multimodal Work of Management Accounting Consultants

Roberta Ciccola[1], Sonia Quarchioni[2], Maria Serena Chiucchi[3]

1. Research background

Small and medium-sized enterprises (SMEs) represent a crucial component of the global economy, corresponding to nearly 99% of European enterprises and substantially contributing to employment and GDP. Due to their significant aggregate environmental and social impacts, the involvement of SMEs has been recognized as essential for advancing sustainability practices (Lisi et al., 2023; Martins et al., 2022). Despite this relevance, sustainability in SMEs remains a highly challenging domain. In this regard, several scholars have underscored that SMEs struggle more than larger firms to adopt sustainability accounting practices due to limited financial and human resources, lack of technical competencies, and the absence of formalized internal structures (Soundararajan et al., 2018; Spence, 2016). Beyond resource scarcity, SMEs often face cognitive and interpretive barriers: sustainability concepts may appear abstract or disconnected from daily operations, making the establishment of shared understandings and sensemaking particularly complex in this organizational context (Guidi et al., 2025; Johnstone, 2020).

Recent regulatory demands, such as the Corporate Sustainability Reporting Directive (CSRD) and the Corporate Sustainability Due Diligence Directive (CSDDD), represent a further catalyst for change, prompting firms to adopt enhanced sustainability accounting practices. Although SMEs may not be subject to mandatory compliance, they increasingly face indirect pressure from supply-chain focal companies demanding standardized sustainability information (Dinh et al., 2023; Kosasih et al., 2023). As a result, SMEs need support to interpret, translate, and operationalize sustainability requirements in ways that resonate with their organizational context and capabilities (O'Reilly et al., 2024). In this setting, external actors, particularly management accounting consultants (hereafter, MA consultants), may potentially play an increasingly pivotal role.

MA consultants have historically contributed to organizational and accounting change processes by transferring knowledge, developing new accounting devices, legitimizing innovations, and facilitating the diffusion of accounting and managerial practices (Christensen & Skaerbaek, 2010; Jones & Dugdale, 2002; Malmi, 1999). Their influence extends beyond providing technical expertise; consultants may act as "packagers of solutions" (Malmi, 1999), "travelling merchants" of ideas (Czarniawska & Joerges, 1996), mediators (Christensen, 2005), or even "fashion setters" of managerial innovations (Canato & Giangreco, 2011).

Furthermore, consultants construct and negotiate their role dynamically through everyday interactions, discursive strategies, and the mobilization of multiple artefacts (Chua, 1995; Czarniawska & Joerges, 1996; Sturdy, 2011). Consultants frequently rely on multimodal representations to translate complex frameworks into engaging and locally meaningful narratives

[1] Assistant Professor, ECON-06/A, Università Politecnica delle Marche; r.ciccola@univpm.it – corresponding author

[2] Associate Professor, ECON-06/A, Università di Palermo; sonia.quarchioni@unipa.it

[3] Full Professor, ECON-06/A, Università Politecnica delle Marche; m.s.chiucchi@univpm.it

for SME clients. Such representations not only convey information but also shape interpretations, facilitate dialogue, and may help consultants enrol clients into sustainability accounting practices.

Despite this rich literature, little is known about how MA consultants construct and enact their role specifically in sustainability-oriented engagements with SMEs, and, especially, how they use multimodal practices to engage clients and foster sustainability sensemaking. Existing studies often focus on larger organizations, while SMEs remain underexplored, notwithstanding their recognized need for tailored approaches that address their specificities (Bartolacci et al., 2020). Moreover, the sustainability domain may intensify the interpretive and relational challenges inherent in consulting, due to the contested, multidimensional, and evolving nature of the concept of sustainability (Adolph & Beckmann, 2024; Meuer et al., 2020).

2. Research Aims

Against this background, this study aims to investigate how MA consultants support SMEs' sustainability transitions by constructing and enacting their role, with a particular focus on the multimodal practices they employ to engage clients. Specifically, the research focuses on three interconnected objectives. First, it seeks to investigate how MA consultants define and construct their role within sustainability-oriented engagements with SMEs, acknowledging the dynamic and relational nature of role construction. Second, it aims to analyze the multimodal practices that consultants employ to foster client engagement and facilitate sustainability sensemaking. Third, it examines how these practices influence MA consultants' interactions with SME clients, shaping their participation, understanding, and commitment to sustainability initiatives. Correspondingly, the study addresses the following research questions:

- RQ1: How do MA consultants construct and enact their role in sustainability-oriented engagements with SMEs?
- RQ2: How do MA consultants draw on multimodal practices to engage clients and translate sustainability into locally meaningful accounting practices?
- RQ3: How does the multimodal orchestration of tools and interactions influence SME clients' engagement and sensemaking?

3. Theoretical background

3.1. Sustainability challenges in SMEs

The integration of sustainability accounting practices into SMEs has become a central topic in recent years, reflecting the growing recognition that sustainability transitions cannot succeed without the active contribution of smaller organizations (Bartolacci et al., 2020; Martins et al., 2022). SMEs collectively exert substantial environmental and social impacts, and their contribution to the global economy is significant, as they represent the vast majority of European enterprises. Despite this centrality, the integration of sustainability into SMEs remains challenging. Scholars consistently observe that SMEs face limitations in financial and human resources, technical expertise, and organizational structures when compared to larger firms (Johnson & Schaltegger, 2016; Spence, 2016). Their managerial processes are often informal, which can hinder the systematic collection and reporting of sustainability data and the interpretation of complex frameworks such as the GRI standards or the ESRS (O'Reilly et al., 2024; Paoloni et al., 2025).

Recent regulatory developments add further complexity to the process. The implementation of the CSRD and the CSDDD reshapes the regulatory context for sustainability accounting practices, increasing the expectations placed on firms to provide transparent and comparable sustainability information (Braun, 2025). Although many SMEs may not be directly subject to these regulatory demands, they often experience indirect pressures when they are integral parts of supply chains led by larger firms (Dinh et al., 2023; Kosasih et al., 2023). These pressures

require SMEs to produce reliable sustainability data and align with emerging reporting standards, reinforcing the need for external actors capable of assisting them in navigating these demands.

The accounting literature has shown that SMEs, due to their limited internal resources and specialized expertise, often rely on external MA consultants to introduce, adapt, and formalize accounting practices (e.g., Carey, 2015; Moschella et al., 2023; Perry et al., 2010). In the context of sustainability, their role becomes even more critical. The integration of sustainability-related measures and reporting frameworks requires not only technical expertise but also extensive interpretive work, involving the construction of shared meaning around sustainability accounting practices and sustainability indicators. In this regard, prior literature emphasizes that sustainability accounting practices rely heavily on sensemaking processes (Onkila et al., 2018; Pain et al., 2024), which can be demanding in organizations with fluid roles and limited formalized accounting practices. For these reasons, the role of external actors, such as MA consultants, who can support SMEs in understanding, translating, and operationalizing sustainability accounting practices appears particularly significant.

3.2. Management Accounting Consultants

The literature on management consulting has long debated the nature and evolution of consultants' roles. Early research tended to frame consultants as technical experts hired to resolve organizations' lack of technical competencies and provide access to specialized knowledge (Fincham, 1999; Newton, 2010). This perspective considers consultants as outsiders delivering neutral, rational solutions based on their expertise. Over time, however, research has challenged this view, recognizing that consultants' work is more relational, negotiated, and socially constructed (Czarniawska & Mazza, 2003; da Costa et al., 2020; Sturdy, 1997). Several studies demonstrate that the role of consultants is not fixed but instead dynamically shaped through everyday interactions with clients. For instance, scholars have demonstrated that the boundaries of knowledge between consultants and clients have become increasingly blurred (Fincham et al., 2008; Sturdy et al., 2008). Knowledge flows with clients are often bidirectional as consultants learn from clients and vice versa as knowledge is often co-produced in an iterative and dialogical manner.

Within the accounting literature, consultants are widely seen as key agents of accounting innovation, facilitating the introduction, diffusion, and institutionalization of new managerial tools (Malmi, 1999; Jones & Dugdale, 2002). Scholars have therefore examined how, and through which mechanisms, consultants shape the trajectory of such accounting tools, showing that their role extends beyond the transfer of technical knowledge. Some scholars argue that consultants secure the success and legitimacy of accounting through processes of "fact-building" (Briers & Chua, 2001). Similarly, Qu and Cooper (2011) show that consultants influence accounting practices through "inscription-building", specifically through the ways in which they mobilize inscriptions. Their study illustrates how the implementation of the Balanced Scorecard in the client organization takes form through a process in which consultants' templates are populated with client-specific details to make the technology accepted. These inscriptions act as devices that construct meaning, align interests, and persuade actors and consultants operate as mediators who translate, transform, and reinterpret knowledge rather than simply transferring it. Likewise, Christensen and Skærbæk (2010) note that reports, slides, and seminars represent co-produced consultant-client outputs that temporarily stabilize contested accounting innovations. They demonstrate that consultants are often hired by internal agents of change to legitimize both specific accounting innovations and the broader process of accounting change, helping to resolve controversies with resistant groups who threaten to destabilize the innovation. Consultants' outputs such as reports, questionnaires, and powerpoint presentations become essential tools for managing social conflict and play a central role in the "purification" of an accounting idea, that is, the process through which a previously controversial innovation becomes accepted.

Christensen (2005) further shows, through a public-sector case study, how consultants promote accrual-based accounting reforms by deploying "phantom images" that idealize the new system while discrediting existing cash-based practices. These persuasive images exert strong influence on politicians and public managers and pave the way for epistemic communities built around the conviction that public-sector accounting should converge toward private-sector standards, thereby providing a theoretical foundation for the shift.

Across these studies, consultants' work emerges also as deeply embedded in networks of power, interests, and resistance. The outcomes of accounting innovations depend on these relationships rather than solely on the technical characteristics of the tools themselves (Brivot et al., 2017; Leiby, 2018). Humphrey (1994) shows that consultants may initially be granted legitimacy based on expectations of expertise, only to face challenges or resistance as their competence is assessed in practice. Similarly, Chua (1995) highlights that consultants' authority is continuously negotiated and sometimes contested, especially when internal actors view themselves as equally or more knowledgeable.

Overall, consultants do not merely introduce accounting practices but co-produce them together with clients. This body of work conceptualizes consultants as active constructors and mediators of accounting innovations, embedded within networks of power, interests, and resistance. Their influence often derives from their ability to craft persuasive representations and negotiate meaning through which accounting practices are implemented and gain legitimacy in organizations.

Such a perspective is potentially relevant in the sustainability context, where concepts are ambiguous and contested (Adolph & Beckmann, 2024; Meuer et al., 2020), requiring a sensemaking process that involves both technical and interpretive aspects. However, despite the growing attention on sustainability accounting practices in SMEs, little is known about how MA consultants construct and enact their role specifically within sustainability-oriented engagements in this organizational context.

3.3. Engagement in Consulting Interactions: A Multimodal Perspective

Client engagement is widely recognized as essential for the success of consulting interventions. In the broader management literature, extensive research has examined the dynamics of the consultant-client relationship and how consultants manage this relationship (e.g., Alvesson et al., 2009; Fincham, 1999; Nikolova et al., 2015; Sturdy, 1997). Similarly, in the accounting literature, several studies have shown that MA consultants must secure clients' involvement to co-produce and sustain the adoption of new accounting practices (Christensen & Skærbæk, 2010; Chua, 1995; Qu & Cooper, 2011). Prior studies have highlighted that consultants may deploy diverse resources and tactics to cultivate engagement, ranging from discursive framing and facilitation techniques to the mobilization of inscriptions, visuals, and artefacts designed to render accounting concepts more accessible and compelling (Briers & Chua, 2001; Christensen, 2005; Qu & Cooper, 2011).

Despite this interest, much of the literature has tended to focus on the means through which consultants attempt to foster engagement, while offering limited insights on what "engagement" actually is in practice. While engagement is often taken for granted in consulting research, recent work suggests that the concept is far more complex and contingent. Although not focused on consulting, but on the engagement capacity of performance measurements, Martinez and Cooper (2019) offer valuable theoretical insights showing that engagement is a multidimensional concept. Engagement may refer to sustained attachment to a device, to the affective and cognitive commitment that emerges when users feel able to shape it with their own narratives, or, conversely, it may reflect the coercive need to work with accounting technologies. Crucially, Martinez and Cooper (2019) shift the meaning of engagement from attitudes or intentions to the ongoing socio-material work required to perform an assemblage of interconnected accounting

inscriptions. Engagement, in this view, is produced through the accumulation of multiple devices, each adding layers of calculative, visual, temporal, or narrative order that users must navigate and enact. This understanding shifts attention from individual attitudes to the multimodal conditions that make engagement possible or difficult to sustain.

Interpreting engagement through this lens allows us to delve into what engaging a client really entails, how engagement can be fostered, and why certain accounting configurations may support consultants in making sustainability meaningful for SMEs. Specifically, engagement can be more effectively examined through a multimodal perspective (e.g., Kress, 2010). Recent studies on multimodality emphasize that meaning is constructed not only through written or spoken language but through the interplay of multiple modes of representation such as text, images, videos, audios, and other semiotic resources (e.g., Höllerer et al., 2019). The construction of meaning arises from the dynamic interaction and influence among these modes, which shape how actors perceive and interpret phenomena.

Engagement, therefore, may arise from the orchestration of these semiotic resources rather than from any single mode. Yet, accounting research has only marginally examined how consultants use multimodal practices in their day-to-day interactions with SMEs, and how such practices contribute to cultivating, or constraining, client engagement in sustainability-oriented projects. Given SMEs' limited familiarity with sustainability concepts and tools, this multimodal work becomes central to how consultants build credibility, negotiate their role, and support clients' understanding.

4. Research Design

In order to achieve the aims of this study, we plan to conduct interviews with MA consultants. Following Alvesson (2003: 14), we conceptualize qualitative interviewing as a central mode of knowledge production and the interview encounter as "a socially and linguistically complex situation." According to Alvesson (2003), such conceptualization requires a reflexive approach aimed at viewing the empirical material through multiple understandings. This implies that researchers must devote more attention to the process of questioning and to the interpretive nature of findings (Qu & Dumay, 2011), as well as bring their own pre-understandings into dialogue with the emerging empirical material (Alvesson & Sandberg, 2022).

Within this reflexive paradigm, we consider interviews not merely as verbal exchanges but as complex social and organizational phenomena that may benefit from the integration of visual methods. Rooted in anthropology and sociology, and recently called for within accounting research (e.g., Parker & Warren, 2017; Warren & Parker, 2009), photo elicitation techniques rely on the premise that introducing a photograph into an interview can prompt ways of seeing and thinking that differ from those elicited by words alone, provided that the image disrupts habitual interpretive frames (Harper, 2002) and potentially brings researchers closer to participants' lived experiences (Meyer et al., 2013).

Extending beyond visual elicitation, Warren (2005) highlights the value of photo-interviewing, in which participants are invited to produce their own photographs as representations of their daily experiences, identities, or organizational realities (Warren, 2002). In particular, the variant of reflexive photography positions data as emerging not from the photograph itself nor from the researcher's extraction of meaning, but from the triadic interaction among researcher, participant, and image, through conversations that foster heightened reflexivity concerning the research questions and related issues.

Recent accounting studies have begun to employ these methods to investigate processes of professionalization, identity construction, and the contestation of occupational stereotypes (Parker & Warren, 2017; Warren & Parker, 2009).

We plan to recruit a purposive sample of MA consultants who have recent experience in sustainability-related projects with SMEs (e.g., sustainability reporting, ESG performance

measurement, sustainability strategy and control systems). Potential participants will be approached through consulting firms and professional bodies, ensuring variation in seniority, type of consulting organization, and sectoral focus of their SME clients. This will allow us to capture diverse ways of construing and enacting the consultant's role in sustainability engagements.

Following Parker and Warren's (2017) two-stage approach, first, each participating consultant will be invited to take a set of photographs over a defined period (e.g., 2–3 weeks) before the interview. To focus explicitly on their role and client engagement, we will ask participants to produce three categories of images:

- "consultant role" (2-5 photos): images that depict how consultants perceive themselves. Participants may choose any subjects (such as environments, objects, people, routines, or moments), capturing elements of their work;
- "engaging moments" (2-5 photos): images that, for the consultant, symbolize or convey situations in which they feel they have successfully engaged SME clients with sustainability issues. These may include, for instance, workshop settings, artefacts (e.g., templates, canvases, dashboards), physical spaces, or other objects and scenes the consultant associates with effective client engagement;
- "non-engagement/challenges" (2-5 photos): images that represent situations in which engagement was difficult, resisted, or did not occur as expected.

In the second stage of the research, individual semi-structured photo-interviews will be conducted with each participant. Each interview will begin with a short warm-up on the participant's consulting background and experience with SMEs. Subsequently, the photographs will be used as prompts for discussion. For each image, the interviewer will invite the participant to describe the situation, explain why it represents engagement (or non-engagement), and reflect on the practices and interactions involved and on perceived client reactions.

All interviews will be audio-recorded and transcribed. The resulting transcripts will constitute the primary empirical material for analysis, while the photographs will be used as supplementary data to enrich interpretation.

5. Expected Contributions

The research is expected to contribute to several streams of research. First, it aims to contribute to the growing literature on sustainability accounting in SMEs. This stream of research has begun to examine how SMEs face their unique structural challenges, such as limited resources and a lack of formalized systems (e.g., Johnstone, 2020; Lisi et al., 2023; Martins et al., 2022). Our study is expected to contribute to this body of literature by analyzing the role of MA consultants in the sustainability transition of SMEs. Furthermore, our study aims to show that the barriers faced by SMEs are not only technical, as sustainability accounting practices require ongoing sensemaking processes through which abstract notions become actionable and meaningful within the organizational context. Highlighting consultants' role in facilitating this sensemaking, the study will offer a more in-depth understanding of how sustainability accounting practices can be developed and sustained in SMEs.

Second, the study advances the consolidated stream of accounting research on consultants (e.g., Christensen and Skærbæk, 2010; Qu and Cooper) by extending it to sustainability-oriented engagements in the underexplored SME context. Existing literature has shown how consultants act as mediators, translators, and co-producers of accounting innovations (Malmi, 1999; Jones & Dugdale, 2002); however, empirical evidence on sustainability-oriented engagements remains scarce. SMEs represent a particularly revealing context, as they often lack internal sustainability specialists and thus rely more heavily on consultants to introduce, adapt, and legitimize sustainability practices. The analysis of consultants' multimodal practices will reveal how their role is performed and reconfigured in interaction with SME clients. In so doing, this study will

provide insights into consultants' roles in shaping emerging forms of accounting change linked to sustainability.

Finally, the study introduces a multimodal lens to the analysis of consulting engagements. While recent accounting studies have argued that meaning emerges from the interplay of multiple semiotic modes (e.g., Ronzani & Gatzweiler, 2022), accounting research has rarely examined how consultants orchestrate such multiple modes to mobilize clients, foster understanding, and sustain engagement in accounting innovation processes. Through the use of photo-interviewing techniques, the study will offer a deeper understanding of how multimodal engagement is perceived and enacted in practice.

Keywords: Management accounting consultants; sustainability; SMEs; multimodality

Il ruolo delle tecnologie digitali e dell'intelligenza artificiale nei processi aziendali: prime evidenze

Simone Manfredi[1], Rosa Lombardi[2], Luana Pellegrini[3], Francesco Sgro[4]

1. Obiettivo

Questo articolo si propone di analizzare il ruolo delle tecnologie digitali e dell'intelligenza artificiale (IA) nei processi aziendali e nella definizione di strutture organizzative adeguate, collocandosi nel contesto economico-aziendale e mutuando alcuni principi e aspetti chiave dal diritto dell'impresa. In questa prospettiva, le principali normative europee e nazionali – in particolare l'AI Act, l'art. 2086 del Codice Civile e il Codice della crisi d'impresa e dell'insolvenza (CCII) definiscono, direttamente o indirettamente, requisiti organizzativi per le imprese, i quali sono analizzati alla luce della definizione del ruolo delle tecnologie nei processi aziendali e nell'adeguata struttura organizzativa. In questa prospettiva, le norme sono interpretate come dispositivi regolativi che influenzano i processi aziendali, i sistemi informativi e le responsabilità di governance. A partire da tale obiettivo, l'investigazione degli adeguati assetti organizzativi, amministrativi e contabili, consente di delineare progressivamente contenuti e implicazioni applicative, sviluppandosi a partire dalla riforma del diritto societario del 2003 e proseguendo con l'introduzione del novellato art. 2086 c.c. e con l'entrata in vigore del Codice della crisi d'impresa e dell'insolvenza (CCII). In particolare, con l'introduzione del CCII e dell'art. 2086, comma 2, c.c. nella sua attuale formulazione, gli assetti diventano uno strumento attraverso cui si realizza la modernizzazione dell'impresa, fondata sulla capacità organizzativa di anticipare e governare i rischi, secondo una logica coerente con i principi europei di early warning (Montalenti, 2020).

In questo ambito, l'impatto della digitalizzazione e delle tecnologie, fra cui intelligenza IA, sistemi di business intelligence e algoritmi predittivi, genera degli effetti sulla conformazione degli assetti aziendali. L'integrazione di strumenti tecnologici evoluti può migliorare la capacità dell'impresa di monitorare la propria situazione finanziaria e di prevenire condizioni di non continuità (Fondazione Nazionale dei Commercialisti, 2021,2023). La nuova regolamentazione europea dell'IA (AI Act) introduce obblighi specifici a carico degli utilizzatori di sistemi di intelligenza artificiale classificati come "ad alto rischio" e apre un nuovo fronte riferito alla compatibilità tra adeguatezza ex art. 2086 c.c. e adeguatezza tecnologica richiesta dal diritto europeo. Infine, il grado di formalizzazione richiesto per poter considerare un assetto adeguato è al contempo oggetto di studio (Bastia & Ricciardello, 2020; Montalenti, 2020).

Sebbene il concetto di adeguatezza degli assetti sia un concetto interdisciplinare (Fellegara et al.,2023), l'orientamento prevalente riconosce che l'adeguatezza non è un requisito statico, ma

[1] Professore ordinario, ECON-06/A, Università Telematica San Raffaele Roma; simone.manfredi@uniroma5.it - corresponding author

[2] Professoressa ordinaria, ECON-06/A, Università degli Studi di Roma "La Sapienza"; rosa.lombardi@uniroma1.it

un parametro evolutivo che deve adattarsi alla complessità dell'impresa, al settore in cui opera, agli strumenti tecnologici disponibili e alla crescente importanza della prevenzione nella gestione aziendale (Abriani, Schneider, 2023).

In proposito, a seguito della modifica dell'articolo 2086 del Codice civile, ad opera dell'articolo 375 del D.Lgs. italiano 14/2019, nonché degli interventi correttivi, tra cui il D.Lgs.83/2022 italiano, gli assetti devono essere in grado di rilevare eventuali squilibri di carattere patrimoniale o economico-finanziario, rapportati alle specifiche caratteristiche dell'impresa, di verificare la sostenibilità dei debiti e le prospettive di continuità almeno nei dodici mesi successivi e di cogliere specifici segnali di allarme.

Sul piano organizzativo, l'adeguatezza implica la presenza di un assetto che individui ruoli, funzioni, deleghe e responsabilità in modo trasparente, nonché la definizione di flussi informativi verso gli organi sociali, in particolare verso l'organo amministrativo e l'organo di controllo. Sul piano amministrativo, rileva la capacità di governare i processi gestionali, dalla gestione del credito alla tesoreria, dalla pianificazione finanziaria al controllo di gestione. Sul piano contabile, risulta essenziale la capacità di produrre, con cadenza adeguata alle esigenze dell'impresa, situazioni infrannuali, report gestionali, analisi dei margini e dei flussi di cassa, in modo da consentire un monitoraggio continuo della continuità aziendale (Caricasulo, 2023).

L'art. 3 CCII, nella sua formulazione vigente, fornisce un importante criterio di concretizzazione dell'adeguatezza, laddove richiede che gli assetti siano idonei a rilevare squilibri patrimoniali ed economico-finanziari, a verificare la sostenibilità dei debiti e la prospettiva di continuità aziendale almeno su un orizzonte di dodici mesi e a rilevare i segnali di allarme elencati al comma 4. Tra questi segnali figurano, ad esempio, l'esistenza di debiti per retribuzioni scadute di importo significativo, la presenza di esposizioni verso l'erario e gli enti previdenziali, nonché situazioni di ritardo protratto nei pagamenti verso fornitori e intermediari finanziari. In questo contesto, la progressiva digitalizzazione dei processi aziendali e l'impiego di nuove tecnologie assumono un rilievo crescente ai fini della valutazione dell'adeguatezza degli assetti. Ormai la gran parte delle imprese, anche di dimensioni medio-piccole, si avvale di software gestionali (ERP) che integrano i flussi contabili con quelli logistici e commerciali, consentendo un monitoraggio più puntuale dei cicli attivo e passivo (Scognamiglio, 2023).

Dunque, l'IA rappresenta un ulteriore salto di qualità, infatti, negli ultimi anni la digitalizzazione ha registrato una crescita repentina e l'introduzione di tecnologie avanzate, come l'IA, hanno trasformato il funzionamento delle organizzazioni (Trequattrini & Schimperna, 2023). La pandemia da Covid-19 ha ulteriormente accelerato questo processo di digitalizzazione, rendendolo non più una grande opportunità, ma una vera e propria necessità (Andreani et. al, 2025). Le tecnologie intelligenti, come l'IA, hanno rivestito un ruolo centrale nel monitoraggio, nella prevenzione e nella gestione dell'emergenza Covid-19 da parte di organizzazioni, istituzioni e policymakers (Lombardi et al., 2022). L'adozione dell'IA genera effetti rilevanti anche sulla struttura e sulle dinamiche della corporate governance. Mentre la letteratura iniziale si concentrava principalmente sulla efficienza operativa e il vantaggio competitivo dell'IA, ricerche recenti approfondiscono il ruolo dell'IA nella corporate governance (Samara et al., 2025; Cordeiro et al. 2025). L'IA è supervisionata dalla governance aziendale (Davenport & Ronanki, 2018; Ahdadou et al., 2025); l'insieme degli strumenti che, nelle aziende che assumono la forma di società, sono preordinati alla migliore realizzazione del processo decisionale strategico nell'interesse delle principali categorie di stakeholder. Tali strumenti possono essere di natura normativa e di natura organizzativa (Trequattrini, 1999; Lombardi, 2012). In tale prospettiva, il Parlamento Europeo ha emanato un regolamento, l'AI Act, il quale incide direttamente sul governo dell'impresa, imponendo un vero e proprio sottosistema di risk management dedicato all'IA che deve coordinarsi con il sistema di risk management complessivo previsto dal CCII. Nonostante l'ampia letteratura sulla digitalizzazione dei processi aziendali e il sempre maggiore interesse per l'IA governance, si contano ancora pochi studi che integrano il ruolo dell'IA nei

processi aziendali e i principi normativi sugli adeguati assetti. Pertanto, la domanda di ricerca è la seguente:

RQ: Qual è il ruolo delle tecnologie digitali e dell'intelligenza artificiale (IA) nei processi aziendali e nella definizione di strutture organizzative adeguate?

2. Metodologia

È stata utilizzata una metodologia qualitativa per raggiungere gli obiettivi di ricerca e rispondere alla domanda di ricerca (Krippendorff, 2018). L'approccio di ricerca è di tipo qualitativo in quanto appare più adatto per affrontare determinati obiettivi di ricerca, soprattutto quando si dispone di poche informazioni sul problema o sulle possibili opportunità (Hair et al., 2003). Pertanto, tale metodo rappresenta la scelta più idonea per indagare lo stato dell'arte relativo all'integrazione dell'IA nei processi aziendali e alla definizione dell'IA negli adeguati assetti organizzativi. In particolare, abbiamo adottato un approccio di content analysis manuale su fonti secondarie, tra cui AI Act (Reg. UE 2024/1689), Art.2086 c.c., Art 3 CCII, per individuare le tematiche ricorrenti alle quali si è prestata maggiore attenzione al fine di garantire gli adeguati assetti nell'implementazione di IA nei processi aziendali. L'analisi ha riguardato le sezioni normative che includono riferimenti a processi aziendali, responsabilità degli amministratori, requisiti organizzativi, sistemi informativi, gestione dei rischi, tecnologie digitali e IA.

- Sono state investigate le seguenti tematiche di ricerca emergenti: quali processi sono più citati nei testi normativi;
- dove l'IA è considerata più rilevante;
- quali responsabilità emergono per gli amministratori;
- quali caratteristiche deve avere una struttura "adeguata";
- come la normativa collega digitalizzazione, adeguatezza, prevenzione della crisi.

Pertanto, è stato definito un protocollo di ricerca, sviluppato in tre fasi: (i) identificazione dei temi attraverso la lettura esplorativa delle norme; (ii) identificazione di un sistema di categorie; (iii) codifica manuale dei testi normativi focalizzata su processi aziendali, responsabilità degli amministratori, strumenti di monitoraggio e logiche di prevenzione; (iv) analisi delle frequenze e delle relazioni tra le categorie emerse. La coerenza interpretativa è stata garantita conducendo inizialmente l'analisi dei documenti in modo individuale tra noi ricercatori, per poi confrontare le evidenze emerse ed includere nello studio esclusivamente le evidenze condivise.

3. Risultati

I risultati rispondono alla RQ "Qual è il ruolo delle tecnologie digitali e dell'intelligenza artificiale (IA) nei processi aziendali e nella definizione di strutture organizzative adeguate?", mostrando alcuni elementi di complementarità, altri di divergenza, ulteriori elementi sono parzialmente convergenti fino ad arrivare ad alcune tematiche che possono essere utilizzate in maniera integrata. In particolare, i primi risultati si sviluppano lungo i processi aziendali all'interno dei quali entrano le nuove tecnologie, modificando la struttura organizzativa, i processi stessi e le conoscenze all'interno del sistema aziendale anche ai fini decisionali da parte della governance. I risultati propongono un set primario di indicatori di frequenza che saranno esplicitati nella versione finale di questo studio, tracciando l'analisi del contenuto documentale delle fonti secondarie in termini di tematiche emergenti e di principali cambiamenti derivanti dal ruolo delle tecnologie digitali e IA nei processi aziendali e nella definizione di strutture organizzative adeguate.

4. Implicazioni

L'articolo offre implicazioni sia teoriche che pratiche rivolte ad accademici e professionisti. Sul piano teorico, interviene a colmare un gap nella letteratura integrando tre ambiti di ricerca affrontati in modo separato: il ruolo delle tecnologie digitali nei processi aziendali, la definizione di assetti organizzativi adeguati (Montalenti, 2019; Rossi, 2018) e l'impatto delle recenti normative sull'IA (AI ACT, 2024; Samara et al., 2025; Cordeiro et al., 2025). Questo studio, inoltre, contribuisce alla letteratura accademica sui processi aziendali e sulle strutture organizzative adeguate, in particolare nel contesto delle tecnologie digitali e dell'IA. Dal punto di vista pratico, lo studio offre un supporto nello sviluppo di normative sempre più adeguate rispetto alle esigenze delle aziende e nell'adozione di decisioni responsabili per un migliore funzionamento aziendale, evidenziando il ruolo delle tecnologie digitali e dell'IA nel modellare strutture organizzative adeguate.

5. Originalità/valore

L'elemento di originalità risiede nell'interpretare le tecnologie digitali e l'IA come componenti strutturali di strutture organizzative adeguate, alla luce delle normative europee e nazionali e delle prassi emergenti, piuttosto che come meri strumenti operativi.

6. Limiti

Lo studio presenta i limiti propri del metodo qualitativo e dell'analisi documentale. La ricerca è preliminare e basata esclusivamente su fonti normative. L'analisi del linguaggio legislativo consente infatti di delineare il modello di organizzazione e di governance che il legislatore presuppone, rinviando a successivi studi sul come le tecnologie digitali e l'IA vengano introdotte e gestite nelle imprese. Inoltre, i risultati non mirano a descrivere prassi operative, proponendo una cornice concettuale utile per comprendere come la normativa possa orientare la progettazione degli assetti organizzativi Di conseguenza, future ricerche potrebbero integrare casi aziendali e dati empirici, così da verificare quanto il modello delineato dal legislatore trovi effettivo riscontro nelle pratiche aziendali.

Storytelling as a performative tool of management accounting in new venture contexts

Paola Demartini[1], Maria Antonietta Cipriano[2], Silvia Soriano[3]

1. Introduction

Management accounting is a fundamental device for orienting organisational behaviour and guiding actors towards shared objectives (Hopper & Powell,1985; Ahrens & Chapman, 2007). It is not merely a set of measurement and control techniques but a performative language capable of constructing organisational realities (Vosselman, 2014), shaping relationships (Mouritsen & Thrane, 2006), and mobilising cognitive and emotional resources (Boedker & Chua, 2013; Repenning et al., 2022; Mouritsen & Kreiner, 2016). As Catasús et al. (2007) observe, what is measured tends to be managed, yet what is mobilised—that is, discussed, narrated, and shared—is what effectively generates action and change (Llewellyn, 1999; Piber et al., 2019).

In this perspective, management accounting assumes a communicative and symbolic function (Pärl, 2012), becoming an instrument of sensemaking (Weick, 1995) and mobilisation (Callon, 1998). This performative view suggests that accounting is not a passive reflection of organisational reality but a constitutive element of it.

In entrepreneurial contexts, particularly start-ups where numbers often represent projections rather than consolidated evidence, the narrative dimension becomes crucial. Entrepreneurial storytelling (Lounsbury & Glynn 2001, 2019) acts as a vehicle for translating visions into action, building legitimacy, trust, and belonging (Downing, 2005). At its core, entrepreneurial storytelling is a performative, communicative act that constructs social reality rather than reflecting it (Garud et al. 2014; Clarke et al., 2019). Entrepreneurs use stories to translate vision into action, create legitimacy, and build belonging, echoing the sensemaking framework of Weick (1995), and the performative ontology of Callon (1998) and Latour (2005).

These traditions collectively suggest that narratives in entrepreneurial settings are symbolic infrastructures — they enact futures, align heterogeneous actors, and stabilize fragile identities through discourse and representation.

By proposing a combination of these theoretical lenses, based on the same sociological and performative roots, we aim to investigate the role of storytelling as a performative tool of management accounting in new venture contexts.

We will focus on an Italian fintech, Banca Widiba (that is the acronym of Wise Dialogue Bank), launched on the market in September 2014. It can be considered as a case of success, both in terms of the level of innovation, and for its financial and sustainability performance, having achieved several awards for innovation, the breakeven within 5 years after its launch, and a Return on Equity of 31% in 2023, after 10 years (Faccia et al., 2020; Demartini & Del Baldo, 2025).

Our findings confirm that, in dynamic and blurred organisational settings such as those of new ventures, the narrative and visual dimensions are more powerful than numbers for orienting start uppers, investors and employees' behaviour. The study expands the "performative turn" in accounting by showing that communication is central to managerial control. It connects

[3] Research Fellow, ECON-06, Roma Tre University; silvia.soriano@uniroma3.it

sensemaking and cultural entrepreneurship, illustrating that accounting operates both as a cognitive framework and as a narrative that mobilises action.

2. Theoretical framework

2.1. From Measurement to mobilisation

Traditional accounting relies on the assumption that measurement directly influences management—an idea summarised in the adage "what gets measured gets managed." Catasús et al. (2007) challenge this notion, demonstrating that the link between indicating (measuring) and acting is neither direct nor significant. Only when introducing the variable mobilising—the discursive and relational process of building attention and consensus—does the relationship become meaningful.

This reframing suggests that measurement is not an end but a symbolic medium that signals relevance, builds priorities, and generates conversation. As Mouritsen (1998, 2006) emphasises, value creation derives not from numbers themselves but from how they are mobilised through collective discourse, interpretation, and storytelling. Management accounting thus emerges as a performative and communicative practice producing social and cognitive effects that precede economic ones.

We assume that in emerging entrepreneurial environments—where uncertainty is high and historical data scarce—narratives play an even more crucial role in mobilising collective sensemaking and action (Demartini & Del Baldo, 2025). Hence, to develop our framework, we combine the performativity of management accounting practices to the theory of cultural entrepreneurship.

2.2. Cultural entrepreneurship and organisational storytelling

Lounsbury and Glynn (2001, 2019) propose the theory of cultural entrepreneurship, interpreting the entrepreneur as a cultural actor who shapes meanings through symbols, language, and stories. This enables them to establish their organizational identities and make their activities comprehensible, meaningful, and appealing to relevant audiences (Czarniawska, 1997) to attract resources and finally generate wealth creation (see Figure 1).

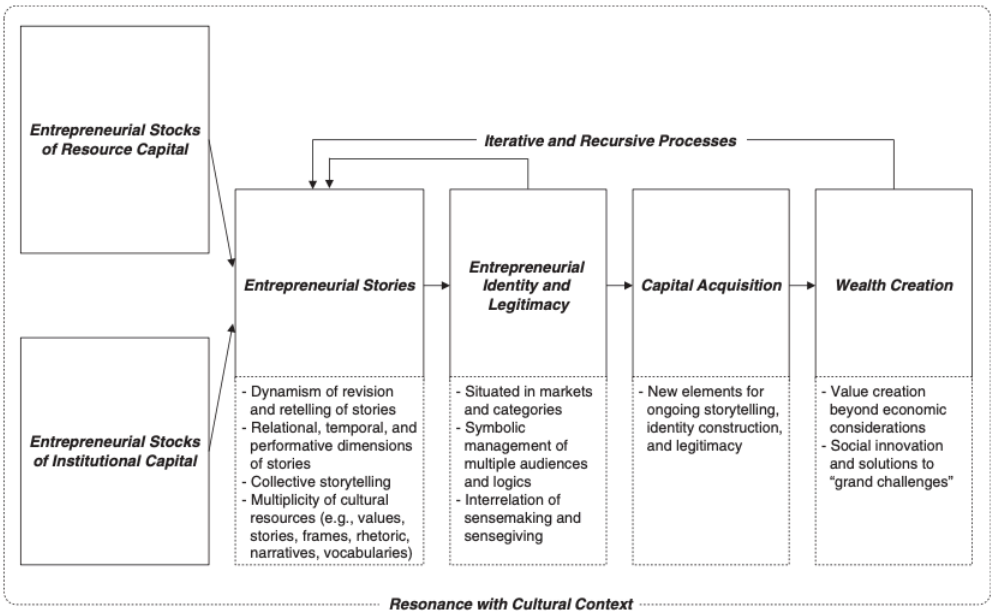

Figure 1. Theoretical Model of Cultural Entrepreneurship (Lounsbury & Glynn, 2019, p.3)

Legitimacy and success depend on the ability to create cultural resonance [4] with stakeholders—defined by:

- Cognitive alignment: consistency between the entrepreneurial narrative and institutional values.
- Emotional impact: capacity to evoke passion, trust, and collective belonging.

Entrepreneurial storytelling thus functions as a device of symbolic mobilisation and social legitimation, reinforcing collective identity and organisational cohesion. Within management accounting, these insights imply that accounting narratives—such as budgets or performance reports and we also include entrepreneurial storytelling—are to be seen as *inscriptions* that construct future realities rather than static depictions of the past (Robson, 1992; Busco & Quattrone, 2015).

3. Research propositions

Based on the integration of these theoretical perspectives, two propositions are advanced:

Proposition 1

When numbers rely on expectations rather than consolidated data, entrepreneurs must employ narrative tools to communicate vision and guide organisational behaviour. Employee conduct is more strongly shaped by the values and symbols embedded in storytelling than by abstract quantitative measures. Management accounting should therefore be interpreted as a sense giving device (Weick, 1995) through which entrepreneurs construct meaning and orient collective action.

[4] About defining the construct of cultural resonance, see Demartini & Del Baldo, 2025, pp.191-193

Proposition 2

The success of an organisation increases when founders, employees, consultants, and financiers actively participate in constructing and disseminating the organisational narrative. Collective storytelling becomes a shared cultural asset that enhances legitimacy, engagement, and organisational culture.

4. Methodology

To understand how the organisational narrative enables the consolidation of collective sense-making, the storytelling of the first few years of Widiba, a fintech start up is analysed. Our timeline of analysis embeds the seed phase (2013), the launch (2014), and the early growth (2015) of the company.

This research was possible thanks to the realization of a book, titled Cronaca Pop di Widiba - Pop Chronicle of Widiba (2018), in which, voluntarily, board members, start-up team, managers, employees and professionals have responded to the invitation to "telling what Widiba was for them, even describing a moment, an experience they consider particularly memorable". A qualitative research design was employed, grounded in interpretive methodology and text analysis. The aim was to understand how cultural processes and collective storytelling contribute to the creation of shared meaning and mobilisation in the start-up setting.

The study drew upon other multiple data sources— external corporate communication to markets and stakeholders, internal communications, social media, and first-hand accounts—to triangulate perspectives and ensure contextual depth. Moreover, one of the authors was directly involved in the launch of the new venture as an independent board member until 2019. The involvement of one of the researchers in the field enabled the authors to develop a broad understanding of the major concerns and challenges "behind the scenes". This has facilitated comprehension of the narratives while also being a potential source of bias, as remarked by Unluer (2012) and Aguinis and Solarino (2019).

In this contribution we present the results of our analysis of the stories collected in the book Pop Chronicle of Widiba (2018). The text analysis focuses on 33 stories of people involved in the start-up setting (i.e. the founder and the start-uppers, the board members, professionals and employees directly involved) placed in the book referring to the years 2013 (seed phase), 2014 (the launch), and 2015 (early growth).

4.1. Approach to text analysis

Text analysis allows systematic examination of the linguistic and symbolic patterns that characterise organisational discourse (Stone et al., 1966). The research assumes that the vocabulary used by members of an organisation reflects the evolution of its culture over time (Levinson, 2003). After establishing the concept of cultural resonance and its two key components—cognitive alignment and emotional impact—the analysis proceeded to identify and code recurring themes across narratives (figure 2).

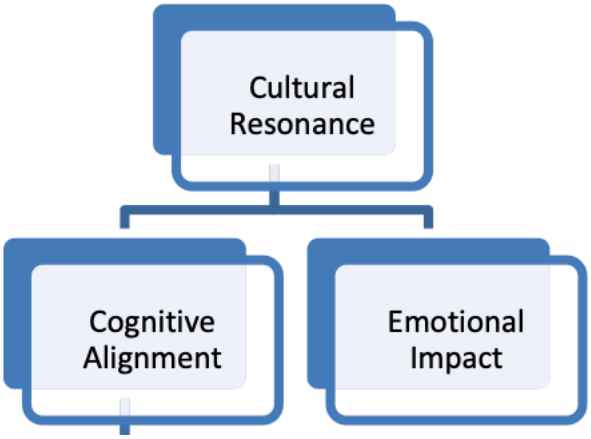

Figure 2. Key components of the construct "Cultural Resonance"

The text analysis focused on four themes: three for unlocking the Cognitive Alignment construct (i.e. Innovativeness, Social Impact, Market Culture) and one for Emotional Impact. Vocabularies are central to meaning creation (Meyer & Höllerer, 2010; Lockwood et al., 2019). Each context unit – a meaningful text fragment expressing one of these themes- was tagged and coded manually to preserve interpretive richness, rather than relying on automated tools.

To build the coding framework, wordlists were compiled from validated sources and expanded via WordNet (Miller, 1995) to include synonyms and related expressions:

- Innovativeness: Based on McKenny et al. (2018), encompassing 147 terms (e.g., creative, innovation, invention, novelty).
- Social Impact: Using Moss et al. (2018), comprising 66 terms (e.g., equality, empowerment, society, benefit).
- Market Culture: Drawing from Cameron et al. (2006), including words such as achievement, performance, growth, competitiveness.
- Emotional Impact: Derived from the Harvard-IV-4 Psycho-Social Dictionary, focusing on words linked to emotion and affiliation (e.g., enthusiasm, affection, passion, trust, belonging).

Each context unit was compared across narratives to identify how cognitive and emotional patterns converged to form a coherent collective story. This coding enabled operationalisation of cultural resonance in the book Pop Chronicle of Widiba.

The database for analysis was structured as it follows:

Phase	**Individuals Story no**	**Role of Individuals**	**Innovativeness Excerpts**	**Social Impact Excerpts**	**Market Culture Excerpts**	**Emotiona Impact Excerpts**

Table 1. Database structure[5]

5. Results

[5] Info available on request.

Operationalizing the construct of cultural resonance highlights the fruitfulness of understanding organisational storytelling as an interactive, negotiated process.

The results of our study confirm that cultural resonance is a complex construct that encompasses cognitive alignment and emotional impact, thereby reinforcing the sense of participation and commitment of qualified human resources in a critical and delicate period for the survival of a company.

5.1. Organisational Storytelling as Inscriptions

"Change and adaptation to a new world do not transform needs but the way of knowing how to meet and grasp them. W. is the bank of all times that has embraced with passion, dedication and study all the tools of today to become effective, efficient, and ready to be competitive." (Founder).

The opening message contained in the Pop Chronicle of Widiba embeds the essential elements of the entrepreneurial narrative. The founder articulates the distinctive feature of the new venture: an orientation towards innovation that positions technology as a means rather than an end. He evokes long-established managerial ideals—effectiveness, efficiency, and competitiveness—while anchoring them in a discourse of passion and commitment.

Collective storytelling within the organization mirrors this founding discourse. For storytelling to become shared and resonant, there must be cognitive alignment and/or emotional impact among organizational members. Analysis of the collected stories reveals coherence—a shared interpretive frame that echoes the founder's themes, while allowing for variation across individual perspectives.

Regarding Cognitive Alignment, the accounts of board members demonstrate comprehensive resonance across all dimensions outlined in the analytical framework. Their narratives integrate notions of innovation, market orientation, and social purpose into a coherent worldview. Conversely, for those occupying more specialized roles—such as IT managers or digital development staff—alignment tends to be selective, oriented primarily around innovation and technological transformation (see Example 1).

Innovativeness "When I was attending team meetings, I was dwelling on a new piece each time: people, systems, ideas and new applications." (Board member)
Social Impact "In W. there is passion that stems from the idea that services are necessary for people, and we have a very high responsibility; enabling customers to experience them in a new and positive way was (and is) the engine that drove the people of W. to dream and realise this dream." (Board member)
Market Culture "There were a need and a new way of listening to and serving customers." (Board member) Innovativeness "We nicknamed ourselves *'incrediBOL'* [BOL stands for *Bank On Line*] because no one believed us that we would succeed in bringing the most modern bank to life inside the oldest bank in the world." (IT manager)

Table 1. Cognitive Alignement (Demartini & Del Baldo, 2025, p.297)

Emotional impact reveals different intensities and affective tones depending on the individual's temporal and functional proximity to the venture's creation. Those involved in the seed and launch phases express deep emotional investment and identification with the founder's vision, while those joining later exhibit more pragmatic enthusiasm tied to daily operational challenges (see Example 2).

"W. is one of the most extraordinary and exciting things of my long professional life." (Board member involved since the seed phase)
"For me, it was love at first sight." (Board member involved since the seed phase)
"I saw the birth of W., experiencing excitement, enthusiasm and pride with the founder… It is a daily challenge where winning is a must and at the same time a great reward." (Employee involved since the seed phase)

Table 2. Emotional Impact (ibidem)

These narratives do more than recount experiences—they inscribe organizational identity. The book Pop Chronicle of Widiba that narrate the collective entrepreneurial storytelling, functions as an inscription: a device that makes sensemaking visible, recordable, and actionable. The founder's foundational story establishes a framework of values and aspirations, while employees' stories materialize and reinforce this framework through their lived experiences.

In this way, organisational storytelling becomes an inscription that translates ideas and values (innovation, responsibility, efficiency, creativity, etc.) into shared representations that guide conduct and sustain collective legitimacy. As such, storytelling operates performatively, constituting rather than merely describing the organization's evolving identity.

5.2. Management Accounting as Cultural Practice

Findings also reveal that in dynamic organisational settings, numbers such as KPIs or performance indices do not precede the narrative but rather translate it symbolically. Economic objectives are embedded within a broader cultural discourse that legitimises and gives them meaning. Echoing Catasús et al. (2007), performance emerges as an effect of mobilisation rather than numerical indication.

Reports, sustainability statements, and engagement indicators become narrative artefacts—tools through which organisational culture renews and legitimises itself. Entrepreneurs act as cultural operators (Lounsbury & Glynn, 2001), constructing entrepreneurial stories that align with stakeholders' values and emotions to gain legitimacy and support.

This operationalisation of cultural resonance confirms that it is a complex, interactive process, encompassing both cognitive alignment and emotional engagement. Such resonance enhances participation, commitment, and identity among human resources—particularly crucial during formative and uncertain stages of organisational life.

5.3. The Performativity of Communication

The performative power of communication emerges as a decisive factor in organisational success. The effectiveness of management accounting lies not only in technological or operational efficiency but in the capacity of communication to render the desired future real through discourse. Language acts as a mobilisation device connecting vision and action, numbers and meaning, control and creativity. The narrative framework transforms accounting practices from mechanical recording into instruments of cultural creation. In this sense, communication performs reality—it produces rather than merely describes it.

6. Conclusions

Integrating the mobilising framework (Catasús et al., 2007) with cultural entrepreneurship theory (Lounsbury & Glynn, 2001, 2019) allows management accounting to be reframed as a performative narrative practice. It does not simply measure what exists; it creates what it

measures. It does not merely describe behaviour; it mobilises it. In this way, accounting, therefore, is a cultural discourse that generates identity, trust, and belonging.

The study highlights three main insights:

- Mobilisation through collective storytelling creates action and performance. Narratives transform data into lived organisational experiences that motivate and align organisation's members.
- In the launch of a new venture, indicators alone do not drive behaviour unless integrated into meaningful, emotionally resonant narratives.
- Management accounting must be reinterpreted as a narrative instrument of cultural governance. Accounting systems can and should serve as communicative infrastructures that sustain vision, values, and participation.

Theoretical Contributions

This research contributes to the growing literature on the performative turn in accounting by demonstrating that communicative processes are not ancillary but constitutive of managerial control. It bridges the gap between sensemaking and cultural entrepreneurship, showing how accounting can be both a cognitive frame and a mobilising narrative.

Managerial Implications

For practitioners, the findings emphasise that leadership requires mastering not only financial metrics but also symbolic communication. Management accountants should act as narrative architects who translate organisational vision into credible and inspiring stories. In contexts characterised by uncertainty—such as digital transformation or start-up ecosystems—storytelling becomes a strategic complement to quantitative control.

Limitations and Future Research

This study acknowledges several methodological and interpretive limitations that also provide avenues for future research development. A primary limitation concerns the insider role of one of the authors, who served as an independent board member of the digital bank during its founding and growth phases. While this involvement provided privileged access and deep contextual understanding, it also carried potential bias stemming from personal engagement and retrospective interpretation. However, the temporal distance between the author's board tenure and data collection enabled greater reflexivity, allowing the insider to engage critically with prior experiences rather than reproducing them unexamined.

A second limitation lies in the case study design and manual coding approach. Although these qualitative methods generated rich, nuanced insights into the dynamics of collective storytelling and sensemaking, they are inherently context-bound. The findings capture the lived meanings of individuals involved in a specific entrepreneurial setting, limiting their transferability to different institutional or cultural contexts. Manual coding, while interpretively rigorous, is also constrained by the researchers' subjectivity and the predefined analytical framework, which may have restricted the emergence of unexpected themes or discursive patterns.

Future research could expand the methodological toolkit to enhance both depth and flexibility. One promising direction is the use of open coding to allow novel categories and relationships to emerge inductively from the data. This approach would enable researchers to remain receptive to unanticipated meanings embedded in organizational narratives, thereby enriching theoretical development.

Another avenue involves integrating computer-assisted text analysis, such as semantic or co-occurrence network analysis, to map the relationships between key words and themes within large

narrative datasets. This complementary method would provide a more systematic and replicable analysis of discourse structures while preserving the interpretive richness of qualitative inquiry.

The findings also highlight a particularly promising field for further investigation: the emotional dimension of organizational storytelling. Emotional resonance emerged as a key factor in mobilizing individuals and sustaining engagement during the venture's creation and growth. Future studies should examine how management practices intentionally shape, amplify, or measure emotional impact as part of broader accounting, control, and communication systems.

Exploring how emotions function as performative forces—interacting with narratives, inscriptions, and calculative practices—could extend the boundaries of management accounting research. This would contribute to a richer understanding of organizations as complex systems where meaning, emotion, and measurement co-produce organizational reality.

Keywords: Management accounting; cultural entrepreneurhip; storytelling

Measuring Social Return on Investment in sustainable hospitality: a technology-enabled framework for social impact assessment in tourism

Annunziata Tarulli[1], Domenico Morrone[2], Chiara Colamartino[3], Yousra Bellahcene[4]

1. Introduction

Tourism and hospitality are among the sectors most closely scrutinised for their social and environmental footprints. Before the COVID-19 crisis, tourism accounted for around 10% of global GDP and one in ten jobs worldwide, a magnitude that underscores both its development potential and its risks in terms of resource use, social equity and local well-being (UNWTO and UNDP, 2017; UNWTO, 2004). The 2030 Agenda for Sustainable Development explicitly recognises tourism under SDGs 8, 12 and 14, and UNWTO and UNDP (2017) call for better alignment of tourism business models with inclusive, low-carbon and community-centred development pathways. In parallel, there is growing pressure on hospitality firms – from investors, regulators, and destination management organisations – to demonstrate their contribution to social value creation, going beyond traditional financial and environmental metrics. Social impact investing and ESG-oriented finance are expanding, but the field still struggles with consistent, decision-useful measures of social outcomes (Roor et al., 2024; Costa and Pesci, 2016). This is particularly acute in hospitality, where benefits (e.g., local employment quality, cultural preservation, community well-being) are diffuse, context-dependent and hard to monetise.

Social Return on Investment (SROI) has emerged as a prominent approach to quantify and monetise the social, environmental and economic value created by projects and organisations, relative to the resources invested. It builds on and extends cost–benefit analysis by explicitly incorporating stakeholder perspectives, non-market outcomes and distributive effects (Lingane and Olsen, 2004; Millar and Hall, 2013; Corvo et al., 2022). While SROI has been widely discussed in social enterprise, health and community projects, systematic applications in tourism and hospitality remain limited and fragmented. Existing work points to both the potential and the methodological challenges of using SROI to understand tourism's social value (Ariza-Montes et al., 2021; Maldonado and Corbey, 2016).

At the same time, hospitality is undergoing a rapid digital transformation: AI-driven revenue management and personalisation, IoT-enabled smart rooms, blockchain-based traceability in supply chains, big-data analytics on guest behaviour and digital platforms that mediate destination experiences (Bulchand-Gidumal, 2024; Zeqiri et al., 2025). Emerging research suggests that these technologies can support more granular, real-time and participatory forms of impact measurement, particularly when aligned with SDGs and destination-level sustainability standards (UNWTO and UNDP, 2017; Zeqiri et al., 2025; UNWTO, 2004).

This work-in-progress paper proposes a conceptual and methodological framework for applying SROI to hospitality enterprises, explicitly integrating sustainability criteria and

[3] Research fellow, ECON-05/A, LUM University; colamartino@lum.it

[4] Ph.D. Candidate, ECON-07/A, LUM University; bellahcene.phdstudent@lum.it

advanced digital technologies for data collection, stakeholder engagement and outcome monitoring. The focus is on hospitality businesses (hotels, resorts, eco-lodges, social enterprises in accommodation and related services) operating within tourism destinations that have explicit sustainability policies or are aligned with frameworks such as the UNWTO sustainable tourism indicators and the Global Sustainable Tourism Council (GSTC) Destination Criteria (UNWTO, 2004; GSTC, 2019).

2. Theoretical background

2.1. Social Return on Investment: foundations and developments

SROI is commonly defined as an analytic tool that monetises social, environmental and economic outcomes and compares them to the value of inputs, yielding an SROI ratio (e.g., "€3 of social value for each €1 invested") (Nicholls et al., 2012; Lingane and Olsen, 2004). Early work by Lingane and Olsen (2004) in California Management Review established methodological guidelines for SROI calculations in corporate and social ventures, highlighting the need for rigorous valuation, transparency on assumptions and sensitivity analysis.

Subsequent guides, notably those developed by the New Economics Foundation and the UK Cabinet Office, systematised a six-stage SROI process: establishing scope, mapping outcomes, evidencing outcomes and giving them a value, establishing impact (deadweight, attribution, displacement and drop-off), calculating the SROI, and reporting and embedding (Nicholls et al., 2012). Corvo et al. (2022) provide a systematic literature review of SROI in Meditari Accountancy Research and show that applications span health, social care, education, environment and employment but remain uneven across sectors and geographies; they also stress the need for better theoretical grounding and methodological standardisation.

In parallel, reviews by Maldonado and Corbey (2016) and Millar and Hall (2013) point to persistent challenges: the risk of over-claiming due to weak counterfactual analysis; the subjectivity of financial proxies; limited stakeholder capacity to engage with complex monetary valuation; and the tendency to reduce rich impact stories to a single headline ratio. Cordes (2017), writing in Evaluation and Program Planning, compares SROI to cost–benefit analysis and emphasises both its promise in capturing broader value for funders and the importance of transparently reporting uncertainties and distributional effects.

More recent work, including Corvo et al. (2022) and Gutiérrez-Nieto et al. (2025), suggests a gradual movement towards "second-generation" SROI, characterised by stronger links to impact investing, integration with lifecycle and sustainability assessment tools, and growing attention to the distinction between measuring impact "to prove" and "to improve" decision-making.

2.2. Social impact measurement in tourism and hospitality

In tourism, social impact evaluation has traditionally relied on non-monetary indicators, often aligned with UNWTO's sustainable tourism indicator frameworks and later with the SDGs (UNWTO, 2004; UNWTO and UNDP, 2017). The GSTC Destination Criteria, for instance, structure sustainability around four pillars – sustainable management, socio-economic benefits, cultural heritage and environmental stewardship – and provide performance indicators that destinations can adapt at local level (GSTC, 2019).

Within hospitality, a large body of research focuses on corporate social responsibility (CSR), ESG practices and sustainability reporting. Pérez and Rodríguez del Bosque (2014), in the International Journal of Hospitality Management, analyse sustainability reporting by Spanish hospitality firms through a Sustainable Development–Stakeholder Relations Management (SD–SRM) lens, identifying both progress and gaps in how firms account for stakeholder-relevant social impacts. Martínez et al. (2013), publishing in Journal of Travel and Tourism Marketing, develop and validate a CSR measurement scale specifically tailored to hospitality, covering

dimensions such as community involvement, employee relations and environmental responsibility.

Empirical studies show that hospitality firms tend to focus on environmental and philanthropic initiatives in their public communications, while social outcomes such as quality of employment, local supplier development or inclusion of vulnerable groups receive less systematic measurement (Martínez et al., 2013; Pérez and Rodríguez del Bosque, 2014; de Grosbois, 2012). At destination level, research on responsible tourism and ESG in hospitality underscores the need for integrated metrics that capture how hotel operations affect community well-being, cultural vitality and social cohesion, not only visitor satisfaction or financial performance (Martínez et al., 2013; Costa and Pesci, 2016).

Despite this, explicit use of SROI in tourism and hospitality remains scarce. Ariza-Montes et al. (2021) apply SROI to assess the impacts of tourism in a specific destination, concluding that the approach can quantify positive social and cultural benefits while highlighting negative externalities, but that data availability and methodological complexity limit its widespread adoption. Case study–based SROI analyses in tourism-related regeneration projects and community programmes similarly reveal potential for making social value visible to policymakers and investors, yet also expose tensions between standardisation and local specificity (Corvo et al., 2022; Maldonado and Corbey, 2016).

2.3. Digital technologies, tourism sustainability and impact data

Digital transformation is reshaping the hospitality industry's operations and its interactions with stakeholders. Bulchand-Gidumal (2024) shows how AI, big data and other "critical digital technologies" are being integrated into hospitality and tourism marketing, enabling personalisation, dynamic pricing and predictive analytics but also raising new questions about privacy and algorithmic bias. Zeqiri et al. (2025) argue that digital tourism platforms leveraging Industry 4.0 technologies (AI, blockchain, VR, IoT) can support the advancement of SDGs by enhancing transparency, participation and resource efficiency in tourism ecosystems.

UN Tourism and other international bodies highlight that innovation and digital tools – such as big-data analytics on mobility, user-generated content, and smart-destination infrastructures – can help measure tourism's impacts more precisely and support better policy and business decisions (UNWTO, 2004; UNWTO and UNDP, 2017). For hospitality firms, this implies the possibility of moving from static, ex-post reporting towards more dynamic, real-time monitoring of social outcomes, including guest behaviour, employee well-being, local procurement patterns and community engagement.

However, the literature also warns that impact measurement in the digital era often focuses on "proving" rather than "improving" impact, and that the abundance of data does not automatically translate into better decisions. Roor et al. (2024) show that many investors use impact metrics mainly for legitimacy and accountability rather than to adapt strategies in ways that enhance real-world outcomes. This tension is directly relevant for SROI in hospitality: advanced technologies may facilitate data collection and valuation, but they can also reinforce box-ticking approaches if not embedded in a learning-oriented governance framework.

3. Research aims and questions

Building on these strands of literature, this work-in-progress study pursues three interconnected aims. First, it seeks to synthesise and critically evaluate existing applications of SROI and related social impact measurement approaches in tourism and hospitality, positioning them within wider debates on sustainable tourism indicators, ESG reporting and impact investing. Second, it aims to develop a conceptual framework for applying SROI to hospitality enterprises that aligns outcome indicators with international sustainability standards – such as the SDGs,

UNWTO indicators and GSTC criteria – while integrating advanced digital technologies to support data generation, stakeholder engagement and continuous learning. Third, the study intends to design and pilot a mixed-method SROI-based methodology across multiple hospitality case studies, generating empirical insights into the social value produced by different business models, including conventional hotels, eco-resorts and social-purpose hospitality ventures.

The core research questions are:

RQ1: How has SROI been conceptualised and operationalised in tourism and hospitality, and what are the main methodological and practical gaps identified in the literature?

RQ2: How can SROI be adapted to capture the social impacts of hospitality firms in a way that is consistent with sustainable tourism frameworks and sensitive to local destination contexts?

RQ3: In what ways can advanced digital technologies enhance or hinder the quality, inclusiveness and usefulness of SROI analyses in hospitality?

RQ4: What does an SROI-based assessment reveal about the social value generated by selected hospitality enterprises, and how can such information inform managerial decisions and destination governance?

4. Methodological framework

This study adopts a sequential exploratory mixed-methods design, combining systematic literature review, qualitative case study research and quantitative SROI modelling. The research is explicitly presented as work in progress: at the time of writing, the literature review and framework development phases are ongoing; empirical data collection with hospitality enterprises is planned but not yet completed.

4.1. Systematic literature review

The first phase involves a structured review of peer-reviewed articles and high-quality reports on SROI, social impact measurement and sustainability in tourism and hospitality. The review strategy builds on Corvo et al. (2022) and Gutiérrez-Nieto et al. (2025) for the general SROI literature, while sector-specific searches target journals such as International Journal of Hospitality Management (Elsevier), Journal of Travel and Tourism Marketing (Taylor and Francis), International Journal of Contemporary Hospitality Management (Emerald), and Journal of Hospitality and Tourism Management (Elsevier), as well as SROI applications in tourism (Ariza- Montes et al., 2021). This phase seeks to clarify how SROI has been deployed – or, in some cases, overlooked – within tourism and hospitality, while mapping the outcome domains and indicators most relevant to capturing the sector's social impact, including decent work, community development, cultural heritage and gender equality. It also engages with key methodological debates on monetisation techniques, attribution issues and the construction of credible counterfactuals. In parallel, it explores how digital technologies are increasingly used to generate, monitor and analyse impact data in tourism, building on recent contributions such as Bulchand-Gidumal (2024) and Zeqiri et al. (2025).

4.2. Conceptual framework and impact map

Drawing from the review, the study will develop an impact map tailored to hospitality firms, aligning SROI outcome categories with SDG targets and GSTC socio-economic and cultural criteria. For instance, the model takes into account inputs such as financial capital (i.e., equity, debt, grants), human resources, physical assets and digital infrastructures, which enable core hospitality activities including accommodation and FandB services, local procurement, staff training, community engagement, cultural programming and environmental initiatives. These activities produce measurable outputs – such as local employment, contracts with SMEs, training

hours, community participation and cultural experiences offered – that translate into social outcomes like improved working conditions and skills for residents, greater inclusion of vulnerable groups and women in quality jobs, stronger local SMEs, enhanced community pride and cultural preservation, and reduced negative social impacts. Financial proxies for these outcomes will be derived from secondary data (e.g., wage differentials, unemployment costs, prior SROI valuations) and stakeholder valuation exercises, consistent with SROI principles and established guidance (Lingane and Olsen, 2004; Cordes, 2017; Nicholls et al., 2012).

4.3. Case study selection and data collection

The empirical component – currently under design – foresees multiple case studies of hospitality enterprises from different segments (e.g., urban business hotels, resort complexes, eco-lodges, social-purpose hospitality ventures) and destinations that have articulated sustainability strategies (e.g., GSTC-aligned or UNWTO-monitored destinations).

Data collection will draw on a multi-layered strategy designed to capture the full breadth of social value created within hospitality contexts. First, documentary evidence – including sustainability and ESG reports, CSR communications and certification records – will be systematically analysed using content-analysis approaches inspired by Pérez and Rodríguez del Bosque (2014) and de Grosbois (2012). Second, semi-structured interviews with managers, employees, local suppliers, community organisations and destination management bodies will surface stakeholders' theories of change and reveal which outcomes they perceive as most meaningful. Third, where feasible, digital trace data such as anonymised HR records (e.g., turnover, training hours), procurement datasets, geolocated guest activity patterns and user-generated content will be incorporated, in full compliance with ethical and privacy standards.

The integration of these qualitative and quantitative sources will enable the construction of robust SROI models for each case, while sensitivity analyses will assess how key assumptions – such as attribution and the duration of outcomes – shape the resulting valuations.

4.4. Role of advanced technologies in SROI implementation

A key contribution of the proposed methodology is its systematic integration of advanced technologies throughout the SROI process. Digital surveys, mobile applications and online platforms will facilitate outcome identification and stakeholder engagement, enabling timely feedback from guests, employees and community members (Zeqiri et al., 2025). Data collection will be strengthened through HR analytics and AI-enabled dashboards for monitoring job quality and training outcomes, IoT and smart-building systems for capturing guest-experience indicators, and supply-chain tools – potentially supported by blockchain – to track local sourcing and fair-trade relationships (Bulchand-Gidumal, 2024). Analytical tools will support impact valuation by linking operational metrics to social outcomes and enabling scenario analyses of alternative hiring or sourcing strategies. Finally, interactive dashboards will enhance reporting and organisational learning by presenting SROI results alongside qualitative indicators and promoting continuous improvement rather than reputational uses (Roor et al., 2024; Costa and Pesci, 2016). The study will also examine whether these technologies improve the robustness, timeliness and stakeholder relevance of SROI analyses, and what organisational capabilities are needed to leverage them effectively.

5. Expected results and contribution

As a work in progress, this study cannot yet present empirical SROI ratios or completed case findings, but several expected contributions can be outlined. First, it is set to offer one of the first integrative frameworks that adapts SROI to hospitality enterprises while aligning it with the

SDGs, UNWTO indicators and GSTC criteria, responding to long-standing calls for tools that link business practices to destination-level sustainability goals. Second, by incorporating AI, big data and digital platforms into the SROI process, the study aims to show how hospitality firms can adopt more dynamic, participatory and fine-grained approaches to social impact assessment, extending current digital transformation research beyond its usual focus on marketing and operational efficiency. Third, forthcoming case studies are expected to compare different hospitality models – such as upscale hotels, community-based lodges and social enterprises – in terms of SROI performance across domains like employment, local economic development, inclusion and cultural heritage, potentially revealing trade-offs and synergies not captured by conventional financial or environmental indicators. Finally, the study aims to generate practical recommendations for hospitality managers and impact-oriented investors on integrating SROI into decision-making, and for destination management bodies on translating firm-level results into coherent destination-wide social impact narratives, contributing to broader debates on standardising social impact metrics in sustainable finance.

6. Limitations and future research directions

The proposed study faces several limitations consistent with those highlighted in the wider SROI literature, including the subjectivity inherent in selecting financial proxies, challenges in establishing credible counterfactuals, the resource-intensive nature of data collection and the risk of reducing complex social outcomes to a single ratio (Millar and Hall, 2013; Maldonado and Corbey, 2016). Within the hospitality sector, further constraints arise from commercial sensitivities surrounding data, uneven levels of digital maturity across firms and destinations and the need to comply with privacy and data-protection regulations when incorporating digital trace data. Future research could build on this work by comparing SROI with alternative impact-measurement approaches in hospitality, investigating cross-cultural variation in how communities value tourism-related social outcomes and assessing how SROI insights shape strategic decisions by hospitality firms and investors over time.

Me, You, and AI: How AI augments value co-creation in brand-customer relationships

1. Introduction

Artificial intelligence (AI) is reshaping how brands design, deliver, and communicate value in contemporary markets, from recommendation engines (Grewal et al., 2021) and automated retail stores (Pillai et al., 2020), to generative tools that co-author marketing content and conversations with customers (Kirkby et al., 2023; Kot & Leszczynski, 2022). Rather than simply adding another channel or touchpoint, AI systems increasingly mediate interactions between brands and customers, promising more personalized, efficient, and adaptive experiences while also triggering concerns about opacity, bias, loss of human contact, and erosion of authenticity and trust (Dwivedi et al., 2021; Kim, 2025). This ambivalence suggests that AI not only enhances marketing relationships, but also transforms the dynamics through which value is created in brand–customer interactions (Chandra & Rahman, 2024).

Service-Dominant Logic (SDL) conceptualizes value as emerging from ongoing relational exchanges in which actors integrate resources to co-create value, rather than passively receiving it (Vargo & Lusch, 2008). Drawing from this perspective, AI can be framed as an operant resource – an entity capable of sensing, learning, and adapting – rather than a passive, operand tool (Mele et al., 2021; Huang & Rust, 2021; Haenlein & Kaplan, 2021). AI can expand customers' access to relevant resources, personalize interactions, and influence decision-making processes and experience along the customer journey (Mele et al., 2021; Peltier et al., 2024). At the same time, SDL research highlights that the same interactions can generate value co-destruction (VCD) when resources are misaligned or misused, leading to diminished well-being for at least one actor (Castillo et al., 2021). In AI-mediated settings, phenomena such as algorithm aversion, perceived manipulation, or the crowding out of human presence may thus undermine trust, authenticity, and perceived fairness in brand–customer relationships (Castelo et al., 2019; Luo et al., 2019; Brüns & Meißner, 2024).

To better understand these mixed dynamics, this paper draws on Actor–Network Theory (Latour, 1996) to move beyond a dyadic view of firm–customer relations and frame AI within a broader socio-technical network (Gutiérrez, 2024). From an ANT perspective, algorithms, datasets, interfaces, brands, and customers are actants that jointly perform programs of action and whose associations are continuously negotiated (Latour, 2005; Gutiérrez, 2024). Outcomes depend on translation, which is the ongoing process through which heterogeneous human and non-human actors align their identities, needs, and activities, allowing networks to stabilize (Li & Zhu, 2024). Misaligned translations can amplify biases, surface irrelevant or culturally inappropriate outputs, and trigger resistance, turning AI into a mediator of VCD (Li & Zhu, 2024).

[1] Ph.D. Candidate, ECON-07/A, University of Milan-Bicocca – Bayes Business School; emanuele.ghianda@unimib.it – corresponding author

[2] Associate Professor, ECON-07/A, Catholic University of Milan – Bayes Business School; domitilla.magni@unicatt.it

[4] Full Professor, ECON-07/A, University of Milan-Bicocca; alice.mazzucchelli@unimib.it

Conversely, when the translations hold and the interests remain aligned, AI can help configure new forms of interactive, experiential value co-creation (VCC) (Gutiérrez, 2024; Li & Zhu, 2024).

Despite growing recognition of AI as a network actor, it remains unclear the role played by AI in shaping VCC and VCD in socio-technical networks. Existing studies often focus on customer perceptions rather than the professional perspective, have found mixed results on the opportunities and tensions that arise when AI becomes a third actor in the relationship between brands and customers (Kim, 2025). Moreover, while computational text analysis and topic modelling are increasingly used to study digital communication, few works integrate these techniques with interpretive qualitative analysis to examine how AI-related narratives organize around relational dimensions such as trust, authenticity, and value creation (Mele et al., 2021).

This paper tries to address this gap by providing a better understanding of the role of AI in brand–customer relationships. In particular, the paper represents a first attempt to conceptualize AI as an actant that augments the co-creation process, thereby better supporting the brand-customer relationship. The "augmented co-creation" that the study conceptualizes describes a socio-technical configuration in which AI does not merely support existing interactions but actively extends and conditions the relational space in which trust, authenticity, and value are negotiated among brands and customers. Drawing on ten semi-structured interviews with practitioners engaged in AI-based communication and customer interaction, the study adopts a qualitative–computational research design that combines semantic network analysis, Latent Dirichlet Allocation (LDA) topic modelling, sentiment analysis, and interpretive reading (Andreotta et al., 2019; Nelson, 2020). This mixed analytical strategy allows us to uncover latent thematic structures in practitioners' discourse and interpret how AI is positioned as both an enabler and a disruptor of VCC across key relational dimensions.

The study makes three main contributions. First, it advances an ANT view of AI as a relational actant in value networks, showing how its involvement reconfigures the brand–customer dyad into a broader socio-technical network (Gutiérrez, 2024; Kim, 2025). Second, it refines the notion of augmented co-creation by theorizing the ambivalent ways in which AI simultaneously extends and constrains the network of actors and relationships through which value is co-created or co-destroyed (Li & Zhu, 2024; Castillo et al., 2021). Third, it illustrates how qualitative–computational methods can be mobilized to map narrative frames of VCC and VCD in practitioners' discourse, offering a scalable yet interpretive approach to studying AI-mediated marketing interactions (Baden et al., 2022).

2. Theoretical background

The concept of VCC has its roots in SDL, which posits that value emerges from the relational exchanges that occur between firms and customers (Vargo & Lusch, 2008). More specifically, SDL underscores the central role of mobilizing operant resources, such as knowledge, skills, and increasingly algorithms, to co-create value through interactions: individuals' behaviors are shaped both by the value they perceive in relational interactions and by the value they actively co-create in engaging with firms' production activities (Payne et al., 2008; Vargo & Lusch, 2016). Consequently, value is not predetermined during production but rather emerges from the interactive integration of resources within specific usage contexts (Grönroos & Voima, 2013). Nevertheless, such interactions can also generate VCD, a condition in which the perceived value decreases for at least one of the actors involved in the relationship, such as resources falling short in integrating themselves due to misalignment, misuse, or unexpected side effects (Plé & Chumpitaz Cáceres, 2010; Echeverri & Skålen, 2011).

Recent research on VCC has highlighted the emerging role of AI in marketing and its potential to amplify VCC (Chandra & Rahman, 2024; Paschen et al., 2021; Dwivedi et al., 2021). AI is characterized by its ability to sense, reason, and adapt through continuous learning and interaction with human users (Huang & Rust, 2021; Haenlein & Kaplan, 2021). Within the SDL

perspective, AI can thus be conceptualized as an operant resource – rather than an operand one, which is a static resource – because it is capable of acting upon other resources, learning from interactions, and autonomously adapting its behavior to co-create value. In this sense, AI enables the VCC process to become more interactive, adaptive, and experiential, where humans, algorithms, and brands jointly create value (Peltier et al., 2024). Indeed, AI can act as a relational and cognitive agent that mediates interactions, learns from behavioral data, and adapts its communication and offerings in real time (Mele et al., 2021). Furthermore, with the rise of AI algorithms that are "designed to autonomously make decisions and act with the ability to pursue complex goals under limited supervision" (Finn & Downie, 2025, p. 7), AI will become increasingly central in mediating relationships between brands and customers (Kim, 2025).

In marketing practice, AI systems support a broad spectrum of co-creative activities: from recommendation engines that align offerings with evolving preferences and contexts (Grewal et al., 2021), to generative GenAI tools augmenting firms' and users' content creation, co-authoring messages and assets that better fit situational needs (Kirkby et al., 2023), or substitute human service even in physical retail settings (Pillai et al., 2020). Such AI systems expand customers' resource accessibility through data-driven insights, extend their engagement via adaptive interfaces such as service robots and conversational chatbots (Kot & Leszczynski, 2022; Song & Kim, 2022), and augment their agency by assisting their decision-making processes (Little et al., 2025). In this sense, AI operates as an intelligent interface between firms and customers, co-shaping the choice architecture that underpins marketing decisions (Mele et al., 2021).

Nevertheless, AI adoption can also result in VCC when resources are misintegrated or service processes fail, especially in technology-mediated interactions where opaque or miscalibrated algorithms lead to unintended adaptations and customer resource loss, triggering anger and dissatisfaction (Castillo et al., 2021). For example, disclosing chatbot identity before an interaction may significantly decrease purchase rates because customers infer lower empathy and competence (Luo et al., 2019). Similarly, disclosing that advertisements were created using GenAI seems to decrease the perception of authenticity and trust, resulting in negative attitudes toward the brand and lower purchase intentions (Brüns & Meißner, 2024; Ali et al., 2025). This mechanism, often referred to as algorithm aversion, can backfire on the relationship between the brand and the customer, undermining their co-creative interaction (Castelo et al., 2019). More often, VCC and VCD within the same service encounter, forming a continuous loop in which actors assess, based on the interaction context, whether their well-being has been enhanced or diminished (Hsu et al., 2021).

In this context, the Actor–Network Theory (ANT) (Latour, 1996) is useful to explain when resource exchanges lead to VCC or VCD. The ANT views networks as chains of associations among human and nonhuman actors, better referred to as actants, meaning any entity that can produce effects through its ties with the other entities in the network (Latour, 2005). The outcomes of these network interactions depend on translation, which is the ongoing process by which heterogeneous actants align their needs, identities, and activities so that their associations stabilize, despite misunderstandings and power shifts (Li & Zhu, 2024; Fritz et al., 2020). According to Callon (1984), translation proceeds through four interdependent moments: problematization (defining the issue and the actors involved), interessement (deploying devices and strategies to align actors' interests), enrolment (negotiating and securing acceptance of roles and scripts), and mobilization (stabilizing agreements so the network can act collectively). When these moments of translation hold, programs are understood, and interests align. In this lens, AI algorithms, datasets, interfaces, and brands interact with customers and employees to execute programs, which are scripts, data, and routines that organize actions (Gutiérrez, 2024). AI is thus an actant and often a social intermediary that carries on programs across the network (Gutiérrez, 2024), especially because AI enables the integration of resources and the VCC process.

Nevertheless, it is still unclear how AI influences the VCC/VCD process. In fact, on the one hand, misaligned translations among key actors can result in algorithmic bias from "quantity–

value" imbalances in training data, unauthorized/illicit uses enabled by tool–content collusion and interface exploitation, a collapse of public trust as AI can outpaces platform verification, and privacy violations stemming from large-scale collection of user-generated and even private data (Li & Zhu, 2024). Consequently, if the system surfaces, for instance, irrelevant or culturally inappropriate recommendations, a translation may falter and AI may become a mediator of VCD by transforming meanings and triggering resistance (Gutiérrez, 2024; Li & Zhu, 2024). On the other hand, when data sources, platforms, and AI algorithms are interdependent actants whose interests are aligned through translation value can be created. With alignment in translation, AI acts as an intermediary that reliably executes programs, such as personalized suggestions, supporting the integration and co-creation of consonant resources (Topsakal & Çuhadar, 2024; Gao & Liu, 2023).

According to recent literature, a potential solution to make networks in which AI is involved more stable – and thus create the conditions for VCC – includes establishing network leadership that facilitates cross-departmental collaboration and builds layered governance to align stakeholders around responsible AI principles, such as transparency, accountability, and human oversight (Fang et al., 2026). Furthermore, AI can enable VCC when heterogeneous human and non-human actors are continuously aligned and mobilized through decentralized governance across the GenAI lifecycle, user empowerment via iterative feedback, the use of trusted agents to stabilize relationships, and usability improvements such as integrating the tool into widely used social platforms (Song et al., 2025).

3. Methodology

This study adopts a qualitative–computational approach (Andreotta et al., 2019; Nelson, 2020) to explore how AI is reshaping brand–customer relationships and enabling new forms of augmented co-creation. The research design integrates interpretive qualitative analysis with computational text mining techniques, allowing both the identification of latent thematic structures and the interpretation of underlying meaning patterns within professionals' discourses (Baden et al., 2022).

The empirical material consists of ten semi-structured interviews with marketing professionals and managers actively engaged in AI-based brand communication and customer interaction practices. The participants were selected through purposive sampling to ensure theoretical and professional heterogeneity across sectors (e.g., retail, digital marketing, and consulting). Each interview lasted between 45 and 60 minutes and was conducted via video conferencing. The interview protocol explored themes such as (a) the role of AI tools in daily marketing practices, (b) perceived opportunities and challenges in human–AI collaboration, and (c) the implications for brand authenticity, trust, and VCC. All interviews were audio-recorded and fully transcribed verbatim, resulting in a corpus of approximately 27,000 words.

The analytical process was conducted in five phases:

1. Preprocessing: Interview transcripts were normalized through tokenization, lemmatization, and stopword removal to ensure linguistic consistency and comparability across texts.
2. Semantic Network Analysis: The co-occurrence of key terms and their cosine similarities were mapped to visualize the conceptual relationships among main constructs such as AI, trust, value, human, and brand.
3. Topic Modeling: A Latent Dirichlet Allocation (LDA) model was implemented to detect recurrent discursive themes. The number of topics was optimized using coherence and perplexity scores, achieving statistical robustness and semantic interpretability.
4. Sentiment and Interpretive Analysis: For each topic, representative quotations were extracted, and sentiment analysis was performed to capture the affective tone of

narratives. These results informed an interpretive reading of the tensions between efficiency, authenticity, communication, and creativity

5. Conceptual Synthesis: Findings were integrated into a conceptual framework of augmented co-creation, illustrating how AI acts as a communicative and relational actor mediating human–brand interactions and shaping co-creation/co-destruction dynamics.

4. Results

The preliminary phase of data preprocessing enabled a first overview of the textual corpus collected through the ten semi-structured interviews. Prior to the modeling stage, interview transcripts were normalized and lemmatized to ensure lexical consistency and reduce linguistic noise, in line with established NLP preprocessing standards (Haddi et al., 2013). Figure 1 shows the most frequent words before and after the cleaning process. Prior to normalization, the text was dominated by high-frequency stopwords (e.g., the, to, and), which provided little semantic information. After applying lemmatization and stopword removal, the vocabulary became more representative of the research domain, highlighting keywords such as AI, people, companies, customer, data, brand, and value. This shift confirms the effectiveness of the cleaning process in isolating the substantive dimensions of the discourse, particularly those related to the relational and technological facets of AI-mediated marketing interactions.

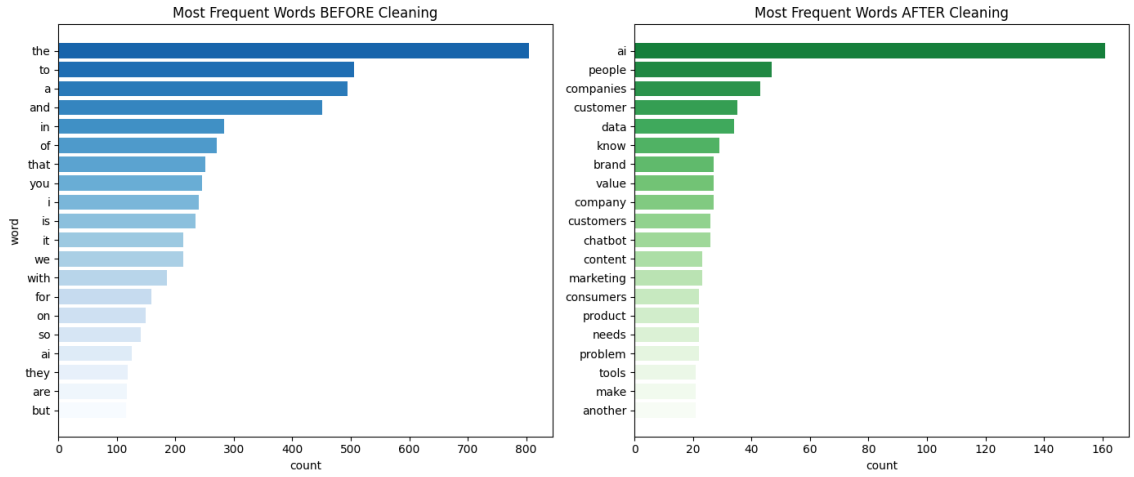

Figure 1. Word frequency distribution before and after text cleaning

An exploratory sentiment analysis was also carried out to gauge the emotional tone of the interviews (Liu, 2020). As illustrated in Figure 2, most participants expressed broadly positive views on the use of AI in marketing (seven cases), emphasising gains in efficiency, greater personalization, and improved value delivery. A smaller group offered more neutral comments (two cases), treating AI mainly as an operational addition rather than a major shift. Only one interviewee voiced negative sentiments, typically linked to worries about authenticity, reduced creativity, or a weakening of human interaction. Hence, the distribution indicates that practitioners tend to see AI as a useful and supportive resource in brand–customer relations, while still remaining alert to its ethical and relational downsides.

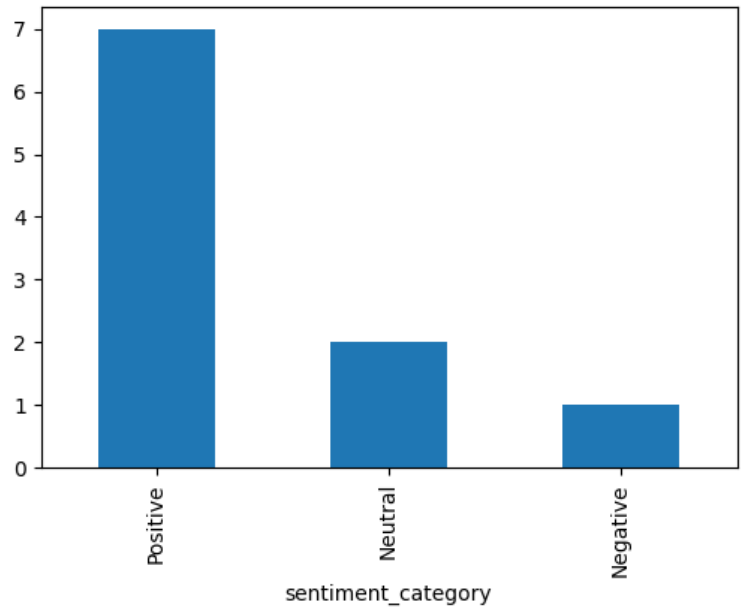

Figure 2. Sentiment distribution across interviews, source: authors' elaboration

To uncover the underlying thematic structures within professionals' narratives, a LDA model was applied to the preprocessed corpus. After testing multiple topic configurations, the model with five topics (n = 5) was selected as the most coherent and semantically interpretable, based on coherence (0.419) and perplexity (503.9) scores. The extracted topics reveal distinct but interconnected dimensions of how AI is transforming brand–customer relationships. Table 1 shows the topics extracted from the LDA model.

Topic	Interpretive Label	Main Keywords	Representative Quotation	Dominant Sentiment
1	AI-enabled trust and value creation	technology, companies, brand, trust, value, intelligence, artificial, customers	AI creates trust and value through personalized, transparent interactions.	Positive
2	Human–AI conversational co-creation	bot, machine, chatbot, people, company, product, know, value	AI acts as a skilled colleague, enhancing human creative work.	Positive
3	Dehumanization in AI-mediated communication	customers, receive, attention, access, creation, tasks, communicate, answers	Automated communication feels efficient but lacks human authenticity.	Negative
4	AI-mediated customer interaction	brand, company, bit, chatbot, project, costumers, needs, data	AI-driven chatbots manage customer needs and collect data, allowing companies to align brand communication with real-time insights.	Neutral
5	Conversational AI and customer–brand relationship	relationship, customers, conversational, interfaces, purchasing, product, experience, customer	Conversational AI strengthens trust and improves the buying experience.	Positive

Table 1. Topics extracted from the LDA model and interpretive synthesis, source: authors' elaboration

The five topics collectively illustrate the ambivalent nature of AI-driven interactions, oscillating between augmentation and dehumanization (Castillo et al., 2021; Mele et al., 2021; Chandra & Rahman, 2024). Topics 1, 2, and 5 emphasize the positive potential of AI as a relational and cognitive partner that enhances trust, personalization, and co-creative collaboration. Conversely, Topic 3 reveals critical narratives around dehumanization, where excessive automation undermines perceived authenticity and empathy in communication. Topic 4 acts as a transitional theme, describing how firms use chatbots and data-driven interfaces to mediate customer interactions—an operational middle ground between efficiency and human connection.

These themes depict AI as a hybrid actor within the brand–customer ecosystem: simultaneously a technological enabler of VCC and a potential source of relational tension when human qualities are perceived as replaced rather than enhanced.

5. Discussion and implications

The findings delineate a multifaceted model of augmented co-creation in which AI, brands, and customers emerge as interconnected actors within an evolving socio-technical network (Latour, 2005; Mele et al., 2021). The LDA-derived frames and interpretive analysis collectively show that AI functions not merely as a technological enabler but as a relational actant – a communicative and cognitive agent mediating exchanges between human and brand actors (Gutiérrez, 2024; Peltier et al., 2024). The findings echo the idea of translation in ANT: value is created when human and technological interests evolve together, and it weakens when this coordination falters (Callon, 1984; Li & Zhu, 2024).

Throughout the analysis, three relational dimensions (i.e. trust, authenticity, and value creation) shape how actors interact. Positive accounts describe AI as a tool that can foster trust through more personalised communication (Gao & Liu, 2023), support creative work and thus enhance value (Little et al., 2025), and encourage exchanges between brands and customers (Kot & Leszczyński, 2022; Song & Kim, 2022). Critical perspectives, however, warn that excessive automation may reduce the human element and weaken perceptions of authenticity (Brüns & Meißner, 2024; Castillo et al., 2021). These views depict AI as a technology that can strengthen marketing relationships but also unsettle them when it undermines human involvement (Chandra & Rahman, 2024).

The resulting conceptual map integrates these insights by visualizing how each actor contributes to trust and value formation through distinct yet overlapping programs of interaction (Figure 3). Brands deploy AI to extend communicative reach and efficiency; customers negotiate their sense of authenticity and agency in response to AI-mediated interfaces; and AI systems dynamically translate inputs between them, shaping the co-creation or co-destruction of value depending on the quality of alignment (Echeverri & Skålen, 2011; Plé & Chumpitaz Cáceres, 2010).

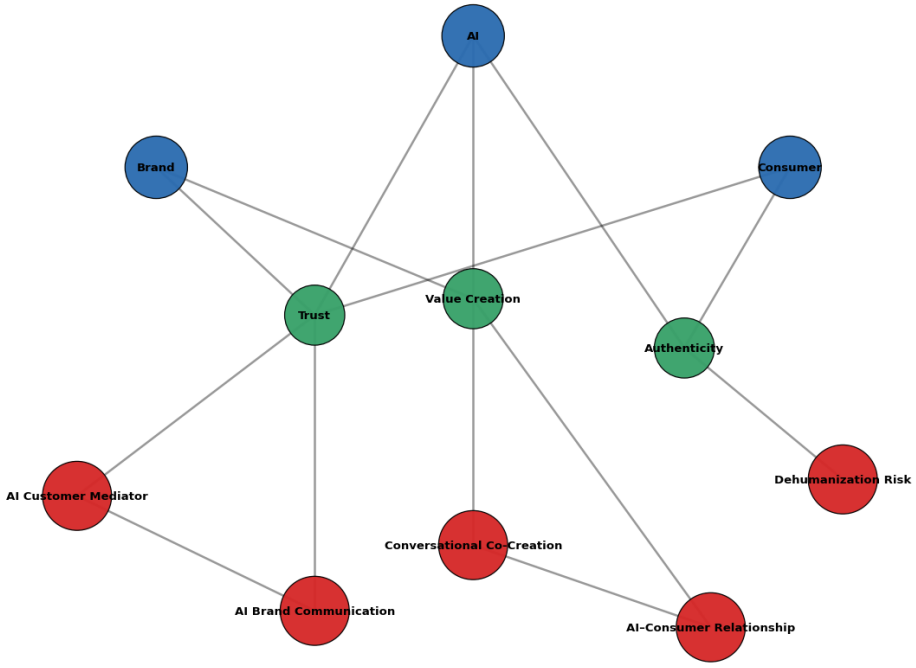

Figure 3. Conceptual map of Augmented co-creation, source: authors' elaboration

The figure illustrates how brands, customers, and AI interact within a shared socio-technical network. The blue nodes represent these three actors, whose connections are shaped by the relational dimensions shown in green – trust, authenticity, and value creation. The red nodes capture the narrative frames that emerged from the topic analysis, highlighting how practitioners see AI both as an enabler of collaboration and a potential source of friction. The network suggests that VCC holds when human and non-human actors stay aligned, while misalignments tend to trigger value loss.

From a managerial standpoint, the findings point to the importance of introducing AI in ways that strengthen relationships rather than simply optimise processes (Fang et al., 2026). This means creating conditions in which transparency is the norm, users feel in control, and human–AI interaction becomes a source of support rather than tension (Haenlein & Kaplan, 2021; Song et al., 2025). Approaches like these help firms retain trust and authenticity while still taking advantage of AI's capacity to adapt and scale.

On the conceptual side, the study brings together insights from SDL (Vargo & Lusch, 2016) and ANT to show how AI reshapes the contours of value creation within marketing systems. As AI tools gain more autonomy and influence, a promising avenue for future work is to examine how these socio-technical networks continue to develop and reorganise over time.

Keywords: Artificial Intelligence; brand-customer relationship; value co-creation; value co-destruction; ator-network theory

Rethinking Emotional Analysis for Digital Management Convergenze e Divergenze tra Intelligenza Ermeneutica, Simbolica e Neurale

Adriana Apuzzo[1], Mario D'Arco[2], Antonio Lieto[3], Mario Testa[4]

1. Introduzione

Negli ultimi anni, la convergenza tra intelligenza artificiale, metodologie qualitative e ricerca manageriale ha ridefinito le modalità di esplorazione e interpretazione delle emozioni nei contesti organizzativi e di mercato. Una tale intersezione ha promosso un dialogo sempre più articolato tra forme eterogenee di razionalità – umana, simbolica e neurale – configurando un paradigma di analisi capace di coniugare la sottigliezza interpretativa della ricerca qualitativa con la capacità di generalizzazione dei modelli computazionali (Bankins et al., 2024; Halpin, 2024). All'interno di tale cornice, la collaborazione tra esseri umani e sistemi di intelligenza artificiale emerge in quanto dibattito focale del management contemporaneo. Se da un lato si riconosce il potenziale delle tecnologie cognitive nell'aumentare di produttività ed efficienza, dall'altro si delineano con chiarezza le sfide legate al mantenimento di un'esperienza lavorativa autenticamente umana, fondata su competenze relazionali ed emotive (Bankins et al., 2024).

Il presente lavoro, attualmente in corso di sviluppo, si propone di esplorare in che modo differenti logiche di codifica emotiva – ermeneutica (umana), simbolica (basata su conoscenza esplicita) e neurale (fondata su apprendimento statistico) – interpretino e rappresentino le emozioni espresse nel linguaggio naturale. L'indagine si colloca nell'ambito degli studi sulle emozioni relazionali nei contesti digitali e nel più ampio campo dell' affective computing (Picard, 2000), applicata al comportamento del consumatore e dei dipendenti (Nizette & Hammedi, 2025). L'obiettivo del lavoro è duplice: comprendere in che misura diverse forme di intelligenza convergano o divergano nell'interpretazione dell'esperienza affettiva, nonché analizzare le implicazioni di tali dinamiche per le pratiche manageriali, nei domini del marketing e della gestione delle risorse umane. In molteplici contesti organizzativi, difatti, la capacità di riconoscere e interpretare con precisione le emozioni espresse nel linguaggio degli attori coinvolti – che si tratti di colleghi, collaboratori o membri di comunità professionali online – costituisce una risorsa conoscitiva sempre più strategica. Le manifestazioni emotive che emergono da feedback formali, conversazioni informali, strumenti digitali di collaborazione e interazioni nei network professionali contribuiscono infatti a delineare aspetti chiave del clima interno, della qualità delle relazioni e dei processi di coordinamento sia entro sia tra le organizzazioni (Sahut & Laroche, 2025; Zerbini et al., 2007). Questa abilità, legata alle componenti cognitive e sociali dell'intelligenza emotiva, assume un rilievo particolare nei contesti ibridi e virtuali, in cui la comunicazione testuale o mediata accresce la necessità di saper decodificare correttamente i segnali affettivi impliciti.

Secondo il World Economic Forum il World Economic Forum (2023, 2025), competenze come empatia, consapevolezza di sé e capacità comunicativa figurano tra quelle maggiormente richieste ai leader del futuro, anche in ambienti organizzativi caratterizzati da automazione e largo impiego dell'IA. Ciò conferma il ruolo centrale della comprensione delle emozioni altrui come base di un management efficace e orientato alla persona. Allo stesso tempo, la crescente integrazione di sistemi di IA generativa nelle imprese – dai chatbot alle applicazioni di sentiment analysis – rende necessario garantire trasparenza e affidabilità nei processi automatizzati di riconoscimento emotivo. Nel settore dei servizi, in particolare, si rafforza la richiesta di soluzioni di XAI in grado di mantenere elevata la fiducia di clienti e dipendenti nelle analisi algoritmiche (Chamola et al., 2023; Kalasampath et al., 2025).

Le organizzazioni internazionali, tra cui il Parlamento Europeo e l'OECD, richiamano l'attenzione sui rischi connessi a un impiego non regolato delle tecnologie di affect recognition, sollecitando l'adozione di procedure di validazione che ne assicurino accuratezza, affidabilità e conformità ai principi etici (OECD, 2025; Ünver, 2024). In tale quadro teorico si consolida l'idea di un approccio integrato, nel quale la potenza analitica dell'intelligenza artificiale si combini con la sensibilità interpretativa dell'intelligenza umana, in una prospettiva di collaborazione cognitiva che produce forme di conoscenza situate e riflessive (Harfouche et al., 2023; Jarrahi et al., 2023).

Il work in progress qui presentato si colloca all'interno di questa linea di ricerca e concentra l'attenzione sull'analisi del linguaggio emotivo che emerge da interviste qualitative relative alle reazioni suscitate da post su LinkedIn in cui altri utenti celebrano traguardi professionali. Tale contesto, divenuto parte integrante della vita lavorativa digitale, rappresenta un terreno empirico particolarmente adatto per osservare come differenti epistemologie – umana, simbolica e neurale – decodifichino la dimensione emotiva. L'indagine si articola attorno a due interrogativi principali:

RQ1**:** Quali emozioni vengono identificate dai tre approcci di codifica (ermeneutico, simbolico e neurale) nell'analisi delle reazioni ai post professionali su LinkedIn?

RQ2: In quale misura e con quali differenze i tre approcci convergono o divergono nella classificazione delle emozioni?

Nel contesto della ricerca manageriale contemporanea, tale orientamento risponde alla direzione degli sviluppi più recenti dell'intelligenza artificiale spiegabile e collaborativa, secondo cui la convergenza tra risultati umani e algoritmici può rafforzare la fiducia nell'integrazione dell'IA nei processi decisionali, a condizione che le responsabilità interpretative restino chiaramente definite (Nizette & Hammedi, 2025).

2. Impostazione metodologica e struttura della ricerca

Per affrontare le domande di ricerca proposte, il work in progress adotta un disegno qualitativo esplorativo fondato su una triangolazione epistemica che integra tre modalità distinte di lettura di uno stesso corpus testuale. L'assunto di partenza è che la comprensione dei processi emotivi risulti più solida e articolata quando prospettive interpretative eterogenee – umana, simbolica e neurale – vengono poste in relazione reciproca. La triangolazione, intesa come impiego simultaneo di metodi o fonti di dati differenti per convergere su un medesimo fenomeno (Carter et al., 2014), consente di mitigare i limiti di ciascun approccio valorizzandone al contempo i punti di forza, producendo una validazione incrociata delle evidenze empiriche.

Il modello metodologico si ispira ai recenti sviluppi della Computational Grounded Theory (Nelson, 2020), che propone un ciclo iterativo di affinamento reciproco tra algoritmi di machine learning e analisti umani per la costruzione teorica. Secondo Nelson (2020), l'inserimento di tecniche computazionali nei metodi qualitativi può essere concepito come un processo di co-generazione: i sistemi artificiali individuano pattern ricorrenti nei dati testuali, mentre l'analista umano ne interpreta il significato e ne valuta la generalizzabilità, creando un circuito virtuoso di scoperta e verifica concettuale. Seguendo questa logica, il nostro disegno di ricerca impiega

algoritmi simbolici e modelli neurali per identificare configurazioni affettive latenti, successivamente confrontate con la codifica umana. Nei casi di divergenza interpretativa, si procede a una rilettura dei testi originari per comprendere la natura dello scarto e, se necessario, a un raffinamento dei criteri di codifica. Questo procedimento induttivo e iterativo richiama i principi del pattern refinement illustrati da Nelson (2020) e la raccomandazione di Venugopal et al. (2025) di impiegare metodi uomo-macchina per generare insight teorici innovativi nelle scienze manageriali e organizzative.

Contesto e procedura di codifica

Il campo empirico riguarda le reazioni emotive ai post celebrativi di successi professionali pubblicati su LinkedIn. È stato costruito un corpus di interviste semi-strutturate a professionisti appartenenti a diversi settori, invitati a descrivere le proprie reazioni emotive alla lettura di tali contenuti. Le trascrizioni di queste interviste costituiscono la base empirica su cui sono state applicate, in parallelo, tre procedure distinte di codifica delle emozioni.

La prima, di natura ermeneutica, si fonda sulla codifica qualitativa manuale condotta da un ricercatore. L'analisi ha seguito un approccio tematico focalizzato sulle categorie emozionali emergenti, assumendo come riferimento la ruota delle emozioni di Plutchik (1982), che distingue otto emozioni primarie e un insieme di emozioni complesse, derivate dalle combinazioni delle primarie. In una prima fase esplorativa, il ricercatore ha esaminato ciascuna trascrizione annotando le emozioni percepite e delineando un sistema preliminare di codici. Successivamente, le definizioni operative dei codici sono state affinate e applicate sistematicamente all'intero corpus, producendo una matrice che costituisce la baseline per il confronto con le codifiche generate artificialmente.

In seguito, il corpus è stato sottoposto al sistema di intelligenza artificiale simbolica DEGARI 2.0 (Dynamic Emotion Generator And Reclassifier), un motore di ragionamento basato sul commonsense progettato per l'attribuzione e la riclassificazione delle emozioni (Lieto et al., 2023, 2024). Il funzionamento di DEGARI si fonda su un'ontologia emozionale ispirata alla teoria di Plutchik e arricchita da un lessico esteso di termini affettivi, nonché su un insieme di regole logiche che consentono di inferire emozioni complesse a partire da quelle di base. Il sistema analizza il testo individuando parole e frasi semanticamente correlate alle emozioni primarie, integrando risorse linguistiche di dominio pubblico come il NRC Emotion Lexicon (Mohammad, 2018). Quando rileva indicatori semantici riconducibili, ad esempio, a "rabbia" o "fiducia", DEGARI attiva le relative categorie di base e, attraverso regole ontologiche, è in grado di inferire emozioni derivate: la co-occorrenza di indicatori di gioia e fiducia può, ad esempio, generare l'inferenza di ammirazione o amore (gioia + fiducia). L'output del sistema consiste in una lista di etichette emotive associate a ciascun testo.

La terza modalità di codifica impiega un modello linguistico neurale di ampia scala (LLM), rappresentato, in questo studio, da GEMINI 3 PRO. Gli LLM si basano su architetture di rete neurale addestrate su vasti corpora testuali, acquisendo la capacità di comprendere contesti linguistici complessi e di generare risposte coerenti (Naveed et al., 2025). L'utilizzo di GEMINI 3 PRO nell'analisi emotiva è stato mediato da una strategia di prompt engineering (Wafa et al., 2025; Xu et al., 2024), che specificava con precisione le istruzioni operative da seguire. Il prompt forniva al modello indicazioni esplicite sull'adozione della tassonomia di Plutchik e sul formato atteso dell'output, chiedendo di identificare e descrivere le emozioni di base e le loro combinazioni complesse, nonché di motivare le inferenze attraverso brevi commenti. Il prompt utilizzato è il seguente:

"Ruolo e contesto: Agisci come un ricercatore accademico esperto di metodologia della ricerca qualitativa, specializzato in analisi delle emozioni e linguistica del discorso. Ti verranno fornite risposte di intervistati provenienti da un'indagine qualitativa. Il tuo compito è identificare e descrivere le emozioni espresse in ciascuna risposta, facendo riferimento al modello del fiore di

Plutchik, che include le otto emozioni di base (gioia, fiducia, paura, sorpresa, tristezza, disgusto, rabbia, anticipazione) e le loro combinazioni complesse.

Istruzioni operative:

Identifica tutte le emozioni di base rilevabili (una o più, se coesistono nel testo).

Se rilevi combinazioni di emozioni che generano emozioni complesse o derivate (es. amore = gioia + fiducia; senso di colpa = tristezza + paura), segnalale esplicitamente.

Fornisci una breve descrizione che spieghi il ragionamento alla base delle emozioni individuate, riferendoti a parole, tono o contesto semantico.

Evita qualsiasi giudizio o interpretazione psicologica soggettiva.

Formato di output richiesto:

RISPOSTA INTERVISTATO: [testo della risposta]

EMOZIONI DI BASE: [elenco di una o più emozioni di base rilevate]

EMOZIONI COMPLESSE (se presenti): [elenco di emozioni complesse e relative combinazioni]

DESCRIZIONE: [spiegazione sintetica che giustifica l'analisi emotiva]"

Pur offrendo analisi articolate e coerenti, gli LLM rimangono modelli in opachi: i processi interni che conducono a un'etichettatura specifica – ad esempio, distinguere tra ansia e anticipazione – non sono direttamente osservabili, se non per abduzione. Questa opacità, unita alla possibile influenza dei dati di addestramento, costituisce un limite noto. Un modello può, infatti, riprodurre associazioni apprese da fonti web che non necessariamente riflettono le intenzioni dell'intervistato. Per mitigare tali rischi, il prompt è stato formulato in modo da ancorare l'analisi al contesto semantico specifico del testo, limitando inferenze basate su associazioni generiche. È opportuno ricordare che modelli di ultima generazione come GEMINI 3 PRO mostrano prestazioni sensibilmente superiori rispetto ai LLM precedenti nei compiti di sentiment analysis ed emotion detection, grazie a architetture più avanzate e dataset di addestramento più diversificati (Mallia, 2025; Yu et al., 2025).

3. Risultati preliminari e analisi comparativa delle codifiche emotive

L'analisi comparativa delle codifiche emotive prodotte dai tre approcci restituisce un quadro articolato in cui convergenze robuste coesistono con divergenze teoricamente istruttive (Tabella 1). Tutti i metodi si ancorano alla medesima architettura concettuale – il fiore delle emozioni di Plutchik – e riconducono le manifestazioni affettive a insiemi di categorie largamente sovrapponibili sul piano delle famiglie primarie. Questa prima evidenza è non banale: la triangolazione consente di ottenere una mappa coerente dei nuclei affettivi ricorrenti nelle narrazioni degli intervistati, confermando che, al di là della specifica lente interpretativa, certi insiemi emozionali si attivano con una regolarità che risponde positivamente alla RQ1. Al contempo, la comparazione mette in luce differenze nel livello di dettaglio, nelle combinazioni tra emozioni e nella coerenza categoriale con cui ciascun metodo restituisce gli stati affettivi offrendo, così, elementi puntuali per la RQ2.

Sulle emozioni positive, in particolare su fiducia e gioia, ricercatore e DEGARI convergono in modo sistematico. La fiducia emerge come sentimento ricorrente e spesso centrale: l'osservazione di successi altrui su LinkedIn può attivare fiducia in sé – quando la risposta è orientata all'auto-efficacia – o riconoscimento della fiducia riposta nell'altro – quando prevale l'ammirazione. La gioia accompagna con frequenza tale dinamica, talora insieme a ottimismo o serenità. L'architettura semantica di DEGARI intercetta con regolarità trust in presenza di espressioni di sicurezza, stima o affidamento, replicando con accuratezza il codice "fiducia" applicato dal ricercatore; quando i testi umani segnalano intrecci di fiducia e gioia (come, ad esempio, "Sono felice per il successo del mio collega, mi fa pensare che anche io potrei farcela"), il sistema simbolico ricompone l'assetto in etichette composte (es. ammirazione). In questo segmento, la vicinanza tra razionalità ermeneutica e simbolica indica che un motore knowledge-

based ben calibrato può produrre etichette allineate al significato contestuale dei passaggi testuali, in modo non distante dal percorso inferenziale deliberato del ricercatore. GEMINI 3 PRO, pur allineandosi sui due poli positivi, tende a leggere fiducia come un equilibrio dinamico tra apertura e difesa e a includere, accanto alla positività espressa, tracce di cautela o di sollievo rispetto a timori impliciti.

Particolarmente istruttiva è la trattazione di anticipazione/aspettativa, emozione ponte che connette orientamento positivo e tensione cognitiva. Molti intervistati descrivono la coesistenza di curiosità verso le storie di successo e di attesa rispetto al proprio futuro professionale. Nelle codifiche umana e simbolica tali passaggi si attestano prevalentemente su anticipazione – intesa come disposizione proattiva al futuro – o su un interesse cognitivo privo di tonalità marcatamente negative; quando emergono sfumature di apprensione, il ricercatore le distingue con etichette dedicate, mentre DEGARI tende a segnalarne la bassa intensità o a non attivare emozioni negative in assenza di marcatori lessicali netti. GEMINI 3 PRO, invece, scompone più spesso l'anticipazione in configurazioni ambivalenti, affiancando alla spinta propulsiva del futuro indizi di insicurezza o lieve frustrazione. Il pattern si ripete quando l'interesse per contenuti formativi o critici ("spunti che mi fanno riflettere e mi incuriosiscono sul mio percorso") viene codificato come interesse/anticipazione dal ricercatore e da DEGARI, mentre GEMINI 3 PRO aggiunge una lieve ansia di miglioramento. È ragionevole ipotizzare che il modello neurale, avendo appreso distribuzioni d'uso su ampie basi testuali, completi l'aspettativa con emozioni che nella pratica linguistica tendono ad accompagnarla, accentuando la dimensione tensiva. Ne risulta una divergenza epistemologica: simbolico e umano privilegiano la funzione di sorpresa e aspettativa, il neurale accentua la componente di tensione o incertezza; la concordanza sull'anticipazione come emozione ponte rimane, ma la granularità del dettaglio diverge rispondendo, così, alla RQ2.

La comparazione delle emozioni complesse conferma il medesimo schema di (quasi) allineamento tra umano e simbolico, con un comportamento neurale più estensivo. La speranza, richiamata spontaneamente in formulazioni come "mi dà speranza vedere che si può avere successo restando autentici", è trattata secondo la struttura di Plutchik come anticipazione+fiducia: il ricercatore la codifica tipicamente combinando i due costrutti – talvolta con l'etichetta esplicita di speranza – e DEGARI opera in modo analogo, generando "ottimismo" o "speranza" a seconda delle sfumature. GEMINI 3 PRO identifica anch'esso speranza/ottimismo come baricentro semantico ma, talora, associa alla tonalità positiva una componente di disapprovazione o lieve disgusto verso toni celebrativi percepiti come eccessivi, andando oltre la singola risposta. Analogo è l'esito sull'ammirazione, rispetto alla quale i tre metodi risultano generalmente coincidenti quando il segnale testuale è netto. Le divergenze si ampliano, invece, per l'invidia. Gli intervistati descrivono sia forme "benigne", legate a stimolo e ispirazione, sia forme "maligne", con tratti di rabbia e tristezza. Ricercatore e DEGARI si mostrano sensibili al contesto pragmatico e modulano le etichette distinguendo i casi di invidia come spinta autopoietica da quelli di disagio competitivo; GEMINI 3 PRO riconosce entrambe le varianti ma tende ad accentuare la componente conflittuale, facendo emergere tracce di frustrazione anche in enunciati globalmente costruttivi. Questo scarto suggerisce che il modello neurale, pur padroneggiando la distinzione concettuale, sovrastimi la probabilità di co-occorrenza di stati negativi quando intercetta lessici tipici dell'invidia.

Sul versante delle reazioni avverse a post percepiti come eccessivi, autoreferenziali o poco autentici, la distanza tra approcci si amplia ulteriormente. Le narrazioni degli intervistati includono spesso fastidio verso contenuti ritenuti stucchevoli o poco autentici. Il ricercatore interpreta tali passaggi principalmente come disgusto – avversione di base – accompagnato da disprezzo – componente valutativa di svalutazione; DEGARI, ricostruisce la coppia attivando disgusto e, quando compaiono marcatori di irritazione, anche rabbia, da cui discende l'etichetta disprezzo. GEMINI 3 PRO riconosce queste traiettorie ma vi affianca categorie semantiche contigue (es. disapprovazione) e, talvolta, introduce elementi ulteriori come lieve rimorso o

tristezza per aver espresso giudizi severi, ampliando il profilo affettivo oltre i confini del lessico plutchikiano.

Pertanto, in questa prima analisi, emerge che, rispetto alla RQ1, tutte le letture – ermeneutica, simbolica e neurale – riconoscono l'intero spettro delle famiglie plutchikiane presenti nel corpus: nelle dinamiche di confronto sociale positivo prevalgono gioia e fiducia, da cui discendono ammirazione, ottimismo e serenità; di fronte a retoriche percepite come artificiose si concentrano disgusto e disprezzo, talora con lieve irritazione; nelle proiezioni al futuro ricorrono anticipazione e fiducia, che compongono speranza; nei dilemmi di esposizione pubblica e timore del giudizio affiorano paura e tristezza; l'invidia, nelle sue varianti benigna e maligna, è riconosciuta trasversalmente. Con riferimento alla RQ2, la convergenza più forte si osserva tra ricercatore e DEGARI mentre GEMINI 3 PRO, pur intercettando le stesse macro-emozioni nella quasi totalità dei casi, diverge su due assi: la proliferazione di etichette per singolo estratto e la propensione a restituire co-occorrenze multiple in luogo di una categoria dominante. Questo comportamento riflette la natura statistico-probabilistica del modello, orientata a coprire lo spazio semantico delle possibilità.

Nel loro insieme, questi risultati – che presentiamo come work in progress – suggeriscono momentaneamente che un sistema simbolico ancorato a un'ontologia solida può avvicinarsi sensibilmente alla sensibilità del ricercatore, mentre un LLM di ultima generazione, pur riconoscendo i medesimi nuclei affettivi, tende a densificare la rappresentazione con componenti aggiuntive e talora latenti.

Famiglia emotiva	**Ricercatore**	**DEGARI (simbolico)**	**GEMINI 3 PRO (neurale)**	**Convergenze**	**Divergenze, virgolettato, note esplicative**
Gioia e Fiducia nei successi altrui (post di traguardi, carriere, etc.)	Codifica fiducia e gioia come asse portante del confronto sociale positivo. Distingue accuratamente tra gioia per l'altro, fiducia in sé e fiducia riposta nel collega.	Intercetta con grande coerenza trust/fiducia quando il testo esprime sicurezza, stima, affidamento, spesso producendo etichette allineate (fiducia, gioia, ottimismo, amore-philia).	Riconosce gioia e fiducia, ma tende ad arricchire con componenti ulteriori (es. cautela, sollievo, equilibrando apertura/difesa).	Forte convergenza sulle famiglie primarie di Plutchik: fiducia + gioia come base di ammirazione, serenità, ottimismo; questo vale per l'intero corpus, specie quando i successi sono percepiti come autentici.	Distonia principale: Gemini eccede in co-occorrenze (fiducia + gioia + sollievo + cautela), mentre ricercatore e DEGARI tendono a una categoria dominante. Esempio: "Sono felice per il successo del mio collega, mi fa pensare che anche io potrei farcela" Ricercatore/DEGARI: fiducia + gioia/ammirazione; GEMINI: aggiunge spesso componenti tensivo–difensive.
Anticipazione/Aspettativa/Interesse (emozione ponte verso il futuro)	Codifica aspettativa/anticipazione prevalentemente in chiave proattiva (curiosità, orientamento al futuro, interesse cognitivo). Quando compaiono sfumature negative (apprensione, ansia), le separa con etichette distinte.	Tende ad attivare anticipazione e interesse con tonalità moderatamente positive; evita di far emergere emozioni negative se il testo non contiene marcatori lessicali netti. Segnala la bassa intensità quando presente.	Scompone molto spesso l'anticipazione in configurazioni ambivalenti, combinando propulsione al futuro con insicurezza, lieve frustrazione, ansia di miglioramento (es. "ansia da prestazione").	Convergenza sulla funzione di "emozione ponte": anticipazione come nodo che connette curiosità, progettualità, riflessione sul proprio percorso.	Divergenza: Ricercatore + DEGARI privilegiano sorpresa/aspettativa come apertura cognitiva; GEMINI accentua la tensione/insicurezza. Esempio: "spunti che mi fanno riflettere e mi incuriosiscono sul mio percorso" Ricercatore/DEGARI: interesse/anticipazione; GEMINI: aggiunge "lieve ansia di miglioramento".

Emozioni complesse positive (speranza, ammirazione, ottimismo)	Tratta speranza secondo Plutchik come anticipazione + fiducia; la codifica spesso come combinazione (anticipazione+fiducia, ottimismo) e, quando il lessico lo consente, usa l'etichetta esplicita di "speranza". Sull'ammirazione, mostra forte sensibilità al contesto (stima autentica vs enfasi artificiale).	Ricostruisce strutturalmente le combinazioni plutchikiane: speranza/ottimismo generati come anticipazione + fiducia, ammirazione come gioia + fiducia. L'output è molto allineato alla logica teorica del ricercatore.	Individua speranza/ottimismo come baricentro, ma espande il profilo affettivo associando talvolta disapprovazione o disgusto lieve verso toni celebrativi eccessivi, andando oltre la singola risposta.	Concordanza generale su: "mi dà speranza vedere che si può avere successo restando autentici" Tutti riconoscono speranza/ottimismo come struttura centrale (anticipazione + fiducia).	GEMINI eccede in "densità semantica": accanto alla speranza introduce valutazioni metadiscorsive (disapprovazione per il tono celebrativo). Ricercatore e DEGARI risultano più "parchi" e aderenti alla micro-unità testuale, GEMINI tende a proiettare sul contesto narrativo più ampio.
Invidia benigna vs maligna (stimolo vs disagio competitivo)	Distingue tra invidia benigna (stimolo, miglioramento, curiosità sul percorso altrui) e invidia maligna (rabbia, tristezza, disagio competitivo). Modula le etichette in base al contesto pragmatico, riconoscendo quando l'invidia funge da spinta autopoietica.	È sensibile al contesto: alterna combinazioni di gioia/anticipazione/fiducia per la forma benigna a disgusto/rabbia/tristezza per la forma maligna. Disprezzo e disgusto emergono quando è esplicito il rifiuto di una forma di invidia "che rode".	Riconosce entrambe le varianti e utilizza esplicitamente la categoria Invidia (rabbia + tristezza), ma tende ad accentuare la componente conflittuale, facendo emergere frustrazione anche in enunciati globalmente costruttivi.	Convergenza concettuale sulla validità della distinzione benigna/maligna, e sul fatto che la prima è spesso descritta come "stimolo" o "curiosità" ("magari un giorno anche io"), mentre la seconda viene riconosciuta e contenuta.	Scarto principale: GEMINI sembra sovrastimare la co-occorrenza di stati negativi quando intercetta lessico legato all'invidia, amplificando rabbia/frustrazione anche dove il ricercatore e DEGARI leggono prevalentemente motivo di miglioramento. Esempio: "L'invidia vera e propria, quella che rode, non mi appartiene" Ricercatore/DEGARI: distanziamento dall'invidia maligna; GEMINI mantiene comunque in background le componenti negative come probabilmente attivabili.
Reazioni avverse a contenuti percepiti come artificiosi, autoreferenziali o "vetrina"	Interpreta il fastidio per post eccessivi come combinazione di disgusto (avversione di base) + disprezzo (valutazione svalutante). Introduce rabbia/irritazione quando il tono viene percepito come ostentativo o manipolatorio.	Ricostruisce la coppia attivando disgusto e, in presenza di marcatori di irritazione, rabbia, da cui deriva l'etichetta disprezzo. Rimane generalmente interno al vocabolario plutchikiano, con buona aderenza ai nuclei semantici negativi.	Riconosce le stesse traiettorie (disgusto, disprezzo), ma vi affianca categorie contigue (es. disapprovazione) e introduce spesso componenti ulteriori: lieve rimorso, tristezza, ansia, talvolta per aver espresso giudizi severi.	Tutti gli approcci concordano sul cluster disgusto–disprezzo come reazione tipica ai post "troppo celebrativi", "vetrine", "televendita del proprio curriculum", "brochure viventi".	Gemini "densifica" la scena affettiva: amplia il profilo oltre il lessico di Plutchik includendo disapprovazione, rimorso, tristezza. Ricercatore e DEGARI risultano più parchi e focalizzati sui vettori disgusto/disprezzo. Esempio: "quelli troppo celebrativi li scorro via"; "non sono per i titoli in maiuscolo e gli emoji a raffica"; "siamo esseri umani, non brochure viventi".
Pressione sociale, confronto e ansia da prestazione	Evidenzia, specie in Int_1 e Int_4, la presenza di aspettativa, vigilanza, apprensione e, nei passaggi esplicitamente critici, paura e tristezza legate al timore del giudizio e alla pressione a mostrarsi sempre performanti. Tuttavia sottolinea	Attiva con parsimonia le emozioni negative (paura, tristezza, rabbia) a intensità bassa e spesso le compensa con fiducia, amore, aspirazione, rispecchiando la presenza di criteri interni e "autostima" implicita.	Esplicita più frequentemente Paura, Ansia, Sottomissione, soprattutto nei riferimenti a "pressione latente", "ansia da prestazione", "narrativa faticosa". Tende a costruire configurazioni in cui l'utente è	Tutti riconoscono la presenza di confronto sociale e percezione di pressione implicita, ma anche il ruolo protettivo dei valori interni (coerenza, etica del lavoro, qualità della ricerca) nel mitigare l'ansia.	Distonia sistematica: GEMINI enfatizza di più il vettore ansioso–sottomissivo, mentre Ricercatore e DEGARI mantengono il fuoco sulla dialettica tra tensione e regolazione (es. "cerco di interpretarla in chiave costruttiva", "non sento il bisogno di mettermi in vetrina"). Questo riflette la

	anche strategie di coping (ridimensionare l'uso della piattaforma, risintonizzarsi sui propri valori).		stretto tra norme sociali e accettazione ("Sottomissione = Paura + Fiducia/accettazione delle norme").		tendenza del modello neurale a completare l'"aspettativa" con emozioni tensionali statisticamente frequenti nei corpora.
Regole implicite, critica alla "narrativa del successo" e desiderio di autenticità	Codifica sistematicamente rabbia, disgusto, tristezza, disprezzo verso la narrativa implicita del "successo permanente", ma li bilancia con fiducia, speranza, ottimismo rispetto alla possibilità di trasformare LinkedIn in uno spazio "più onesto, meno competitivo, più umano e vulnerabile".	Rende questa tensione con combinazioni di fiducia, gioia, aspettativa, ottimismo, amore (per la comunità e per la vulnerabilità condivisa), lasciando in secondo piano la componente di conflitto, pur presente (disgusto/disprezzo a bassa intensità).	Meticolosamente articola disgusto, tristezza, disapprovazione verso la "recita collettiva", la "tendenza sotterranea" a mostrarsi brillanti, accanto a anticipazione, speranza e cluster come Amore, Speranza (anticipazione + fiducia), spesso esplicitati.	Convergenza sull'idea che esistano regole implicite e che la piattaforma incentivi logiche di vetrina/performance, ma anche sull'orizzonte desiderato: più contenuti di percorso, più "non so" e "sto cercando di capire", più vulnerabilità professionale.	GEMINI tende ad esplicitare in maniera molto estesa sia la critica (disgusto/disapprovazione) sia la dimensione propositiva (speranza, amore/agape), "densificando" lo spazio emotivo. Ricercatore e DEGARI, pur convergendo sui nuclei, producono codifiche più economiche. Esempio: "LinkedIn possa evolvere verso una piattaforma più onesta", "non vetrine ma luoghi di scambio", "la vulnerabilità non come debolezza ma come connessione", "non siamo brochure viventi".

Tabella V. Tabella di sintesi comparativa dei tre sistemi di analisi emotiva

4. Discussione dei risultati e valore scientifico potenziale

I risultati finora conseguiti, frutto di una ricerca ancora in corso, offrono stimoli di riflessione su molteplici piani.

L'indagine conferma il valore di una prospettiva multi-razionale nell'analisi delle emozioni, mostrando come le tre forme di intelligenza convergano su un nucleo affettivo comune, riconoscibile attraverso epistemologie differenti. Tale convergenza suggerisce che strumenti di intelligenza artificiale come DEGARI, se opportunamente progettati, possano avvicinarsi al giudizio umano anche in domini complessi come quello linguistico-emozionale. Le divergenze emerse, tuttavia, sono altrettanto significative poiché evidenziano le specificità interpretative di ciascun approccio. L'elevata corrispondenza tra DEGARI e l'analisi ermeneutica mostra come una razionalità basata su regole e concetti espliciti possa generare rappresentazioni affettive comparabili a quelle umane, fungendo da "secondo ricercatore" capace di estendere la scala dell'analisi e garantirne replicabilità e coerenza. In questa prospettiva, l'intelligenza simbolica può essere impiegata come supporto nelle fasi di codifica qualitativa, in un processo di ibridazione che combina l'esplorazione computazionale con la sensibilità interpretativa del ricercatore (Venugopal et al., 2025).

L'analisi condotta con GEMINI 3 PRO evidenzia, invece, la complessità e l'eterogeneità proprie dei modelli neurali. L'ampiezza e la variabilità delle etichette prodotte possono generare risultati articolati ma difficili da interpretare in assenza di un riferimento teorico solido; ne deriva, dunque, l'importanza di mantenere un controllo semantico umano poiché solo l'integrazione tra

competenza ermeneutica e calcolo algoritmico consente di evitare distorsioni interpretative, nonché di preservare l'affidabilità epistemica nell'analisi di esperienze affettive complesse.

Dal punto di vista manageriale e, in particolare, di marketing, i risultati evidenziano l'utilità di una lettura più fine delle emozioni che si manifestano nei contesti digitali di confronto sociale. Comprendere come emozioni positive coesistano con emozioni ambivalenti o negative, come invidia o disprezzo, aiuta a interpretare con maggiore precisione i processi di costruzione del sé e di percezione dell'altro nella comunicazione professionale online. La rilevazione di un'invidia latente, spesso celata dietro forme di cordialità, offre spunti strategici per le pratiche di employee engagement e per la progettazione di messaggi e post più empatici, evitando effetti indesiderati di competizione o inadeguatezza. Strumenti ibridi di analisi emotiva, basati sulla collaborazione tra ricercatore e IA potrebbero, inoltre, consentire il monitoraggio in tempo reale del clima affettivo aziendale, individuando precocemente segnali di disaffezione o malcontento e supportando interventi tempestivi di guida e comunicazione.

Più in generale, la capacità di interpretare con accuratezza le emozioni espresse dai consumatori nelle interazioni digitali – recensioni, commenti, post – rappresenta un vantaggio competitivo cruciale. L'approccio proposto consente di superare i limiti della sentiment analysis tradizionale, ancora troppo legata a modelli black box, e di evolvere verso una emotional analysis trasparente. Tale metodo consente di distinguere non solo la polarità del sentimento, ma la composizione affettiva sottostante offrendo una comprensione più ricca dei driver emozionali che orientano le percezioni di marca e le decisioni di acquisto.

L'adozione di simili strumenti, tuttavia, richiede una nuova alfabetizzazione manageriale all'uso dell'intelligenza artificiale e una competenza emotiva capace di integrare sensibilità etica e capacità analitica. Come osserva McKinsey (2025), la sfida non consiste solo nel disporre di tecnologie avanzate ma nel saperle interpretare e tradurre in decisioni responsabili e orientate al valore relazionale. In questa direzione, la collaborazione tra intelligenza umana e simbolica (DEGARI) diventa strumento di conoscenza, networking e leva di vantaggio competitivo, personale e d'impresa.

Parole chiave: Analisi delle emozioni; triangolazione epistemica; IA simbolica e neurale; confronto sociale digitale

Where sectors meet: festival as space of collaboration

Alessia Anzivino[1], Lala Hu[2], Roberta Sebastiani[3]

1. Introduction

Festivals are often regarded as platforms for displaying cultural expression, artistic talents, and shared community experiences. They encompass a wide array of events in diversified sectors, from music, film, literature, and performing arts festivals to smaller, localized celebrations of specific traditions or practices (Quinn, 2006). From a marketing perspective, festivals have been analyzed by adopting the relationship marketing approach (Collin-Lachaud & Duyck, 2002; Larson, 2002). However, literature to date focused on specific aspects of festivals, e.g., effects on visitors or marketing management of the festival as a product.

The recent proliferation of festivals as platforms for sustaining cultural industries and local economies has attracted increasing attention from scholars, professionals, and local governments (Lin & Bestor, 2020; Leone & Montanari, 2022).

Festivals have been considered in literature as social constructs that mirror and influence cultural values and identities (Getz, 2010), this perspective offers a lens through which understanding the role of creative and cultural industries within larger cultural and economic ecosystems. Indeed, festivals create opportunities for individuals to discover and build collective understanding and communities (Quinn et al., 2020; Wu et al., 2020), and they are shaped through the interactions of diverse actors who come together at a specific time and place, united by a common purpose (Quinn et al., 2020).

Festivals rely on partnerships between heterogeneous actors, such as companies, non-profit organizations, and public entities, this ensures financial stability, improves cultural offerings, and enhances community engagement (Getz et al., 2006). These collaborations arise from the benefits they offer to the community and to the single actors (Getz et al., 2006): through participation in the organization and management of a festival, public organizations may seek to promote, for example, cultural tourism and social cohesion; private companies can leverage festivals for marketing and brand visibility through sponsorships; and non-profit organizations through these events try to enhance community wellbeing and cultural preservation.

Given this, the study analyzes cultural festivals as platforms, and specifically the relationships among different actors belonging to heterogeneous sectors. In the festival context, so far, previous literature has posed more attention on customer perspective on value co-creation processes (Werner et al., 2020). Indeed, in the context of festivals, multiple interactions are activated among different actors (e.g., partners, local governments, profit and non-profit organizations, etc.) belonging to diversified industries, a topic that has been overlooked in previous studies.

According to Collin-Lachaud and Duyck (2002), festivals are characterized by a multiplicity of financing sources, many targets, and a complex marketing. Indeed, the marketing process of a festival involves interactions among actors with varying degrees of relationships whose interests might differ (Larson, 2002). Festivals can be viewed as systems of heterogeneous units that

[3] Professoressa ordinaria, ECON-07/A. Università Cattolica del Sacro Cuore; roberta.sebastiani@unicatt.it

interact to achieve a common purpose. (Troisi et al., 2019). Evrard (1991) identified three marketing levels: upstream (or standard marketing), in which the target is the consumer; downstream, which addresses suppliers of goods and services; and lateral, which is associated with private, non-profit, and public-sector partnerships.

Moreover, previous literature has posed more attention on value co-creation processes considering the customer perspective (Werner et al., 2020), for instance by analyzing co-creation among festival participants (Rihova et al., 2018), while the relationships between the heterogeneous actors that intervene in festivals creation and management have been overlooked.

Our research focuses on how different actors, including profit, non-profit and public organizations, integrate their resources and co-create value in the context of cultural festivals. This study responds to recent calls for a more integrated and comprehensive approach to festival management that considers the cross-sector actors' collaborations and interactions (Andersson et al., 2009; Getz al., 2010; Wilson et al., 2017).

2. Methodology

This study employs a multiple-case study methodology, a qualitative approach well-suited for exploring emerging and complex phenomena (Stake, 1995; Yin, 2014), such as those examined in our research. We chose a multiple-case study approach to develop a more generalizable theory by comparing and replicating findings across different cases (Eisenhardt & Graebner, 2007). Furthermore, this approach enables the investigation of data from several cases throughout a continuous process of comparing empirical data and theory, seeking a close alignment between them (Creswell & Creswell, 2017; Gehman et al., 2018). The empirical data for the investigation consist of two in-depth, longitudinal case studies, aimed at achieving a full understanding of the phenomenon studied in this paper.

Primary data were collected throughout 12 semi-structured interviews conducted between 2022 and 2025 with 8 key informants, which include festival founders, company managers, policymakers, and other key informants.

3. Preliminary Findings

In our preliminary analysis, we identified three aggregate dimensions that explain how heterogeneous actors co-create value when collaborating in managing cultural festivals: actors' engagement, actors' resource integration, and collaboration challenges.

3.1. Actors' engagement

The management and organisation of cultural festivals brings together a wide range of actors and mobilises resources from local institutions, non-profit organisations, and companies. Preliminary findings show that festivals can connect diverse stakeholders by fostering an environment of collaboration that encourages engagement, interaction and the co-creation of value among local companies, cultural associations and artists. Rather than focusing solely on event management, the festivals we analysed prioritised community development and long-term relationship building. This is achieved through tailored engagement strategies that recognise the contributions of each stakeholder and utilise communication channels beyond the festival itself. Many stakeholders use their own social media, for instance, to reach broader audiences throughout the year, intensifying communication before and after the event. These strategies necessitate the reorganisation of roles, as actors' responsibilities often evolve over time. For instance, a non-profit organisation may initially act only as a co-founder, but later become the main promoter of the festival, forming new partnerships with other companies in the process.

Public institutions also experience a change of traditional roles, starting as sponsors and later becoming connectors that link artists, associations, and communities: when public actors assume the role of connectors, festivals benefit from this change and interactions evolve into stable, long-term collaborations that produce new cultural initiatives benefiting broader communities.

3.2 Resource integration

Preliminary results have highlighted the positive outcomes generated by collaboration between the various actors involved in organizing and managing festivals. Festivals bring together organizations with different institutional structures, allowing them to integrate their resources, skills, and knowledge. This cooperation encourages the creation and sharing of knowledge about the communities of reference and their needs. The role of festivals as fertile ground for building new relationships and strengthening existing ones thus emerges, as participants become aware of the specific resources and capabilities of each actor, both at the personal and systemic levels. Preliminary research results also show that each actor involved in the festival contributed not only with economic resources, but also with non-economic resources: cultural organizations brought artists and community associations into contact, while companies, for example, provided essential funding. This integrated contribution strengthened the structure of the festival and improved its long-term impact.

Local public institutions play a dual role: they finance and sponsor festivals, and they also assume the role of connector between festival organizers and local associations, companies, and cultural groups, and through this, they stimulate the broader community involvement. Preliminary findings also show that cultural festivals, through performances, exhibitions, and creative activities, take on an educational role for the public, raising awareness of local traditions and stimulating a deeper understanding of cultural heritage. By highlighting local narratives and artistic expressions, festivals showcase the stories of residents in different neighborhoods. This approach strengthens the ties between artists and their communities and promotes cultural inclusion, enabling marginalized groups to participate actively. Through participatory dramaturgical processes, festivals encourage co-creation, allowing different actors to exchange ideas and perspectives, thus enriching the experience of all the actors involved. The analysis of the interviews and secondary data showed that when actors with different objectives collaborate, the overall mission of the festival becomes a guiding reference for the development of partnerships and the integration of resources.

3.3 Collaboration challenges

The case studies reveal several misalignments that could create frictions and tensions in festival management, largely due to the diverse perspectives, languages, timeframes, and objectives of the actors involved. For example, sometimes organizers noted a limited participation from local communities, despite the festival's themes and aims.

The analysis of data shows a recurring challenge that concerns the attraction of resources and the maintenance of long-term commitment from heterogeneous actors: while a festival's cultural mission can unify contributions from public institutions, companies, and non-profit organizations, aligning their differing objectives and perspectives remains a complex issue. Each actor brings specific priorities and expectations, and although pooling resources can strengthen the festival's impact, it can also generate frictions and tensions that need to be addressed. When economic objectives dominate, the festival risks drifting away from its core purpose of cultural enrichment and community engagement and this may lead to decisions that prioritize the economic sphere rather than artistic or social value, weakening the festival's identity and long-term viability.

Additionally, reliance on multiple funding sources can expose festivals to instability: divergent requirements from stakeholders may result in compromises that dilute the original mission. These conflicting priorities can impede cooperation and slow decision-making processes.

Preliminary findings show the importance of establishing strong communication channels and shared values among stakeholders to manage these complexities. Ensuring that the cultural mission remains central, taking also into account economic issues, is essential to safeguard the festival's integrity, strengthen collaborations, and maintain its impact within the community.

4. Preliminary Conclusions

This ongoing research shows that actors' engagement and the integration of their resources are central to the co-creation of value within the organization and management of cultural festivals. At the same time, several challenges emerge, given the diversity of actors involved and the different goals, languages, and timelines they bring.

Findings indicate that festivals can be considered as a "place" where value is co-created among heterogeneous actors. They act as dynamic platforms (Blasco-Arcas et al., 2020; Kleinaltenkamp, et al., 2019) where public institutions, companies, and non-profit organizations work together, share knowledge, and combine both material and intangible resources. Within this collaborative environment, actors often change their original roles over time, adapting to evolving needs and contributing to value creation not only for the festival itself but also for the broader community. Collaboration frequently extends beyond the event days and continues through social media and communication, throughout the year, strengthening relationships and expanding participation.

Festivals also play an important territorial role by fostering local networks (Hjalager & Kwiatkowski, 2018), enhancing place-based knowledge, and supporting community development: they create a shared environment in which actors collectively define and express the cultural identity of the area, promote inclusive initiatives, and enable beneficiaries to attribute new meanings to cultural activities.

However, cooperation among heterogeneous actors also generates tensions and frictions (Vogel et al., 2022). Divergent interests may lead to outcomes that do not fully align with the festival's cultural mission: economic pressures, for instance, can overshadow social or community-oriented goals. Additionally, the involvement of companies, for example, with high brand awareness, sometimes risks marginalizing the contributions of non-profit organizations.

All these potential frictions require ongoing discussion, communication, and alignment among actors to ensure collaboration remains effective and sustainable. However, paradoxically, differences in perspectives may encourage actors to explore new forms of cooperation and collaboration that could enrich the partnerships and stimulate innovation.

When Nature Becomes Data: How Digital Platforms Are Rewriting Biodiversity

Chiara Ottolenghi[1], Valentina Cucino[2], Gennaro Iasevoli[3]

1. Introduction and objectives

Biodiversity has emerged as a critical theme within sustainability and management studies (Testa et al. 2025). It represents a foundational component of the ecological systems that support organizational activity, yet it is simultaneously placed at risk by those same activities. Recognizing this dual condition—organizations relying on biodiversity while contributing to its degradation—introduces a systemic lens through which the relationship between business and the natural environment can be reconsidered. Within this evolving perspective, digital platforms and digital ecosystems are becoming increasingly relevant, as they offer new mechanisms to monitor, coordinate, and manage interactions between firms and ecological resources.

In recent years, both scholars (Winn & Pogutz, 2013; Testa et al. 2025) and consulting firms (Accenture, 2023; Deloitte, 2025) have shown increasing interest in biodiversity.

Although sustainability research has traditionally concentrated on issues such as climate change and pollution, the loss of biodiversity has only recently begun to attract substantial interest within the sustainability management domain (Testa et al., 2025). Scholars argue that bringing biodiversity and related notions—such as ecological systems and the functions they perform—into the management debate broadens the analytical frame through which interactions between firms and the natural environment are examined (Winn & Pogutz, 2013). Businesses activities rely on ecological resources and processes, yet these same activities frequently degrade them through emissions, waste generation, overexploitation, and other pressures. By acknowledging this dual relationship of dependency and influence, the increasing focus on biodiversity encourages a move away from narrow, performance-driven arguments and opens the door to more systemic and critical reflections on how organizations engage with the natural world.

Given that biodiversity is a relatively recent topic within the management domain—gaining momentum in the literature only in the past few years—and considering the rapid expansion of research on digital platforms and digital ecosystems, we identified the need for an initial exploratory step. A quantitative review of the existing literature was considered appropriate to understand how these themes are currently addressed in academic studies. Consequently, conducting a structured literature analysis that organizes and synthesizes prior studies becomes essential to provide researchers with a comprehensive overview of the topic as a whole.

The aim of the present study is to provide a comprehensive analysis of the existing literature at the intersection of biodiversity and digital platforms and ecosystems, through a bibliometric analysis. Bibliometric methods are particularly suitable for identifying the intellectual structure and dominant trajectories of an emerging field, thereby offering evidence-based insights that can inform and direct subsequent research (Siao et al., 2022). Building on this premise, our analysis

[1] Assistant Professor, ECON-07/A, University of Rome LUMSA; c.ottolenghi@lumsa.it – corresponding author

[2] Associate Professor, ECON-07/A, University of Rome LUMSA; v.cucino@lumsa.it

[3] Full Professor, Pro-Rector for Research and Internationalization, ECON-07/A, University of Rome LUMSA; iasevoli@lumsa.it

explores how biodiversity is linked to digital platforms and ecosystems, how the resulting thematic configurations relate to one another, and how they have evolved over time. Accordingly, this bibliometric review addresses the following research questions:

RQ1: What are the dominant themes characterizing research that jointly examines biodiversity and digital platforms?

RQ2: How are these themes conceptually related and structured within the field?

RQ3: How have the core themes and their interrelationships evolved over time?

2. Conceptual background

2.1. Biodiversity

According to the Convention on Biological Diversity (1992), biodiversity encompasses the range of living organisms across all environments—terrestrial, marine, and freshwater—and includes variation within species, among species, and across ecosystems. In more concise terms, biodiversity can be described as the diversity of living forms and the variability in their characteristics and functions (Cardinale et al., 2012).

Although the expression biological diversity has been informally used since the nineteenth century, its formal introduction in academic discourse is attributed to Wilson in the late 1980s (Colwell, 2009). Subsequent ecological research has expanded this notion, framing biodiversity as the genetic, taxonomic, and functional heterogeneity of life over space and time (Naeem, 2009). In this view, biodiversity reflects the interaction of organisms with the non-living components of their environment, forming ecological systems.

Contemporary ecological theory emphasizes that biodiversity is far more than a simple count of species. Instead, it represents a hierarchical construct observable at multiple organizational scales—ranging from genes and individuals to populations, communities, ecosystems, and biomes—and it can be examined through different analytical lenses, such as evolutionary or ecological perspectives. For instance, species richness refers to how many species belonging to a certain group (e.g., birds, mammals) exist within a given habitat, whereas at broader spatial scales biodiversity may refer to the distribution, composition, and configuration of ecosystems.

A further distinction concerns the concepts of functional diversity and response diversity. Functional diversity relates to the variety of ecological roles carried out by species within an ecosystem (e.g., pollination or nutrient cycling), while response diversity indicates the range of ways through which a specific function can be performed by different organisms (e.g., pollination by insects versus birds) (Elmqvist et al., 2003). Functional groups thus contribute to the overall performance of ecological systems, and greater species diversity is typically linked to higher levels of ecosystem functioning and productivity (TEEB, 2011).

Taken together, these contributions conceptualize biodiversity as a systemic property: it reflects the diversity of biological components, the ecological processes they support, and the resilience of the systems in which they operate.

2.2. Digital platforms and ecosystems

Ecosystems generate essential contributions to human well-being by providing goods, regulatory functions, and cultural and supporting benefits. These contributions—commonly referred to as ecosystem services—derive from the interaction of living organisms with their surrounding physical environment and include food provision, raw materials, water filtration, climate regulation, and sources of genetic and biochemical resources (MEA, 2005). The Millennium Ecosystem Assessment classifies these services into four broad categories: supporting services that sustain ecological processes, provisioning services that provide tangible resources, regulating services that stabilize biophysical conditions, and cultural services that offer experiential or symbolic value. Over time, the concept has progressively gained relevance across

academic communities, particularly within ecology and economics, as a means to articulate the interdependence between human activities and natural systems (Gómez-Baggethun et al., 2010). Although the underlying idea emerged several decades ago, ecosystem services became a central reference point in sustainability research from the 1990s onward, offering a structured lens for evaluating environmental resources and informing decision-making processes related to development, policy, and resource management (Costanza et al., 1997; De Groot et al., 2002; UNEP, 2008; World Bank, 2009). More recently, research on digital platforms and platform ecosystems has opened a parallel and complementary stream of inquiry. Digital platforms enable coordination among multiple actors—often from distinct sectors or markets—by providing the technological and governance infrastructure necessary to support interactions, data exchange, and collaborative value creation (Kretschmer et al., 2022). Prior studies show that platform-based arrangements can mobilize diverse stakeholders to address large-scale societal issues, such as access to health services, waste reduction, cybersecurity, or financial inclusion (Bode et al., 2019; Ciulli et al., 2020; Rauch & Ansari, 2022). A key feature of these systems is the presence of network effects: when participants benefit from joining, the platform attracts more actors, amplifying the scale of impact (Cennamo, 2021). Scholars argue that when economic incentives align with social or environmental goals, platform ecosystems can generate outcomes that extend beyond conventional organizational boundaries and address complex societal challenges (Porter & Kramer, 2011; Ritala et al., 2021; Ritala, 2024). Drawing these streams together, digital platforms can be conceptualized as organizational and technological infrastructures capable of supporting ecosystem services and biodiversity management. By coordinating heterogeneous participants and leveraging data flows, platforms facilitate monitoring, valuation, and stewardship of natural resources at scale. In this way, platform ecosystems offer a novel avenue through which economic value creation and ecological value preservation can coexist: a condition increasingly recognized as necessary for addressing grand sustainability challenges.

3. Method

A quantitative approach based on bibliometric analysis was adopted to analyze the extant literature that discusses both the topics of biodiversity and platforms. This method has seen a wide increase in adoption during the last few years (Gutiérrez-Salcedo et al., 2018). The bibliometric analysis permits sorting out systematic and orderly literature already existing on the research topic. The analysis consists of a map with a spatial representation of the keywords, countries, or research strands related to each other (Cobo et al., 2012). To develop the analysis, extant papers have been gathered from Scopus online database; instead, for the bibliometric analysis, it has been used VOSviewer software. Scopus was used as a tool for information gathering as it has been described as a "huge multidisciplinary database with citations and abstracts from peer-reviewed journal literature, trade journals, books, patent records, and conference publications... It is the largest abstract and citation database" (Joshi, 2016), and it cover many topics, especially social sciences.

Upon meticulous examination of the pertinent literature, it was conjectured that the key terms "digital," "ecosystem," "platform," and "biodiversity" as the most conceptually central to the scope of the research. Consequently, for the preliminary study, it was resolved to confine the exploration exclusively to the Scopus database. Observing that certain articles also delved into domains such as Agriculture and Biological science, a decision was made to refine the research focus further by delving deeply into the following reference areas: Business, Management and Accounting, Environmental Science, and Social Sciences. Therefore, the final query was as follows: KEY (("digital" AND "ecosystem" OR "platform") AND "biodiversity"). The selection of the documents took place on November 1st, 2025. The period analyzed has been 1997-2025 and the articles searched were only written in English. The year 1997 has been chosen since in that year was written the first article on the topic by Keating and since that year more and more

authors have started to address the issue of biodiversity and digital. The search conducted identified 528 total publications. Given the nature of this study bibliometric, subsequent to the analysis of titles and abstracts of the papers, we undertook a comprehensive examination of all 528 articles identified within the database.

4. Overview of publications

To outline the link between biodiversity and digital platforms and ecosystem, it is important to quantitatively examine evidence from the extant literature. Table 1 reports the size and basic characteristics of the dataset, including the total number of articles (528), the total number of keyword occurrences (5,933), and the number of unique authors (565). Table 1 also indicates the distribution of publications across the two focal streams: 437 articles are classified within the "digital ecosystems" domain and 91 within the "digital platforms" domain.

Query	Number of articles	Number of keywords	Authors
("digital" AND "ecosystem" OR "platform")	528	5933	565
("digital" AND "ecosystem")	437	5026	475
("digital" AND "platform")	91	907	90

Table 1. Quantitative analysis

It is interesting to analyze the evolution of the topic. As shown in figure 1, the phenomenon was already studied in the first years of 2000s then it had a first development in 2014 and it had an exponential growth since 2019.

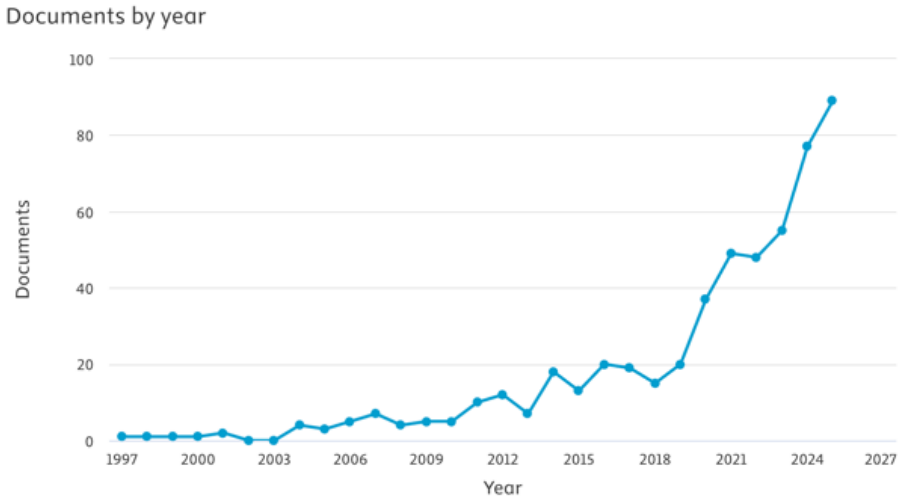

Figure 1. Documents by year

Considering the analysis of the topics, we have decided to do an overview of subject areas that Scopus create, that is outlined in figure 2. It is possible to note that most papers are in the area of Environmental sciences, where 44.5% of documents were written. Then, in the area of Agricultural and Biological Sciences, 23% of articles were written while in Social Sciences, an

area interesting for the debate of the topics, 9.5% of documents were written. Other minor categories are found, but those are considered less interesting for the aim of the present paper.

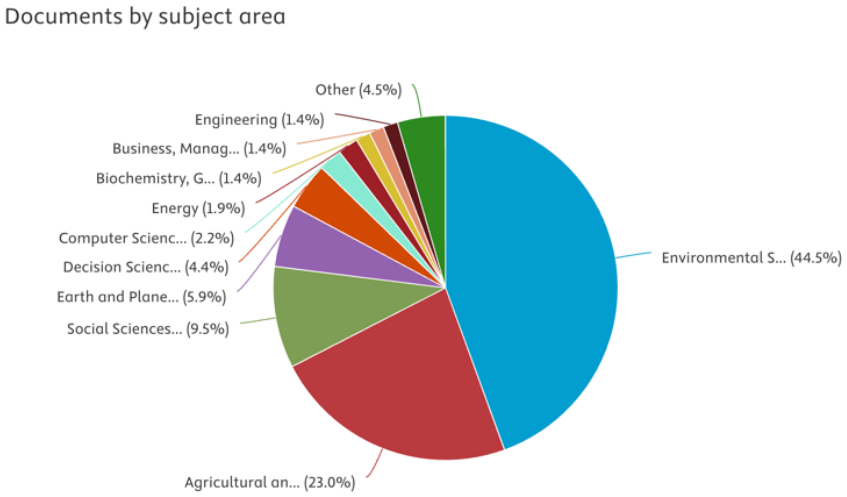

Figure 2. Documents by subject area

Talking of the countries where the first authors of the analyzed papers come from, we can see that in the US there are many authors interested in the subject, in fact 93 papers have been written in the last 28 years. Following we see China with 90 publications, UK with 54 articles and followed by Germany with 53 published articles and Canada and Italy with 39 publications each.

In table 2, there are the five most cited articles. The most cited are "Bioenergy production potential of global biomass plantations under environmental and agricultural constraints" with 348 citations and "On the spatial relationship between ecosystem services and urbanization: A case study in Wuhan, China" with 340 citations. With 332 citations, there is the article by Kasten et al. (2021). Following, there are the articles "Massive soybean expansion in South America since 2000 and implications for conservation" with 296 citations and "How can statistical models help to determine driving factors of landslides?" with 260 citations.

Article title	**Authors**	**Year**	**Source**	**Cited**
Bioenergy production potential of global biomass plantations under environmental and agricultural constraints	Beringer et al.	2011	Gcb Bioenergy	348
On the spatial relationship between ecosystem services and urbanization: A case study in Wuhan, China	Zhang et al.	2018	Science of the total environment	340
The remote environmental assessment laboratory's acoustic library: An archive for studying soundscape ecology	Kasten et al.	2012	Ecological informatics	332
Massive soybean expansion in South America since 2000 and implications for conservation	Song et al.	2021	Nature Sustainability	296

How can statistical models help to determine driving factors of landslides?	Vorpahl et al.	2015	Ecological modelling	260

Table 2. The five most cited articles

5. Findings

In order to answer RQ1, Table 2 summarizes the most frequently occurring author keywords in the dataset and highlights the conceptual anchors of the literature. “Biodiversity” is by far the most prevalent term (n = 504), confirming its role as the dominant focal concept. The second most frequent keyword, “ecosystem(s)” (n = 318), indicates that a substantial share of the literature frames biodiversity within ecosystem-level dynamics rather than in isolation. The prominence of “climate change” (n = 132) suggests that biodiversity research in this domain is frequently embedded in broader debates on environmental risk, mitigation, and adaptation. Notably, “digital storage” (n = 130) appears among the top keywords, signalling the growing relevance of data infrastructures and information management to biodiversity-related research. The presence of the generic term “article” (n = 110) likely reflects indexing practices rather than a substantive theme and should therefore be interpreted with caution. Finally, “forestry” (n = 108) points to a strong application context, suggesting that forest ecosystems represent a central empirical setting in which the biodiversity–digital ecosystem nexus is being investigated.

Keywords	**Frequency**
Biodiversity	504
Ecosystem/Ecosystems	318
Climate change	132
Digital storage	130
Article	110
Forestry	108

Table 3. Most frequent author keywords in the dataset

Figure 3 shows the main clusters of the relationship between biodiversity and ecosystems. To get to this bibliographic spatial map and answer RQ2, the authors have decided to develop a co-occurrence map based on all keywords (5,933) and a minimum occurrence of at least 10 keywords, in order to make the analysis more circumscribed and to bring out those analyses that are treated together. With this combination just mentioned, of the 5,933 keywords, only 179 meet the threshold. In figure 3, each circle stands for a keyword from the dataset. In the chart, it is possible to note that if terms co-occur frequently, they are located close to each other; otherwise, if they are not connected, it means that they are co-occurring less. The circles’ dimension relies upon papers’ numbers that were found to contain that specific keyword. A significant number of keywords refer to “climate change, “forestry”, “land use” and “ecosystem”. Keywords were divided into 5 clusters, represented by colors.

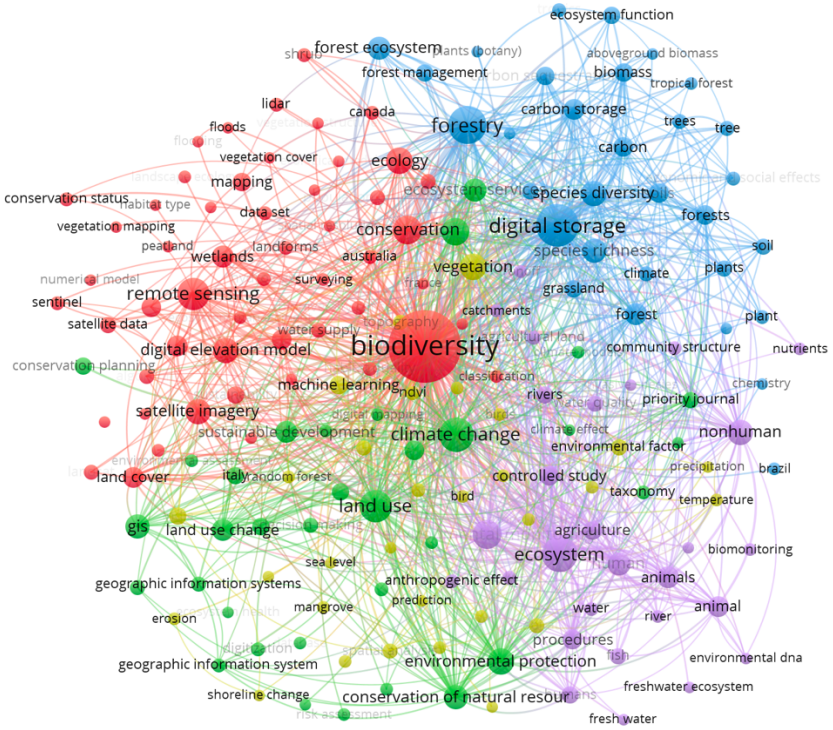

Figure 3. Keyword co-occurrence analysis

The five main clusters outlined from the previous analysis displayed in figure 3 are:

- The main cluster is the red one and represents “Biodiversity”; this cluster shows that authors who deal with biodiversity usually treat it with ecology, conservation, remote sensing and sustainability.
- The blue one is the “Digital storage” cluster, and usually, authors write as well about forestry, ecosystem function, species diversity and carbon.
- The green cluster concerns with “Climate change” and is linked with land use, sustainable development and environmental protection.
- The yellow cluster represents “Vegetation” and is linked with environmental factor, temperature, sea level and habitat.
- The violet cluster is the “Ecosystem” cluster and usually, authors write as well about nonhuman, environmental monitoring, animals and water.

The network visualizes how the literature conceptualizes the relationship between biodiversity and digital-platform ecosystems. Rather than framing these domains as separate research streams, the map shows that they are structurally interdependent: biodiversity operates as the central anchor, while digital-, ecosystem-, and land-use–related keywords connect to it through dense co-occurrence patterns. The short distances between nodes indicate that scientific publications increasingly treat biodiversity not only as a biological construct, but as a data-driven object integrated into broader digital infrastructures. The network highlights that research on platforms and digital systems rarely appears alone; instead, such terms systematically co-occur with ecological and environmental concepts. This reinforces a conceptual transition in the literature, where biodiversity is understood through quantification, data collection, and decision-support mechanisms enabled by platforms and digital ecosystems.

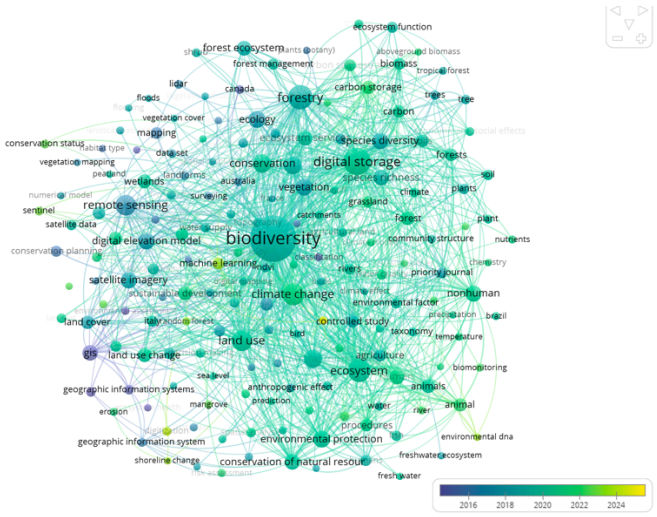

Figure 4. Co-occurrence analysis in overlay visualization

In figure 4, the network retains the same structural configuration as the previous figure, but the addition of temporal information illustrates the evolution of research priorities and answers RQ3. Earlier contributions (represented by cooler tones) are concentrated around traditional themes such as forestry, land use, and conservation. More recent studies (highlighted in warmer tones) cluster around *digital storage, remote sensing, machine learning,* and *platforms*, indicating a progressive integration of digital technologies into biodiversity research. The temporal gradient demonstrates a clear shift from descriptive ecological studies toward data-intensive, digitally mediated approaches. Biodiversity increasingly becomes a measurable and computational object rather than only a biological or ecological concept.

6. Discussions and final conclusion

The analysis shows that research on this topic expanded significantly in recent years, a trend also highlighted by by scholars and consulting firms (Winn & Pogutz, 2013; Testa et al. 2025; Accenture, 2023; Deloitte, 2025). The results indicate that US-based authors the most active contributors to the field and that Environmental sciences remains the primary disciplinary area of interest.

The keywords analysis reveals that scientific publications increasingly treat biodiversity not only as a biological construct, but as a data-intensive and digitally mediated domain, consistent with Cardinale et al., (2012). Biodiversity is progressively framed as a measurable and computational, and monitorable object integrated with broader digital infrastructures.

The prominence of digital-related keywords alongside traditional ecological terminology, suggests the emergence of a hybrid domain in which biodiversity is analyzed through platforms, sensors, and data repositories- confirming Kretschmer et al., (2022).

Overall, the analysis shows that biodiversity and digital platforms/digital ecosystems are increasingly intertwined within the academic debate. Through the keyword clusters, it becomes evident that biodiversity is consistently associated with concepts such as ecosystem monitoring, land-use management, and environmental sustainability, while digital-related terms appear in connection with data storage, remote sensing, and platform coordination. The preliminary bibliometric evidence therefore suggests that digital platforms are emerging as a relevant organizational and technological architecture through which biodiversity can be monitored, shared, and managed collaboratively. However, a critical observation is that despite this growth, the literature remains fragmented and predominantly descriptive; few studies interrogate the

ethical, politic, or socio-institutional implications of digitizing biodiversity, and a mature theoretical framework bridging ecological and digital perspective is still lacking.

7. Theoretical and managerial implications

This study provides empirical evidence confirming the growing relevance of biodiversity within the research on digital platforms and digital ecosystems. The findings suggest that these fields are evolving rapidly and increasingly converge. While prior studies have mainly addressed biodiversity from an ecological or environmental perspective, the bibliometric analysis reveals the emergence of new interconnected themes—such as digital monitoring, data sharing, remote sensing, and collaborative decision-making—that position digital platforms as key enablers of biodiversity management.

A key theoretical contribution of this study is that it identifies the foundations for a conceptual framework capable of interpreting the intersection between biodiversity and digital platforms. More concretely, through the bibliometric clustering process we uncovered five main thematic clusters that structure this emerging research domain. These clusters capture the dominant conceptual pathways through which biodiversity becomes embedded within digital infrastructure, thereby offering an initial scaffold for future theory-building. These results suggest that a new conceptual space is taking shape, one in which biodiversity is not only a biological construct but also a digitally mediated object embedded within socio-technical systems. This contributes to the theoretical understanding of how environmental and digital ecosystems coevolve and how technological infrastructure reshape ecological governance.

From a managerial perspective, this work highlights that digital platforms represent not only a technological infrastructure but also a governance mechanism capable of coordinating heterogeneous actors—firms, institutions, NGOs, and citizens—around biodiversity-related objectives. Managers and decision-makers should therefore consider how platform architectures can be used to collect, integrate, and leverage ecological data, enabling transparency, accountability, and informed strategic decisions concerning natural resources.

In particular, integrating digital tools and data-driven systems into biodiversity strategies requires organizations to invest in data generation, analytics, and user engagement. Platforms that foster knowledge sharing and participation can amplify collective action, align economic and environmental incentives, and contribute to scalable solutions for biodiversity protection. Such an approach supports the transition from isolated, project-based environmental initiatives to collaborative, ecosystem-level strategies that enhance both organizational value creation and environmental impact.

8. Limitations and further research

Some limitations emerge from this study. First of all, it only relies on bibliometric data, not gathering insights from firms and encompassing their perspectives to develop new theoretical and managerial implications. Moreover, even though Scopus is considered one of the most suitable and reliable publication databases for most researchers, some other relevant papers might not be included - or included in other databases – and might have been overlooked. We think it might be interesting for future research on the subject, to deepen the analysis. In fact, it would be interesting to read all the papers in depth and do a systematic literature review and then go into more detail identifying the various important aspects of related issues.

The 30-60-90 Routine: Structuring Community Feedback for Value Co-creation

Alessio Sartore[1], Paola Signori[2]

1. Introduction

In the current competitive landscape, the paradigm of value creation has shifted significantly. The traditional view of the firm as the sole innovator has given way to a more permeable approach where customers are active participants (Prahalad & Ramaswamy, 2004; Ciasullo et al., 2018). Digitalization has accelerated this trend, providing consumers with the technological capabilities to share feedback, modify products, and interact directly with R&D departments (Gupta, 2023). However, this accessibility creates a double-edged sword for organizations. On one hand, it offers a "sea of information" rich in potential (Chan et al., 2021). On the other, it generates a massive volume of unstructured data that can paralyze decision-making processes. The core problem addressed in this study is how Small and Medium Enterprises (SMEs), which often lack the resources of multinational corporations(Spithoven et al., 2013), can structure this chaotic flow of community insights to fuel continuous innovation without being overwhelmed (Yang, 2012; Lin et al., 2021).

2. Theoretical background

To interpret these dynamics, this study moves beyond the traditional Open Innovation framework to adopt the Service-Dominant Logic (SDL) lens (Vargo & Lusch, 2004; 2016). While Open Innovation explains that ideas flow across boundaries (west & Bogers, 2013), SDL explains why these ideas are valuable. According to SDL, a physical product (like in our case study a bicycle trainer) is merely a distribution mechanism for service provision (the training experience). Consequently, innovation is not just about improving technical specifications but about enhancing the value-in-use. This perspective redefines the customer from a passive recipient to an active co-creator of value (Prahalad & Ramaswamy, 2004). In this context, the most critical knowledge does not reside solely within the firm's engineering department but emerges from the users' daily interactions with the product in real-world scenarios. Understanding why customers will to contribute is crucial for sustaining this co-creation. Recent literature challenges the assumption that users are motivated primarily by financial rewards. Chan et al. (2021) highlight that in digital crowdsourcing and community environments, intrinsic motivations often prevail. Users are driven by the quality of their experience, a sense of belonging to a community, and the desire to see their specific needs reflected in the product. This creates a specific type of feedback: unlike generic market research, community-driven insights are highly contextualized and technically detailed. However, leveraging this "experiential" knowledge requires specific technological and organizational capabilities. While Customer Feedback Acquisition Technologies (Gupta, 2023) provide the necessary channels to capture data (such as social media, support platforms, IoT data), technology alone is insufficient. The bottleneck is often organizational. Integrating external knowledge requires firms to develop absorptive capacity, that is the ability to recognize, assimilate, and apply new information (Zahra & George, 2002). Here, a theoretical tension

[1] Adjunct Professor, ECON-07/A, Università di Verona; alessio.sartore@univr.it

[2] Full Professor, ECON-07/A, Università di Verona; paola.signori@univr.it

emerges. As noted by Lin et al. (2021), organizational routines can paradoxically affect innovation. Typically, routines are seen as sources of inertia and rigidity that stifle creativity. But in the context of high-volume feedback, the absence of routines leads to chaos and information overload. Lin et al. (2021) suggest that to operationalize external creativity, firms need flexible routines that structure the intake of information without constraining the novelty of the output. The present study builds on this premise, examining empirically how a specific organizational mechanism, that has been called the 30-60-90 Routine, allows an SME to resolve this paradox, transforming the noise of community feedback into a structured engine for continuous product evolution.

3. Methodology

The empirical investigation focuses on a longitudinal case study, as a prominent Italian firm highly specialized in cycling training equipment and accessories. Elite S.r.l. Società Benefit has been founded in 1979 and headquartered in Fontaniva (Padua), the company represents an ideal case study for several reasons. First, it operates in a highly competitive global market, exporting 90% of its production to over 70 countries. Second, despite being an SME (approx. 63 employees), it possesses a strong orientation to innovation, with a dedicated R&D team of 25 collaborators, and a history of technological milestones, such as the introduction of the first wireless trainers in 2004 and the Optical Torque Sensor (OTS) in 2016. Crucially, the firm has recently experienced a shift in its customer base. Following the post-pandemic boom in indoor cycling, the user profile expanded from professional athletes to a broader community of "prosumers" (active users willing to contribute to innovation). This transition challenged the firm's traditional feedback mechanisms, necessitatinga more structured approach to listen to its digital ecosystem, which includes over 137,000 Instagram followers, a dedicated Facebook support group (11,000+ members), and a Strava club (6,000+ active cyclists).

To capture the complexity of this ecosystem, the study adopts a mixed-method approach. This design is particularly effective in innovation management research as it allows for triangulating quantitative patterns of user behavior with the qualitative nuances of experiential knowledge (Bracio & Szarucki 2020). By combining survey data with unstructured digital feedback, we aimed to overcome the limitations of single-method studies, providing both the magnitude of user interest (quantitative) and the meaning behind their suggestions (qualitative). Data collection was conducted through a multi-channel strategy involving both structured instruments and unstructured data harvesting. The primary sampling frame consisted of the firm's newsletter subscribers (approximately 269,000 contacts, segmented into active user groups) and customers interacting via the Zendesk support platform(customer care software). To structure data collection and avoid systematic bias, the target mailing list was split randomly into two distinct clusters:

- Cluster A (Quantitative Focus) - This group received a closed-ended questionnaire designed to measure interest in co-creation, preferred touchpoints, and usage habits. The survey generated 41,349 opens and 1,652 clicks, resulting in 1,037 valid responses. This instrument utilized Likert scales (1-5) to quantify the users' propensity to collaborate and their satisfaction with current touchpoints.

- Cluster B (Qualitative Focus) - The second group received an open-ended instrument aimed at eliciting rich narratives. Users were asked to describe specific friction points, desired features, and the reasons behind their feedback. This instrument generated 34,341 opens, 901 clicks, and 392 full narrative responses.

To incentivize participation without compromising the intrinsic motivation discussed in the theoretical background, a gamification element was introduced: respondents were offered a one-month free trial of the "My E-Training" software. This ensured that the sample was composed of

active users interested in the product experience. Additionally, unstructured feedback was harvested from post-use touchpoints.

We analyzed interactions on the Zendesk platform (which boasted a 97.4% satisfaction rate) and discussions within the Strava community. These channels were selected because they represent what we called 'moment of truth' where value-in-use is experienced and reported. Following the core quality criteria for mixed methods research (O'Cathain et al., 2008), data analysis proceeded through a convergent design where quantitative and qualitative data were integrated during the interpretation phase. Quantitative data were analyzed using descriptive statistics to identify trends in channel preference and co-creation willingness. Qualitative data (open-ended responses and social media comments) underwent a thematic analysis. Responses were manually coded into three categories derived from the literature: (i) Functional Feedback: reports, hardware issues, and feature requests (such as calibration drifts); (ii) Relational Feedback: comments on customer support speed, brand trust, and community belonging; (iii) Symbolic Feedback: Narratives related to identity, achievement, and the pains & gains of training. To ensure interpretative reliability, the quality of the feedback was assessed using a standardized five-point scale (1=low, 5=high) evaluating three dimensions: richness, diagnostic value, and implementability. This evaluation was triangulated across two researchers and the firm's product managers to mitigate subjective bias and ensure that the insights were actionable for the R&D department. Throughout the study, top managers were continuously involved, actively ideating and implementing organizational changes in pursuit of a new Open Innovation model. To validate the findings, a qualitative check was performed: product managers evaluated the relevance of the collected insights through a specific 1-5 Likert scale questionnaire and subsequent in-depth dialogue with the researchers.

4. Findings

The quantitative analysis reveals a pronounced willingness among customers to contribute to innovation processes. Data from the closed-ended survey indicate that approximately 75% of respondents expressed a high or very high interest in taking part in co-creation activities. Specifically, when asked: How motivated are you to contribute to product development?,552 respondents (53%) selected the highest rating on the Likert scale (5), while another 41% expressed moderate to high interest.

The qualitative analysis of the open-ended responses clarifies the nature of this motivation. Consistent with Chan et al. (2021), participation was largely driven by intrinsic factors rather than financial incentives. Although a symbolic reward (a one-month free software trial) was offered, the narrative responses highlighted a 'sense of belonging' to the cycling community and a desire to improve the tools they use daily. Users did not act as paid consultants but as passionate "prosumers" seeking to enhance their own value-in-use. This confirms that the firm's community represents a latent repository of competence that goes beyond mere brand loyalty. While the willingness to participate was widespread, the study reveals that the diagnostic value of the insights was unevenly distributed across digital channels (see Figure 1). The analysis of social media channels (Instagram and Facebook) showed high interaction volumes (the Instagram profile alone generated over 19,000 interactions in the observation period) but low diagnostic quality (rated 2.8/5). Comments here were often brief, emotional, or related to brand image (symbolic feedback), useful for engagement but less actionable for R&D. Conversely, post-use touchpoints such as the Zendesk support platform and the Strava community produced the most substantive feedback (rated 4.9/5 for quality). These channels provided what we define as 'contextualized knowledge': detailed reports on calibration drifts, noise levels at specific wattages, and firmware inconsistencies. This feedback emerged from actual usage experiences (value-in-use) rather than pre-purchase expectations. For instance, the Strava group discussions

often contained technical telemetry data that internal R&D could not replicate in laboratory settings, validating the SDL premise that value is determined by the beneficiary during usage.

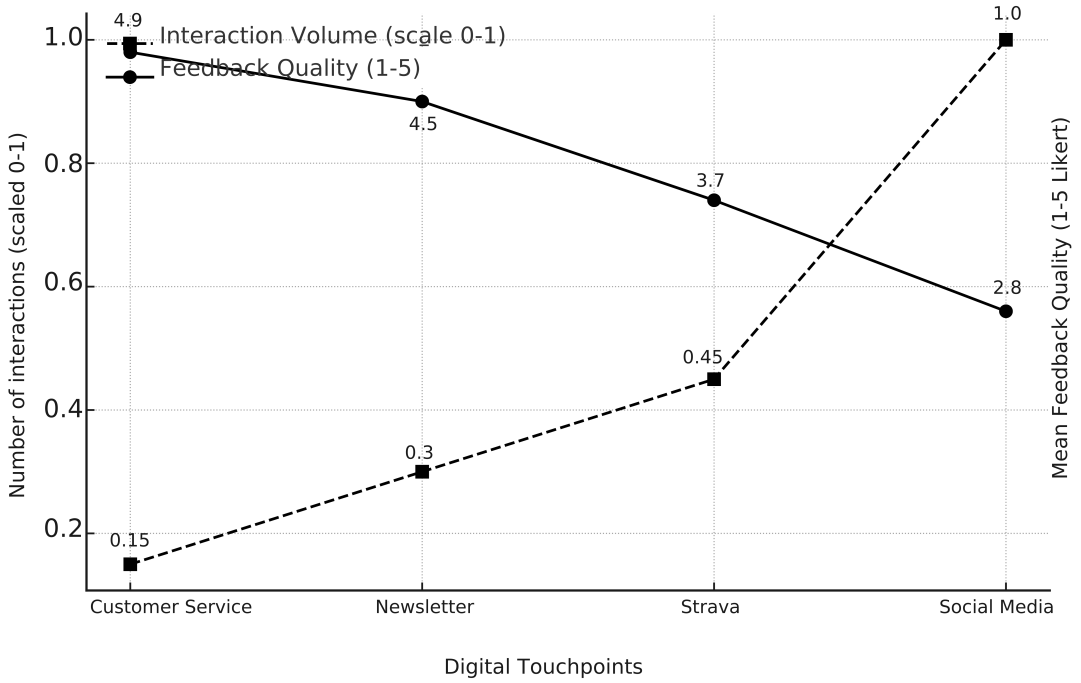

Figure 1. Interaction Volume vs Feedback Quality across Digital Touchpoints

A concrete example of how this feedback loop materializes is the development of the so-called 'Zwift Cog & Click' compatibility update. Through the analysis of support tickets and community discussions, the firm identified a recurring friction point: users with older trainer models felt excluded from the new virtual shifting features introduced by the virtual cycling platform Zwift. This was not a hardware failure, but a gap in the service experience. Initially, this dispersed feedback was treated as noise or simple complaints. However, by applying the structured listening routine, the firm re-categorized these inputs as a prioritized innovation opportunity. This led to the development of a specific firmware update released which enabled older direct-drive trainers to support the new virtual shifting protocols. The impact of this user-driven innovation was immediate. In the weeks following the update, the company registered a 15.3% increase in website traffic, with the specific news page generating over 1,600 unique views in the first few days. More importantly, the sentiment analysis on social channels shifted from frustration to gratitude, reinforcing the trust bond between the firm and its user base.

At this stage, the mixed team of researchers and product managers analyzed the results to assess the efficacy of each touchpoint in generating actionable ideas (see Table 1). This joint evaluation revealed a clear distinction in the efficacy of different channels, validating the Open Innovation model the firm intended to experiment with.

Touchpoint	**Customer Journey phase**	**Type of interaction**	**Efficacy in generating ideas**
Instagram Stories	Engagement/Post-use	Survey answer (closed and open-ended)	Medium
Facebook	Engagement	Comments and link to survey	Medium
Strava	Engagement/Use	Participiation in events and groups	Medium
Reddit	Consideration	Free discussion (no direct link)	Low
Newsletter	Post-use	Direct link to the survey	High
Website	Consideration-use	Informative visits (no interactions)	Low
Reviews	Post-use	Product feedback	Medium
Shop visits	Use	QR code	Medium
Events	Awareness/Engagement	Tablet or QR code on site	Medium
Zendesk	Post-use	Tickets	High
Chatbot	Use/Post-use	Chats (like/dislike)	Low
Knowledge base	Use	Article reads	Medium
Phone calls	Use	Spontaneous conversations	Medium
Focus groups	Post-use	Interviews	High

Ambassador	Awareness/Engagement	Distribtion through personal community	High

Table 1. Perceived effectiveness of touchpoints in generating customer ideas, source: authors' own elaboration

From an organizational perspective, the transition to this open innovation model was not painless. The sheer volume of feedback initially triggered the organizational paradox,described by Lin et al. (2021): the R&D team, accustomed to internal roadmaps, faced cognitive overload and potential inertia (the so-called Not-Invented-Here syndrome). The turning point was the formalization of a new organizational six-months routine, called "the 30-60-90 Routine". This simple yet rigid temporal framework provided the necessary structure to channel external creativity without disrupting internal efficiency:

- 30: day 0-30 (one month of Listening & Filtering) - Dedicated to the aggregation of unstructured data from Zendesk and Community Managers. Feedback is coded and prioritized based on frequency and feasibility;
- 60: day 31-90 (two months of Testing & Feasibility) - The selected insights (like the Zwift compatibility issue) enter a rapid prototyping phase. Here, the firm verifies technical constraints and runs micro-tests, often involving the "Focus Group" of 33 elite cyclists identified in the research context;
- 90: day 91+ (three months of Implementation & Communication) - The innovation is released (for instance, the firmware update) and the outcome is communicated back to the community, closing the loop.

This routine acted as a selective valve allowing the firm to harness the 'sea of information' without drowning in it. It transformed the abstract concept of Open Innovation into a manageable operational process. Top management said that this protocol allowed the company to transform "Feedback Data into Good Data".

5. Conclusion

The findings of this research offer significant empirical contribution to Open Innovation and Service-Dominant Logic (SDL) studies, particularly within the context of manufacturing SMEs. By analyzing the transition of Elite S.r.l. Società Benefit from a product-centric model to a community-driven innovation ecosystem, three major theoretical implications emerge.

First, this study addresses the organizational paradox highlighted by Lin et al. (2021). The literature often presents a dichotomy: rigid routines stifle innovation, while openness fosters it. However, our results demonstrate that in the digital age, openness without structure leads to cognitive overload and inertia. The 'sea of information' generated by 137,000 followers and thousands of support tickets creates a noise that can paralyze an SME's absorptive capacity. The 30-60-90 Routine identified in this case study functions as a dynamic capability that resolves this paradox. It provides the necessary rigidity (fixed timeframes) to manage the unstructured waves of external inputs. This challenges the assumption that Open Innovation requires loose organizational structures. But it also suggests that structured routines are the necessary antecedent to effectively operationalize co-creation. The routine transforms the Not-Invented-Here syndrome from a defensive psychological barrier into a manageable filtering process.

Second, the study deepens the application of Service-Dominant Logic (Vargo & Lusch, 2004; 2016) to physical product development. The discrepancy in feedback quality between social media (high volume, low diagnostic value) and post-use channels like Zendesk and Strava (lower volume, high diagnostic value) confirms that innovation is increasingly driven by value-in-use. While Open Innovation frameworks often emphasize the quantity of ideas (Big Data), an SDL

perspective emphasizes the context of usage (Good Data). The Zwift Cog example illustrates this perfectly: the innovation did not come from a blue sky idea on Instagram, but from users experiencing friction during the actual service provision (the training session). This suggests that for manufacturing firms, the most valuable external knowledge is not creative in the artistic sense, but in the experiential sense, derived from the interaction between the user and the product.

Third, responding to the call for a broader understanding of innovation's social dimension, this study highlights how co-creation fosters social capital. As noted by Chan et al. (2021), intrinsic motivation is key. When Elite S.r.l. Società Benefit implemented the firmware update requested by the community, it did not merely fix a technical issue; it validated the users' expertise. This act of "listening and doing" legitimizes the community, transforming customers from passive buyers into active stakeholders. This reciprocal value creation strengthens brand trust and resilience, creating a social buffer that protects the firm even during market disruptions. From a practitioner's standpoint, this study offers a replicable blueprint for SMEs navigating the complexities of digital feedback in three ways: (i) reimagining Post-Sales as Innovation Hubs: managers should stop viewing Customer Support solely as a cost center dedicated to troubleshooting. Our data shows that platforms like Zendesk and Strava are the richest sources of actionable innovation. Firms should integrate R&D personnel into support loops or create structured reporting channels (like the "Day 0-30" phase) to capture these insights; (ii) implementing lightweight routines: SMEs often fear that Open Innovation requires expensive platforms or massive teams. The 30-60-90 routine demonstrates that a simple, time-based heuristic can be effective. It allows firms to "listen" without losing focus on execution; (iii) gamification and engagement: while this study utilized a simple incentive (free software trial), the high participation rate suggests that users are eager to engage. Managers should explore advanced gamification strategies such as badges for lead contributors or beta-testing leaderboards to sustain this engagement over the product lifecycle, turning sporadic feedback into a continuous dialogue.

6. Limitations and Future Research

This study is not without limitations. Being a single case study focused on the sports equipment industry, the generalizability of the findings to other industries (for example services or Fast-moving consumer goods) requires verification. The analysis focused primarily on digital touchpoints potentially overlooking insights from physical retail interactions. Future research should extend this work in two directions. First, by collecting data to evaluate the 30-60-90 Routine overall impact, as a value driver for different stakeholders. Then by investigating the long-term effects of willingness to contribute to co-creation.

Keywords: Value co-creation; service-dominant logic; open innovation; organizational routines

Socio-Demographic Profiles and Experiential Retail: Evidence for Designing Experience-Centric Digital Retail Strategies

Massimiliano Ruggiero[1], Martina Toni[2], Giovanni Mattia[3]

1. Introduction

The digital transformation of retail has significantly reshaped the interface between consumers and points of sale, fostering new interaction models and profoundly altering expectations throughout the purchasing process. The increasing integration of digital technologies has accelerated the diffusion of e-commerce, making product search, comparison, and transactions more efficient and accessible, while not diminishing the strategic role of the physical store. On the contrary, existing literature highlights that in-store experiences continue to generate value through sensory, emotional, and relational dimensions that remain difficult to replicate in digital environments (Zamfirache et al., 2024; Ghiuță and Nistor, 2025). Direct contact with products, the possibility of touching or trying them, and the opportunity to assess their physical characteristics play a central role in reducing uncertainty and shaping perceptions of quality, thereby influencing channel choice and purchase intention (Peck et al., 2013; Hermes et al., 2022). Similarly, interaction with sales personnel contributes to both cognitive and emotional evaluations of the shopping experience, as personalised advice and informational support foster trust, satisfaction, and loyalty intentions (Liu and Lee, 2024).

On the digital side, shopping experience is primarily shaped by functional and usability-related dimensions, including ease of use, speed, convenience, and informational clarity. Prior research consistently shows that perceived usefulness and ease of use represent key determinants of consumers' evaluations of digital technologies and e-commerce services (Davis, 1989; Venkatesh and Davis, 2000; Chen and Chang, 2023). Efficient navigation, smooth transaction processes, and reliable delivery services are therefore central elements in shaping positive digital shopping experiences and supporting online purchase decisions (Grewal et al., 2023; Mangano et al., 2021).

Alongside experiential and functional dimensions, sustainability has become an increasingly relevant criterion in consumers' evaluations of retail channels. Consumers show growing attention to environmentally responsible practices, particularly in relation to logistics and last mile delivery, and tend to incorporate sustainability considerations into their overall assessment of shopping experiences (Klein and Popp, 2022; Bjørgen et al., 2019). As such, sustainability can be interpreted not merely as an ethical concern, but as an evaluative dimension that contributes to how consumers perceive and compare physical and digital shopping options.

Against this backdrop, existing research has progressed along three partially separate streams. A first stream compares physical and digital shopping by focusing on differences in channel-related evaluations and outcomes (Zamfirache et al., 2024; Ghiuță and Nistor, 2025). A second stream conceptualises customer experience as a multidimensional construct, emphasising the coexistence of sensory, emotional, relational, and functional elements, particularly within omnichannel settings (Rahman et al., 2022; El Hedhli et al., 2013). A third stream examines

[1] Ph.D., ECON-07/A, University of Roma Tre: massimiliano.ruggiero@uniroma3.it – corresponding author

[3] Associate Professor, ECON-07/A, University of Roma Tre; giovanni.mattia@uniroma3.it

sustainability-related perceptions in e-commerce and last-mile delivery, highlighting the role of perceived environmental responsibility in the evaluation and acceptance of delivery solutions (Bjørgen et al., 2019; Klein and Popp, 2022; Mangano et al., 2021). While demographic variables are frequently employed in consumer behaviour research (Hossain, 2024), evidence remains fragmented regarding how age and gender systematically shape specific experiential dimensions across physical and digital channels, and how sustainability perceptions co-occur with these experiential evaluations when consumers assess alternative shopping channels.

In this context, understanding how different consumer groups attribute value to physical and digital shopping experiences is particularly relevant for retailers operating in sectors where channel integration has intensified in recent years. This is especially the case for product categories such as consumer electronics, books, and apparel, which have experienced strong digital acceleration and structural changes in shopping behaviour, and where consumers frequently alternate between physical and online channels. Although prior studies have compared online versus offline shopping experiences (Zamfirache et al., 2024; Pathamuthu and Venkateshwari, 2025) and extensively examined technology-related evaluations in digital environments (Davis, 1989; Venkatesh and Davis, 2000; Chen and Chang, 2023), empirical evidence remains limited on how distinct experiential dimensions are weighted across channels by different demographic profiles within these retail contexts. In particular, sensory and relational facets characterising physical retail, functional and usability-related facets characterising digital retail, and sustainability-related perceptions are often examined in isolation rather than jointly within a single profiling-based analysis (Rahman et al., 2022; El Hedhli et al., 2013; Klein and Popp, 2022). This fragmentation limits the managerial usability of existing findings for retailers redesigning both physical touchpoints and digital interfaces as part of their digital transformation strategies (Grewal et al., 2023).

This study addresses this gap by proposing an integrated analysis of sociodemographic profiles, experiential dimensions of physical and digital channels, and sustainability-related perceptions, with the aim of generating profiling-based insights to support retail strategy design. The central objective of the study is to examine how consumer profiling based on shopping experiences can inform digital transformation strategies for retail stores. Rather than treating demographic variables as standalone predictors of channel choice, the study adopts an experience-centric profiling logic, in which age and gender are used to interpret how consumers evaluate sensory, emotional, relational, functional, and sustainability-related aspects of physical and digital shopping differently. Shopping experience is therefore conceptualised as a multidimensional construct encompassing both experiential and functional dimensions across channels.

Accordingly, the study aims to identify significant differences in perceptions of physical and digital shopping experiences across age and gender segments and to examine the role of sustainability in channel evaluation, with a specific focus on retail contexts characterised by strong online–offline integration, such as electronics, books, and apparel. It is important to note that this research represents a work in progress and provides a preliminary empirical basis for future investigations.

Consistent with consumer behaviour literature, age and gender were selected as key profiling variables, as they systematically influence how experiential attributes are evaluated across retail channels (Hossain, 2024). From a methodological perspective, the study adopts a quantitative approach and employs a Likert-scale questionnaire with items scored from 1 to 7, based on validated constructs in the literature (Rahman et al., 2022; Liu and Zhang, 2024; Kiliswa and Mugovax, 2025). The items capture experiential dimensions of physical shopping (e.g. product touch, interaction with sales personnel, emotional responses) and experiential and functional dimensions of digital shopping (e.g. layout, interactivity, ease of use, delivery services), as well as sustainability-related perceptions. The sample consists of 172 participants segmented by age group (Gen Z, Millennials, Adult Consumers) and gender. Data were analysed using one-way ANOVA and independent samples t-tests to compare group means and identify differentiated

patterns in shopping experiences and sustainability perceptions, thereby deriving implications for retail channel design.

2. Methodology

The study adopts a quantitative approach to analyse how different demographic profiles influence perceptions of experiential dimensions across physical and digital shopping channels. The main profiling variables used are age and gender. Age was divided into three groups consistent with literature and commonly adopted generational classifications in consumer behaviour research: Gen Z (18 to 28 years), Millennials (29 to 44 years), and Adult Consumers (45+). Gender was included as a second key demographic variable. Both variables were selected because they are widely employed predictors in studies of consumer behaviour, are easily measurable and interpretable, and are particularly effective at differentiating perceptions, preferences, and shopping choices (Hossain, 2024).

The questionnaire was built using items measured on seven-point Likert scales derived from validated constructs in prior research (Rahman et al., 2022; Liu and Zhang, 2024; Mugovax, 2025). The variables included key dimensions of the physical shopping experience, such as store atmosphere, the ability to touch products, interaction with sales staff and emotional responses, as well as dimensions of the digital experience, including website layout, interactivity, and perceptions of delivery services. Variables related to sustainability were also incorporated to assess both the importance attributed to this factor in purchase decisions and the perceived environmental impact of physical versus digital shopping.

The questionnaire explicitly referred to three retail product categories - apparel, consumer electronics, and books - and respondents were instructed to evaluate their physical and digital shopping experiences within these sectors.

Data analysis was conducted in SPSS using bivariate techniques, including One-Way ANOVA and independent-samples t-tests, to compare group means by age and gender. For ANOVA, homogeneity of variances was assessed using Levene's test: when $p > 0.05$, the assumption was met and standard ANOVA was applied, followed by Bonferroni post hoc tests if significant; when $p < 0.05$, robust ANOVA (Brown-Forsythe or Welch) was used, with Games-Howell post hoc tests (Delacre et al., 2019; Reed & Stark, 1988).

The same procedure was applied to t-tests: the classical test was used under homogeneity ($p > 0.05$), while the Welch correction was applied otherwise ($p < 0.05$) (Delacre et al., 2017; Ruxton, 2006). In all cases, statistical significance was used to assess differences between groups.

3. Results

The results are presented by sample profiling data summarised in Tables 1 and 2, which illustrate the distribution of participants across age groups and gender categories.

Gender	**Frequency (N)**	**Percentage (%)**
Women	99	57.6
Men	73	42.4
Total	**172**	**100**

Table 1. Gender Distribution

Age Group	Frequency (N)	Percentage (%)
Gen Z (18–28)	75	43.6
Millennials (29–44)	61	35.5
Adult Consumers (45+)	36	20.9
Total	**172**	**100**

Table 2. Age Group Distribution

Following the sample profiling, the analysis proceeds with mean comparisons across three subsequent sections, examining differences between groups within the physical and digital channels and in sustainability-related perceptions.

To analyse the effect of age on the variable FIS_1 "Being able to touch or try products is essential for me before purchasing", a comparison was conducted across the three age groups included in the study. A One-Way ANOVA was performed for this purpose.

Levene's test for homogeneity of variances yielded a significance level of 0.002, which is below the 0.05 threshold. This result indicates that the assumption of homoscedasticity was not met, and the analysis therefore proceeded with the robust tests of equality of means, namely the Welch and Brown-Forsythe tests. Both tests showed significance levels below 0.05, suggesting that not all group means are equal.

Based on these results, multiple comparisons were examined using the Games-Howell post hoc test, which is appropriate when variances are heterogeneous. The comparison revealed a significant difference between two groups, with a significance level of 0.008, specifically between Millennials and Adult Consumers.

	(I) Età in classi:	(J) Età in classi:	Differenza della media (I–J)	Errore std.	Sign.	Intervallo di confidenza 95% Limite inferiore	Limite superiore

*. La differenza della media è significativa al livello 0.05.

Table 3. Post-hoc Comparisons of Age Groups for FIS_1

The descriptive statistics table shows that Millennials report a mean score of 5.25, whereas Adult Consumers report a higher mean of 6.08. This indicates that, for Adult Consumers, the ability to touch or try products before purchasing is perceived as more important than for Millennials. This result is also clearly visible in the mean plot, which highlights the gap between the two groups.

	N	Media	Deviazione std.	Errore std.	95% di intervallo di confidenza per la media		Minimo	Massimo
					Limite inferiore	Limite superiore		
18 – 28 (Gen Z)	75	5,51	1,465	,169	5,17	5,84	2	7
29 – 44 (Millennials)	61	5,25	1,598	,205	4,84	5,66	1	7
45+ (Adult Consumers)	36	6,08	1,079	,180	5,72	6,45	3	7
Totale	172	5,53	1,469	,112	5,31	5,76	1	7

Table 4. Descriptive Statistics of Age Groups for FIS_1

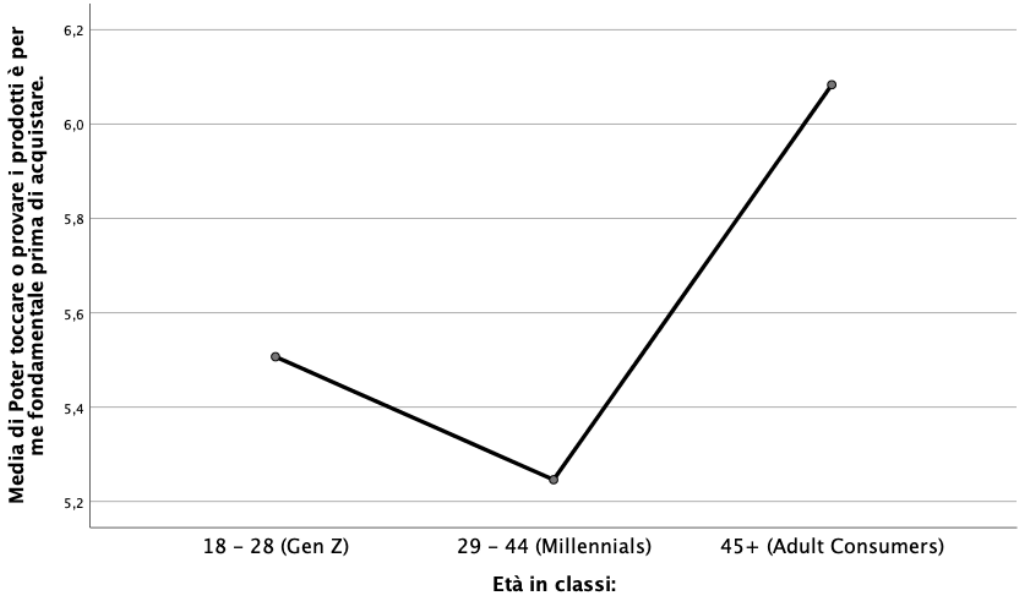

Figure 1. Mean Scores by Age Group by Age Groups for FIS_1

To examine differences across age groups for the variable FIS_2 "The positive emotions I feel while shopping (relaxation, enthusiasm, good mood)", a One-Way ANOVA was conducted. Levene's test indicated a significance level above 0.05, confirming the homogeneity of variances, and the classical ANOVA was therefore applied. The analysis returned a significant p-value below 0.05, indicating that the group means differ. Post hoc comparisons using the Bonferroni test revealed a significant difference between Millennials and Adult Consumers, with a significance level of 0.013.

	(I) Età in classi:	(J) Età in classi:	Differenza della media (I–J)	Errore std.	Sign.	Intervallo di confidenza 95% Limite inferiore	Limite superiore
Bonferroni	18 – 28 (Gen Z)	29 – 44 (Millennials)	,521	,275	,178	–,14	1,19
		45+ (Adult Consumers)	–,450	,323	,496	–1,23	,33
	29 – 44 (Millennials)	18 – 28 (Gen Z)	–,521	,275	,178	–1,19	,14

	45+ (Adult Consumers)	18 – 28 (Gen Z)	,450	,323	,496	–,33	1,23
		29 – 44 (Millennials)	,971*	,335	,013	,16	1,78
Games-Howell	18 – 28 (Gen Z)	29 – 44 (Millennials)	,521	,272	,138	–,12	1,17
		45+ (Adult Consumers)	–,450	,330	,366	–1,24	,34
	29 – 44 (Millennials)	18 – 28 (Gen Z)	–,521	,272	,138	–1,17	,12
		45+ (Adult Consumers)	–,971*	,339	,015	–1,78	–,16
	45+ (Adult Consumers)	18 – 28 (Gen Z)	,450	,330	,366	–,34	1,24
		29 – 44 (Millennials)	,971*	,339	,015	,16	1,78

*. La differenza della media è significativa al livello 0.05.

Table 5. Post-hoc Comparisons of Age Groups for FIS_2

The descriptive statistics show that Millennials reported a mean of 4.28, whereas Adult Consumers reported a higher mean of 5.25. This suggests that Adult Consumers tend to experience stronger positive emotions while shopping than Millennials do. The mean plot further illustrates this difference between the two groups.

	N	Media	Deviazione std.	Errore std.	95% di intervallo di confidenza per la media Limite inferiore	Limite superiore	Minimo	Massimo
18 – 28 (Gen Z)	75	4,80	1,594	,184	4,43	5,17	1	7
29 – 44 (Millennials)	61	4,28	1,561	,200	3,88	4,68	1	7
45+ (Adult Consumers)	36	5,25	1,645	,274	4,69	5,81	1	7
Totale	172	4,71	1,625	,124	4,46	4,95	1	7

Table 6. Descriptive Statistics of Age Groups for FIS_2

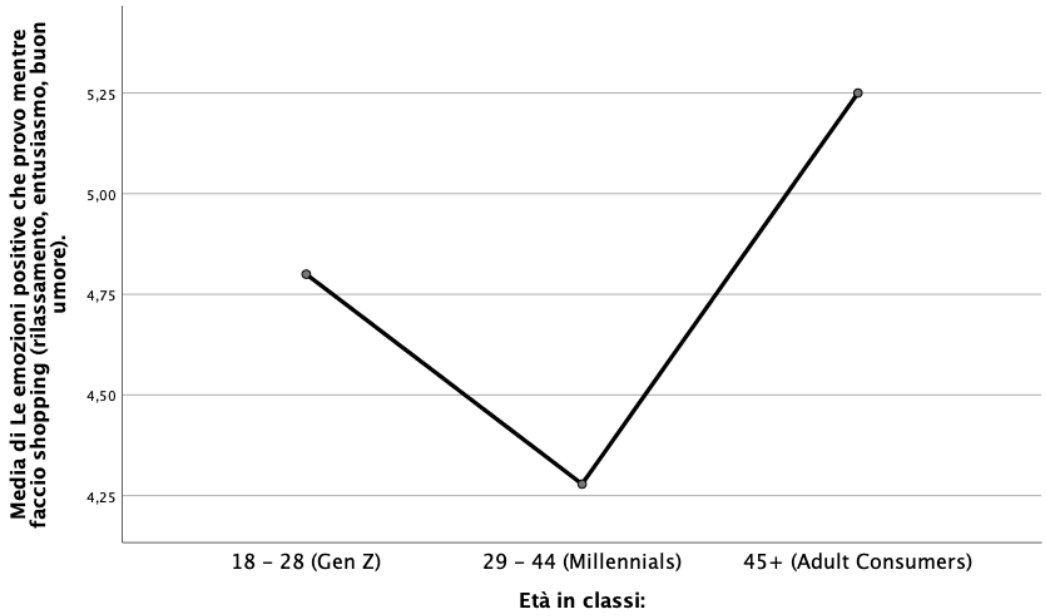

Figure 2. Mean Scores by Age Group by Age Groups for FIS_2

The same variable, FIS_2, was also compared between genders using an independent samples t-test. Levene's test indicated a significance level above 0.05 (p = 0.698), confirming the assumption of equal variances, and the first row of the t-test output was therefore used. The two-tailed test yielded a p-value of 0.004, below the 0.05 threshold, indicating that the mean scores differ significantly between men and women.

Based on the descriptive statistics, women report higher mean scores than men on this variable, suggesting they tend to experience stronger positive emotions during shopping. This pattern is also reflected in the descriptive table.

		Test di Levene per l'eguaglianza delle varianze		Test t per l'eguaglianza delle medie				
		F	Sign.	t	gl	Sign. (a due code)	Differenza della media	Differenza errore standard
Le emozioni positive che provo mentre faccio shopping (rilassamento, entusiasmo, buon umore).	Varianze uguali presunte	,151	,698	2,887	170	,004	,709	,245
	Varianze uguali non presunte			2,928	162,402	,004	,709	,242

Table 7. Independent Samples t-test of Gender Differences for FIS_2

	Genere:	N	Media	Deviazione std.	Media errore standard
Le emozioni positive che provo mentre faccio shopping (rilassamento, entusiasmo, buon umore).	Donna	99	5,01	1,651	,166
	Uomo	73	4,30	1,506	,176

Table 8. Descriptive Statistics of Gender for FIS_2

To examine age differences for the variable FIS_3 "The multisensory atmosphere of the store (lighting, scents, music, colors)", the same analytical procedure used for the previous tests was applied. After checking Levene's test and identifying the appropriate significance thresholds, the results indicated that group means differ. Post-hoc comparisons using the Bonferroni test revealed a significant difference between Millennials and Adult Consumers at the 0.007 level.

			Differenza della media (I–J)	Errore std.	Sign.	Intervallo di confidenza 95%	
	(I) Età in classi:	(J) Età in classi:				Limite inferiore	Limite superiore
Bonferroni	18 – 28 (Gen Z)	29 – 44 (Millennials)	,558	,287	,159	-,13	1,25
		45+ (Adult Consumers)	-,527	,337	,360	-1,34	,29
	29 – 44 (Millennials)	18 – 28 (Gen Z)	-,558	,287	,159	-1,25	,13
		45+ (Adult Consumers)	-1,085*	,349	,007	-1,93	-,24
	45+ (Adult Consumers)	18 – 28 (Gen Z)	,527	,337	,360	-,29	1,34
		29 – 44 (Millennials)	1,085*	,349	,007	,24	1,93
Games-Howell	18 – 28 (Gen Z)	29 – 44 (Millennials)	,558	,285	,127	-,12	1,23
		45+ (Adult Consumers)	-,527	,338	,270	-1,33	,28
	29 – 44 (Millennials)	18 – 28 (Gen Z)	-,558	,285	,127	-1,23	,12
		45+ (Adult Consumers)	-1,085*	,339	,006	-1,90	-,27
	45+ (Adult Consumers)	18 – 28 (Gen Z)	,527	,338	,270	-,28	1,33
		29 – 44 (Millennials)	1,085*	,339	,006	,27	1,90

Table 9. Post-hoc Comparisons of Age Groups for FIS_3

The descriptive statistics show that Millennials reported a mean of 4.08, whereas Adult Consumers reported a higher mean of 5.17. This suggests that Adult Consumers place greater importance on the store's multisensory atmosphere than Millennials do. This pattern is also clearly reflected in the mean plot.

	N	Media	Deviazione std.	Errore std.	95% di intervallo di confidenza per la media		Minimo	Massimo
					Limite inferiore	Limite superiore		
18 – 28 (Gen Z)	75	4,64	1,737	,201	4,24	5,04	1	7
29 – 44 (Millennials)	61	4,08	1,584	,203	3,68	4,49	1	7
45+ (Adult Consumers)	36	5,17	1,630	,272	4,62	5,72	1	7
Totale	172	4,55	1,701	,130	4,30	4,81	1	7

Table 10. Descriptive Statistics of Age Groups for FIS_3

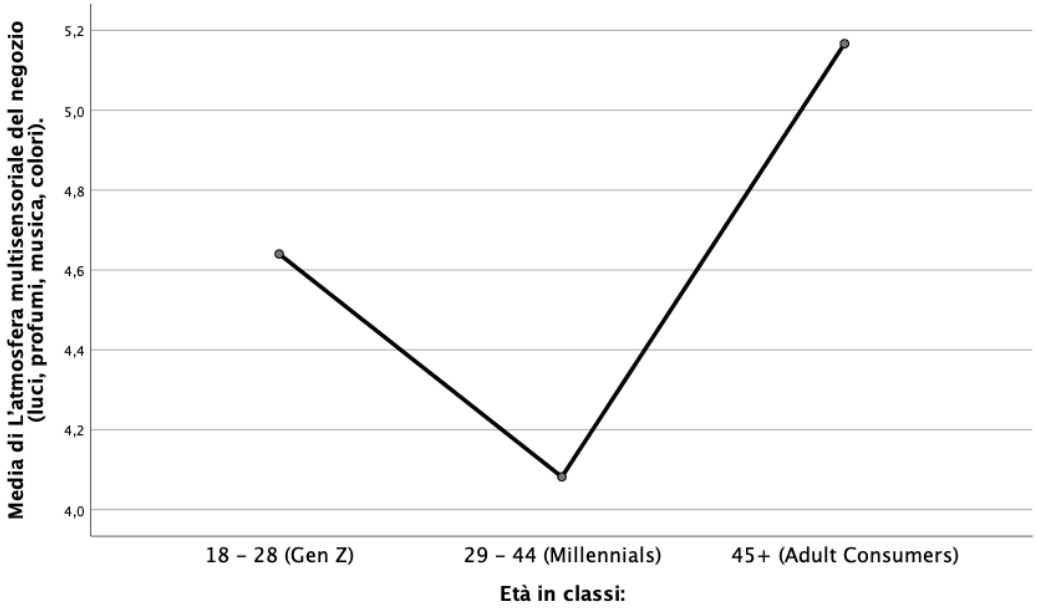

Fig. 3. Mean Scores by Age Group by Age Groups for FIS_3

To examine age differences for the variable FIS_4 “The human interaction with store staff or the opportunity to share the moment with other people”, the same analytical procedure used in the previous tests was applied. After checking Levene’s test and identifying the appropriate significance thresholds, the results indicated that group means differ. Post hoc comparisons using the Bonferroni test showed significant differences between Adult Consumers and both Gen Z ($p = 0.013$) and Millennials ($p = 0.000$), but no significant difference between Gen Z and Millennials.

	(I) Età in classi:	(J) Età in classi:	Differenza della media (I–J)	Errore std.	Sign.	Intervallo di confidenza 95% Limite inferiore	Limite superiore

	45+ (Adult Consumers)	18 – 28 (Gen Z)	,974*	,321	,009	,21	1,74
		29 – 44 (Millennials)	1,591*	,337	,000	,79	2,40

*. La differenza della media è significativa al livello 0.05.

Table 11. Post-hoc Comparisons of Age Groups for FIS_4

The descriptive statistics indicate mean scores of 4.39 for Gen Z, 3.77 for Millennials, and 5.36 for Adult Consumers. This suggests that Adult Consumers place considerably greater importance on the human relationship with store personnel and on sharing the shopping moment with others. The mean plot clearly reflects this pattern.

	N	Media	Deviazione std.	Errore std.	95% di intervallo di confidenza per la media Limite inferiore	Limite superiore	Minimo	Massimo
18 – 28 (Gen Z)	75	4,39	1,684	,194	4,00	4,77	1	7
29 – 44 (Millennials)	61	3,77	1,717	,220	3,33	4,21	1	7
45+ (Adult Consumers)	36	5,36	1,533	,256	4,84	5,88	1	7
Totale	172	4,37	1,754	,134	4,11	4,64	1	7

Table 12. Descriptive Statistics of Age Groups for FIS_4

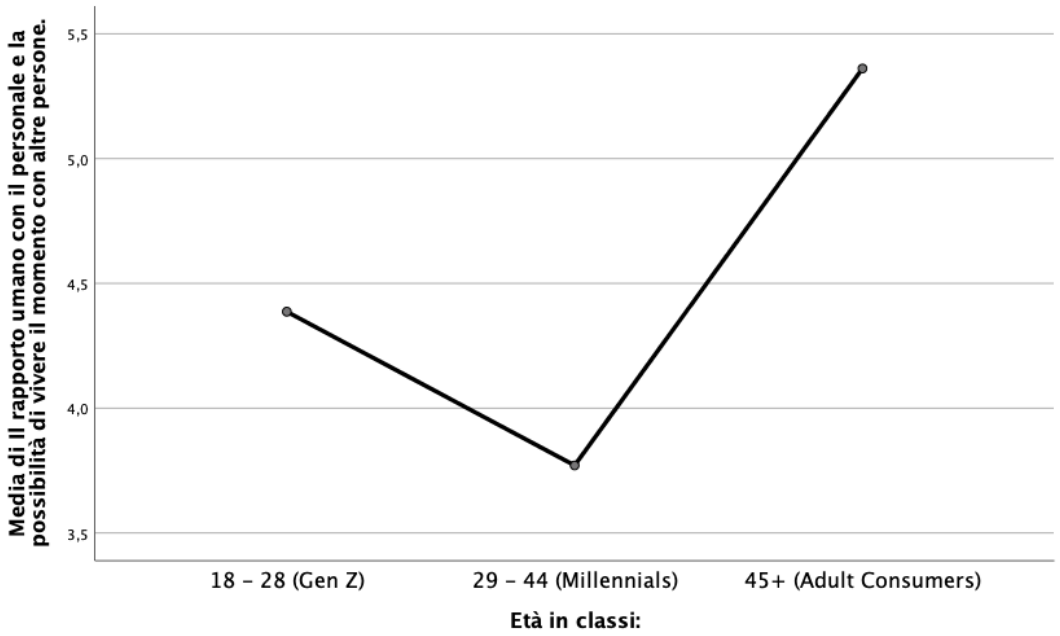

Figure 4. Mean Scores by Age Group by Age Groups for FIS_4

Finally, the variables FIS_1 to FIS_4 were also compared across gender. No significant differences emerged, except for FIS_2, related to positive shopping emotions, as previously discussed.

For the digital section, the variable DIG_1, "A well-designed and visually appealing website/app layout encourages me to continue the shopping experience," was compared between genders using an independent-samples t-test. Levene's test indicated a significance level above 0.05 (p = 0.051), so the first row of the output, assuming equal variances, was considered. The two-tailed test yielded a p-value of 0.009, which is below the 0.05 threshold, confirming that the mean scores differ between men and women.

As shown in the descriptive statistics, women report higher mean values than men, indicating that a visually appealing, well-designed layout tends to influence their continued online shopping experience more strongly. This pattern is also reflected in the descriptive table.

		Test di Levene per l'eguaglianza delle varianze		Test t per l'eguaglianza delle medie				
		F	Sign.	t	gl	Sign. (a due code)	Differenza della media	Differenza errore standard
Un layout ben curato e visivamente piacevole del sito/app mi invoglia a continuare l' esperienza di acquisto.	Varianze uguali presunte	3,851	,051	2,643	170	,009	,469	,178
	Varianze uguali non presunte			2,557	134,179	,012	,469	,184

	Uomo	73	5,52	1,292	,151

Table 14. Descriptive Statistics of Gender for DIG_1

For the variable DIG_2 "*If the website is interactive and easy to use, I feel more engaged and motivated to purchase*", a One-Way ANOVA was conducted to examine age differences. After checking Levene's test and identifying the appropriate significance thresholds, the analysis required robust tests, which indicated significant differences across groups. Post-hoc comparisons using the Games-Howell test revealed a significant difference between Millennials and Adult Consumers (p = 0.007).

	(I) Età in classi:	(J) Età in classi:	Differenza della media (I–J)	Errore std.	Sign.	Intervallo di confidenza 95% Limite inferiore	Limite superiore

*. La differenza della media è significativa al livello 0.05.

Table 15. Post-hoc Comparisons of Age Groups for DIG_2

The descriptive statistics show a mean of 5.41 for Millennials and a higher mean of 6.11 for Adult Consumers. This suggests that Adult Consumers place greater importance on having an online shopping experience that is simple, intuitive and easy to navigate, whereas Millennials appear to be more focused on the purchase itself rather than on the user friendliness of the interface. This pattern is also visible in the mean plot.

	N	Media	Deviazione std.	Errore std.	95% di intervallo di confidenza per la media Limite inferiore	Limite superiore	Minimo	Massimo

Table 16. Descriptive Statistics of Gender for DIG_2

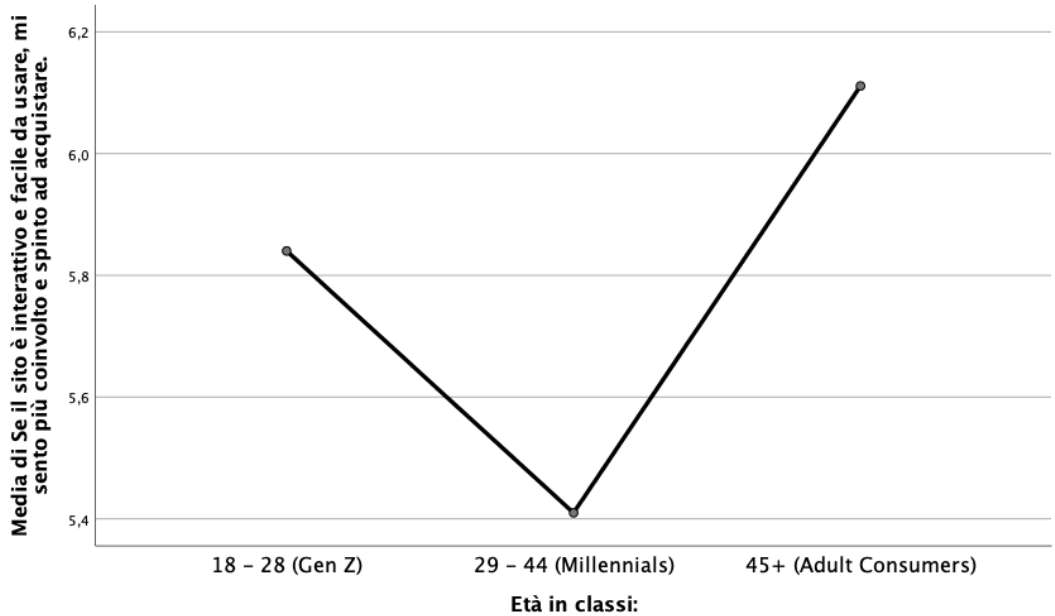

Fig. 5. Mean Scores by Age Group by Age Groups for DIG_2

For the variable DIG_3 "*When I shop online, deliveries arrive within the promised time*", a One-Way ANOVA was conducted. After checking Levene's test and identifying the appropriate significance thresholds, the analysis required robust tests, which indicated significant differences across groups. Post-hoc comparisons using the Games-Howell test revealed a significant difference between Gen Z and Adult Consumers (p = 0.003).

	(I) Età in classi:	(J) Età in classi:	Differenza della media (I–J)	Errore std.	Sign.	Intervallo di confidenza 95% Limite inferiore	Limite superiore

*. La differenza della media è significativa al livello 0.05.

Table 17. Post-hoc Comparisons of Age Groups for DIG_3

According to the descriptive statistics, Gen Z reports a mean of 5.45, while Adult Consumers show a higher mean of 6.11. This suggests that older consumers tend to perceive delivery reliability as more consistent or to place greater importance on punctual deliveries than younger shoppers. The mean plot visually reflects this pattern.

	N	Media	Deviazione std.	Errore std.	95% di intervallo di confidenza per la media Limite inferiore	Limite superiore	Minimo	Massimo

45+ (Adult Consumers)	36	6,11	,820	,137	5,83	6,39	4	7
Totale	172	5,74	1,074	,082	5,58	5,90	2	7

Table 18. Descriptive Statistics of Gender for DIG_3

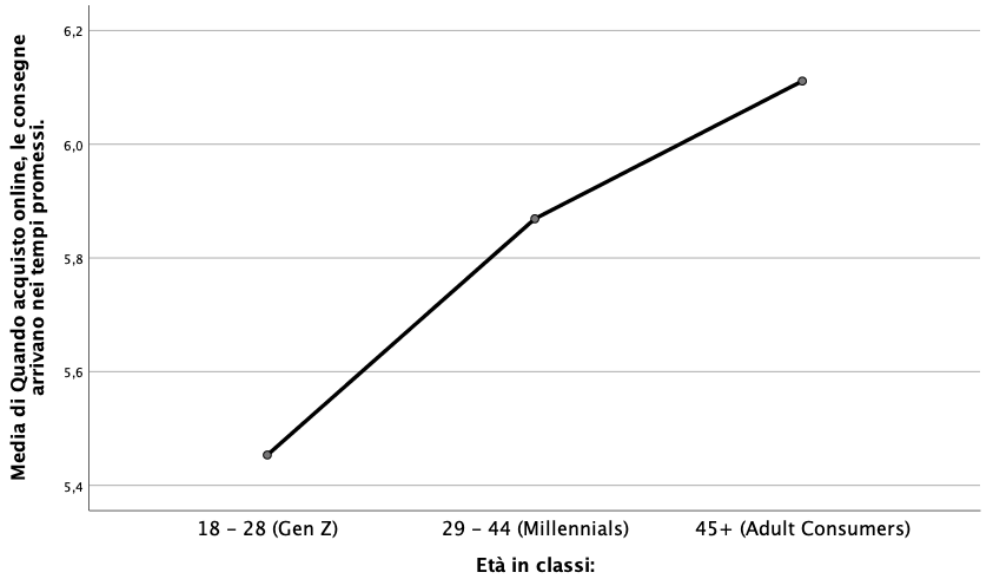

Figure 6. Mean Scores by Age Group by Age Groups for DIG_3

Finally, the variables DIG_1 to DIG_3 were also compared across gender. No significant differences emerged, except for DIG_1, related to the website layout, as previously discussed.

The final section of the analysis focuses on sustainability-related perceptions, beginning with the variable SOS_1 "*When choosing where to shop, how important is sustainability to you?*". Following the ANOVA, after checking Levene's test and applying the appropriate significance criteria, classical ANOVA was used. The analysis showed significant differences across groups, and post-hoc comparisons using the Bonferroni test revealed a significant difference between Millennials and Adult Consumers (p = 0.016).

	(I) Età in classi:	(J) Età in classi:	Differenza della media (I–J)	Errore std.	Sign.	Intervallo di confidenza 95% Limite inferiore	Limite superiore

		45+ (Adult Consumers)	–,879*	,304	,013	–1,60	–,15
	45+ (Adult Consumers)	18 – 28 (Gen Z)	,652*	,272	,050	,00	1,30
		29 – 44 (Millennials)	,879*	,304	,013	,15	1,60

*. La differenza della media è significativa al livello 0.05.

Table 19. Post-hoc Comparisons of Age Groups for SOS_1

The descriptive statistics indicate a mean of 4.43 for Millennials and a higher mean of 5.31 for Adult Consumers. This suggests that older consumers place greater importance on sustainability when choosing where to shop than Millennials do. The trend is clearly reflected in the mean plot. No significant differences emerged when comparing the variable by gender.

	N	Media	Deviazione std.	Errore std.	95% di intervallo di confidenza per la media		Minimo	Massimo
					Limite inferiore	Limite superiore		
18 – 28 (Gen Z)	75	4,65	1,419	,164	4,33	4,98	1	7
29 – 44 (Millennials)	61	4,43	1,658	,212	4,00	4,85	1	7
45+ (Adult Consumers)	36	5,31	1,305	,218	4,86	5,75	3	7
Totale	172	4,71	1,513	,115	4,48	4,94	1	7

Table 20. Descriptive Statistics of Gender for SOS_1

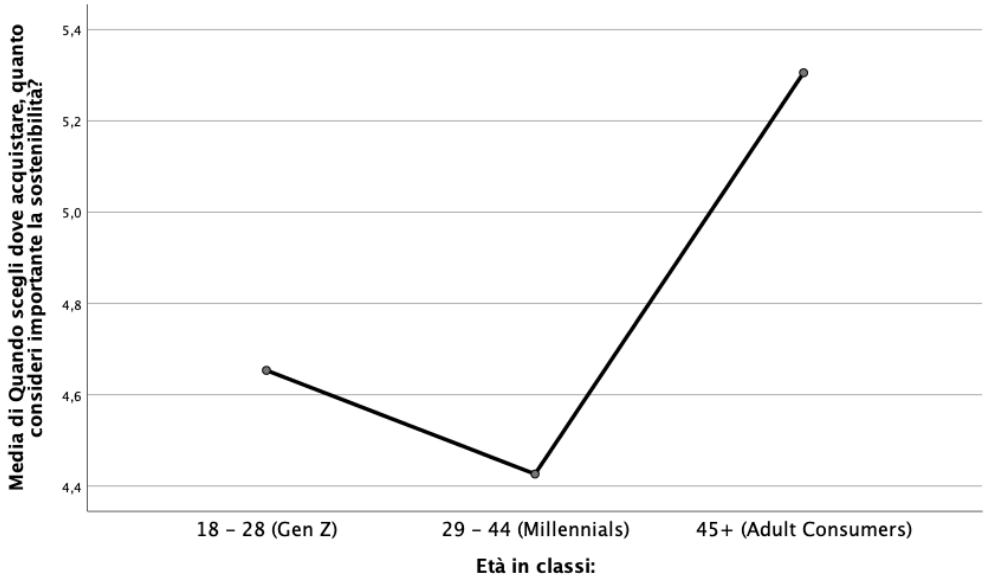

Figure 7. Mean Scores by Age Group by Age Groups for SOS_1

Finally, for the variable SOS_2 "*I believe that online shopping has a greater environmental impact than shopping in a physical store*", gender differences were examined using an independent samples t-test. Levene's test indicated a significance level above 0.05, confirming the assumption of equal variances, so the first row of the t-test output was considered. The two-tailed test showed a significant result (p = 0.003), indicating that men and women differ in their perceptions of the environmental impact of online shopping.

The descriptive statistics show a mean of 4.51 for men and a higher mean of 5.22 for women, suggesting that women are more likely to believe that online purchases have a greater environmental impact than in-store purchases. No significant age differences emerged for this variable.

		Test di Levene per l'eguaglianza delle varianze		Test t per l'eguaglianza delle medie				
		F	Sign.	t	gl	Sign. (a due code)	Differenza della media	Differenza errore standard

	Uomo	73	4,51	1,582	,185

Table 22. Descriptive Statistics of Gender for SOS_2

4. Conclusion

The findings of this study show that consumer evaluations of physical and digital retail channels differ systematically across demographic profiles, highlighting the relevance of an experience-centric approach to retail strategy design. Age emerges as a particularly influential factor in shaping the evaluation of experiential dimensions. Adult Consumers consistently assign greater importance to key experiential attributes of the physical store, including product touch, emotional engagement, store atmosphere, and interpersonal interaction. In digital environments, there is greater value placed on simplicity, usability, and intuitive interfaces, indicating a preference for frictionless, accessible online experiences. Younger consumers, by contrast, appear more transaction-oriented, prioritising speed and functional efficiency over experiential richness.

Sustainability also plays a distinct role in channel evaluation, particularly among Adult Consumers, who exhibit greater environmental sensitivity when assessing shopping experiences in both physical and digital contexts. This suggests that sustainability functions as an evaluative component of the overall shopping experience rather than as an isolated ethical concern. Gender-based differences are more limited, yet they indicate that women tend to experience stronger positive emotions during in-store shopping, show greater appreciation for visually curated digital interfaces, and perceive a higher environmental impact associated with online shopping.

Overall, the results confirm that experiential preferences are not homogeneous but are shaped by sociodemographic profiles. By adopting an experience-centric profiling perspective, the study contributes to a deeper understanding of how consumers evaluate retail channels in contexts characterised by strong online–offline integration, such as apparel, consumer electronics, and books. These insights provide a foundation for designing targeted digital transformation strategies that align channel-specific experiential configurations with the expectations of different consumer groups.

5. Managerial implications

The study provides actionable insights for retailers aiming to redesign their online and offline value propositions through an experience-centric perspective. The strong experiential expectations expressed by Adult Consumers highlight the importance of preserving and enhancing sensory and relational elements of the physical store, such as product tryouts, interpersonal interaction, and emotionally engaging atmospheres. Rather than being residual features, these elements should be strategically leveraged as core components of the in-store experience, particularly in retail contexts characterised by strong online–offline integration, such as apparel, consumer electronics, and books.

In digital channels, the findings suggest that retailers should prioritise simplicity, usability, and clarity in interface design, as these attributes are especially valued by Adult Consumers and women. For younger consumers, who appear more transaction-oriented, digital experience design should emphasise efficiency through streamlined checkouts, fast product search functions, and

transparent delivery information. This differentiation supports the development of channel-specific experiential configurations rather than uniform digital solutions.

Sustainability also emerges as a relevant dimension of experience design. Given the higher sensitivity observed among Adult Consumers and women, retailers should integrate sustainability cues into both physical and digital touchpoints, for instance through transparent communication about eco-friendly practices, responsible packaging, and green delivery options. Framing sustainability as part of the overall shopping experience, rather than as an isolated ethical message, may enhance its perceived relevance and effectiveness.

Overall, the findings indicate that digital transformation strategies should be grounded in experience-centric profiling, using demographic variables as interpretative lenses for channel-specific experience design. This approach enables retailers to differentiate functional and emotional value across channels and to better align retail experiences with the heterogeneous expectations of different consumer groups.

6. Limitations and Future Research

This study presents several methodological considerations that open avenues for future research. First, the analysis used bivariate techniques, which provided a clear initial picture of how demographic variables relate to different experiential dimensions. However, this approach does not allow for the exploration of the simultaneous effects of multiple variables. Future studies could therefore adopt multivariate methods to enable a more integrated examination of demographic, experiential, and sustainability-related factors, particularly when supported by a broader dataset. Regarding the sample size, it will be expanded in the second phase of the research, as this is an ongoing study.

Another limitation concerns the exclusive use of quantitative data. While this approach ensures comparability and statistical rigour, it does not capture the deeper nuances underlying consumer motivations and interpretations of their shopping experiences. Integrating qualitative methods, such as interviews or focus groups, would complement the quantitative results and provide richer insights. In addition to, while the study focuses on three retail categories characterised by strong online–offline integration (apparel, consumer electronics, and books), future research could further explore sector-specific differences by analysing each category separately. Future research will incorporate additional control variables, such as online shopping familiarity, purchase frequency, and digital literacy, to better isolate demographic effects.

Finally, the operationalisation of sustainability perceptions could be expanded to include additional components, such as behavioural intentions, perceived trade-offs, or the role of specific sustainable practices. This would allow future research to investigate more comprehensively how consumers incorporate environmental considerations into their channel preferences and purchasing behaviours.

Keywords: Consumer profiling; shopping experience; digital transformation; experiential retail; online–offline integration

Strega comanda colore: trova il colore per comunicare la sana alimentazione

Susanna Graziano[1], Benedetta Grandi[2], Maria Grazia Cardinali[3], Guido Cristini[4]

1. Introduzione

Il colore rappresenta uno degli elementi visivi più influenti nella formazione delle percezioni dei consumatori. Studi precedenti (es. Spence, 2019) hanno infatti dimostrato che il colore non solo è in grado di catturare l'attenzione, ma anche di influenzare le risposte cognitive ed emotive degli individui. Nel corso del tempo, l'influenza del colore è stata studiata in numerosi ambiti, dalle neuroscienze alla psicofisica, dalla psicologia sperimenale alla biologia (Labrecque et al., 2013). Uno degli ambiti in cui è stato studiato maggiormente è quello del marketing. Infatti, sono stati condotti numerosi studi sul colore nel campo dell'avertising (es. Mehta & Zhu, 2009), del branding (es. Bottomley & Doyle, 2006), dell'influenza sull'intenzione d'acquisto (es. Agariya et al., 2012), del design del punto vendita (es. Barlı et al., 2012), etc.

Un filone della letteratura si è dedicato allo studio del colore nel campo del marketing nutrizionale. In particolare, in questo ambito, sono stati condotti numerosi studi relativamente al packaging (es. Hallez et al., 2023), sicuramente una delle leve più importanti che hanno a disposizione sia l'Industria che la Distruzione. Tuttavia, dato che il punto vendita costituisce un elemento fondamentale nelle decisioni di acquisto (es. Hecht et al., 2020), i distributori possono assumere un ruolo particolarmente rilevante nel guidare i consumatori verso scelte più salutari. I retailers hanno a loro disposizione numerose leve in-store (es. assortimento, visual merchandising, comunicazione point of purchase, display, layout, etc.) che possono manovrare all'interno delle strategie di marketing nutrizionale. Una di queste è la comunicazione in store. Studi precedenti hanno dimostrato che l'in-store communication è efficace nell'influenzare le scelte dei consumatori, fornendo informazioni pertinenti e facilitando un processo decisionale consapevole (es. Roggeveen et al., 2023), incoraggiando anche l'acquisto d'impulso (es. Chitty et al., 2017).

Se da un lato l'influenza del colore è stata ampiamente studiata nell'ambito della salute e del marketing nutrizionale applicandolo a diverse leve, resta poco esplorata l'applicazione alla leva della comunicazione in-store. Questa ricerca, ancora work in progress, intende indagare l'impatto del colore in relazione a un'iniziativa di comunicazione in-store, al fine di promuovere l'acquisto di prodotti a valenza salutistica per la prima colazione. Per fare ciò, è stato condotto dapprima un pre-test e, successivamente, un esperimento in ambiente reale, implementando un'iniziativa di comunicazione in-store – una con il colore verde e una con il colore blu - in due supermercati nel nord Italia appartenenti a una delle più note catene della Grande Distribuzione Organizzata (GDO) italiana.

2. Sviluppo concettuale

La teoria tricromatica di Hurvich & Jameson (1957) sostiene che l'occhio umano percepisce tre colori primari (rosso, verde e blu) da cui derivano tutti gli altri colori dello spettro visibile. Questi colori sono divisi in due categorie: i colori caldi, come il rosso, con lunghezze d'onda più lunghe, e i colori freddi, come il blu e il verde, con lunghezze d'onda più corte. Van Goethe (1970) ha identificato tre attributi del colore: tonalità, valore tonale e saturazione.

Nel corso del tempo, numerose ricerche nel campo della psicologia (vedi Brosch et al., 2010 per una rassegna della letteratura), hanno studiato il legame tra colore ed emozioni, ma anche tra colori e alimentazione (vedi Steiner & Florack, 2023 per una rassegna recente della letteratura). È emerso che i colori caldi e saturi sono spesso percepiti come eccitanti (es. Labrecque & Milne, 2012) e stimolanti (es. Gorn et al., 1997), mentre i colori freddi sono associati alla calma e alla salubrità (es. Hallez et al., 2023). Inoltre, è stato dimostrato che l'utilizzo di colori più desaturati e con una maggiore luminosità è positivamente associato alla percezione di salubrità (es. Tijssen et al., 2017). Ad esempio, il rosso stimola l'appetito (Raghunathan et al., 2006) e fa percepire i cibi come più dolci (Huang & Lu, 2015) o meno salutari (Levy et al., 2012). Mentre, il blu e il verde vengono percepiti come più salutari e sostenibili, ma meno gustosi (es. Hallez et al., 2023). Queste ricerche si basano su campioni ristretti e omogenei, il che ne limita la validità esterna (es. Agariya et al., 2012; Raghunathan et al., 2006). Inoltre, la maggior parte degli studi utilizza contesti sperimentali laboratoriali e stimoli manipolati digitalmente, che non riflettono le condizioni reali di esposizione al colore (es. Huang & Lu, 2015; Hallez et al., 2023). Le misure adottate sono prevalentemente auto-dichiarate, focalizzandosi su percezioni e intenzioni piuttosto che su comportamenti effettivi di acquisto, creando un gap tra atteggiamenti e azioni (es. Agariya et al., 2012; Hallez et al., 2023).

Inoltre, in letteratura, il dibattito su quale colore sia più efficace in termini di percezione di salubrità resta ancora aperto.

Di conseguenza, viene formulata la seguente domanda di ricerca:

RQ1: Quale colore è percepito come più salutare nelle iniziative di comunicazione in-store?

Questa ricerca si pone l'obiettivo, in primo luogo, di determinare se è il blu o il verde a essere più efficace in termini di percezione di salubrità. In secondo luogo, mira a identificare quale dei due colori sia più efficace nello stimolare gli acquisti di prodotti a valenza salutistica. Nelle fasi successive, la ricerca si prospetta inoltre di studiare l'impatto di questa iniziativa sulla capacità di cambiare il comportamento del consumatore, i fattori che moderano l'impatto dell'intervento, analizzando se l'efficacia dipenda dalla salubrità percepita della categoria di prodotto e se l'iniziativa si dimostri significativamente più incisiva sui clienti fedeli all'insegna del distributore.

3. Quadro metodologico

3.1. Pre-test

Al fine di selezionare i colori da testare in ambiente reale, è stato condotto un pre-test con i colori più utilizzati nell'ambito del marketing in-store attraverso un sondaggio online between subject. Sono stati testati sei colori: arancione, giallo, rosso, blu, verde e bianco. Il campione era composto da 144 partecipanti, 64% donne (35% uomini); l'età del campione era: 59% 18-24; 24% 25-34; 6% 35-49; 10% 50-54, 3% 65 o più. Ai partecipanti è stato chiesto di valutare, utilizzando una scala Likert a 7 punti, il livello percepito di salubrità e le diverse emozioni evocate dai colori utilizzati (Zielke, 2006). È stato misurato anche l'interesse generale per la salute (Roininen et al., 1999), che è stato mantenuto come covariata. Al fine di garantire la veridicità delle risposte dei soggetti, è stato incorporato nel sondaggio un attention check - e un intervistato è stato rimosso. Il pre-test ha mostrato che il verde (5,25) e il blu (5,13) sono stati percepiti come significativamente ($p < .001$) più salutari del bianco (4,69), dell'arancione (4,39), del giallo (3,71) e del rosso (3,04). Questo risultato è dunque in linea con la letteratura precedente (es. Hallez et

al., 2023). Inoltre, il blu (5,64) e il verde (5,23) sono risultati più efficaci nell'evocare emozioni positive ($p < .001$) rispetto agli altri. Dato che l'obiettivo di questo studio è quello promuovere l'acquisto di prodotti a valenza salutistica per la prima colazione, sono stati selezionati il blu e il verde come colori da utilizzare in ambiente reale.

3.2. Esperimento in ambiente reale

L'esperimento in ambiente reale è stato implementato installando in un punto vendita la comunicazione con il colore blu e nell'altro quella con il colore verde. Sono stati utilizzati diversi strumenti di comunicazione in-store: bandiere, stopper, calpestabili e crowner. Il messaggio di comunicato era lo stesso per entrambi i punti vendita e faceva appello al beneficio fisico di una dieta sana. Questa scelta si basa sulla teoria del guadagno e della perdita (gain & loss), che deriva dalla Prospect Theory di Tversky & Kahneman (1979). È stata strutturata in un frame di "guadagno" in quanto la promozione di comportamenti considerati "sicuri" (come una "dieta equilibrata") è più efficace se formulata in termini di potenziali guadagni (Rothman & Salovey, 1997). Mentre, l'enfasi sui benefici fisici ("energia") è dovuta al fatto che la comunicazione funzionale è considerata efficace nel modificare i comportamenti legati alla salute (es. Bertolotti et al., 2020).

In particolare, il messaggio recitava: "L'ENERGIA è BENESSERE. Una dieta varia ed equilibrata e uno stile di vita sano sono le basi del tuo benessere. Scopri QUI la nostra selezione di prodotti che, per i loro ingredienti e valori nutrizionali, possono contribuire al tuo benessere fisico."

L'iniziativa di comunicazione in-store ha compreso un paniere di prodotti per la prima colazione (cereali, biscotti e merendine) a marchio del distributore (MDD) identificati, in accordo con l'insegna, sulla base del loro profilo nutrizionale. Il periodo sperimentale è durato sei settimane. L'efficacia del colore è stata misurata attraverso dei questionari semi-strutturati somministrati ai consumatori davanti allo scaffale e l'analisi dei dati di vendita. Il campione dei questionari semi-strutturati includeva 271 individui. In particolare, 135 soggetti sono stati raccolti nel supermercato 1 (blu), 136 nel supermercato 2 (verde), con 91 nella categoria cereali, 90 nella categoria merendine e 90 nella categoria biscotti. Il campione era prevalentemente femminile (64,57%), con un'età media di 52,53 anni e un'età mediana di 54 anni. Per misurare la percezione di salubrità del colore è stata utilizzata una scala Likert a 7 punti, dove 1 rappresentava "per niente salutare" e 7 rappresentava "molto salutare". Inoltre, sono stati misurati il livello di appetito (da 1 che rappresenta "per niente" e 7 che rappresenta "molto affamato"), l'atteggiamento nei confronti della MDD (Burton et al., 1998 - $\alpha = .870$), il confronto tra marchio del distributore e marchio industriale (Liljander et al., 2009 - $\alpha = .934$), l'impegno del distributore per la salute dei consumatori (Anselmsson & Johansson, 2007 - $\alpha = .935$), l'interesse generale per la salute (Roininen et al., 1999 - $\alpha = .733$) che sono state mantenute come covariate, insieme all'età e al genere. Per quanto riguarda i dati di vendita, sono state analizzate le unità vendute - al fine di limitare l'effetto dell'inflazione che ha colpito l'Italia durante quel periodo - senza l'applicazione di promozioni - per isolare l'effetto delle promozioni che potrebbero cambiare il comportamento dei consumatori – confrontandole con quelle dell'anno precedente.

4. Risultati

Utilizzando SPSS, sono state eseguite delle ANOVA a misure ripetute sui dati di vendita. È stata identificata un'interazione significativa ($p < .001$) tra il periodo considerato (il periodo di implementazione dell'esperimento rispetto all'anno precedente), il tipo di prodotto (comunicato rispetto a non comunicato) e il punto vendita ($p < .001$). Nello specifico, per i prodotti comunicati,

il punto vendita con il verde ha mostrato un maggiore aumento delle vendite rispetto all'anno precedente e rispetto agli altri due negozi, crescendo da 12,19 a 13,99. Il punto vendita di controllo ha dimostrato un aumento delle vendite da 4,67 a 5,18, mentre il punto vendita con il colore blu ha mostrato un aumento da 7,32 a 7,36 (entrambi gli aumenti non erano significativi). Per quanto riguarda i questionari semi-strutturati, sono state condotte delle ANCOVA. I risultati hanno indicato che il verde è stato percepito come più salutare del blu (Mverde= 5,19, Mblu = 5,16; p = .031). Di conseguenza, possiamo rispondere alla RQ1 sostenendo che il verde è percepito come più salutare nelle iniziative di comunicazione in-store.

5. Altri risultati attesi

Sulla base della letteratura precedente, che sottolinea l'efficacia delle leve del marketing in-store e della comunicazione nel catturare l'attenzione e influenzare le decisioni di acquisto (es. Garrido-Morgado et al., 2021), si ritiene che l'iniziativa di comunicazione in-store basata sul benessere, indipendentemente dal colore, migliorerà le prestazioni dei prodotti comunicati in termini di vendite. Inoltre, dato che studi precedenti (es. Noar et al., 2020) indicano che il comunicare messaggi chiari e persuasivi, la percezione di salubrità (es. Provencher & Jacob, 2016) e la visibilità (es. Slapø et al., 2021) siano determinanti nel modificare i comportamenti legati alla salute e le intenzioni di acquisto, ci si aspetta che l'efficacia dell'iniziativa nel guidare gli acquisti sarà direttamente correlata all'efficacia percepita della comunicazione, al suo impatto nel cambiare il comportamento del consumatore, alla salubrità percepita del colore e alla visibilità della comunicazione in-store. Ci si aspetta anche che l'efficacia dell'iniziativa sia maggiore per le categorie di prodotti che i consumatori percepiscono già come salutari (nel caso di questo studio, potrebbe riguardare i cereali), ciò dovuto a un maggiore perceived fit tra il messaggio comunicato e la natura del prodotto (es. Siegrist et al., 2008). Infine, dato che la fiducia e la fedeltà all'insegna sono state identificate come fattori chiave che rafforzano l'atteggiamento positivo verso le iniziative e i prodotti MDD, aumentando la probabilità di acquisto (es. Louis et al., 2023), ci si aspetta che l'iniziativa risulterà essere più efficace nell'influenzare il comportamento di acquisto dei consumatori abituali.

6. Conclusioni

I risultati di questo studio da un lato si allineano con la letteratura esistente che associa il verde al concetto di salute (es. Schuldt, 2013), suggerendo così che, nel contesto della comunicazione in-store, questa associazione possa tradursi in una maggiore efficacia in termini di vendite. Dall'altro, questo risultato è in contrasto con il filone di ricerca che riconosce il blu come più efficace nella percezione di salubrità (es. Plasek et al., 2021). Questo fornisce un insight importante per i distributori e per i brand industriali interessati a guidare i consumatori verso scelte alimentari più sane attraverso il marketing in-store. L'implementazione di un'iniziativa di comunicazione con il colore verde si è dimostrata efficace nel potenziare le prestazioni dei prodotti comunicati, anche rispetto al blu, che è un colore molto utilizzato nelle linee di prodotti salutistici. Di conseguenza, si raccomanda di utilizzare il verde desaturato per la segnaletica in-store volta a promuovere opzioni salutari, poiché è stato dimostrato che questa scelta ha una maggiore influenza sugli acquisti effettivi. Inoltre, se fossero confermati i risultati attesi, i manager della distribuzione dovrebbero considerare l'utilizzo della comunicazione in-store come strumento per rafforzare la fedeltà e le associazioni della MDD con un impegno per la salute e il benessere. Questo soprattutto nei prodotti che già godono di un'alta percezione di salubrità, dove dovrebbero concentrare gli sforzi comunicativi e promozionali, evitando dunque di attuarlo su categorie percepite come meno salutari, dove l'intervento potrebbe avere un impatto minore o addirittura irrilevante. Tuttavia, questo studio non è esente da limiti. In primo luogo, le auto-dichiarazioni dei rispondenti sulla percezione del colore potrebbero essere biased. In secondo

luogo, l'efficacia dell'esperimento potrebbe essere stata ridotta a causa dell'implementazione in un contesto sul campo in cui le variabili non potevano essere controllate. In terzo luogo, il campione dei questionari semi-strutturati non è rappresentativo, limitando potenzialmente la generalizzabilità. Future ricerche potrebbero riproporre l'esperimento con un campione più ampio o effettuare un'analisi quantitativa interculturale. Inoltre, l'integrazione di alcune tecnologie, come quella dell'eye-tracking, potrebbe migliorare la nostra comprensione dell'attrattiva del colore e dell'attenzione dei consumatori rispetto all'iniziativa di comunicazione. Ulteriori studi potrebbero testare il colore e i messaggi basati sul benessere attraverso altre leve, come la comunicazione out-of-store, i social media, il sito web, etc.

More Than a Beauty Makeover? Evaluating Organizational Change Toward Sustainability of a Benefit Company in the Cosmetic Industry

Teresa Izzo[1], Ludovica Evangelista[2], Gianluca Risaliti[3]

1. Introduction

Globally, firms are increasingly pressured to embrace long-term value creation business models, aligning strategy and operations with social and environmental goals. One significant development in this landscape is the emergence of the Benefit corporation (BC), a new legal structure that may create more ethical and socially responsible organisations (Gamble et al., 2020; Moroz and Gamble, 2021). The BC form embraces a dual-purpose business model, striving for balance between profit maximization and creation of positive social and environmental impact. In recent years, the diffusion of hybrid legal forms has accelerated across jurisdictions – such as Benefit Corporations in the USA (2010), Società Benefit in Italy (2015), Entreprises à Mission in France (2019), and Sociedades de Beneficio e Interés Común (SBIC) in Spain (2022) – raising a central question for scholars and policymakers: do such reforms function as mere signals or translate meaningful organisational change? (Meyer and Rowan, 1977; Hiller, 2013; Stubbs, 2017a, b; Segrestin et al., 2021). Following the 2010 US landmark – namely the first BC statute enacted in Maryland (Maryland General Assembly, Senate Bill 690, Chapter 97, 2010) – BC statutes are now recognised in 39 countries. Within this global landscape, Italy was the first European country to introduce this hybrid corporate form with the 2016 Budget Law (Legge 208/2015; Del Baldo, 2019) and this legal form operates within a broader EU framework that is a key jurisdiction for sustainability rule-setting. Despite the rise and worldwide diffusion of the B-Corp movement, the depth and authenticity of this transition remain in question. In fact, the transition of an organisation into a benefit form is an 'entrepreneurial journey' of a particular kind (Moroz et al., 2018, p. 117), one where actors learn over time how to build environmental and ethical concerns into their organisation. Rather than being a simple formal or symbolic change, the adoption of BC status should imply a dynamic organisational process that requires the development and refinement of new daily routines and procedures, governance arrangements, and cultural commitments (Picciaia and Mari, 2022). Despite the increasing debate among scholars (Blasi and Sedita, 2021; Pollmeier et al., 2025), the key unresolved issue is not whether adoption occurs, but whether it produces substantive reconfiguration across organisational layers. Empirical evidence is inconclusive as to whether these adoptions are predominantly ceremonial (decoupling) or reconnect purpose to fundamental organisational practice (Bromley and Powell, 2012; Crilly et al., 2012). To explore this issue, we examine the case of Acqua dell'Elba, a family-owned fragrance company that became a BC in 2021. Since the adoption of the new legal status, the company has actively progressed toward B-Corp certification 4 (Occhipinti, 2023; Diez-Busto

et al., 2022). Drawing on Laughlin's (1991) model of organisational change, we analyse how the firm's shift toward benefit status unfolds across its interpretive schemes, design archetypes, and subsystems, thereby assessing the extent to which the transition reflects surface-level adjustments or deeper, transformative change. This framing allows us to distinguish symbolic adjustments, which primarily serve legitimising purposes, from substantive transformations that penetrate core organisational structures and routines. The cosmetics industry represents a critical setting to test the boundary between symbolic adoption and substantive transformation. In fact, firms in this sector often operate under heightened scrutiny from consumers and stakeholders, creating strong incentives to signal ethical commitments while simultaneously confronting the challenge of embedding such commitments into daily practices and operational routines. This tension makes the case particularly suited to investigating whether the transition to benefit status functions mainly as a reputational device or as a catalyst for meaningful organisational reconfiguration. Accordingly, we foreground the nature of change itself and formulate a sharper research question: RQ: Is the adoption of Benefit legal form actually cosmetic or substantive in nature?

Therefore, the objective of this study is to critically examine the nature, motivators, and credibility of the B-Corp transition. The research question is addressed through a single-case study. The research is conducted using semi-structured interviews with key decision-makers, including executives, sustainability officers, and operational managers. Additional data are gathered through longitudinal document analysis (e.g., sustainability reports, certification materials, and internal planning tools). Our case organisation allows us to observe how sustainability management and place-based accountability condition symbolic versus substantive trajectories. Crucially, we operationalise "symbolic vs. substantive" via Laughlin's layers and change types, enabling transparent classification of observed shifts. The case is significant because the company has recently adopted the legal form of SB it is pursuing multiple ISO-based management standards, thereby if restructuring roles, processes, management and governance rotines. Our contribution is threefold. First, we enrich the literature on B-Corp adoption by examining how the SB transition unfolds across organisational layers. In doing so, we shed light on the conditions under which this legal form produces symbolic rather than substantive change. Second, we apply Laughlin's (1991) model of organisational change to the contemporary debate on purpose-driven organisations, demonstrating its analytical value for disentangling surface-level adjustments from deeper transformations. Third, we prvode a nuanced, empirically grounded understanding of how industry and environmental dynamics shape the trajectory and authenticity of the benefit transition. The remainder of this study proceeds as follows. Section 2 introduces the background and theoretical framework, while Section 3 details the research methodology. Lastly, preliminary findings and avenues for future research are discussed.

2. Background and theoretical framework

2.1. Organisational change in Benefit corporations

BC are required to demonstrate that sustainability is not peripheral but central to their value creation model (Haigh et al., 2015; Stubbs, 2017a). Being legally recognised as BC is just the starting point to state the company's approach to sustainability. In fact, the BC status often triggers an in-depth organizational reflection, with changes in managerial practices, operational routines and practices, performance metrics, internal communication, as well as shared value, norms and culture. These changes can translate into a substantive or a symbolic integration of sustainability. Symbolic sustainability integration occurs when organizations adopt sustainability language, certifications, or reporting mechanisms primarily to enhance legitimacy, reputation, or market differentiation without materially altering core processes or decision-making routines (Bromley and Powell, 2012). In contrast, substantive integration is characterized by the reconfiguration of business models, resource allocations, organizational incentives, and operational practices in ways that measurably improve social and environmental outcomes (Eccles and Serafeim, 2013;

Gehman et al., 2019). Research examining the entrepreneurial journey of BC organisations underscores different kind of changes occurring in firms' organizational practices. Exiting literature on BCs have documented changes in governance structures (André, 2012; Hiller, 2013), the use of management information systems as facilitators of organizational change and sustainability integration (Dashwood, 2014; Gond et al., 2012; Fonseca et al. 2021), the formalization of impact measurement practices aligned with recognized standards (Stubbs and Higgins, 2014). Moreover, becoming a BC often stimulates cultural and identity work, prompting organizations to renegotiate their purpose narratives, articulate shared values, and embed sustainability considerations into everyday sensemaking (Grimes et al., 2018). However, several voices highlight that companies face pressures that can encourage "decoupling", that is, the disconnection between formal sustainability commitments and actual organizational practices (Bromley and Powell, 2012; Stubbs, 2017b). As a result, the adoption of the BC legal form risks being enacted as mere symbolic compliance, serving primarily to grant company legitimacy without translating into a credible or substantive integration of sustainability principles. For instance, case-based research by Villela et al. (2019) on Brazilian Small and Medium-Sized Enterprises (SMEs) illustrates that BC certification often functions as a market-oriented legitimacy tool, enabling firms to signal credibility and social responsibility to investors and clients. In fact, the study suggests that the certification itself does not automatically translate into internal transformation. According to the authors, incremental governance adjustments and operational reforms emerged only gradually in two companies, while failed to enact any deep organisational change towards greater sustainability in the other case organisations. These findings echo broader concerns in the literature that hybrid forms—despite their formal legal commitments—remain vulnerable to decoupling, where symbolic adoption of sustainability-oriented structures masks the persistence of conventional managerial routines (Bromley and Powell, 2012). Similarly, Kim et al. (2016) and Stubbs (2017) finds that many certified B Corps use certification to signal legitimacy and differentiate in the market, but internal change varies markedly. Some firms show strong substantive integration of sustainability, while others maintain conventional practices with only superficial adjustments. In this sense, BC certification may provide firms with reputational and market advantages, but without strong internal drivers, organizational capabilities, or governance pressures, it risks being incorporated merely as a symbolic legitimacy-enhancing mechanism. This not only limits genuine sustainability advancements but may also undermine the credibility of the BC movement itself, as firms gravitate toward compliance that enhances legitimacy without fostering substantive mission alignment (Haigh et al., 2015; Gehman and Grimes, 2021).

2.2. Theoretical framework

Organisational change is a complex and multifaceted process, particularly when it involves a shift toward sustainability and CSR, as exemplified by the transition to B-Corp certification. To analyse this transformation, we adopt Laughlin's (1991) model of organisational change, which argues that business must pursue the common good alongside profitability (Mion and Tessari, 2021).

With Laughlin's framework, organisations comprise three interrelated elements – sub-systems (structures, technologies, procedures), design archetypes (formal management systems and organisational structures), and interpretive schemes (values and worldviews) – and change can occur at each level. Laughlin distinguishes between first order (morphostatic) changes (minor adjustments within structure and design archetypes with no shifts in shared value, norms and beliefs); second order (morphogenisis) changes (transformation of interpretive schemes). According to Laughlin (1991), four different pathways of change may occur. Early normative work on the BC itself positions the form as an ethical step toward embedding public-benefit duties in corporate law (Hiller, 2013), further illustrating the potential for second and third-order shifts.

Rebuttal and reorientation tend to yield first-order change, whereas colonization and evolution affect the organisation core and typically align with second-order trasjectories. Several studies have applied Laughlin's model to explore the integration of sustainability in different organisational settings (Bebbington and Fraser, 2014; Guthrie et al., 2017). For instance, a longitudinal case study by Narayanan and Adams (2017) used the model to examine how a global financial services organisation integrated sustainability into its operations, highlighting the role of accounting discourses and calculative practices in enabling radical change. Similarly, Adams and McNicholas (2007) applied the model to investigate sustainability reporting practices, emphasizing the importance of internal discourses and governance structures in shaping organisational responses. Also, Stubbs and Higgins (2014) used similar theoretical foundations to examine the internal mechanisms and processes employed by early adopters of integrated reporting. Hence, Laughlin offers a suitable lens to assess whether B-Corp-related change is symbolic or substantive across different layers of our case organisation. Despite its relevance, no previous study has applied this model in the context of BC. In line with our RQ, we use Laughlin to classify SB-related changes as cosmetic/symbolic (sub-systems only; rebuttal/reorientation) versus substantive (design-archetype reconfiguration; colonisation/evolution; with possible interpretive shifts). We therefore apply Laughlin's model to our case organization in order to test whether the SB reform precipitated substantive redesign of control and governance, beyond cosmetic compliance.

3. Research method

3.1. Case selection

The case organisation, Acqua dell' Elba, is a family-run artisan fragrance company based on the island of Elba, Italy. Acqua dell' Elba, operating in a highly competitive sector dominated by multinational corporations, represents a unique example of a small enterprise that has embedded sustainability at the core of its strategic and operational framework. Since its foundation, the company has sought to intertwine its deep local roots, artisanal values, and environmental consciousness with a forward-looking strategic vision. Consistent with qualitative case research, the organisation was selected through theoretical, purposeful sampling to maximise learning about whether and how a hybrid legal form (Società Benefit) translates into symbolic or substantive organisational change (Eisenhardt, 1989). The case is especially relevant for several reasons. Firstly, the Italian cosmetic-and-fragrance industry remains a late-mover in embracing hybrid legal forms: an extraction from the Assobenefit–InfoCamere register (ATECO 2025 code 20.42 – Manufacture of perfumes and cosmetics) shows that, as of June 2025, fewer than a dozen firms in the cosmetic industry (among them Davines, L'Erbolario, Pettenon Cosmetics, Integra Fragrances and GRC Parfum) have converted to SB, and only about half of these are also certified B-Corp. Acqua dell' Elba adopted the SB legal status in 2021 but is still progressing through the multi-year B Lab certification process, allowing us to observe the critical 'in-between' phase in which statutory public-benefit duties exist without the external certification seal, thereby positioning the firm as a genuine pioneer within its peer group.

Secondly, the organisation's geographical context adds another layer of significance. The company operates on Elba Island, part of the UNESCO MAB Biosphere Reserve "Isole di Toscana", a protected zone that presents both limitations and opportunities in terms of environmental stewardship, tourism sustainability, and local community engagement. The case thus bridges business sustainability with territorial resilience and environmental governance.

Thirdly, Acqua dell' Elba is part of the fast-growing B-Corp movement in Italy, there are only 3,619 companies as of the end of 2023, representing just 1.23 per thousand of all Italian firms. The company was legally recognised as a SB in 2021, and B Lab certification will formally attest its commitment to social and environmental impact, transparency, and accountability when completed. Recent place-branding research conceptualises this symbiotic firm–territory dynamic

as "reverberation branding", showing how Acqua dell' Elba's initiatives co-create value with Elba Island's stakeholders and reinforce the island's sustainable identity (Minestroni and Lucarelli, 2025).

The selection of Acqua dell'Elba as a case is compelling due to its unique territorial embeddedness, artisanal identity, and pioneering role in the Italian fragrance sector.

Therefore, although it is a single case study, difficulties and challenges faced by Acqua dell' Elba in its entrepreneurial journey may well be experienced by other organisations. As such, Acqua dell' Elba is a useful case study to add to the growing body of evidence in the field investigated.

In July 2025, we conducted a first, in-depth interview with the Director of Marketing, Communication, and Sustainability, which provided the initial insider view of the firm's sustainability governance. On this basis, we refined the second-wave protocol (2025-2026). Further interviews with key actors involved in sustainability transition are planned for the end of January.

3.2 Research design

The authors adopted a qualitative research approach with a single-case, exploratory design. Case study methodology (Yin, 2003) offers an in-depth understanding of a specific context, prioritising analytical over statistical generalisations. This methodology allows for capturing the significant features of real-life events by comparing and triangulating multiple sources and perspectives (Yin, 2018). An initial theoretical framework guides data collection and is iteratively refined as evidence accumulates, making the design well suited to exploring Acqua dell' Elba's transition through Laughlin's (1991) lens. To ensure the reliability and credibility of our study, we employed a combination of interviews and document analysis. This approach allowed us to cross-verify information and address any inconsistencies, enhancing the overall quality of the data. It's worth noting that interviewees readily acknowledged their uncertainty about certain events and were proactive in identifying others who could provide accurate information. Semi-structured interviews (one completed; three scheduled) and documentary sources (company disclosures, internal, and secondary documents) were analysed trough manual content analysis procedure. This approach was preferred because it balances thematic consistency with the flexibility required to probe emergent issues (Alvesson and Deetz, 2000; Kvale and Brinkmann, 2009).

3.3. Data collection and analysis

Interviews

Our data collection process involves a cycle of semi-structured interviews, where we posed similar questions to multiple interviewees while maintaining the flexibility to explore intriguing lines of inquiry. We use semi-structured interviews to surface (i) perceived "environmental disturbances", that is the sustainability challenges faced by the organisation and motivations for adopting SB/B-Corp pathways; (ii) changes in structures, roles and processes; (iii) how the organisation responded to these challenges and the effect (if any) this had on the organisations' interpretive schemes and design archetypes (Narayanan and Adams, 2017). Broad themes were identified from Laughlin's pathways of change model and an interview guide (Yin, 2003) developed to aid the reliability of the study. Interview guides (drafted in Italian to avoid linguistic bias) were e-mailed to participants in advance, following Qu and Dumay's (2011) recommendations.

Interviewees were encouraged to raise other relevant issues. The interview questions covered the environmental disturbances faced by the company, their sustainability initiatives, motivations for sustainability engagement, how participants viewed the meaning of sustainability, how (if at

all) decision-making processes had changed, cultural changes observed by participants and structural changes.

Four members of the sustainability department have been identified from the organisation chart as initial respondents. The Director of Marketing, Communication and Sustainability, was interviewed on July 10, 2025. He was identified by researchers as a gatekeeper, facilitating access to additional informants in all functional areas (Dumay, 2010). It confirmed that the mandate sits within the Marketing, Communication, and Sustainability directorate (formally reinforced in 2024), clarified the distribution of operational responsibilities across an inter-functional team (including a process/certifications officer and a social-area lead), and showed how external audits and certifications have catalysed a more formal organigram and data routines. Subsequent, interviews are scheduled as shown in Table 1; conducting interviews across managerial levels support whitin-case variation and reduces single-informant bias.

When	Who	Where	Duration (min)
1-July 2025	Director of Marketing, Communication and Sustainability (gatekeeper)	On-line	90
20-November 2025	Environmental Management System Manager	On-line	30-60
2-December 2025	Sustainability Officer and Carbon Footprint Processes Officer	On-line	30-60
4-December 2025	Carbon Footprint Analyst	On-line	30-60

Table 1. Planned interviews

Interviews were audio-recorded with consent, conducted in Italian and transcribed within 24 hours to preserve detail (Patton, 2014). Interview data will undergo a two-stage manual coding: (i) a deductive read using a codebook anchored to Laughlin (interpretive schemes, design archetypes, sub-systems; disturbances; pathway cues); (B) an inductive read to surface unanticipated sub-themes (e.g., place-based accountability, certification-induced formalisation, role reconfiguration). The researchers independently code a stratified sample and reconcile discrepancies through adjudication sessions; the codebook is updated iteratively. From the codes we develop themes and temporal sequences (rebuttal, reorientation, colonisation, evolution) to classify each episode as symbolic/morphostatic or substantive/morphogenetic (with possible interpretive reframing). Interview transcripts were examined through qualitative content analysis following an interactive, multi-phase procedure; each author analysed transcripts independently and compared interpretations to reach shared results. After iterative comparison of codes and emerging categories, no new categories emerged; we therefore deemed thematic saturation to have been reached.

Insights from the interview with the gatekeeper informed probes for the second wave. Following this process, an initial narrative to analyse case studies (Miles and Huberman 1994; Yin, 2003) was developed from the coded data.

Documentary sources of data

We diversified our data sources, supplementing interviews with company documents, articles from business press, and information from B-Lab Europe.

Documentary sources of evidence were used, firstly, to corroborate and contextualise the interview data and, secondly, as a primary source of data. A manual content analysis is the technique particularly useful for extracting information that is not explicitly presented in a quantitative and structured format but is implicit in the information (Krippendorff, 2018).

The documents analysed included Sustainability Reports 2017 and 2020, Benefit Impact

Reports 2021, 2022, and 2023, the current organisation chart, the corporate 'Sustainability Charter' agreed with local communities, company website, press releases and other documents provided by participants. Table 2 shows a complete list of the papers reviewed in this study. The use of documents allowed us to rely less on respondents providing information related to their sustainability reports and reduced the need to rely on participants' memory recall in relation to past events. These sources were reviewed independently by the authors and coded alongside interview data to enable pattern matching and temporal bracketing, reducing single-observer bias

Secondary data, including the article by Minestroni and Lucarelli (2025), press releases and further website materials, will enrich contextual understanding and corroborate interviews' insights.

Table 2. Documentary sources

Consistent with the RQ, coding and thematic analysis will classify observed episodes as symbolic (morphostatic/sub-systems; rebuttal/reorientation) or substantive (morphogenetic/ design-archetype; colonisation/evolution; with possible interpretive reframing). Triangulation will operate both across sources (documents, interviews, web material) and across researchers, increasing credibility (Denzin, 1978; Creswell and Miller, 2000). Data triangulation allows multiple perspectives to be included and can be a means to ensure data saturation, validity, and reliability of search results (Fusch and Ness, 2015; Creswell and Miller, 2000). Between the two main forms of data triangulation (Modell, 2005), researcher triangulation and data triangulation were used. Preliminary results of the data analysis are discussed in the next section.

4. Preliminary findings and future steps

This study contributes to the academic debate by showing how a SME in a sensitive sector can translate a hybrid legal form into organisation-wide change, rather than mere symbolic signalling. Rather than treating SB status as a label, early evidence points to a transformation trajectory affecting structures, roles, routines, and local accountability. Leveraging Italy's first-mover SB statute, the paper illustrates how legal design and territorial embeddedness shape the extent to which SB transitions are cosmetic or substantive, offering insights for similar models such as entreprise à mission in France and SBIC in Spain.

Content analysis of company reports reveals a three-stage evolution. Stage 1 (2020) is narrative and place-based, centred on values and the launch of "Elba 2035". Stage 2 (2021) introduces targets and KPIs, including carbon neutrality, stakeholder initiatives (e.g., Green Week), and the Acqua dell'Elba philanthropic trust. Stage 3 (2022–2023) embeds a structured target–action–indicator logic, including ISO 14001/EMAS III roadmaps, biodiversity partnerships, gender-equality metrics (UNI PdR 125:2022), and multi-year carbon accounting (ISO 14064-1).

This progression reflects a shift from narrative purpose to operationalised commitments, enabling cross-functional alignment and legitimising investment under uncertainty. Interpreted through Laughlin's framework, Stage 1 aligns with rebuttal (morphostatic), Stage 2 with

colonisation, and Stage 3 with evolution (morphogenetic with emerging interpretive change), suggesting a substantive rather than cosmetic transition.

Interview evidence reinforces these findings. Managers frame sustainability as "harmony"—a balance between economic growth, environmental stewardship, and well-being—serving as an interpretive anchor for decision-making. The shift from compliance-driven reporting to a hybrid architecture of practices is described as deliberate. While early reports (2017; 2019) followed GRI standards, the Impact Report has become the central tool, structured around four statutory benefit objectives and cascading into projects and KPIs. It is conceived as "an instrument of listening, transparency and continuous improvement," primarily addressed to the local community rather than capital markets, reflecting place-based accountability (Gray, 2002; Andon et al., 2007).

Governance and roles have been progressively formalised, particularly with the creation of a Marketing, Communication and Sustainability directorate (2024). Strategic oversight sits at director level, while operational responsibilities are distributed across an inter-functional team. External certification has accelerated role clarity and integration across branding, market development, and sustainability practices (Ahrens and Chapman, 2007). Carbon accounting—conducted annually with AzzeroCO2—has supported efficiency investments (e.g., solar panels, supplier switching, retrofits), delivering cost savings and workplace improvements. It also underpins participation in the island's emerging Energy Community, where carbon metrics act as a credibility mechanism (Ascui and Lovell, 2011).

Stakeholder engagement follows a pragmatic, place-based logic rooted in the Elba 2035 project. Managers rely on established local networks (e.g., Park Authority, schools, NGOs), which shape both information flows and indicator relevance. This proximity fosters high levels of community trust, illustrated by rapid COVID-19 fundraising efforts (Interview 1), consistent with community-oriented accountability (Gray, 2002). Initiatives such as Via dell'Essenza, Domus Mellifere, and EU4Oceans function as boundary objects, linking internal controls with territorial partnerships and translating purpose into measurable outcomes.

Overall, the staged evolution and emphasis on place-based accountability provide converging evidence of substantive SB adoption. Ongoing triangulation of documents, interviews, and secondary studies will assess whether observed changes reflect adaptive adjustments or deeper interpretive shifts.

Future research will: (i) extend interviews across functions to test competing explanations (compliance vs interpretive change); (ii) analyse 2024–2025 reports to assess continuity and resourcing; and (iii) strengthen negative-case analysis by identifying symbolic initiatives. A comparative extension within the cosmetics sector (SB adopters vs non-adopters) will further test boundary conditions.

Limitations include the single-case design, which constrains generalisability; the context-specific nature of a family-run Italian SME; and reliance on early-stage and primarily qualitative evidence. Transferability is therefore analytical and most applicable to SMEs with strong territorial embeddedness, engagement with SB/B-Corp frameworks, and emerging KPI systems.

Imprenditorialità femminile e migrazione: una revisione sistematica sui meccanismi di supporto formale e informale

Giulio Palmas[1]

1. Inquadramento teorico

Numerosi studi dimostrano che l'imprenditorialità dei migranti contribuisce significativamente alla crescita economica e sociale delle regioni ospitanti (Achidi Ndofor & Priem, 2011) e rappresenta una strategia per affrontare la discriminazione e gli svantaggi strutturali nel mercato del lavoro (Andrejuk, 2017; Dheer, 2018). L'imprenditorialità migrante si riferisce alle "attività imprenditoriali intraprese da migranti con uno specifico background socio-culturale ed etnico o di origine migratoria" (Sahin et al., 2007) e costituisce spesso una risposta alle limitate opportunità lavorative dovute a fattori quali razza, lingua e origine etnica (Aldrich & Waldinger, 1990; Volery, 2007).

I migranti incontrano frequentemente difficoltà nel mercato del lavoro dipendente a causa di discriminazioni, mancanza di reti sociali adeguate e insufficienti conoscenze istituzionali (Kay & Schneck, 2012). Una barriera particolarmente rilevante riguarda il mancato riconoscimento del capitale umano: nonostante molte donne migranti possiedano titoli di studio elevati, le loro credenziali vengono sistematicamente svalutate, generando fenomeni di dequalificazione che bloccano la mobilità professionale (Creese & Wiebe, 2012; Lens, 2023). Per comprendere queste dinamiche, il presente studio adotta la lente teorica dell'intersezionalità (Crenshaw, 1991; Collins, 2015), che concepisce genere, etnia e condizione migratoria non come entità separate e additive, ma come fenomeni che si costituiscono reciprocamente, generando configurazioni specifiche di svantaggio (Bowleg, 2008; Lassalle & Shaw, 2021).

L'imprenditorialità emerge come percorso per superare questi svantaggi strutturali. Per molte donne migranti, il lavoro autonomo non rappresenta un "Piano B" rispetto al lavoro dipendente, ma un "Piano A" necessario quando le qualifiche non vengono riconosciute (Brieger & Gielnik, 2021). Gli imprenditori migranti avviano frequentemente imprese che servono le loro comunità di origine, sviluppando la cosiddetta "imprenditorialità etnica", una strategia che consente di valorizzare le risorse culturali, sociali e familiari disponibili (Chrysostome, 2010). Tuttavia, l'imprenditoria migrante non rappresenta una soluzione universale: permangono ostacoli significativi nell'accesso al credito, nelle relazioni con clienti e partner commerciali e nella costruzione di reti al di fuori della propria comunità (Bijedić et al., 2017; Brooks et al., 2014).

Le reti sociali emergono come elemento fondamentale nel sostegno alle imprenditrici migranti, con dinamiche nettamente diverse rispetto agli uomini. Le imprenditrici si affidano tipicamente a reti informali incentrate sulla famiglia e sugli amici, mentre gli uomini tendono a utilizzare reti professionali più strutturate (Brush, 1992; Verheul et al., 2002). Sebbene essenziali per il sostegno emotivo e l'assistenza finanziaria, queste reti informali si rivelano spesso meno efficaci nell'accesso alle conoscenze istituzionali, fondamentali per il successo imprenditoriale (Andersson & Larsson, 2016; Minniti, 2005). Le imprenditrici di origine straniera sono inoltre spesso sottovalutate a causa di stereotipi di genere (Apitzsch, 2005), nonostante il loro contributo documentato in termini di innovazione e diversificazione del tessuto imprenditoriale (Verheul et al., 2004).

2. Obiettivi

Nonostante la crescente importanza delle donne imprenditrici migranti nel panorama socio-economico contemporaneo, la letteratura presenta lacune significative. In primo luogo, sebbene esistano studi sui supporti formali (programmi governativi, incubatori) e sulle reti informali (famiglia, comunità coetniche), manca un'analisi sistematica della loro interazione dinamica e delle possibilità di integrazione strategica (Barrios et al., 2025; Polychronopoulos & Nguyen-Duc, 2023). In secondo luogo, le politiche di supporto all'imprenditorialità migrante adottano spesso un approccio "cieco al genere" o di "managerialismo etnico" che ignora come genere, classe ed etnia si sovrappongano nel definire l'accesso alle risorse (Ram et al., 2017; Villares-Varela, 2018). Questa omogeneizzazione dei bisogni non riconosce le barriere specifiche delle donne migranti, come il doppio svantaggio che intensifica lo scetticismo delle istituzioni finanziarie (Cunha et al., 2024).

Questa revisione sistematica mira a colmare tali lacune proponendo un quadro analitico che integra esplicitamente quattro dimensioni: le barriere affrontate, i sistemi di supporto formale, le reti informali e la loro interazione dinamica. L'urgenza di questo studio è accentuata dal contesto attuale: i flussi migratori verso i paesi OCSE hanno raggiunto livelli record (OECD, 2024), mentre gli interventi di supporto all'imprenditorialità risultano frammentati e insufficientemente adattati alle specificità delle imprenditrici migranti (Desiderio, 2014). Comprendere come articolare efficacemente supporti formali e reti comunitarie esistenti diventa quindi cruciale per promuovere un'inclusione economica effettiva.

Dal punto di vista teorico, il presente studio si distingue dalle rassegne precedenti. A differenza di Chreim et al. (2018), che adotta un quadro di radicamento misto, e di Sarihasan et al. (2023), che applica le teorie del capitale umano e dello svantaggio, questo lavoro adotta una prospettiva esplicitamente intersezionale (Crenshaw, 1991), evidenziando come le donne migranti affrontino configurazioni specifiche di emarginazione. Rispondendo alle sollecitazioni della letteratura recente (DiVito & Ingen-Housz, 2021; Lassalle & Shaw, 2021), l'analisi si concentra non solo sulle singole dimensioni del supporto, ma sulla loro interazione.

La rassegna è strutturata intorno a due domande di ricerca: (1) In che modo le politiche e i programmi di sostegno formale aiutano le imprenditrici migranti a superare le barriere socio-culturali e istituzionali? (2) Quale ruolo svolgono le reti familiari e coetniche nello sviluppo delle imprese delle donne migranti e come si integrano con il sostegno formale? Queste domande consentono di esaminare sia la dimensione istituzionale sia quella sociale-informale, nonché la loro interazione dinamica.

3. Metodologia

Questo studio è stato condotto in conformità alle linee guida PRISMA 2020 (Page et al., 2021). La ricerca si è focalizzata sull'intersezione tra l'imprenditorialità femminile nel contesto migratorio, i meccanismi di supporto formale e le reti informali, adottando una delineazione concettuale che integra le dimensioni del genere, dell'etnia e del supporto imprenditoriale.

La strategia di ricerca ha utilizzato insiemi terminologici validati da precedenti revisioni sistematiche, anziché sviluppare nuovi termini in modo indipendente. Questa scelta metodologica garantisce continuità concettuale con le tradizioni accademiche esistenti, riduce i bias terminologici e favorisce la comparabilità tra studi. La ricerca è stata strutturata attorno a due insiemi di termini: il primo (Chreim et al., 2018) relativo a migrazione e imprenditorialità femminile; il secondo (Polychronopoulos & Nguyen-Duc, 2023) relativo ai meccanismi di supporto. La stringa di ricerca è stata costruita secondo la formula: Set 1 AND Set 2.

Sono state selezionate due banche dati (Scopus e Web of Science) per la loro copertura interdisciplinare e le rigorose procedure di indicizzazione degli articoli sottoposti a revisione tra

pari. I parametri di ricerca hanno incluso esclusivamente articoli scientifici completi in versione definitiva, pubblicati in lingua inglese, nel periodo 2005-2024.

L'implementazione della strategia di ricerca ha prodotto inizialmente 424 record (233 da Scopus e 191 da Web of Science). L'applicazione sistematica dei filtri predefiniti ha ridotto il corpus a 307 articoli potenzialmente rilevanti. La rimozione dei duplicati tramite Zotero (versione 6.0) ha ulteriormente ridotto il corpus a 219 articoli unici.

Prima dell'applicazione completa dei criteri di inclusione ed esclusione, i due ricercatori hanno condotto uno screening pilota su 20 articoli selezionati casualmente per calibrare l'interpretazione dei criteri e garantire coerenza metodologica. L'affidabilità inter-valutatore è stata misurata mediante il kappa di Cohen, ottenendo $\kappa = 0{,}81$, che indica un "accordo quasi perfetto" secondo il framework di Landis e Koch.

Successivamente, due ricercatori indipendenti hanno condotto uno screening parallelo e sistematico di abstract e titoli utilizzando criteri predeterminati. I criteri di inclusione comprendevano: focus specifico sulle imprenditrici migranti; riferimenti espliciti a meccanismi di supporto quali formazione, incubatori, politiche pubbliche e reti coetniche; considerazione della dimensione socio-culturale o istituzionale; presenza di evidenze empiriche o di un quadro teorico rilevante. Sono stati invece esclusi gli studi privi di riferimenti all'imprenditorialità femminile migrante, con focus non imprenditoriale o senza analisi dei meccanismi di supporto. L'applicazione di questi criteri ha portato alla selezione di 40 articoli per l'analisi full-text. Lo screening successivo ha escluso ulteriori 2 articoli per inaccessibilità del testo completo, risultando in un'inclusione finale di 38 studi (Figura 1).

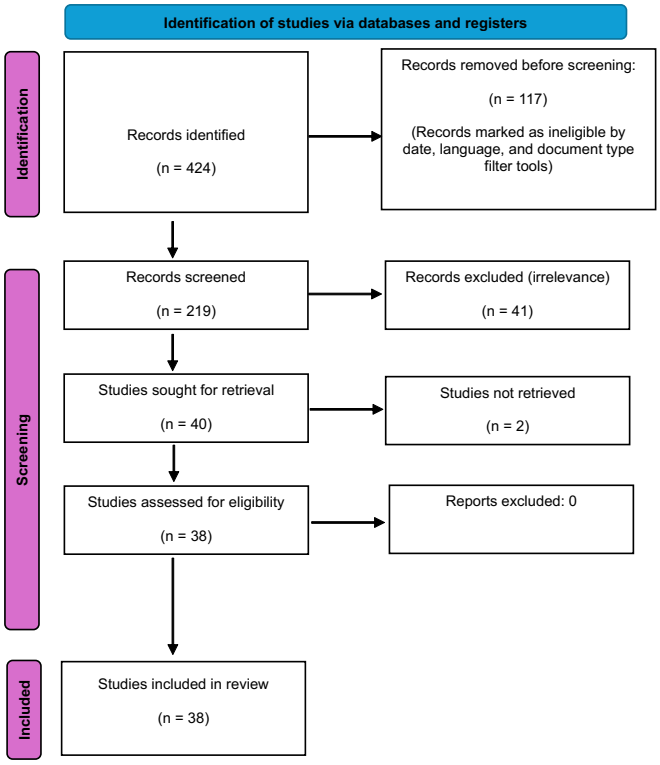

Figura 1. Diagramma di flusso PRISMA 2020 per il processo di selezione dei 38 studi inclusi nella revisione sistematica

La valutazione della qualità metodologica degli studi inclusi ha costituito parte integrante del protocollo. Tutti gli articoli selezionati (n = 38) sono stati verificati per il loro status di pubblicazioni peer-reviewed e per l'indicizzazione in Scopus e Web of Science.

I 38 studi selezionati sono stati analizzati con NVivo 12 attraverso un processo in due fasi. La prima fase ha previsto l'estrazione sistematica dei dati, mappando le caratteristiche bibliometriche, il contesto geografico, l'approccio metodologico, i quadri teorici, i meccanismi di supporto e i principali risultati di ciascuno studio. L'analisi tematica è stata condotta attraverso una lente intersezionale, che ha orientato l'attenzione verso le configurazioni specifiche di svantaggio e supporto emergenti dall'interazione tra genere, etnia e condizione migratoria, piuttosto che verso l'esame separato di ciascuna dimensione. Da questa struttura tematica sono emersi tre pattern distintivi di interazione tra sistemi di supporto formali e informali, concettualizzati come complementarità sinergica, sostituibilità funzionale e conflitto strutturale, approfonditi nella sezione dei risultati.

L'analisi del corpus ha rivelato alcuni pattern distributivi rilevanti per l'interpretazione dei risultati: una concentrazione temporale degli studi nel periodo 2020-2024 (52,6% del corpus); una predominanza di approcci qualitativi (65,8%); una frammentazione disciplinare su 30 riviste accademiche; e una concentrazione geografica nelle economie occidentali, con limitata rappresentazione dei contesti dell'Asia orientale e dell'Africa subsahariana.

4. Risultati

L'analisi preliminare dei 38 studi rivela che i meccanismi di supporto formale e le reti informali interagiscono in modi complessi per aiutare le imprenditrici migranti a superare le barriere strutturali. I risultati preliminari sono organizzati in risposta alle due domande di ricerca, esaminando prima l'efficacia dei supporti formali (RQ1), poi il ruolo delle reti informali (RQ2), e infine le configurazioni di interazione tra i due sistemi.

La letteratura documenta un insieme strutturato di barriere che impattano significativamente sulle traiettorie imprenditoriali delle donne migranti. Queste barriere sono manifestazioni interconnesse delle relazioni tra genere, etnia, classe sociale e condizione migratoria. La concettualizzazione di tali svantaggi è evoluta dal "doppio svantaggio" (Sarihasan et al., 2023) a formulazioni più complesse di "tripla discriminazione" (Maharjan et al., 2025). Una barriera significativa è il limitato riconoscimento delle qualifiche professionali acquisite nel paese d'origine: studi in Norvegia (Munkejord, 2017a) e Scozia (Lassalle & Shaw, 2021) documentano come le donne migranti affrontino ostacoli nel trasferimento delle competenze nonostante un capitale umano sostanziale. Questo processo di dequalificazione è distintamente connotato dal genere e influenza sia i percorsi verso l'imprenditorialità sia la concentrazione settoriale. Le tensioni socioculturali complicano ulteriormente i percorsi imprenditoriali, particolarmente riguardo al conflitto lavoro-famiglia, esacerbato da aspettative culturali di genere che limitano l'autonomia imprenditoriale delle donne (Essers et al., 2013). Il fenomeno è particolarmente acuto per le trailing wives, donne migrate al seguito del coniuge (Lassalle & Shaw, 2021).

La revisione sistematica identifica una sostanziale variabilità istituzionale nei meccanismi di supporto formale tra i diversi contesti nazionali. L'analisi comparativa rivela contrasti significativi nei modelli istituzionali, esemplificati dalla differenza tra l'approccio olandese di "laissez-faire" e il sistema interventista turco con consistenti sussidi statali per le imprenditrici (Ozasir-Kacar & Essers, 2023). Un pattern ricorrente è il divario tra retorica istituzionale e realtà implementativa: nonostante i discorsi inclusivi, molti programmi allocano risorse limitate al supporto imprenditoriale. I programmi di formazione mostrano efficacia significativa quando integrano moduli specifici di genere (Khatib et al., 2024) e flessibilità organizzativa per accomodare le molteplici responsabilità delle donne migranti (Sweet, 2016). Tuttavia, i programmi riservati alle donne comportano compromessi: facilitano l'accesso iniziale al supporto ma rischiano di rinforzare vincoli strutturali che limitano l'integrazione delle donne in reti decisionali economiche

più ampie (Ozasir-Kacar & Essers, 2023). Un risultato consistente è l'importanza della dimensione relazionale e affettiva: gli spazi di supporto operano come ambienti in cui aspettative e identità imprenditoriali vengono negoziate (Webster, 2020). I modelli più efficaci integrano accessibilità linguistico-culturale, flessibilità organizzativa e approcci multidisciplinari che combinano competenze tecniche con supporto psicosociale.

Le reti familiari e coetniche costituiscono risorse chiave nell'ecosistema imprenditoriale delle donne migranti, fornendo supporto multidimensionale attraverso assetti complementari. Le reti familiari fungono da fonti primarie di capitale finanziario e risorse lavorative: circa metà delle imprenditrici etniche utilizza risparmi personali e supporto familiare per l'avvio dell'attività (Piperopoulos, 2012). Le reti coetniche più ampie forniscono risorse specializzate radicate nell'identità culturale condivisa (Colombelli et al., 2020). La dimensione digitale estende significativamente la portata del capitale sociale coetnico, con piattaforme online che operano come infrastrutture informative parallele (Homel, 2020), allineandosi al concetto di "bifocalità" (De Luca & Ambrosini, 2019). Gli assetti di rete mostrano una notevole variabilità contestuale: nelle aree rurali con bassa densità di popolazione migrante, le donne si affidano maggiormente a risorse del paese ospitante, spesso mediate da partner locali (Munkejord, 2017b), mentre i contesti urbani con popolazioni etniche concentrate favoriscono lo sviluppo di robuste reti coetniche (Maharjan et al., 2025). Tuttavia, le reti etniche mostrano importanti sfumature: emergono contraddizioni tra supporto materiale e meccanismi di controllo sociale, con il finanziamento familiare che talvolta limita l'autonomia imprenditoriale (Essers et al., 2013). Evidenze longitudinali rivelano traiettorie evolutive negli equilibri di rete, con transizioni sistematiche da reti dense ed etnicamente omogenee durante le fasi di avvio verso assetti più diversificati durante il consolidamento (Basit, 2017).

L'analisi delle interazioni tra supporto formale e reti informali rivela tre configurazioni distintive. La prima è la complementarità sinergica, in cui i due ambiti svolgono funzioni diverse ma congiuntamente necessarie: in Israele, i programmi governativi aumentano simultaneamente il capitale umano e sociale delle partecipanti (Lerner et al., 2005), mentre in Finlandia i servizi di consulenza migliorano non solo i business plan ma anche le reti sociali delle imprenditrici migranti (Aman et al., 2024). La seconda configurazione è la sostituibilità funzionale, in cui le reti informali colmano sistematicamente le lacune di quelle formali: dove le barriere strutturali limitano l'accesso al credito formale, le reti familiari e coetniche forniscono capitale alternativo per l'avvio (Addo, 2017; Piperopoulos, 2012). Questa sostituibilità è pronunciata dove le politiche di integrazione sono limitate: le reti comunitarie diventano cruciali per i nuovi arrivati, fornendo supporto materiale e compensando canali informativi ufficiali inefficienti (Sitchinava, 2025). La terza configurazione è il conflitto strutturale, che evidenzia incompatibilità sistemiche: le istituzioni finanziarie ostacolano l'accesso al credito attraverso pratiche discriminatorie basate sull'etnia (Maharjan et al., 2025), mentre aspettative culturali intergenerazionali possono scontrarsi con le aspirazioni imprenditoriali, come nel caso delle donne polacche le cui carriere sono subordinate alle priorità domestiche dopo la migrazione (Lassalle & Shaw, 2021).

Un pattern ricorrente è la capacità delle imprenditrici migranti di trasformare potenziali fattori di marginalizzazione in risorse competitive distintive. Ricerche su imprenditrici ghanesi in Sudafrica documentano processi attraverso cui competenze culturalmente specifiche vengono trasformate in vantaggi di mercato nonostante il limitato supporto istituzionale (Ojong, 2016). Utilizziamo il concetto di "capacità d'azione adattiva" per indicare gli aggiustamenti intenzionali e situati attraverso cui le imprenditrici migranti riposizionano le proprie identità, negoziano le norme familiari e comunitarie, e mobilitano selettivamente reti informali in combinazione con il supporto istituzionale per superare le barriere (Adeeko & Treanor, 2022; Essers & Benschop, 2007). Questa coordinazione dinamica suggerisce che i programmi istituzionali dovrebbero integrare e rafforzare il capitale sociale esistente piuttosto che tentare di sostituirlo con meccanismi formali decontestualizzati.

5. Originalità del contributo

Questa revisione sistematica offre un contributo originale alla letteratura sull'imprenditorialità delle donne migranti, colmando le lacune identificate nella ricerca esistente. In risposta alla mancanza di studi che analizzino l'interazione tra supporti formali e informali, il lavoro propone una tipologia di tre configurazioni (complementarità sinergica, sostituibilità funzionale, conflitto strutturale) che cattura le dinamiche relazionali tra i due sistemi. In risposta all'approccio "cieco al genere" delle politiche di supporto, lo studio adotta una prospettiva esplicitamente intersezionale che evidenzia come genere, etnia e condizione migratoria si sovrappongano nel definire l'accesso alle risorse.

Sul piano teorico, il contributo principale risiede nel concetto di "capacità d'azione adattiva", che integra la letteratura sull'intersezionalità con quella sul capitale sociale, mostrando come le imprenditrici migranti non siano soggetti passivi di fronte alle barriere strutturali, ma attori capaci di riposizionare identità, negoziare norme comunitarie e mobilitare selettivamente risorse formali e informali. Questo supera le rappresentazioni unidimensionali delle reti etniche come esclusivamente emancipatrici o costrittive.

Sul piano metodologico, l'applicazione rigorosa del protocollo PRISMA 2020 a un corpus di 38 studi recenti (2005-2024) fornisce una sintesi sistematica e aggiornata che arricchisce la base empirica disponibile, offrendo un quadro analitico replicabile per future ricerche.

Sul piano delle implicazioni pratiche, i risultati suggeriscono che gli interventi efficaci non dovrebbero introdurre meccanismi formali decontestualizzati, ma costruire ponti istituzionali con le reti comunitarie esistenti. I programmi di supporto risultano più efficaci quando integrano accessibilità linguistico-culturale, flessibilità organizzativa e consapevolezza delle barriere intersezionali. Per i policy maker, questo implica ripensare la progettazione degli interventi in collaborazione con le comunità coetniche, riconoscendo il capitale sociale informale come risorsa da valorizzare piuttosto che da sostituire.

Parole chiave: Imprenditorialità femminile migrante; supporto formale; reti informali; intersezionalità; revisione sistematica

Corporate social responsibility and non-profit corporate foundations: a systematic literature review (2015-2025)

Marianna Carpinelli[1], Francesca Capo[2]

1. Introduction

Over the past decade, corporate social responsibility (CSR) has consolidated its presence as a central dimension in business strategy and academic inquiry (Dreesbach-Bundy and Scheck, 2017; Burbano et al., 2024). Its relevance is rooted in the capacity of CSR to create shared value, reinforce trust-based relationships with stakeholders, and strengthen corporate reputation across diverse audiences, including employees, customers, communities, and institutional actors (Schwartz, 2024; Zhao et al., 2022; Moon et al., 2024; Petersen and Lemke., 2015). In this scenario, corporate foundations have attracted increasing attention as structured, non-profit instruments through which firms can institutionalize their social commitments and transform them into long-term and purpose-driven initiatives (Gehringer, 2020; Gehringer, 2021; Minefee et al., 2015).

As hybrid organizations situated between business and society, corporate foundations represent an evolution of the traditional philanthropic role of companies. They enable firms to pursue initiatives with a strong social and community impact, while ensuring alignment with corporate strategy and stakeholder expectations (Pedrini and Minciullo, 2011; Monfort et al., 2021). Their distinctiveness lies not only in the types of initiatives they promote, but also in the institutional form through which CSR is organized, communicated, and measured.

The conceptual relationship between CSR and corporate foundations is analysed in debates on the double nature of the company (i.e., economic and social). Mintzberg (1983) early explains that corporate power carries moral consequences. The framework developed by Garriga and Melé. (2004) further articulated the multiplicity of CSR logics (instrumental, political, integrative, and ethical) explaining the simultaneous coexistence of moral commitment and strategic gain within CSR practices. Stakeholder theory (Freeman et al., 2020) proposed a conceptual framework though which CSR can be interpreted as a process of creating multiple forms of value that goes beyond the company's economic objectives, broadening the purpose of business from shareholder value to the creation of multiple stakeholder value.

Corporate foundations, as Gehringer (2021) observes, embody this hybridisation, mediating between corporate priorities and social needs with a degree of autonomy and legitimacy that is not always achievable through internal CSR activities. Their strategic value as institutionalized instruments of CSR are demonstrated in their ability to aggregate resources efficiently, often outperforming in fund raising compared to independent foundations (Rey-Garcia et al., 2018).

The present study aims to contribute to this debate by conducting a systematic literature review (SLR) of peer-reviewed contributions published between 2015 and 2025 in high-ranking journals (ABS 2-4*). It investigates how CSR implemented through non-profit corporate foundations generates value and impact. Moreover, it positions corporate foundations within the broader strategic and conceptual landscape of CSR, addressing their governance, hybridity,

[1] Dottoranda di ricerca, ECON-07/A, Università degli Studi di Milano-Bicocca; m.carpinelli3@campus.unimib.it – corresponding author

[2] Ricercatrice, ECON-07/A, Università degli Studi di Bergamo; francesca.capo@unibg.it

strategic alignment, and performance measurement. To this aim, this study is guided by the following research question: How does CSR through non-profit organizations create value?

Because research on corporate foundations remains limited, especially when compared with the vast CSR literature, this study seeks to provide an updated mapping of the field, highlight emerging patterns, and identify gaps that require further research.

2. Methodology

2.1. Systematic review approach

The study adopts a systematic literature review approach, which offers transparency, reproducibility, and methodological rigor across all stages of research. As Rousseau (2024) argues, a systematic review must adhere to the same standards of robustness as empirical research, using predetermined, transparent procedures. Similarly, Simsek and Heavey (2023) emphasize the importance of consistency and replicability, noting that the clarity of methodological processes is essential for ensuring the reliability of SLR outcomes.

In line with these principles, the present review was designed with:

- precise documentation of search strategies and parameters;
- clear justification for inclusion and exclusion choices;
- consistent application of coding and categorization criteria;
- iterative refinement of thematic and conceptual categories.

Hiebl (2023) stresses the need to disclose databases, keywords, time frames, and selection filters as an integral part of methodological rigor.

2.2. Scope of the review

The aim of the review is to understand how corporate foundations contribute to CSR strategies and how these hybrid organizations generate both social and economic value. Rather than treating corporate foundations as independent entities, the review situates them within the broader CSR conversation to allow for comparative interpretation. This positioning is necessary because, despite their increasing relevance, corporate foundations remain underrepresented in mainstream CSR scholarship.

Given this conceptual gap, the review incorporates selected papers directly related to corporate foundations even when these were not captured by the initial database search. This choice mirrors the methodological approach used by Gehringer (2021), who combined academic and grey literature to map the domain comprehensively.

It is important to note that this review does not aim to cover the entire CSR literature, which would result in a substantially larger body of studies. Instead, the scope is deliberately restricted to research explicitly addressing corporate foundations within the CSR domain. This focused approach explains the relatively limited number of articles identified and reflects the evolving nature of corporate foundation research.

2.3. Database and time frame

The review uses Scopus as the main database because of its comprehensive coverage in management, sustainability, and social sciences. The chosen time frame, from 2015 to 2025, reflects the impact of the United Nations 2030 Agenda for Sustainable Development. As Hiebl (2023) notes, setting a temporal boundary allows researchers to capture contemporary developments while narrowing the analytical focus. Rousseau (2024) emphasizes that such boundaries should be linked to relevant scientific or policy shifts rather than arbitrary time spans. Therefore, the 2015 threshold aligns with a globally recognized turning point in sustainability debates.

2.4. Search string and query structure

The search string was constructed using Boolean logic to ensure the appropriate balance between specificity and comprehensiveness. Boolean operators allowed for both the inclusion of synonymous terms and the targeted retrieval of articles directly addressing CSR, non-profit organizations, and value creation.

Following Simsek and Heavey's (2023) principles of coverage and coherence, the search string contained three conceptual blocks:

- Corporate Social Responsibility;
- Foundations / Non-Profit Organizations;
- Value Creation / Impact.

Additional filters were applied:

- Only ABS-ranked journals (levels 2-4*);
- Business and management subject areas;
- English-language peer-reviewed articles;
- Journal articles only (no conference papers or book chapters).

This structured approach ensured both thematic precision and alignment with the research question.

2.5. Screening and selection process

The initial search returned 47 articles from Scopus. To ensure a comprehensive analysis, 5 additional articles were incorporated through cross-referencing, following the bibliographic mapping provided in Gehringer (2021). This brought the total to 52 papers.

Screening progessed in two phases:

- Title and abstract screening, which excluded 7 papers (6 off-topic, 1 retracted);
- Full-text assessment, resulting in a final corpus of 45 eligible articles [Table 1].

Papers were included when they offered a substantive contribution to the understanding of CSR, specifically when they examined how CSR initiatives generate social and/or economic value, how CSR practices affect internal or external stakeholder relationships, or how governance, ethical principles, and sustainability frameworks shape responsible corporate conduct. This also encompassed studies explicitly addressing corporate foundations and other hybrid non-profit structures involved in CSR implementation.

Conversely, papers were excluded when CSR was not the main analytical focus (e.g., studies centred on digital transformation or firm competitiveness without a CSR grounding), when contributions addressed highly specific contexts without broader conceptual relevance, when CSR appeared only marginally or without a clear link to value creation or stakeholder dynamics, or when the article had been retracted.

2.6. Coding and thematic classification

Each paper was coded using a structured analytical matrix comprising:

- Authors;
- Title of the Study;
- Year of Publication;
- Source (Journal/Publisher);
- Abstract;
- Inclusion/Exclusion Criteria;
- Thematic Categories;
- Underlying Economic Theory;

- Theoretical Framework/Argument;
- Research Question(s);
- Methodological Approach;
- Main Findings;
- Directions for Future Research.

The coding framework captures authorship, publication details, theoretical grounding, research questions, methodological choices, findings, and proposed future directions, and it enabled to identify recurring methodological patterns, dominant theoretical perspectives, and the main conceptual tensions that characterize the literature.

Following Simsek and Heavey's (2023) principle of connectedness, the articles were grouped into four thematic categories.

2.7. Thematic classification

The thematic categorization reveals three dominant lines of inquiry:

- Stakeholder engagement and organizational performance - Studies in this category analyse how CSR initiatives shape stakeholder perceptions, engagement, trust, and ultimately corporate performance.
- Sustainability and ethical governance - This category addresses the governance structures and ethical principles that shape CSR implementation. It encompasses research on regulatory pressures, decision-making, and sustainability-oriented governance.
- Value creation through social initiatives - These papers focus on social impact, reputational benefits, hybrid organizational forms, and the specific role of corporate foundations in mediating between corporate strategy and social value.

Together, these categories provide the basis for the conceptual analysis presented in the next sections.

3. Analysis and discussion

Literature mapping

The temporal distribution reveals two peaks in 2021 and 2024, indicating a rise in scholarly interest linked to the global sustainability agenda and the institutionalization of CSR practices. The thematic distribution shows that value creation is the most studied area (19 papers) highlighting a shift toward assessing CSR outcomes rather than motivations.

In parallel, the analysis of theoretical frameworks shows the predominance of stakeholder theory, followed by a range of complementary approaches, reflecting a diversified conceptual landscape. Methodologically, the field is dominated by quantitative studies, with only a smaller share of reviews, conceptual papers, and limited qualitative or mixed-methods contributions.

Comparative perspective: CSR in firm and corporate foundations

As a result of the literature review, this section provides a detailed comparison of CSR and corporate foundations across key dimensions [Table 2].

Regulation

CSR has gradually shifted from voluntary norms to institutionalized frameworks, embedded in standards, guidelines, and certifications, influenced by multiple actors (Adib et al., 2020). Corporate foundations extend this regulatory structure by implementing social programs that reinforce corporate legitimacy, especially in particular contexts. Brammer et al. (2021) argue that

groups such as NGOs can intervene to ensure that large corporations act more responsibly, in contexts with weak institutional pressures.

Governance

Corporate foundations face structural governance challenges due to their hybrid nature. Minefee et al. (2015) emphasize the role of governance structures in mediating corporate and social logics, while Gehringer (2021) identifies governance tensions in nearly half of the corporate foundation studies examined. Burbano et al. (2024) show how sustainability-oriented governance innovations are reshaping the overall CSR landscape.

Funding

Corporate foundations manage resources differently from internal CSR budgets. Whereas CSR budgets often target annual initiatives, foundations engage in long-term investments, partnerships, and advocacy (Gehringer, 2020). Rey-Garcia et al. (2018) note that corporate foundations outperform independent ones in raising programmatic resources.

Strategic alignment

Strategic alignment concerns the consistency between foundation activities and corporate values. Monfort et al. (2021) similarly assert that coherence between corporate and foundation communication enhances trust. Gehringer (2021) interprets this alignment as strategic hybridization.

Hybridity

Hybridity is the defining characteristic of corporate foundations, reflecting their dual orientation toward corporate and social logics. Gehringer (2021) identifies hybridity at multiple levels, strategic, organizational, and contextual, in which foundations must bring together profit-driven ratios with philanthropic missions.

Measurement and metrics

Measurement is central to CSR credibility. Juščius and Jonikas (2016) describe CSR strategies as proactive or reactive, emphasizing the importance of evaluation systems capable of capturing both tangible and intangible impacts. Zhao et al. (2022) argue that aligning CSR with objectively measured practices improves employee engagement and organizational credibility**.**

Cultural impact

CSR shapes internal values and cultural identity. Corporate foundations contribute to embedding social purpose within organizational culture by stabilizing long-term commitments.

Market and reputation

Eng et al. (2020) and Hsu et al. (2022) show that CSR enhances legitimacy and reduces reputational risk. Corporate foundations amplify these reputational gains by demonstrating sustained commitment to social causes.

Overall, the comparative analysis reveals that, although CSR and corporate foundations share a common ethical foundation, they differ in terms of structure, scope, and the level of strategic

development of their activities. CSR represents the internalization of social responsibility within corporate operations, while corporate foundations externalize and institutionalizes this responsibility in distinct organizational forms. Across all dimensions, corporate foundations emerge as key channels for extending corporate responsibility into the social domain.

4. Conclusion and future directions

The SLR highlights how CSR has evolved from a voluntary practice into an institutionalized strategic framework integrated into business models. Corporate foundations are emerging as hybrid organizational structures that turn CSR commitments into high-impact, long-term social initiatives. They strengthen corporate reputation, and foster value creation that integrates social and economic dimensions.

From a theoretical perspective, the centrality of stakeholder theory reflects the importance of stakeholder trust and engagement in CSR strategies. Complementary theoretical perspectives enrich this field by explaining the mechanisms through which CSR generates both business and societal benefits.

Methodologically, the prevalence of quantitative studies underscores a growing emphasis on impact measurement. However, the limited use of qualitative and mixed-method approaches suggests the need for more exploratory research which can capture complex social dynamics.

Future research opportunities include:

- analyze governance models that balance corporate autonomy and oversight;
- explore forms of strategic alignment and organizational hybridity;
- develop impact assessment frameworks for corporate foundations that integrate social, economic, and reputational indicators.

Corporate foundations represent promising but underexplored organizational forms. Their ability to combine corporate resources with social missions positions them at the forefront of the evolution of CSR toward more strategic, collaborative, and sustainable models.

Table 1. Outlook of papers as classified into the relevant thematic categories emerged according to the analysis. Categories are indicating the main relevant issues in understanding the impact of CSR to identify their relationship with corporate non-profit foundations

Dimension	**Corporate social responsibility**	**Corporate foundations**	**References**
Regulation	Voluntary certification and regulatory standards guide companies toward stakeholder expectations. CSR is integrated into risk, ethics, and sustainability control systems. Increasing codification of CSR through ESG frameworks and mechanisms that define corporate legitimacy.	Separate non-profit legal entities affiliated with companies. Subject to the law on foundations or non-profit organizations. They operate within their own area of expertise, aligning themselves with the company's sustainability objectives. Corporate foundations are influenced by the transparency and accountability requirements associated with public-private partnerships.	Maon et al. (2015); Minefee et al. (2015); Sartor et al. (2016); Wang et al. (2018); Adib et al. (2020); Brammer et al. (2021); Pandey et al. (2023); Burbano et al. (2024); Schwartz (2024); Tenakwah et al. (2024); Waddock et al. (2024)
Governance	Supervision of the board of directors and executives (ESG/CSR committees), internal policies, strategy, and disclosure of information. The role of integrating governance into CSR is important, with particular emphasis on ESG committees and multi-level coordination.	Boards often include members appointed by the company. Governance varies depending on the degree of corporate control and stakeholder involvement. For corporate foundations, governance increasingly includes independent oversight and stakeholder representation, balancing	Maon et al. (2015); Minefee et al. (2015); Gehringer (2020); Gehringer (2021); Brammer et al. (2021); Mukherjee et al. (2022); Pandey et al. (2023); Burbano et al. (2024); Schwartz, (2024); Tenakwah et al. (2024)

		autonomy with strategic alignment.	
Funding	CSR budgets integrated into annual business planning. Project-based allocations and partnerships. CSR expenditures are considered strategic investments.	Corporate donations or grants. Ability to pool and leverage resources with public and non-profit partners. Corporate foundations diversify funding sources with the goal of creating long-term social value.	Rey-Garcia et al. (2018); Gehringer (2020); Gehringer (2021); Giacomin et al. (2021)
Strategic alignment	CSR is shifting from reactive philanthropy to integrated shared value strategies that incorporate sustainability into the business model.	The alignment ranges from reputational philanthropy to mission-driven, translating the corporate purpose into social initiatives. Foundations act as strategic extensions, implementing social innovation projects that complement the company's core mission.	Minefee et al. (2015); Rey-Garcia et al. (2018); Adib et al., (2020); Gehringer (2021); Schwartz (2024); Waddock et al. (2024)
Hybridity	The hybrid nature of CSR manifests itself in a dual logic, economic and social, and requires adaptive structures.	Hybrid organizations at the intersection of business and civil society. Exhibit strategic, organizational, and contextual hybridity. Corporate foundations bridge corporate and civil society-oriented missions.	Rey-Garcia et al. (2018); Gehringer (2020); Gehringer (2021)
Measurement and metrics	ESG disclosure and impact measurement remain central challenges.	Corporate foundations increasingly adopt evaluation frameworks aligned with SDG indicators and corporate impact assesment methods.	Juščius et al. (2016); Gehringer (2020); Zhao et al. (2022); Waddock et al. (2024)
Cultural impacts	Corporate cultural responsibility has an impact on cultural progress, fostering organizational and societal cultural change.	Dedicated programs can protect and promote local cultures. Corporate foundations act as cultural ambassadors, reinforcing corporate values across local communities and international contexts.	Maon et al. (2015); Gehringer (2021); Tenakwah et al. (2024)

Market and reputation	Leadership attributes shape reputation and performance. CSR communication strategies influence market reputation, investor trust, and brand value.	Announcements about the creation can affect market value. The visibility of the foundation reinforces the narrative of the company's legitimacy, especially when accompanied by long-term commitments.	Petersen et al. (2015); Eng et al. (2020); Giacomin et al. (2021); Monfort et al. (2021); Bo-Xiang Hsu et al. (2022); Mukherjee et al. (2022); Moon et al. (2024)

Navigating the Nexus: A Systematic Review of Barriers and Enablers for Social Enterprises in Social Procurement

Roberta Guglielmetti Mugion[1], Laura Di Pietro[2], Atifa Amin[3], Maria Francesca Renzi[4], Veronica Unargo[5]

1. Introduction

Social procurement (SP) is an initiative of utilizing organizational purchasing power to enhance social value. Presently, it has garnered significant attention and evolved into a critical policy measure and management tool in sustainable supply chain management (Barraket et al., 2016). SP is an insightful transfer of organizational intentions from purely economic to social. It includes a procurement mechanism that aims to create earning opportunities for social enterprises (SE). SEs are a form of hybrid organizations that have emerged as the distinctions between the private, public, and non-profit sectors have become increasingly indistinct and more fluid. Hybrid organizations are the descendants of two distinct species (OED., 2010) and within the literature on organization and management, the term has been utilized to characterize entities that transcend institutional boundaries (Brandsen & Karré, 2011; Jay, 2013; Pache & Santos, 2012) and function across multiple domains. SPs' initiatives for empowering SEs address various social issues, including poverty, employment, and social exclusion (Furneaux & Barraket, 2014). It help to create a quasi-market for SE, facilitating their growth and providing a margin to employ disadvantaged individuals. Often, SP policies impose new obligations on SEs to generate employment opportunities for individuals experiencing disadvantages (Loosemore et al., 2020).

Despite increasing research interests, the literature remains fragmented across various disciplines, including public administration, supply chain management and operations management. Present studies have focused on a single dimension, such as examining micro-level barriers or a single sector, which often lack an integrated view (Małyjurek & Szymczak, 2024; Goal et al., 2019). There is an urgent need for a holistic analysis of the integration of SP into SE (Aitken, 2022; Natoli et al., 2023). This systematic review synthesizes contemporary literature to provide clarifying the conceptual foundations, a holistic mapping of the field, persistent challenges, and systemic enablers that define the complex relationship between procurement and social enterprise.

Considering recent research, this study synthesized the contemporary literature on SP with a precise focus on integration with SP. Hence, the research objectives are to map the current conceptual terrain and identify the dominant theoretical lenses, synthesize systemic barriers, and topologize operational pathways through a systematic literature review (SLR).

2. Methodological framework

[1] Roma Tre University, Italy; roberta.guglielmettimugion@uniroma3.it – corresponding author

[2] Roma Tre University, Italy; laura.dipietro@uniroma3.it

[3] Roma Tre University, Italy; atifa.amin@uniroma3.it

[4] Roma Tre University, Italy; mariafrancesca.renzi@uniroma3.it

[5] Roma Tre University, Italy; veronica.ungaro@uniroma3.it

To ensure rigorous analysis, this study adopts SLR methodology, following the PRISMA (Preferred Reporting Items for Systematic reviews and Meta-Analyses). A systematic literature review is a form of research synthesis employed to provide a comprehensive overview of the current state of research (Burgers et al., 2019; Pasca et al., 2021). Initial search was performed in academic database Scopus, using the key terms (TITLE-ABS-KEY ("social procurement") AND TITLE-ABS-KEY ("social enterprises") OR TITLE-ABS-KEY ("social entrepreneurship")). Scopus is recognized due to its most comprehensive coverage of research articles, abstract and citation database of scientific literature worldwide (Chadegani et al., 2013). It encompasses a wide range of sources, including journals, conferences, and other publications, covering multiple disciplines such as social sciences. Compared to Web of Science, Scopus encompasses a larger array of sources, providing a more comprehensive and varied coverage of academic literature Meho et al., 2008. The research was limited to the English language, with no time limitation. In the initial phase, all the titles and abstracts were analyzed for relevance to the core research objectives. All studies addressing the interaction between procurement and SE are considered in the first phase (Figure 1).

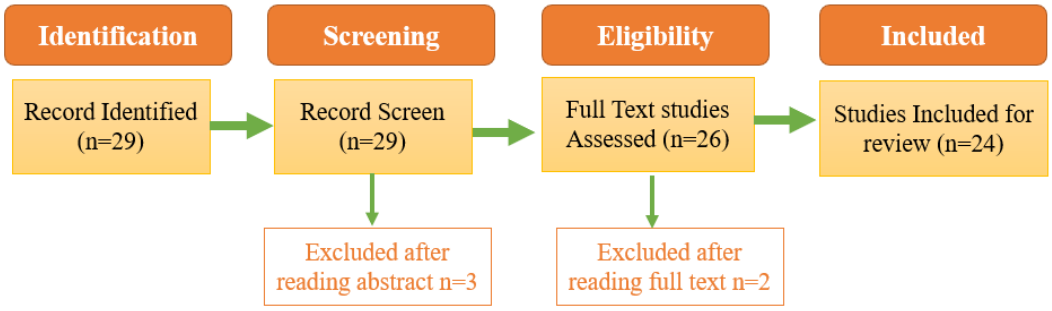

Figure 1. PRISMA Flowchart. Source: Pasca et al., 2021

Three studies were excluded at this stage. During the screening phase, 26 studies were thoroughly reviewed, with full article reading. At this point, 2 studies were excluded. This exclusion is due to general SE studies without a procurement link. 24 studies are finally included, and structured Excel sheet was developed to code publication with various details, including research purpose, methodology, geographical and sectoral context, primary findings, and identification of barriers and enablers. Through this process of screening, coding, and theme development, 4 analytical themes were identified, which help authors to structure the findings.

3. Findings

The synthesis of the selected articles reveals a core tension in the potential of policy endorsements of SP. The generation of consistent social value is hindered by various types of barriers, including commercial, institutional, and operational (Loosemore, 2015; Barraket & Loosemore, 2018). This issue manifested across 4 interrelated thematic areas: 1) conceptual foundations that frame the practices, 2) hindrances created by multi-stakeholders, 3) Pathways for integration that enable it, and 4) a broader ecosystem that can sustain it.

Conceptual and Institutional Foundations

The foundation of SP is developed through the theories of New Public Governance that mark it as a tool for co-creation and networked service delivery within a multi-actor state (Barraket, Keast, & Furneaux, 2015; Hastings & Weate, 2018). A significant contribution of the present literature is the examination of institutional conflict between the social welfare logic of SE and

the commercial logic of SP (Razmdoost & Alinaghian, 2024; Meqdadi, Johnsen, & Pagell, 2020). Various empirical studies indicate that the implementation of SP practices is more influenced by external pressure than by the actual intentions and internal normative beliefs of organizations. Particularly, pressures arise through mimetic isomorphism from peers and coercive isomorphism from government mandates (Nawaz & Guribie, 2024). To handle these conflicts, a buying firm can engage in "institutional work" through proper actions to decrease cognitive conflicts, legitimize new practices, and cross-sector boundaries (Razmdoost & Alinaghian, 2024). Furthermore, the conceptualization of research is complemented by Hunt, Haneberg, and de Boer (2024), who position SE as an alternative source of public welfare.

A Multi-Stakeholder Landscape of Barriers

The literature consistently delineates a multifaceted ecosystem of obstacles that hinder the incorporation of SEs into procurement processes. These barriers are persistent across diverse economic and geographical contexts, from Botswana and Lithuania to the UK and Australia (Kuruneri, Dube, & Obadire, 2025; Loosemore, 2016; Kanapinskas, Plytnikas, & Tvaronavičienė, 2014; Natoli, Lou, & Goodwin, 2023). These barriers can be segregated into two main groups. The first group is relevant with the "Capacity and Visibility Gaps" in SEs themselves. Such issues involved small operational scales, a track record of operations, financial instability, a lack of awareness, and low visibility in relationship-driven supply chains (Kuruneri et al., 2025; Loosemore, 2015). The second group, that is more crucial, is Structural and Regulatory Deficiencies. This consists of legal frameworks that are unable to support policy implementation, governance, and accountability issues, as well as a lack of monitoring systems. In some cases, a rigid procurement culture that focuses on achieving the lowest price instead of the best social value (Kuruneri et al., 2025). In such scenarios, these barriers are even more detrimental for marginalized groups, such as Indigenous businesses struggling with financial difficulties, accessing business advice, and joining industry networks (Denny-Smith & Loosemore, 2017; Loosemore & Denny-Smith, 2016).

Pathways to Integration and Co-Creation

Even with the above-discussed barriers, this article identified the concrete pathways through which SEs can successfully engage with procurement systems. One way is "Competition on Unique Value", through which SEs win the contracts. It receives no special treatment, but by offering specialized services that qualify for procurement streams focusing on innovation or initiated in a specific location. This is an identified point where social and commercial value can be aligned (Hunt, 2025). Another pathway is "Strategic Relationship Configurations," which are crucial. In such scenarios, successful transition often requires basic dyadic buyer-supplier relationships to more intricate triadic or quadratic frameworks. It includes intermediaries such as NGOs, specialized social brokers, or primary contractors. These intermediaries play a crucial role in building trust, reducing perceived risk, and facilitating the growth of SEs as suppliers (Meqdadi et al., 2020; Barraket, 2020; McNeill, 2020). However, such cross-sector partnerships often indicate that they frequently function as "cooperative" arrangements that are transactional and focused on risk mitigation, rather than as "collaborative" initiatives founded on a shared vision and collective value creation. This limitation is due to project-based industry structures, business pressures, and a lack of relational skills (Barraket & Loosemore, 2018; Loosemore et al., 2020).

Policy, Ecosystems, and Macro-Impact

Furthermore, this analysis suggests that realizing SP potential requires a shift beyond simplistic policy mandates to foster a supportive ecosystem. Firstly, it focuses on the importance

of “Enabling Ecosystem Components, which includes capacity-building frameworks for both suppliers and buyers, digitalization, and AI-driven platforms. Moreover, it emphasizes the formalization of intermediary roles to enhance market transparency, social value verification, and matchmaking efficiency (Delina & Šulová, 2025; Natoli et al., 2023). Secondly, the SP practices are being framed more in terms of their “Strategic Macro-Impact”, such as Agenda 2030. In such cases, SP is seen as a strategic tool with large-scale infrastructures that can create jobs, reduce poverty, and build resilient communities (LePage & Renaerts, 2023; Allen et al., 2023). Finally, “Local Government” is recognized as a crucial catalytic actor, distinctly equipped to promote collaborations and serve as an anchor institution within networked governance frameworks to tackle hyper-local social and economic issues (Hastings & Weate, 2018).

Through this in-depth analysis barriers and enablers are mapped mentioned in table 1.

Theme	Barriers	Enablers
Conceptual & Institutional	Mimetic/coercive isomorphism, institutional logic conflicts;	Cross-sector boundary spanning; institutional work;
Multi-Stakeholder Landscape	Rigid procurement culture; capacity gaps; lack of visibility	Intermediary roles; Strategic relationship configurations;
Pathways to Integration	Lack of supportive ecosystems; transactional cooperation vs. collaborative partnerships	Competition on unique value; triadic/quadratic frameworks
Policy & Ecosystems	weak local government engagement	Digital platforms; policy alignment with SDGs; anchor institutions

Table 1. Barriers and Enablers of SE into the SP

4. Discussion

The goal of this systematic review was to synthesize the literature on the integration of SP and SE. The results reveal that the field has both promising and problematic aspects. Social procurement, on the one hand, is a powerful tool for creating social value, whereas on the other hand, a long-standing conflict between new social goals and conventional business practices makes this challenging to achieve. The most important insight from this synthesis is that the change occurs at multiple levels simultaneously. Tis analysis underlines, obstacles and solutions are interrelated across four domains: concepts, relationships, systems, and support frameworks. There is a strong connection between the four themes. The prevailing concepts and theories regarding procurement (Conceptual Foundations) directly influence the practical obstacles encountered (Barriers). A culture that prioritizes the "lowest price" often creates rules that overlook social value. To overcome these barriers, new types of relationships and pathways are necessary. These should extend beyond simple transactions to include complex partnerships with intermediaries who foster trust and develop skills. However, these new relationships are too fragile to sustain without a supportive environment that includes clear rules, training, and technology. A policy mandate will not be effective without an accompanying transformation in mindset and interpersonal skills. All parts must move forward simultaneously.

Practitioners must navigate important tensions inherent in this cycle. Organizations often view SP as a risk to be avoided rather than an opportunity to be leveraged, which limits its scope and potential. The literature distinguishes between superficial "cooperation" to fulfill contractual obligations and profound "collaboration" rooted in a shared vision, suggesting that the former

currently prevails in the field. Local initiatives are effective, but the most challenging problems, such as national laws or industry-wide culture, require change on a larger scale.

This synthesis connects theory to real life. "Institutional work" is an academic term that describes the conscious effort needed to change habits. In practice, this means that procurement officers are forming new partnerships. Digital matchmaking platforms are a real-world example of "ecosystem development" in the same way. Overall, SP is not just a procurement issue; it is also a system change issue. The results show that adding social clauses to existing systems is insufficient.

This systematic analysis provides a clear and organized picture of a field that is complex and rapidly evolving. It enhances both theoretical and practical understanding in three fundamental aspects. First, this article provides a strong and connected framework to the scholars and researchers. This analysis combines ideas from different areas, for example public management, supply chain studies and institutional theory, to offer a clearer picture of SP, ranging from policy pressure (Macro level) to typical partnerships (Micro level). Second, the most important next steps are to monitor long-term results, learn about new digital tools and platforms, and examine how policies work in different countries, especially those with developing economies. Finally, for policymakers and managers, it goes beyond simply listing problems and provides a plan of action. The review highlights areas of the system that require improvement, including simplifying the tender process for small businesses, establishing stronger support networks, and enhancing procurement teams' ability to manage relationships effectively. It demonstrates that to be successful, everyone in the ecosystem must work together.

5. Conclusion, limitations, and future research

This review finds that the main challenges with SP integration into SE are the difficulty of incorporating new social values into existing, inflexible buying systems. This potential to build inclusive communities and help reach global goals is enormous; however, two main challenges exist: many SEs are not stable enough in their operations, and secondly, traditional buyers are not open to new ideas. The research indicates that the most effective approach is a dual and connected strategy. There is a need to improve the procurement systems that SEs conveniently join and support, which require support networks and intermediaries, trust-building, training, and technology implementations for transparent social value creation. This research has limitations as it depends on a single database, Scopus, and lacks empirical evidence. Therefore, future research requires access to broad academic databases and empirical analysis. Further research may also adopt empirical studies on context base such as developing countries. Further studies may also investigate how SP affect SE scalability over the time and how digital tools integrations such as AI-driven platform improve the transparency.

Cooperative Bridging: Investigating transnational employee well-being and organizational learning between Senegal and Italy

Monica Veneziani[1], Laura Rocca[2], Anna Maria Fellegara[3]

1. Introduction

In the context of post-2020 development cooperation, characterized by calls for inclusive governance, horizontal partnership, and social innovation, cooperative enterprises have regained policy and academic attention as democratic, locally embedded, and socially responsible economic actors. The present study explores how transnational cooperative partnerships between Senegal and Italy, facilitated through development cooperation programs such as the Programma di Partenariato Italia-Senegal 2024-2026, impact employee well-being, participation, and governance experiences in cooperatives across both contexts. Although cooperative development features prominently in Italian cooperation policy, particularly in Senegal where cooperatives are leveraged for job creation and reintegration of return migrants, little is known about the micro-level organizational effects of these initiatives. Specifically, how do cooperative employees, often youth, women, and migrants, experience governance, voice, and inclusion in cooperatives shaped by transnational knowledge flows? What tensions emerge when organizational models cross national and cultural boundaries? And to what extent do these partnerships result in mutual learning?

This extended abstract presents a comparative, qualitative research design that addresses these questions through a multi-sited case study of cooperative organizations in Italy and Senegal. Rather than idealizing cooperatives as inherently democratic, we treat them as contested institutional spaces where norms of participation, accountability, and legitimacy are continuously negotiated by workers, members, and managers (Battilana et al., 2009; Battilana et al., 2015; Borzaga & Tortia, 2006; Pache & Santos, 2013).

2. Context

Senegal is a key priority country for Italian development cooperation, with over €259 million in active projects in 2023, of which 28% was allocated to private sector and employment initiatives (AICS, 2023). Many of these projects support cooperatives in agriculture, agro-processing, and manufacturing industries, especially among women and youth in Kaolack, Thiès, and Dakar. Italian cooperatives, particularly in regions such as Emilia-Romagna and Lombardy, participate in these partnerships through technical assistance, training exchanges, and diaspora engagement. The Dakar office dedicated substantial effort in 2023 to planning future action. This included finalizing the Italy-Senegal Partnership Program 2024-2026 (AICS, 2024), which was developed through consultation with Italian organisations and ratified through institutional meetings with local governmental counterparts.

More in detail, the Italy-Senegal Partnership Program 2024-2026 provides a strategic framework for bilateral development cooperation aligned with Senegal's national priorities and the UN 2030 Agenda for Sustainable Development. Grounded in a rights-based and results-oriented approach, the Program adopts the Theory of Change to frame development as a multidimensional and transformative process. It prioritizes inclusive development, with particular attention to women, youth, rural communities, and other vulnerable groups, and treats gender equality and social inclusion as cross-cutting principles. It addresses key structural challenges in Senegal, including rural poverty, youth unemployment, climate vulnerability, and migration, through four strategic areas: rural development and food security; education and vocational training; employment and private sector development; and environmental sustainability. Migration is approached as a structural development issue, emphasizing regular mobility, rights protection, reintegration of returnees, and the role of diasporas. Implemented through multi-level partnerships and robust monitoring mechanisms, the Program exemplifies a cooperative, context-sensitive model of development cooperation that implements the principles of the 2030 Agenda through horizontal partnership and long-term sustainability. The 2024-2026 Program is set to total €105 million, and it adopts a Result-Based Management approach for effective monitoring and evaluation.

The 2023 Annual Report of the AICS Regional Office in Dakar provides a comprehensive overview of Italy's development cooperation in West Africa, highlighting its strategic orientation, operational results, and future perspectives within the framework of the UN 2030 Agenda for Sustainable Development. The Report is structured around the five pillars of the 2030 Agenda: People, Prosperity, Planet, Peace, and Partnerships, which serve as both an analytical lens and an operational framework. This approach emphasizes the multidimensional and interconnected nature of development, framing cooperation as a transformative and participatory process rather than a set of isolated interventions. Central to this vision are the principles of national ownership, inclusion, and results-based management. In particular, partnerships constitute a transversal element of Italy's cooperation model. The Report emphasizes the role of the Italy System, involving civil society organizations, universities, local authorities, diasporas, and private actors, and promotes horizontal, multi-level partnerships based on co-creation and mutual learning. Overall, the 2023 Annual Report portrays Italian development cooperation in West Africa as a results-oriented and people-centered policy, aligned with the principles of the 2030 Agenda and committed to fostering inclusive, sustainable, and resilient development pathways in the region.

While program documents describe these collaborations in terms of capacity building and knowledge transfer, few empirical studies have examined how such partnerships impact the internal dynamics of cooperatives, especially from the point of view of the employees who must navigate both local traditions and international development norms (Poledrini, 2015). Based on preliminary document analysis (AICS, 2023; AICS, 2024; Defourny & Nyssens, 2017; Cappellaro et al., 2025), we argue that cooperative employees in Senegal and Italy may encounter conflicts between imported governance models and local social hierarchies (e.g., respect for elders or religious leaders), unequal participation dynamics within cooperatives, despite formal democratic structures and emotional and identity-related pressures when serving as cultural or linguistic bridges in transnational projects (Gammelgaard et al., 2020). These propositions ground the project's focus on the lived experiences of governance and cooperation within the transnational field.

3. Literature review

Cooperative governance literature has long highlighted the tensions between participatory ideals and managerial realities (Battilana et al., 2015; Pache & Santos, 2013; Ometto et al., 2019; Smith et al., 2013). Cornforth (2004) identifies governance paradoxes where member control coexists with technical or hierarchical management. Storey et al. (2014), show how cooperatives

may become "hybrid" organizations, blending market logic and democratic legitimacy, often creating ambiguity for members. Battilana et al. (2009) introduce the concept of institutional entrepreneurship, where actors within organizations challenge or adapt institutional templates. In a transnational context, such entrepreneurial behaviour may involve reinterpreting cooperative values to align with local cultural or religious norms. Jaumier (2017) offers an ethnographic perspective on how worker cooperatives navigate "bureaucratization of democracy," revealing that formal democratic procedures may mask inequalities in voice and influence. These dynamics may be particularly relevant in development projects, where external reporting and auditing mechanisms shape internal processes. Varman and Chakrabarti (2004) argue that democracy in cooperatives is socially embedded, often shaped by local power relations such as caste, patriarchy, or patronage. This insight could be relevant for Senegal, where informal authority structures coexist with formal governance norms. Together, these works suggest that employee experience of democracy cannot be inferred from governance design alone. Participation must be understood as an embedded and evolving process, shaped by context, power, and culture.

Looking at the transnational cooperative partnerships, that involve not just financial or technical flows, but also the movement of ideas, values, and organizational models. Saka-Helmhout et al. (2020) emphasizes that institutional practices are rarely transferred wholesale; instead, they undergo a process of translation, where local actors deconstruct and reconstruct norms to fit new environments. Gooderham et al. (2011) stress that successful knowledge transfer requires both institutional compatibility and relational trust, conditions that may not always exist in development settings with asymmetrical power relations. Jackson (2012) critiques the imposition of Western management systems in African contexts, advocating for recognition of indigenous organizational knowledge. In Senegal, traditional collective economic forms (e.g., tontines, family lineages, Islamic moral economy) may offer alternative governance logics to imported cooperative templates.

Going deeper into the bridge between western and developing countries (such as AICS, 2024) using the lens of cooperative organisations, Cappellaro et al. (2025) provide a significant theoretical and empirical contribution to the study of international development governance by shifting the analytical lens from individual intermediary organizations to what they term "intermediary clusters", networks of organizations that collaboratively mediate between global mandates and local institutional contexts. Their research focuses on the United Nations' "Delivering as One" (DaO) reform, implemented between 2007 and 2015, which aimed to improve development effectiveness by integrating the operations of UN organizations within eight pilot countries. Through extensive fieldwork, the authors develop the concept of "contextual bridging" to explain how these intermediary clusters align global development goals with local governance environments. The study identifies a dynamic process in which internal collaboration within clusters is strengthened through the amalgamation of operations and the development of a cohesive collective voice, which is then entrenched locally through power-sharing with host governments and the careful calibration of the collaborative purpose to local political and institutional realities. This process enables intermediary clusters to navigate complexity, absorb coordination costs, foster local ownership, and translate global mandates into context-sensitive practices. While the study focuses on UN country teams, its theoretical implications extend far beyond, offering a framework for understanding how other organizational forms, such as transnational cooperatives, might function as intermediary clusters capable of contextual adaptation. Their findings highlight how organizational hybridity and interorganizational collaboration can produce adaptive, trust-based governance mechanisms, rather than static or hierarchical ones. Moreover, Cappellaro et al. (2025) call for future research into similar dynamics outside the UN system, emphasizing the need to understand how non-traditional actors, like cooperatives, may contribute to development governance through locally embedded, globally informed practices. Another interesting work is that of Gammelgaard et al. (2022) that critically examines the emerging landscape of transnational development governance through a

postcolonial lens, arguing that what appears to be inclusive or collaborative engagement in fact often reproduces deep-seated global asymmetries. Their work interrogates how private corporations, donor states, and multilateral institutions engage with development in Africa through what they term the "corporate scramble," a process that extends and reconfigures colonial patterns of economic and political control under the guise of partnership and capacity building. Drawing from critical political economy and postcolonial theory, the authors show that contemporary development governance, particularly in "transglocal" arrangements that blend global mandates with localized implementation, often positions African states and institutions as sites for experimentation, intervention, and extraction, rather than as equal partners. They highlight how formal mechanisms of cooperation, such as public-private partnerships and donor-driven projects, are framed in neutral, technocratic terms but are deeply embedded in geopolitical logics of control, dependency, and selective inclusion. Their analysis reveals how notions of development are governed not only by policy and resource flows, but also by normative hierarchies and structural constraints that privilege Northern agendas and institutions. This critique is directly relevant to studies of cooperatives operating within international development frameworks, as it raises urgent questions about voice, ownership, and epistemic authority in transnational partnerships. The authors provide a valuable framework for examining whether and how cooperatives might challenge, replicate, or rework these dynamics. In this sense, their work offers both a caution and an opportunity: it warns against romanticizing development partnerships while opening conceptual space for alternative governance models that foreground mutual accountability, historical consciousness, and postcolonial justice.

According to that literature, the current paper would like to adopt the Cappellaro et al. (2025) framework for the exploratory research on how cooperatives engaged in transnational collaboration, how that entails building institutional arrangements that genuinely empower local members and stakeholders, including through co-determination of priorities and budgetary choices. In Senegal, this may involve incorporating traditional knowledge systems or local development needs into governance frameworks that originate from European cooperative models. These mechanisms also require cooperatives to absorb the transaction costs of collaboration, especially those previously borne by local actors, and to mobilize their global networks to deliver contextually relevant technical expertise and policy advocacy. The value of this framework for cooperative research lies in its attention to both structure and agency. It emphasizes not only how organizations coordinate across boundaries but how they become locally meaningful by embedding themselves within the institutional, cultural, and political ecologies of place. Moreover, the notion of contextual bridging provides a useful lens to study the micro-level dynamics of identity negotiation and inclusion within transnational cooperatives. It allows us to theorize how return migrants, local leaders, and cooperative workers function as boundary-spanning agents, translating between global cooperative ideals and the lived realities of work and governance in Italy and Senegal. Finally, this framework aligns with postcolonial critiques of development partnerships (e.g., Gammelgaard et al., 2022), which caution against romanticized notions of "local participation" that obscure structural inequalities.

According to that, this research investigates how transnational cooperative partnerships, specifically between Italian and Senegalese actors, can contribute to inclusive, democratic development by adapting and embedding governance practices through mechanisms of contextual bridging. Building on Cappellaro et al.'s (2025) model and postcolonial critiques of global-local development relations (Gammelgaard et al., 2022), the study aims to bridge macro-level institutional dynamics with micro-level worker experiences and agency within cooperatives.

The main research question of the current work is:

How do Italian–Senegalese cooperative partnerships enact mechanisms of contextual bridging to promote locally owned, inclusive development governance?

This main question is accompanied by several related sub-questions: How do cooperative employees experience governance, voice, and inclusion within organizations influenced by transnational knowledge flows? What tensions arise when organizational models move across national and cultural boundaries? And to what degree do these partnerships foster reciprocal learning?

These overarching questions are explored through two interrelated levels of analysis: organizational governance and worker experiences within the transnational cooperative context.

The research aims to critically examine the governance dynamics shaping transnational cooperative partnerships between Italy and Senegal, focusing on how mechanisms of contextual bridging (Cappellaro et al., 2025) are enacted and negotiated by organizations and individuals across national boundaries. Specifically, it explores the extent to which Senegalese institutions and cooperative members exercise substantive authority and voice in processes of formal project design, agenda setting, and decision-making, issues closely tied to ongoing critiques of asymmetry and tokenistic participation in North–South partnerships (Gammelgaard et al., 2022; Gammelgaard et al., 2020). The study also investigates the micro-level consequences of such transnational cooperative engagements, examining how participation affects worker inclusion, identity formation, and perceived empowerment within hybrid organizational settings (Battilana & Dorado, 2010; Ghio & Verona, 2022). In doing so, the research contributes to the literature on hybrid organizations and interorganizational collaboration (Doherty et al., 2014; Mair et al., 2015), while also addressing a gap in postcolonial development scholarship by foregrounding cooperatives as institutional actors that mediate between global governance regimes and locally grounded democratic aspirations (Cappellaro et al., 2025, Gammelgaard et al., 2022).

4. Methodology

This exploratory research adopts a comparative, multi-sited qualitative case study approach grounded in the principles of grounded theory (Charmaz, 2006; Glaser & Strauss, 1967). The aim is to develop empirically anchored insights into how transnational cooperative partnerships between Italy and Senegal enact mechanisms of contextual bridging and democratic governance. The multi-sited design allows for a cross-contextual understanding of cooperative governance in two distinct but interconnected settings, thereby enabling a richer analysis of the dynamics at play in both the Global North and South.

Fieldwork in Senegal will be conducted across three sites: Kaolack, Thiès, and Dakar. These regions were selected due to the presence of cooperatives engaged in agriculture, textiles, and service sectors that have documented or emerging links with Italian cooperative partners. In Italy, research will be carried out in the regions of Emilia-Romagna and Lombardy, both hubs of cooperative innovation and migrant-inclusive enterprises. Case selection within these regions will focus on cooperatives active in social care, and agro-food sectors, with particular attention given to those employing Senegalese migrants or participating in projects aligned with South–South cooperation or return migration schemes.

Data collection will rely on a triangulation of qualitative methods. Semi-structured interviews will be conducted with cooperative employees, return migrants, cooperative leaders, and transnational facilitators who mediate between Italian and Senegalese organizations. These interviews will explore themes such as participation, decision-making, identity formation, and transnational learning. Focus groups will also be held with cooperative members to elicit collective reflections on democratic practices, knowledge sharing, and organizational inclusion. In addition, documentary analysis will be undertaken on key governance materials, including cooperative statutes, partnership agreements, internal meeting minutes, and training manuals. To capture the lived and embodied dimensions of cooperative work and governance, the study will also include participant observation in selected cooperative activities in both countries.

The data analysis will combine thematic coding with grounded theorizing. Interview transcripts, fieldnotes, and documentary data will be subjected to an iterative coding process using open and selective coding stages to identify recurring patterns in how participants describe governance processes, learning, and identity (Corbin & Strauss, 2008). Particular attention will be paid to variations in how contextual bridging is experienced across the two national settings. Cross-case comparison will be used to systematically trace both convergences and divergences in governance dynamics, with the aim of understanding how transnational models are adapted, hybridized, or resisted at the local level. Finally, findings will be triangulated with official policy documents and cooperative governance frameworks to assess the extent to which lived practices align with or diverge from formal institutional expectations.

The current work is in progress – so, we have no findings yet as we have already analysed only the public documents and we need to start the interview process.

5. Contribution

The study advances a micro-foundational perspective on transnational development cooperation, integrating insights from cooperative governance, institutional theory, and organizational learning. It positions employees not just as beneficiaries but as active agents in the co-production and translation of organizational norms.

By documenting employee perspectives across two national contexts, the study generates rare comparative data on how cooperative governance is practiced and perceived at the grassroots level in transnational settings.

For development agencies like AICS and cooperative unions, the findings will inform more inclusive training programs that centre employee experience and social context, will monitor frameworks that measure democratic participation, financial or employment metrics and it will support for reciprocal learning exchanges, where Southern cooperatives are not only recipients but knowledge contributors.

6. Conclusion

Transnational cooperative partnerships offer powerful opportunities for inclusive development, but their success depends not only on resources and models, but on how those models are interpreted and enacted by workers on the ground. By placing employee narratives and expectations at the centre, this research moves beyond idealized visions of cooperation and toward a grounded, democratic development practice.

Dal mindset alla postura strategica: concettualizzazione e misurazione dell'Individual Humane Entrepreneurial Orientation

Chiara Crudele[1], Rosangela Feola[2], Roberto Parente[3], Ricky Celenta[4]

1. Introduzione

L'imprenditorialità guidata dal purpose (purpose-driven innovation) è diventata un canale centrale attraverso cui gli attori imprenditoriali rispondono a grandi sfide contemporanee quali sovraconsumo di risorse, degrado ambientale e disuguaglianza sociale (Cucino et al., 2025), temi chiaramente richiamati anche dall'Agenda 2030 delle Nazioni Unite. Al di là di pratiche incrementali di Corporate Social Responsibility (CSR), un numero crescente di iniziative imprenditoriali sta infatti perseguendo forme di innovazione esplicitamente orientate alla creazione di valore condiviso, combinando sostenibilità economica con risultati sociali e ambientali osservabili (Parente et al., 2018). Questo cambiamento è particolarmente evidente tra le micro, piccole e medie imprese (MSMEs) e tra le imprese ibride (hybrid ventures), che integrano logiche commerciali e mission-driven, riposizionando l'imprenditorialità come leva di trasformazione sociale e non soltanto come meccanismo di generazione di ricchezza.

In questo dibattito, l'intersezione tra imprenditorialità, sostenibilità e gestione human-centric ha favorito l'emergere della teoria della Humane Entrepreneurship (HumEnt), che concettualizza una postura strategica capace di integrare l'orientamento imprenditoriale con la sostenibilità sociale e ambientale e con un forte impegno verso le risorse umane dell'impresa (Parente et al., 2018, 2021). La HumEnt è stata discussa per le sue basi epistemologiche (Parente et al., 2018) e per il suo potenziale nel generare lavoro dignitoso e benefici sociali più ampi (Kim et al., 2018). La ricerca empirica esistente ha iniziato a mostrare come i principi HumEnt influenzino strategie e pratiche organizzative (ad es., Anggadwita et al., 2021; Vesci et al., 2023) e come possano essere associati a risultati di performance (Vesci et al., 2025; Le, 2022).

Una questione cruciale, ma ancora poco esplorata nella ricerca su purpose-driven e hybrid venturing, riguarda dove nasca il purpose e come esso diventi azionabile. In questo filone di ricerca, la HumEnt riconosce esplicitamente che le scelte imprenditoriali affondano le radici nella cultura organizzativa, ma anche nei valori personali e negli orientamenti di imprenditori e forza lavoro (Parente et al., 2018; Vesci et al., 2023). Tuttavia, nonostante il crescente interesse per la Humane Entrepreneurial Orientation (HEO) come costrutto a livello d'impresa, sappiamo ancora relativamente poco su come i suoi elementi fondamentali si manifestino a livello individuale, soprattutto tra i nascent entrepreneurs, definiti dal Global Entrepreneurship Monitor come gli individui in età lavorativa attivamente coinvolti nell'avvio di una nuova impresa, che si aspettano di diventarne proprietari (o comproprietari) e che hanno intrapreso azioni concrete per avviarla negli ultimi 12 mesi (GEM Report, 2025; Reynolds, 2005). Recenti studi hanno infatto evidenziato la necessità di studiare l'entrepreneurial orientation oltre il livello organizzativo

(Robinson & Stubberud, 2014; Koe, 2016) e concettualizzare la sustainability orientation e la human resource orientation non solo come postura d'impresa ma anche come orientamento individuale (Parente et al., 2020; Crudele et al., 2025).

Per colmare questo gap, lo studio propone, attraverso lo sviluppo concettuale e un test empirico preliminare, una nuova scala di misurazione, l'Individual Humane Entrepreneurial Orientation (IHEO), che cattura il grado in cui gli individui integrano nel proprio mindset e nelle proprie tendenze comportamentali: (i) l'individual entrepreneurial orientation, (ii) l'individual sustainability orientation e (iii) l'individual human orientation.

Proponendo una scala con adeguate proprietà psicometriche, questo studio intende fornire ai ricercatori uno strumento affidabile per misurare l'HEO negli individui, abilitando ulteriori analisi sulle sue implicazioni per il comportamento imprenditoriale e per l'imprenditorialità purpose-driven.

Inoltre, lo studio intende offrire un contributo anche sul piano applicativo, fornendo a educatori e policy maker un riferimento per la progettazione di programmi capaci di promuovere imprenditori humane-oriented, in grado di integrare sostenibilità ambientale e sociale con un forte impegno verso il benessere e lo sviluppo delle risorse umane all'interno delle proprie imprese. In particolare, lo studio indaga come i valori e le caratteristiche associati all'approccio HumEnt si configurino nei nascent entrepreneurs, cercando di rispondere alla seguente domanda di ricerca (RQ): In che modo le caratteristiche e i valori associati a un approccio HumEnt si configurano a livello individuale nei nascent entrepreneurs?

2. Framework Teorico

2.1. Humane Entrepreneurship e Humane Entrepreneurial Orientation

Alla luce del crescente acuirsi delle sfide ambientali, e in risposta alla richiesta di una forma di impresa che recuperi la centralità dell'essere umano e del senso di umanità, rispettando al contempo la società nel suo complesso (Business Roundtable, 2019; Melé, 2016), l'imprenditorialità ha reagito generando modelli di business che incorporano, in modo strategico, la cura per l'ambiente, le comunità e i dipendenti. Coerentemente con tale evoluzione, la HumEnt è emersa come un nuovo framework teorico che amplia la nozione di entrepreneurial strategic posture proposta da Covin e Slevin (1989). Introdotta inizialmente da Parente et al. (2018) e successivamente sviluppata da Parente et al. (2020) e Vesci et al. (2023), la HumEnt interpreta gli imprenditori come soggetti al contempo orientati alla ricerca di opportunità e portatori di valori human-centered. L'assunto di fondo è che le imprese possano, e debbano, perseguire il vantaggio competitivo promuovendo simultaneamente il coinvolgimento dei dipendenti, l'equità sociale e la cura della comunità, preservando l'integrità ambientale (Kim et al., 2018; Parente et al., 2018; Criado-Gomis et al., 2018).

In questa prospettiva, la performance economica non viene negata né compressa, ma piuttosto integrata e completata dalla responsabilità sociale e ambientale. Ne deriva un ampliamento della postura strategica imprenditoriale, denominata Humane Entrepreneurial Orientation (HEO) (Parente et al., 2018), che riflette l'intenzionalità dell'impresa nel perseguire simultaneamente competitività, sostenibilità e benessere delle risorse umane coinvolte nell'impresa (Vesci et al., 2024). L'HEO non è semplicemente la somma di tre dimensioni separate; rappresenta piuttosto un comportamento strategico che integra in modo congiunto tre orientamenti (Parente et al., 2018, 2021; Vesci et al., 2023): (1) l'Entrepreneurial Orientation (EO) (Covin & Slevin, 1989), (2) la Sustainability Orientation (SO) (Shepherd & Patzelt, 2011; Schaltegger & Wagner, 2011; Muñoz & Dimov, 2015) e (3) la Humane-Resource Orientation (HRO) (Kim et al., 2018; Parente et al., 2018, 2021; Vesci et al., 2023, 2024).

Tuttavia, sebbene la HEO sia concettualizzata prevalentemente come postura strategica di livello organizzativo, la logica della HumEnt implica che tale postura affondi le proprie radici anche in valori, convinzioni e orientamenti individuali (Parente et al., 2018; Vesci et al., 2022),

soprattutto nelle fasi iniziali dell'azione imprenditoriale, quando il progetto è ancora in costruzione e dipende in larga misura dalle disposizioni personali del fondatore e del team. Coerentemente con le indicazioni della letteratura che invita a considerare l'EO anche a livello individuale (Robinson & Stubberud, 2014; Koe, 2016; Clark et al., 2024) e con l'attenzione crescente verso declinazioni individuali della sostenibilità (Parente et al., 2020), risulta quindi teoricamente e metodologicamente rilevante tradurre le tre componenti della HEO in un framework di livello micro. In altri termini, comprendere "quanto" e "come" un individuo incorpori orientamento imprenditoriale, sostenibilità e principi human-centered nel proprio mindset e nelle proprie tendenze comportamentali consente di cogliere le micro-foundations dell'approccio HumEnt e di osservare precocemente la possibile emergenza di posture strategiche di tipo humane prima ancora che esse si consolidino in pratiche e assetti organizzativi. Per queste ragioni, nella sezione successiva discutiamo le tre dimensioni della HumEnt al livello individuale, Individual Entrepreneurial Orientation (IEO), Individual Sustainability Orientation (ISO) e Individual Human Orientation (IHO), che costituiscono la base concettuale della scala Individual Humane Entrepreneurial Orientation (IHEO).

2.2. Individual Entrepreneurial Orientation (IEO)

L' EO è un concetto originato da Miller (1983) e articolato in tre dimensioni: innovatività, proattività e propensione al rischio. Successivamente, Covin e Slevin (1989) ne hanno ulteriormente consolidato la diffusione attraverso il concetto di entrepreneurial strategic posture (ESP). Negli anni seguenti, Lumpkin e Dess (1996) hanno raffinato l'EO proponendo un modello a cinque dimensioni che include autonomia, innovatività, propensione al rischio, proattività e aggressività competitiva. Nel tempo, l'EO è stato ampiamente riconosciuto dalla comunità scientifica come un costrutto a livello d'impresa in grado di influenzarne la performance (ad es.: Grande et al., 2011; Hafeez et al., 2011; Chandrakumara et al., 2011; Gupta & Gupta, 2015). Ad esempio, utilizzando un modello a cinque dimensioni, Koe (2013) ha rilevato che innovatività, proattività, propensione al rischio, aggressività competitiva e autonomia incidono positivamente sulla performance aziendale. Inoltre, Dada e Watson (2013) hanno considerato l'EO come un costrutto olistico, confermandone la relazione positiva con performance finanziarie e non finanziarie. Tuttavia, negli ultimi anni, diversi autori hanno suggerito che l'EO possa essere considerata anche come un costrutto a livello individuale (Robinson & Stubberud, 2014). Tale indicazione ha aperto nuove opportunità di ricerca, consentendo di indagare l'EO da una diversa prospettiva. Gli studi che hanno analizzato l'Individual Entrepreneurial Orientation (IEO) concordano nel considerarlo un costrutto multidimensionale, composto da elementi simili a quelli dell'EO a livello d'impresa. Ad esempio, Chien (2014) ha evidenziato una relazione positiva tra IEO e performance aziendale; analogamente, Bolton (2012) ha dimostrato un legame tra IEO e successo dell'impresa. Questi contributi forniscono spunti rilevanti sull'IEO come declinazione individuale dell'EO. Tuttavia, gran parte di tali studi si concentra soprattutto sulla relazione tra IEO e performance. Inoltre, poiché l'IEO è una concettualizzazione relativamente recente, è necessario dedicare maggiore attenzione all'operazionalizzazione dei suoi elementi nelle ricerche empiriche (Martins & Perez, 2020; Hassan et al., 2021).

L'IEO può essere definito come la capacità, la competenza e la disponibilità (o motivazione) di un individuo a diventare imprenditore (Taatila & Down, 2012). In quanto concetto sviluppato più recentemente, l'IEO richiede anche strumenti di misurazione e scale dedicate (Frunzaru & Cismaru, 2021). Covin and Selvin (1989) hanno offerto un punto di partenza con le tre dimensioni dell'EO; successivamente, Bolton e Lane (2012) hanno sviluppato una scala a livello individuale basata sulle stesse tre dimensioni di innovatività, propensione al rischio e proattività. L'IEO è considerata una competenza imprenditoriale che può essere sviluppata attraverso l'apprendimento esperienziale (Sahoo & Panda, 2019). Studi recenti evidenziano una relazione positiva tra IEO ed entrepreneurial intention (Ekpe & Mat, 2012; Martins & Perez, 2020; Robinson & Stubberud,

2014; Zhang & Bruning, 2011). Ibrahim e Lucky (2014), ad esempio, analizzando un campione di studenti presso l'Università della Malesia, hanno riscontrato una relazione positiva e significativa tra IEO ed EI. Hassan et al. (2021) hanno inoltre rilevato un ruolo diretto e indiretto dell'IEO e dell'entrepreneurship education nel determinare l'intenzione imprenditoriale degli studenti, attraverso la mediazione delle motivazioni imprenditoriali. L'IEO cattura il grado in cui gli aspiranti imprenditori sono innovativi, proattivi e propensi al rischio nel processo di avvio dell'attività imprenditoriale. In generale, le nuove iniziative che presentano una più elevata entrepreneurial orientation mostrano un potenziale maggiore in termini di performance (Rauch et al., 2009). Di conseguenza, è importante valutare in che misura gli aspiranti o nascent entrepreneurs si impegnino attivamente nell'innovazione, siano disposti ad assumere rischi calcolati e mantengano un approccio orientato al futuro nello sviluppo del business, poiché la loro entrepreneurial orientation può favorire la creazione di imprese di maggior successo (Bolton & Lane, 2012; Clark et al., 2024).

2.3. Individual Sustainability Orientation (ISO)

La Sustainability Orientation (SO) si è sviluppata nell'ambito della sustainable entrepreneurship, un'area di ricerca che rimane ancora ambigua. Di conseguenza, anche il dominio della sustainability orientation risulta tuttora poco definito. L'analisi della letteratura evidenzia infatti l'assenza di un consenso sulla definizione di SO: alcuni autori si concentrano esclusivamente sulle questioni ambientali, mentre altri includono sia dimensioni ambientali sia sociali. Inoltre, sebbene molti studiosi continuino a considerare la SO come una concettualizzazione di livello organizzativo, recenti contributi propongono di misurarla a livello individuale (Parente et al., 2020; Crudele et al., 2025). Non è inoltre chiaro se la SO debba essere intesa come postura strategica, atteggiamento o motivazione all'azione, poiché in letteratura sono state adottate tutte queste categorizzazioni.

Sebbene siano state proposte numerose scale di misurazione della SO, la maggior parte deriva dalla scala di Kuckertz e Wagner (2010), adattata nel tempo a concettualizzazioni di tipo attitudinale o comportamentale. Tuttavia, poiché l'HEO è una postura strategica misurata a livello d'impresa, e presenta componenti sia attitudinali sia comportamentali, la misurazione della SO non risulta altrettanto consolidata in letteratura ai fini della misurazione dell'HEO. Parente et al. (2020) definiscono la SO come un orientamento strategico di livello d'impresa, evidenziato dal fatto che i comportamenti organizzativi mostrano un elevato impegno nella preservazione dell'ambiente naturale, ma anche attenzione e rispetto per iniziative e azioni guidate da istanze sociali. Coerentemente, in questo lavoro definiamo l'ISO come un orientamento a livello individuale, riscontrabile quando il comportamento dell'individuo manifesta un elevato impegno verso la tutela dell'ambiente naturale e, al contempo, rispetto per iniziative di natura sociale e azioni volte a migliorare la qualità della vita nella comunità locale.

In questa prospettiva, un punto di partenza per la generazione di item utili a misurare l'ISO, così come inquadrata nell'IHEO, sembra essere la proposta di Muñoz e Dimov (2015), che invita a considerare atteggiamenti e convinzioni degli imprenditori rispetto alla sostenibilità. Poiché HumEnt concepisce l'HEO come una postura strategica al tempo stesso attitudinale e comportamentale, la concettualizzazione e l'operazionalizzazione proposte per l'ISO coprono semanticamente entrambe le dimensioni della sostenibilità, ambientale e sociale. Gli item risultano inoltre in grado di catturare sia gli aspetti attitudinali (orientamento) sia quelli comportamentali (azioni) inclusi nel dominio della SO così come definito dai teorici di HumEnt.

2.4. Individual Human Orientation (IHO)

La Human Resource Orientation (HRO) si fonda sull'assunto che rispettare e coinvolgere i dipendenti rappresenti una strategia efficace per conseguire risultati organizzativi (Parente et al.,

2022). Tuttavia, l'HRO, così come intesa nel dominio della HumEnt, costituisce un costrutto relativamente nuovo: sebbene il management delle risorse umane (HRM) sia un tema ampiamente trattato, un modo per valutare l'HRO in termini di postura strategica è porre attenzione alle humane resources practices, intese come azioni intraprese per perseguire in modo strategico specifiche pratiche. Sfortunatamente, non esiste una scala di misurazione condivisa del comportamento di imprenditori/top manager che risulti pienamente coerente con l'HRO nel dominio della HumEnt (Parente et al., 2020; Vesci et al., 2022). Inoltre, la letteratura non presenta un accordo sul numero e sulla tipologia di politiche e pratiche HR che rientrano nel perimetro dello HRM.

Kim et al. (2018) hanno proposto un insieme di politiche e pratiche di gestione delle risorse umane strettamente connesse alla HumEnt, interpretandole alla luce dei principi dello Humanistic Management (Melè, 2016). A partire dalle concettualizzazioni di HRO proposte da Kim et al. (2018) e testate da Le (2022), che descrivono le modalità con cui l'HR management viene integrato nella visione di HumEnt degli autori, identifichiamo e definiamo quattro dimensioni principali che dovrebbero qualificare l'IHO a livello individuale: (a) empatia, intesa come il grado in cui un individuo condivide emozioni e informazioni con gli altri; (b) equità, intesa come il grado in cui un individuo tratta gli altri in modo giusto e paritario; (c) enablement, inteso come il grado in cui un individuo fornisce agli altri ciò di cui hanno bisogno per sviluppare i propri progetti (di vita) al meglio delle proprie capacità; e (d) empowerment, inteso come il grado in cui un individuo condivide informazioni e risorse con un'altra persona nello svolgimento di un compito, offrendo la possibilità di partecipare al processo decisionale.

3. Metodologia

Per proporre e testare una scala di misurazione dell'IHEO, abbiamo condotto uno studio quantitativo basato su analisi fattoriale esplorativa (EFA). I dati utilizzati derivano dal database nazionale GUESSS Italia (somministrazione ottobre–dicembre 2023), coordinato dal GUESSS Board Italy con il supporto delle università partecipanti. La rilevazione ha raccolto complessivamente 4.374 questionari provenienti da oltre 26 atenei italiani, coinvolgendo giovani appartenenti a differenti ambiti disciplinari e livelli di studio. Ai fini del presente lavoro, abbiamo utilizzato un sottoinsieme delle variabili disponibili nel dataset GUESSS Italia, selezionate perché coerenti con l'operazionalizzazione delle tre dimensioni dell'IHEO. Inoltre, l'analisi è stata condotta su un sottocampione di nascent entrepreneurs, definiti come individui che, da soli o con altri, stanno attivamente cercando di avviare una nuova iniziativa imprenditoriale, prevedono di diventarne proprietari (o comproprietari) e hanno intrapreso azioni concrete di start-up negli ultimi 12 mesi (GEM Report, 2019; Reynolds, 2000).

In linea con le raccomandazioni metodologiche di Churchill (1979) e Kline (2005), lo studio adotta misure multi-item su scala Likert a sette punti per tutti i costrutti, al fine di garantire affidabilità e validità nella rilevazione della loro natura multidimensionale. Il questionario include scale adattate dalla letteratura precedente (Kim et al., 2018; Bolton & Lane, 2012; Muñoz & Dimov, 2015; Le, 2022) per misurare le tre dimensioni dell'IHEO.

L'IEO cattura il grado in cui i nascent entrepreneurs risultano innovativi, proattivi e propensi al rischio nel processo di avvio dell'attività imprenditoriale, mediante la scala Likert a 7 punti composta da 10 item proposta da Bolton e Lane (2012).

Poiché l'HEO è concepita in seno alla Hument come una postura strategica al tempo stesso attitudinale e comportamentale, la scala proposta per misurare l'ISO è stata derivata da due scale presentate da Muñoz e Dimov (2015): (i) la Sustainability Orientation scale, dalla quale sono stati adattati due item attitudinali (uno relativo alla sostenibilità ambientale e uno a quella sociale); e (ii) la Sustainability-Oriented Entrepreneurial Actions scale, dalla quale sono stati adattati due item comportamentali (uno sociale e uno ambientale). Più nel dettaglio, per misurare la SO, Muñoz e Dimov (2015) hanno indagato atteggiamenti e convinzioni degli imprenditori riguardo

alla sostenibilità, riflessi nelle loro percezioni della venture che stavano creando, utilizzando una scala Likert a 6 item (a sua volta adattata da Kuckertz & Wagner, 2010). Per misurare le sustainability-oriented entrepreneurial actions, gli autori si sono concentrati sul grado in cui gli imprenditori miravano a risolvere problemi di sostenibilità nella definizione di obiettivi immediati durante lo sviluppo dell'impresa, attraverso una scala Likert a 8 item, le cui dimensioni derivano dallo studio di Dyllick e Hockerts (2002) e rappresentano otto obiettivi tradizionali di sostenibilità. Di conseguenza, per valutare l'ISO proponiamo quattro item che coprono semanticamente entrambe le dimensioni della sostenibilità, ambientale (due item) e sociale (due item). Tali item consentono inoltre di cogliere sia gli aspetti attitudinali (orientamento) sia quelli comportamentali (azioni) che rientrano nel dominio della SO così come definita nell'ambito HumEnt. Infine, i quattro item selezionati sono stati adattati spostando il focus dal livello organizzativo a quello individuale, al fine di allineare la misura dell'Individual Sustainability Orientation con quella dell'Individual Entrepreneurial Orientation.

Nella concettualizzazione originaria di Kim et al. (2018), la dimensione HRO presenta una duplice natura: da un lato, riguarda caratteristiche personali del manager; dall'altro, considera la prospettiva del leader che, di fronte a sfide differenti, riconosce l'importanza di implementare un HRM strategico attraverso specifiche pratiche di gestione delle risorse umane. Per questa ragione, le dimensioni sono intese come costrutti comportamentali, la cui misurazione si basa sui comportamenti di manager e imprenditori in termini di azioni svolte per realizzare ciascuna dimensione. Di conseguenza, la scala di Kim et al. (2018) per emphaty, equity, enablement ed empowerment è stata sviluppata con riferimento al livello d'impresa, coerentemente con il livello di postura strategica concettualizzato nel dominio HumEnt. Per allineare tale concettualizzazione a una prospettiva individuale di humane orientation, abbiamo selezionato un item per ciascuna dimensione (empatia, equità, enablement ed empowerment; per un totale di 4 item) e lo abbiamo adattato dal livello organizzativo a quello individuale, così da allineare la misura dell'IHO a quella dell'IEO.

È stata quindi condotta un'exploratory factor analysis (EFA) per identificare la struttura latente del costrutto IHEO a livello individuale. Per l'estrazione e l'interpretazione dei fattori è stata applicata una Principal Axis Factoring con rotazione Oblimin. L'adeguatezza dei dati all'analisi fattoriale è stata valutata attraverso la misura Kaiser-Meyer-Olkin (KMO) e il test di sfericità di Bartlett.

4. Risultati preliminari

Il campione finale dell'analisi è composto da 651 nascent entrepreneurs. Il campione è composto per il 58,7% da uomini e per il 39,8% da donne, con un'età media pari a 23,1 anni (DS = 2,06). Con riferimento al background familiare, il 59,9% del campione dichiara che nessun genitore è lavoratore autonomo e/o proprietario di un'impresa. Al contrario, il 40,1% riporta una forma di imprenditorialità familiare: nel 23,2% dei casi è il padre, nel 5,7% la madre e nel 11,2% entrambi i genitori. Per quanto riguarda l'area disciplinare, la quota più ampia proviene da un background ingegneristico (28,9%), seguita da Business/Management (18,3%) ed Economia (16,9%).

I risultati dell'analisi fattoriale esplorativa (EFA) sui 18 item mediante Principal Axis Factoring con rotazione obliqua (Oblimin con normalizzazione di Kaiser), mostrano elevata adeguatezza del campione (KMO = .913), e il test di sfericità di Bartlett è risultato significativo (χ^2 (153) = 5252.537, $p < .001$), confermando la fattorizzabilità della matrice di correlazione. Sulla base del criterio degli autovalori > 1, sono stati estratti quattro fattori che spiegano complessivamente il 52,54% della varianza. La pattern matrix ha restituito una soluzione interpretabile: sia i 4 item di ISO ($|\lambda|$ = .587–.847) che di IHO (λ = .531–.787) saturano su un fattore con carichi elevati, supportando la distinzione empirica delle dimensioni di sostenibilità e orientamento umano. Gli item di IEO mostrano invece una struttura a due componenti: IEO_8–

IEO_10 (appartenenti alla sottodimensione "proactiveness") saturano sul primo fattore (λ = .456–.915) e IEO_1–IEO_7 (appartenenti alle due dimensioni "risk taking" e "innovativeness") sul secondo (λ = .423–.777). Nel complesso, l'EFA conferma una struttura coerente con le dimensioni teoriche per ISO e IHO, mentre per IEO emerge una segmentazione interna che suggerisce la presenza di sottodimensioni e richiede ulteriori verifiche nelle analisi successive. Complessivamente, la scala IHEO finale comprende 4 fattori e 18 item e presenta buone proprietà psicometriche, offrendo una base affidabile per future ricerche sulla HumEnt a livello individuale.

5. Conclusioni e implicazioni

Questo studio contribuisce alla letteratura sull'imprenditorialità e sulle purpose-driven businesses estendendo il costrutto di Humane Entrepreneurial Orientation (HEO) al livello individuale e introducendo il concetto di Individual Humane Entrepreneurial Orientation (IHEO). Sebbene la ricerca abbia ampiamente analizzato l'HEO a livello d'impresa, rimane limitata la comprensione di come i principi HumEnt si manifestino negli individui, in particolare tra i nascent entrepreneurs. Integrando Individual Entrepreneurial Orientation (IEO), Individual Sustainability Orientation (ISO) e Individual Human Orientation (IHO), il lavoro propone un impianto concettuale e fornisce evidenze empiriche preliminari a supporto di una misura multidimensionale dell'IHEO, contribuendo a colmare un gap rilevante nella letteratura.

Sul piano teorico-metodologico, lo studio adatta costrutti consolidati a livello organizzativo (ad es., Kim et al., 2018; Muñoz & Dimov, 2015; Bolton & Lane, 2012) a un framework di misurazione individuale, rispondendo alle sollecitazioni che invitano a considerare entrepreneurial orientation e sustainability orientation anche come costrutti di livello micro (Robinson & Stubberud, 2014; Koe, 2016). I risultati dell'analisi fattoriale esplorativa supportano in modo chiaro la distinctiveness delle componenti ISO e IHO, mentre la dimensione IEO mostra una segmentazione interna in due componenti, suggerendo che l'orientamento imprenditoriale individuale possa presentare una struttura più articolata nelle fasi iniziali dell'azione imprenditoriale. Nel complesso, tali evidenze indicano l'utilità dell'IHEO per analizzare le micro-fondazioni dell'approccio HumEnt, pur richiedendo ulteriori verifiche (ad es., CFA e test di robustezza su campioni diversi) per consolidare la struttura della scala.

I risultati di questo studio offrono implicazioni rilevanti per formatori e docenti di imprenditorialità, policy-maker e practitioner interessati a promuovere una nuova generazione di imprenditori responsabili e humane-oriented. In primo luogo, identificando le dimensioni chiave dell'IHEO, la ricerca evidenzia l'importanza di coltivare negli aspiranti imprenditori non solo competenze di business, ma anche mindset etici e orientati alla sostenibilità. Le istituzioni educative svolgono un ruolo cruciale in questo processo, poiché possono utilizzare tali evidenze per progettare curricula che vadano oltre la formazione manageriale tradizionale. I programmi dovrebbero integrare apprendimento esperienziale, mentoring ed esposizione a sfide imprenditoriali reali, assicurando che gli studenti sviluppino sia competenze cognitive sia competenze socio-emotive necessarie a guidare imprese capaci di bilanciare redditività e responsabilità ambientale e sociale e attenzione alle persone. Business school e incubatori dovrebbero inoltre valorizzare progetti a impatto sociale, collaborazione interdisciplinare e framework di decision-making etico, dotando gli aspiranti imprenditori di strumenti utili a navigare contesti complessi mantenendo un forte impegno verso sostenibilità e valori "humane".

Per i decisori pubblici, lo studio suggerisce la necessità di sviluppare politiche mirate e sistemi di incentivi in grado di sostenere l'imprenditorialità umana e sostenibile già a livello individuale. Governi e istituzioni dovrebbero investire in programmi di formazione, opportunità di finanziamento e iniziative di mentoring dedicate a giovani imprenditori che mostrano elevate caratteristiche di IHEO. Ciò potrebbe includere grant per startup con missione sociale o ambientale, incentivi fiscali per imprese fondate da student entrepreneurs orientati a pratiche sostenibili e partnership tra università e leader industriali per facilitare trasferimento di

conoscenze e strutture di supporto. Inoltre, l'integrazione di strumenti di assessment basati su IHEO all'interno di programmi imprenditoriali finanziati con fondi pubblici potrebbe aiutare a identificare e coltivare individui ad alto potenziale in linea con i principi della HumEnt. Promuovendo una cultura di responsabilità imprenditoriale, accademia e policy-maker possono contribuire allo sviluppo di un ecosistema dell'innovazione in cui le imprese non siano solo orientate al profitto, ma anche agenti di cambiamento sociale positivo.

Un'ulteriore implicazione pratica riguarda in modo specifico i nascent entrepreneurs, per i quali il purpose tende a costituire una risorsa ancora in formazione e non pienamente tradotta in scelte organizzative e pratiche operative. In questa fase precoce, strumenti come la scala IHEO possono supportare incubatori universitari, programmi di pre-accelerazione e percorsi di entrepreneurship education nel rendere misurabile e implementabile l'orientamento humane e purpose-oriented, aiutando a identificare i profili che presentano maggiore coerenza tra ambizione imprenditoriale, sostenibilità e attenzione alle persone. In termini operativi, l'IHEO può essere utilizzata (i) come strumento di diagnosi iniziale per personalizzare mentoring e formazione, (ii) come metrica di valutazione ex ante ed ex post dei programmi (per monitorare l'evoluzione del purpose e delle tre componenti nel tempo), e (iii) come supporto alla progettazione di interventi mirati che trasformino il purpose dichiarato in comportamenti concreti, ad esempio attraverso project work su problemi socio-ambientali, feedback strutturato sugli impatti e attività di team-based learning orientate a empatia, equità, enablement ed empowerment.

Nonostante i contributi offerti, lo studio presenta alcuni limiti che è opportuno riconoscere. In primo luogo, la ricerca si basa su un campione di nascent entrepreneurs che, sebbene appropriato per indagare l'Individual Humane Entrepreneurial Orientation (IHEO), può limitare la generalizzabilità dei risultati ad altre popolazioni. Studi futuri potrebbero estendere questa linea di ricerca esaminando l'IHEO in imprenditori già avviati o in differenti ecosistemi imprenditoriali, così da valutarne l'applicabilità oltre la popolazione studentesca.

In secondo luogo, lo studio si fonda su dati self-reported, che possono introdurre bias di desiderabilità sociale. I rispondenti potrebbero aver sovrastimato o sottostimato il proprio orientamento verso l'imprenditorialità umana in funzione di aspettative personali o sociali. Ricerche future potrebbero integrare dati comportamentali o disegni longitudinali per verificare se le percezioni auto-riferite si traducano in comportamenti imprenditoriali effettivi.

Infine, lo studio può essere condizionato dal contesto, poiché fattori istituzionali, culturali ed economici potrebbero influenzare in modo diverso la rilevanza e l'impatto dell'IHEO nelle diverse aree geografiche. Ricerche future dovrebbero quindi considerare confronti cross-culturali o testare la robustezza del framework IHEO in Paesi e ambienti educativi differenti.

Purpose-Driven Leadership and ESG Governance Amplification: Managing E-S Interdependence for Supply Chain Resilience in the Aerospace Industry

Francesca Castaldo[1], Francesco Mercuri[2], Massimo Battaglia[3], Nicola Cucari[4]

1. Introduction

The contemporary global operating environment is distinguished by a mounting and systemic degree of uncertainty, predominantly driven by climate change, the energy crisis and geopolitical tensions, which surpasses conventional market risk and underscores the inherent vulnerability of supply chains. As evidenced by recent disruptions, the business realm is profoundly influenced by VUCA (Volatility, Uncertainty, Complexity, Ambiguity) environments (Volpe & Castaldo, 2021), where risks are not isolated but intricately interconnected, thereby substantiating Peter Drucker's caution that "the gravest peril in periods of turbulence does not lie in the turbulence itself. It is to act with yesterday's logic" more relevant than ever (Drucker, 1980). Climate change and the resulting energy crisis are no longer, in fact, exogenous threats, but systemic risk factors that affect cost structures and operational stability. The necessity for an expedited energy transition, in conjunction with the volatility of fossil fuel prices, has exposed the fragility of logistics paradigms predicated on pure efficiency, for example. As Yossi Sheffi (2007) contends in the context of supply chains, the relentless pursuit of Just-in-Time (JIT) manufacturing has been demonstrated to engender suboptimal levels of vulnerability. Consequently, the enhancement of supply chain resilience and the integration of strategic redundancy have emerged as the contemporary imperative for achieving competitive advantage.

Similarly, the geopolitical tensions of recent years are eroding confidence in globalisation and introducing significant political and strategic risks into corporate planning. In such a situation, the Board of Directors can no longer limit itself to mitigating traditional agency risk (Jensen & Meckling, 1976), but must evolve, as theorised by Michael Power (2004), into a risk governance system focused on monitoring non-financial risks. In order to cope with disruptive scenarios, governance should ensure that the company develops dynamic capabilities - the ability to perceive, capture, and quickly reconfigure resources - as outlined by David Teece (2018). This is particularly crucial in the context of managing strategic decisions pertaining to reshoring or geographical diversification, which are often imposed by periods of instability (Adorbor et al., 2021). The current scenario thus pushes companies to adopt a stakeholder-centric perspective (Freeman, 1984), integrating Environmental, Social, and Governance (ESG) factors and supply security as critical metrics of performance and resilience (Wildgoose et al., 2012) and, even more so, as the foundations of organisational survival and long-term value creation. For example, getting involved in supply chain digitisation programmes can lead to a pretty significant rise in ESG scores, and this improvement is mostly driven by stronger corporate governance (Zhu &

Zhang, 2024). In other words, companies are no longer judged only on how much money they make, but also on how well they can mix environmental (E) and social (S) responsibility with solid governance systems (G). However, despite the growing focus on sustainability, literature and managerial practice reveal a paradox: although ESG pillars are conceptually interdependent, their management and reporting often occur in a fragmented manner, limiting the organisational capacity to anticipate and govern the complex risks that emerge along SCs (Berg et al., 2022).

This contribution, which is currently in the form of a working paper, addresses the aforementioned deficit by proposing an organisational analysis based on purpose-driven leadership. This analysis is intended to serve as a lever to amplify the integration and governance of ESG dimensions (Annesi et al., 2025). The focus of this analysis is on the interdependence between the E and S pillars, as will be explained shortly.

The Corporate Purpose is the fundamental raison d'être of an organisation, going beyond the mere creation of value for shareholders, according to the now dominant view of stakeholder theory. It is not merely a mission or vision, but rather "the aspiration of what the company wants to be and how it intends to contribute to the world" (Hollensbe et al., 2014). The extant literature defines purpose as a guiding principle that provides an answer to the existential question of why the organisation exists (Gartenberg et al., 2019). It has been demonstrated that it acts as a catalyst for strategic alignment (Craig, 2018), motivating stakeholders and providing a moral compass in contexts of high uncertainty (Frey, 2025), where 'old management models based on predictability are no longer effective' (Johansen, 2012).

Purpose-Driven Leadership can be defined as the practical and strategic implementation of Corporate Purpose (Ribeiro et al., 2024). The purpose is not merely declared, but firmly anchored to governance structures, culture, and decision-making processes (Cardona et al., 2019).

The Purpose-driven Leader employs purpose as the primary criterion for resource allocation and systemic risk management (Porter & Kramer, 2011). This individual personifies the organisation's corporate values, fostering a culture of authenticity and integrity (George et al., 2007), and plays a pivotal role in fortifying the corporate structure (Ribeiro et al., 2024).

Purpose-driven Governance ensures that a company's actions (including responses to environmental "E" and social "S" innovation) are consistent with its long-term commitment to all stakeholders (Eccles et al., 2014). Despite its growing theoretical centrality and solid empirical evidence linking it to superior financial performance (Edmans, 2020; Gartenberg et al., 2019), the literature on Purpose-Driven Leadership still lacks a single, shared operational definition. This terminological and conceptual inconsistency represents a significant research gap that hinders its systematic measurement and consistent integration into Corporate Governance frameworks.

The present study aims to address this theoretical lacuna by proposing a robust, conceptual definition of purpose-driven leadership, which is essential for analysing its impact on risk governance mechanisms in contexts of systemic uncertainty.

In more specific terms, with regard to the supply chain, the research aims to examine how leadership, through the internalisation and widespread sharing of the corporate purpose, manages to expand Governance (G) in order to strategically channel and balance the critical E-S interdependence in the supply chain.

The following research questions have been identified as the guiding principles for the investigation:

RQ1: In what manner does the adoption of environmental innovations (E) along supply chains influence the social and labour practices (S) of the organisation?

RQ2: What is the specific contribution of Purpose-Driven Leadership in enhancing Corporate Governance (G)?

The research adopts an applied perspective, focusing on the aerospace industry. This sector was selected for its strategic importance in terms of the resilience of its supply chain and the robustness of its governance systems.

2. Theoretical background

The present research is positioned at the intersection of corporate governance, sustainable supply chain management, and purpose-driven leadership, and takes as its starting point the enduring ambiguity that still surrounds the notion of corporate purpose. For several decades, debates on corporate governance have been dominated by agency theory, with the classic formulation of Jensen and Meckling (1976), and Friedman's doctrine of shareholder primacy, which effectively reduced corporate purpose to the maximisation of shareholder value (Friedman, 1970). In this view, governance mechanisms are primarily designed to align managerial behaviour with shareholders' financial interests, while broader societal concerns are treated as constraints, or, at best, as instrumental resources for reputation and long-term profitability. The progressive erosion of this paradigm, under conditions of systemic uncertainty and mounting environmental and social crises, has reactivated stakeholder-oriented perspectives, most notably Freeman's stakeholder theory (1984), which conceptualises long term value creation as dependent on managing interdependent relationships with a plurality of stakeholders. Within this stream, corporate purpose is reinterpreted as a commitment to serve society by creating value for stakeholders (Edmans, 2020) and is increasingly framed as a central lever for strategic orientation and organisational resilience, rather than as a purely discursive complement to profit seeking (Teece, 2018).

In this context, Purpose-driven Leadership should be understood less as a call to action to lead with values, and more as a small-scale institutional mechanism for turning a company's strategic purpose into real organisational practice. By placing the firm's why at the core of decision making, it provides a potential basis for value alignment, ethical management of externalities, and enhanced accountability (Ricart & Rey, 2022). At the same time, the literature highlights a persistent tension between substantive and symbolic enactment of purpose. In the absence of adequate governance architectures, purpose-driven leadership may be confined to rhetoric, generating a decoupling between aspirational statements and everyday practices. The notion of fit for purpose governance, developed in the adaptive governance field, offers a useful corrective. It reframes governance design as a diagnostic exercise that begins with an explicit clarification of purposes, proceeds through a systematic analysis of the socio, ecological and institutional context, and assesses whether existing configurations of structures and processes are actually capable of delivering the intended outcomes (Esposito De Falco et al., 2024).

This perspective resonates with recent work that conceptualises corporate purpose as the metabolism of the firm and proposes a multidimensional framework, structural, systemic and strategic, to analyse how purpose shapes organisational architectures and stakeholder relationships over time (Quinn & Thakor, 2018). Taken together, these contributions suggest that purpose driven leadership is unlikely to generate meaningful change in isolation. It must be embedded in governance mechanisms that are intentionally designed, monitored, and periodically reassessed in terms of their capacity to enact, rather than merely signal, corporate purpose in complex and uncertain environments (Esposito De Falco et al., 2024).

A second theoretical pillar of this research speaks to a persistent and consequential gap in the sustainable supply chain management literature. Despite the diffusion of ESG frameworks in both scholarly and managerial discourse, existing studies still provide a partial and fragmented understanding of the causal directionality and managerial implications of interdependence among the Environmental, Social and Governance dimensions (Sancak, 2023). In particular, the ways in which environmental pressures and technological or regulatory innovations in the environmental domain cascade into practices, vulnerabilities and distributive tensions in the social domain along supply chains remain under theorised. This omission is not simply a technical limitation. It reflects a more general tendency to treat ESG components as parallel and additive, rather than as dynamically interacting systems. A more critical stance acknowledges that ambitious decarbonisation strategies or environmental innovations can generate second order social effects, such as new forms of inequality, heightened precarity or labour rights violations within supplier

networks. Understanding the E to S relationship therefore requires a re-examination of the role and scope of governance. Governance cannot be reduced to a residual container for compliance and reporting. It constitutes the institutional infrastructure through which firms anticipate, govern and, where possible, mitigate socio environmental trade-offs, including those that emerge in distant tiers of global value chains. A politically aware conception of just transition must therefore account not only for the technical feasibility of environmental targets, but also for their social distributional consequences, and for the governance arrangements that shape who bears the costs and who appropriates the benefits of transition.

These theoretical perspectives are particularly relevant in the aerospace and defence industry, which is the setting for the present study. Firstly, the supply chains in this industry are extremely complex. They are characterised by considerable length, stringent regulatory requirements, and a multilayered network of tier 1, tier 2, and tier 3 suppliers involved in the provision of critical components and materials. This structural configuration amplifies information asymmetries, complicates the monitoring of environmental and social performance and creates fertile ground for the decoupling between corporate purpose as declared at the apex of the firm and practices enacted in peripheral nodes of the chain. Secondly, the sector is subject to intense environmental pressure (Castaldo, 2021a). The imperative to reduce carbon emissions drives substantial investments in sustainable aviation fuels, hydrogen propulsion and electrification. These environmental innovations are not neutral from a social standpoint. They require extensive reskilling and upskilling of the workforce, reconfiguration of occupational profiles, and the ethical sourcing of new materials, often associated with sensitive mining activities and local community impacts. The E to S challenge is therefore particularly acute in this context, since environmental trajectories directly reshape the social fabric of both internal labour forces and external supplier networks.

Third, governance in aerospace and defence assumes a critical character that goes beyond the boundaries of individual firms (Castaldo, 2020). Flight safety, the dual use nature of many technologies, and the geopolitical relevance of defence activities impose exceptionally high standards of oversight, transparency and risk management. It is important to note that any ethical, social or environmental failure along the supply chain can quickly escalate into systemic risk. The ramifications of such an event may encompass implications for national security, public trust, and the legitimacy of the sector in its entirety. In such a context, the alignment between corporate purpose, governance structures and ESG dynamics along the supply chain is not only a matter of normative desirability. It becomes a strategic, institutional and political necessity.

These considerations have direct implications for the research design. The aerospace and defence sector, with its hyper complex multi-tier supply chains, high innovation intensity and critical governance requirements, represents an ideal laboratory for an in depth and process-oriented investigation. For this reason, the study adopts a case study strategy that focuses on selected firms and supply chains within the sector. This approach makes it possible to trace how purpose is interpreted and translated into governance mechanisms, how these mechanisms travel across organisational and contractual boundaries, and how environmental initiatives generate intended and unintended social consequences along the chain.

3. Methodology

The exploratory nature of the research questions, which focus on organisational mechanisms and complex causal processes, calls for a qualitative case study design (Eisenhardt, 1989; Ellram, 1996). A multiple case study strategy was therefore adopted, involving two major strategic players in the aerospace sector, namely Leonardo S.p.A. and Magnaghi Group, both operating as Original Equipment Manufacturers or Tier 1 suppliers of complex systems.

The selection of companies was conducted through theoretical sampling (Yin, 2018), with the objective of identifying cases that demonstrate three core features. Firstly, it is vital that

corporate purpose is clearly articulated and publicly disclosed, so that it can be examined as an explicit reference for strategic and governance choices. Secondly, the firm must demonstrate a substantial commitment to environmental innovation, evidenced by initiatives such as programmes on sustainable aviation fuels or analogous decarbonisation strategies. Thirdly, the firm is obliged to publish Environmental, Social and Governance reports that include Environmental and Social indicators related to the supply chain. This enables an assessment of how purpose and ESG commitments are translated beyond organisational boundaries.

To enhance the validity and reliability of the findings, the research design relies on data source triangulation (Yin, 2018). This strategy is of particular importance in light of the intangible and often contested nature of corporate purpose and the mix of formal and informal dimensions that characterise governance arrangements. The triangulation of leaders' perceptions with documentary evidence, such as ESG disclosures and internal policies, facilitates a more robust reconstruction of how purpose is interpreted, institutionalised and enacted within and across the selected organisations.

The core of the data collection consists of in-depth interviews conducted with senior executives (e.g. Chief Sustainability Officers, Chief Procurement Officers, or the CEO themselves) from the selected companies (Primary Data). The objective of these interviews is to explore the perception and effectiveness of Purpose-Driven Leadership, investigating how purpose is communicated, internalised and translated into supplier selection and management criteria. The investigation sought to identify specific case studies that would shed light on the challenges encountered in managing E-S trade-offs and the accountability mechanisms (G) that are activated by leadership.

The primary data was supplemented by a systematic analysis of public and internal company documents (i.e. Secondary Data). These documents include sustainability reports (or non-financial reporting, in line with standards such as the Corporate Sustainability Reporting Directive (CSRD)), codes of conduct for suppliers and, where accessible, board of directors' minutes. Document analysis is essential for verifying the scope of governance (G) and measuring the extent to which social due diligence (S) requirements have been formally extended to critical supply chains in response to environmental (E) challenges. Furthermore, these documents provide the basis for contextualising companies' E-S performance.

Finally, in order to contextualise the actual risk and resilience of the supply chain, data from ESG rating agencies (e.g. MSCI, Sustainalytics) and/or publicly available news items relating to environmental or social controversies in the companies' supply chains were consulted (Contextual Data). This source provides an external empirical context to validate the practices declared by leadership and risk management in general.

The integration of these three sources will provide a comprehensive and robust view, thus overcome the limitations of a single perspective and ensure that conclusions on leadership and governance are anchored in both strategic perception and operational formalisation. The data analysis followed an iterative approach.

The data collected from interviews and documents were analysed using thematic analysis. The following aspects will be examined: first, the challenges and responses in terms of the social dimension of ecological transition (E-S, or Just Transition); second, leadership practices for sharing objectives; and third, the evolution of governance mechanisms (G) in response to these challenges. The objective of this study is to identify patterns and chains of evidence across a series of case studies in order to draw conclusions.

4. Results and discussion

The emerging evidence from the cases points to a pronounced and often underestimated nexus between environmental innovation and social dynamics along the supply chain. As firms transition to hybrid or electric propulsion systems and experiment with sustainable aviation fuels,

they must reconfigure not only their technologies, but also their skills, roles, and relationships with suppliers. This transition requires significant investment in the retraining of line technicians and supplier maintenance personnel yet training activities for suppliers are not always incorporated into environmental KPIs. In such cases, a widening skills gap becomes evident, accompanied by the potential for social tension and disputes, particularly in organisational contexts where productivity and safety requirements escalate while support and capability building lag behind. Environmental innovation also reshapes procurement practices. The search for new materials, such as cobalt and lithium, pushes buyers into unfamiliar supply chains, often located in regions with fragile labour protections. In these spaces, governance must extend anti-slavery and human rights policies to tiers that had never previously been monitored. The environmental agenda therefore exposes firms to new social and ethical vulnerabilities rather than simply generating linear sustainability gains. Within this evolving landscape, purpose emerges as a crucial interpretive lens and organisational resource that connects leadership orientations with governance practices. In the most advanced cases, purpose is not merely a slogan or branding device. It functions as an explicit decision-making criterion that can override traditional efficiency metrics. Managers' reports instances in which purpose has been used as a veto principle in supplier selection, legitimising the decision to accept higher marginal costs in order to maintain higher social standards in the supply chain, and thereby challenging the long-standing dominance of lowest cost logics (Craig, 2018; Ellsworth, 2002). Concurrently, purpose becomes a catalyst for the redesign of governance architectures. Cross-functional ESG committees, overseen by the Board and led by C-level executives, are entrusted with the authority to evaluate and sanction supplier conduct, and when deemed necessary, to exclude suppliers that demonstrate deficiencies in social parameters, even in instances where their environmental performance is technically proficient. In such cases, the fundamental purpose of governance provides the ethical and symbolic legitimacy for its expansion into domains that were previously regarded as peripheral or negotiable. Such domains include, but are not limited to, living wages, worker safety and community impacts (Donna, 2020; Rusconi, 2019).

These preliminary findings suggest that environmental innovation in hypercomplex sectors indicates that environmental innovation in hypercomplex sectors does not necessitate the implementation of more sophisticated technologies or reporting systems. It surfaces deep organisational questions about who is responsible for the social consequences of transition and how far corporate governance should extend beyond the legal boundaries of the firm (Annesi et al., 2025). Purpose oriented leadership appears to act as a bridge, translating abstract commitments into concrete governance choices that redistribute costs and benefits along the supply chain. At the same time, the cases highlight significant tensions and limits. Purpose can empower leaders and committees to challenge established procurement routines, yet its effectiveness depends on the credibility of governance mechanisms, the consistency of decisions over time and the willingness to absorb economic trade-offs in the name of social protection. These dynamics, which play out in specific episodes of supplier evaluation, contract renewal and investment in training, provide fertile ground for further case-based inquiry into the micro foundations of just transition and purpose driven governance in industries marked by high technological intensity and systemic risk.

A contribution to the field of Organisational Theory

The ensuing discourse aims to draw parallels between these findings and extant literature, thereby advancing the argument that: (a) Purpose-driven leadership can be considered both an ethical construct and an organisational governance mechanism that resolves E-S trade-offs; (b) Supply Chain Resilience (SCR) is a direct function of the breadth of G, determined by the depth with which purpose is shared and formalised.

The strategic reflections that have emerged from this analysis thus far converge on the necessity of adopting a robust conceptual framework in order to address the interdependence of ESG risks. In this regard, the notions of Corporate Purpose and Purpose-Driven Leadership should not be regarded as mere rhetorical devices; rather, they constitute the foundational principles upon which the development of corporate resilience within the VUCA environment can be built (Castaldo, 2021b).

5. Conclusion: implications, limitations and future research

Although the study is still in progress and the findings remain preliminary, the emerging evidence already suggests a meaningful contribution to the theoretical debate on Sustainable Supply Chain Management. The analysis shifts attention away from a narrow focus on Environmental, Social and Governance reporting towards a more fine-grained understanding of the internal organisational mechanisms that govern the interdependence among the three pillars. In particular, the cases indicate that purpose and leadership operate as causal drivers that shape the effectiveness of governance in mitigating the social risks generated by ecological transition, that is, in managing the E to S nexus rather than simply documenting it.

For managers in the aerospace industry and, by extension, in other highly complex and capital-intensive sectors, several implications begin to surface. First, the management of just transition should not be treated as a technical or operational issue delegated solely to sustainability or procurement functions. It ought to be elevated to the board agenda and integrated into the core governance of strategic risk. Second, executive remuneration systems should be reconsidered so that they reflect the interdependence between environmental and social outcomes along the supply chain, rather than relying exclusively on firm level financial or isolated ESG metrics. Third, substantial and sustained investment in fostering a deep and shared understanding of corporate purpose appears crucial. Such investment can help move the organisation beyond a compliance driven approach and reposition environmental and social commitments as strategic imperatives that permeate relationships with suppliers and other stakeholders.

At the same time, the study is subject to several limitations that need to be acknowledged. From a methodological standpoint, the qualitative and case-based design allows for rich, process-oriented insight but does not permit statistical generalisation. Future research could build on these findings by testing the proposed framework with quantitative data on a broader sample of firms and supply chains. From a sectoral standpoint, the specific characteristics of aerospace and defence, including hyper complexity, stringent regulation and the criticality of components may constrain the transferability of insights to other industries. Comparative studies in different sectors would therefore be useful to explore contextual contingencies and boundary conditions. Finally, from a temporal standpoint, the analysis captures a particular phase in the evolution of governance and leadership practices. Longitudinal research would be needed to examine how purpose driven governance architectures evolve over time and to assess the long-term effectiveness of purpose-oriented policies in sustaining just transitions and resilient supply chains.

From Purpose-Oriented Policies to Purpose-Driven Ecosystems: a data-driven framework for territorial diagnosis and policy alignment in social inclusion

Valentina Mallamaci[1], Melita Nicotra[2], Marco Romano[3]

1. Introduction

The problems that come with social inclusion in Europe have gotten bigger, more complicated, and more interdependent. These problems include child poverty, labour market alienation, demographic imbalance, limited access to key services, and territorial marginality. These factors have made it clearer than ever that standard public policies don't work well for social vulnerability that is deeply rooted in society and varies by region. Most interventions are linear, programmatic, and sector-based, while the problems they try to solve are relational, cross-sectoral, and adaptable. Consequently, several social policies yield disjointed responses, challenges in coordination, and restricted revolutionary potential, particularly in areas where vulnerabilities accumulate throughout missions.

In recent years, the literature has agreed on the necessity for approaches that prioritize purpose, mission, and collaborative value creation in policy formulation. Mission-oriented innovation strategies (Mazzucato, 2018; 2021) contend that governments should embrace socially relevant missions that not only provide direction but also engage many stakeholders, guide investments, and promote experimentation. Missions serve as "public purpose compasses" that guide group activities toward systemic change instead of small improvements. This perspective is enhanced by the concept of purpose-oriented policies, which transcend programmatic classifications or administrative divisions, being fundamentally rooted in the attainment of defined societal objectives.

Simultaneously, a concurrent line of inquiry in public administration has proposed that public value is co-created through the interactions among institutions, organizations, service providers, and communities, rather than being solely provided by the government (Osborne et al., 2016; Osborne, 2021). This public service logic viewpoint stresses relational processes, context specificity, and collaborative governance, demanding systems that can coordinate value generation among many actors. One of these systems is a purpose-driven ecosystem (Lyon et al., 2025): following Moore's definition (1993) they are not just networks or partnerships; they are collaborative and competitive governance infrastructures where people work on common goals, share skills, plan actions, and keep learning.

This ecosystemic logic is especially important when dealing with wicked problems, which are problems that have non-linear causes and interactions at many levels (Kania et al., 2013). Social inclusion in Italy exhibits precisely these characteristics and the vulnerabilities overlap differently among regions because of their demography, local resources, and institutional set up. The literature on place-based policies (Barca, 2009; Iammarino, Rodríguez-Pose & Storper, 2019)

[3] Full Professor, ECON-07/A, University of Catania; marco.romano@unict.it

emphasizes that effective territorial governance must be founded on thorough assessments of local needs and resources, facilitating tailored, mission-aligned actions.

This research enhances theoretical discussions by establishing a thorough analytical model for assessing territorial priorities and policy coherence, finally illustrating the necessity and rationale for purpose ecosystems to realign public action with purpose-driven objectives. The analytical framework incorporates OT9 indicators which refer to the European Cohesion Policy's thematic objective dedicated to promoting social inclusion, combating poverty, and addressing all forms of discrimination, in ISTAT territorial indicators database. These constitutes the main analytical framework through which territorial vulnerabilities and social policy needs are assessed reaching a stringent classification of six structural domains (missions) and regional clustering based on mission priorities. The integration with project-level investment mapping (on 'social inclusion and health' sector for the 2021-2027 programming cycle) and a multi-dimensional coherence matrix allow to evaluate the congruence between needs and financial obligations and point out the conceptual operational model for purpose ecosystems.

OT9 indicators show that there are big differences in trends that are not random; they are systematic and long-lasting. This shows that we need governance structures based on common goals that can break down administrative barriers (Emerson & Nabatchi, 2015).

The theoretical and empirical justifications converge on a principal research inquiry: How can purpose-driven ecosystems be developed and implemented to synchronize purpose-oriented policies with geographically specific social inclusion requirements?

There are two main ways that the study adds to the field. First, it suggests a data-driven framework that may turn scattered information into a complete territorial diagnostic, which will help policymakers find structural weaknesses, shortages in investment, and strategic misalignments. Second, it creates a model for a purpose ecosystem that is based on evidence from Italy and may be used in other mission-driven policy areas as well.

2. Theoretical Framework

This study is built on three primary theoretical areas: mission-oriented innovation policy (Mazzucato, 2018), public service logic and value co-creation (Kania et al., 2013), and place-based development (Barca, 2009). These sets of literature elucidate the challenges standard public policies have in tackling intricate societal issues and propose that purpose-driven ecosystems (Dahlmann et al., 2020) may provide a structurally distinct and perhaps more efficacious governance framework.

According to Mazzucato (2018), mission-oriented innovation policy calls for a change in the role of the state from being a passive fixer of market failures to becoming an active shaper of markets and a conductor of systemic change. Missions are socially meaningful, politically acceptable, and analytically manageable goals that establish the direction for action. They get institutions, scientists, technologists, and citizens to work together to find answers that need people from different fields to work together. In this way, missions provide a public purpose that brings together investments, institutions, and people. Sectors are only administrative tools, whereas missions describe shared goals that go beyond boundaries. They necessitate the amalgamation of varied knowledge repositories, ongoing experimentation, iterative learning, and flexible coordination. This obviously contradicts the traditional concept of hierarchical policy execution, which is based on linear causal chains, limited rationality, and stable institutional settings (Mazzucato, 2021).

In the context of social inclusion, missions are especially pertinent because to the multi-dimensional nature of vulnerabilities, their impact on various groups, and the necessity for sustained coordination among welfare systems, labor markets, educational institutions, health services, housing authorities, and community stakeholders. Social missions, including reducing NEET rates, alleviating child poverty, boosting long-term care, or improving geographical

accessibility, are intrinsically cross-cutting, rendering them analytically and practically aligned with mission-oriented methodologies.

In this context, purpose-oriented policy represents an advancement of mission-oriented thought. Missions set out common goals, whereas purpose-oriented policies make sure that strategic goals, resource allocation, coordination mechanisms, and local execution all work together (Neumeyer et al., 2019). In other words, they link missions to real-world operations and territories, making sure that goals guide not only words but also how public action is organized.

Changes in public administration, especially the rise of Public Service Logic (Osborne et al., 2016), have made the move from hierarchical policy execution to mission-oriented governance stronger. Public Service Logic contests the notion that public value is imparted in a top-down manner by governments; rather, value is perceived as co-created through the interactions among public institutions, service providers, communities, and individuals. Public services are not just pipes; they are relational systems that are part of the communities they serve (Osborne, 2021).

From this point of view, government is not just about making rules; it's also about making places where different people can share information, set priorities, and adjust their plans (Emerson & Nabatchi, 2015). This is especially important for social inclusion, because weaknesses are connected, they do not have predetermined solutions and require co-produced interventions, continuous monitoring, and iterative adjustment. This logic is reflected in the design of purpose-driven ecosystems (Hollensbe et al., 2014), which mobilize actors at strategic, tactical, and operational levels to co-create public value and integrate their contributions into shared missions.

The Collective Impact framework (Kania et al., 2013) provides a complementary perspective on collaborative governance. It posits that large-scale social change requires not isolated projects but structured, multi-actor alignment, characterized by five conditions: a common agenda; shared measurement systems; mutually reinforcing activities; continuous communication; a backbone organization. This model has inspired numerous policy initiatives in complex domains such as education, public health, and community development. However, subsequent research has enriched and problematized its initial formulation. Hanleybrown, Kania, and Kramer (2012) emphasize the importance of coordination mechanisms and capacity-building, while Kania, Hanleybrown, and Juster (2013) highlight the need to embrace emergence in complex systems. They argue that social change cannot be centrally planned but must evolve through adaptive cycles of experimentation, learning, and distributed leadership.

More recently, Collective Impact scholarship has integrated equity-centered perspectives (Kania et al., 2022), emphasizing that collaborative governance must address structural inequities and power asymmetries, especially in contexts characterized by long-term marginalization. This resonates strongly with the Italian context, in which regional inequalities reflect not only economic conditions but institutional, demographic, and historical dynamics.

Collective Impact frameworks are thus deeply aligned with the architecture of purpose ecosystems. Both emphasize shared purpose, distributed roles, adaptive learning, and common measurement systems. Both reject bureaucratic fragmentation in favour of coordinated action. And both recognize the structural importance of backbone organizations or governance hubs capable of sustaining long-term collaboration.

Social inclusion is a classic example of a complex adaptive challenge. Vulnerabilities arise from the interaction of multiple factors - economic, demographic, institutional, social, spatial - that evolve over time in non-linear ways (Neumeyer et al., 2019). This makes simplistic, linear models of policy insufficient. Complex problems display feedback loops and tipping points; unpredictable responses to interventions; shifting dependencies; emergent outcomes (Adner, 2017). Tensions and paradoxes are present to balance interdependence and competition and to align social value logics with commercial sustainability (Jacobides et al., 2018).

In parallel, research on innovation ecosystems (Adner, 2017; Jacobides et al., 2018) shows that transformative change emerges not from isolated efforts but from the interaction of diverse

actors, resources, and feedback mechanisms. Ecosystem thinking is thus a natural extension of mission-oriented governance in contexts of complexity.

Place-based development also intersects with complexity. Scholars such as Iammarino, Rodríguez-Pose, and Storper (2019) argue that regional inequalities are structurally embedded and path-dependent, shaped by historical trajectories, institutional configurations, and spatial interactions. Overcoming these inequalities requires not only investment but institutional and strategic innovation, including governance arrangements capable of absorbing complexity and enabling local adaptation.

The place-based policy paradigm (Barca, 2009) highlights the importance of tailoring interventions to territorial characteristics rather than applying uniform solutions. According to this view, policy effectiveness depends on understanding local socio-economic conditions; recognising institutional capacities and constraints; addressing structural rather than superficial deficits; embedding interventions in local governance networks.

Place-based logic also emphasizes that territories possess latent potential as well as deficits. Purpose ecosystems, as multi-stakeholder systems that aligns diverse actors around a shared societal purpose, enabling co-creation of social value and measurable impact (Emerson & Nabatchi, 2015), operationalize this dual perspective: they seek not only to correct vulnerabilities but to mobilize local assets towards purpose-driven transformation (Hollensbe, 2014).

Unlike traditional networks or innovation ecosystems, the defining feature is purpose-driven collaboration, focused on social, economic, and environmental outcomes beyond individual organizational goals (Neumeyer et al., 2019); purpose-driven ecosystems emerge as the governance architecture that integrates all dimensions: they are mission-oriented, multi-level, polycentric, adaptive, territorially grounded, co-creative and systemic (Jacobides, 2018).

3. Methodology

The methodology developed for this study translates the conceptual foundations outlined above into an operational, data-driven framework for diagnosing territorial vulnerabilities and assessing the alignment between regional needs and public investment patterns, focuses on Italy's twenty administrative regions (with Trentino-Alto Adige analysed in its two autonomous provinces).

3.1. Operationalizing Missions Through OT9 Indicators

The first analytic step consisted in transforming the OT9 thematic area (Promoting Social Inclusion, Combating Poverty, and any Discrimination) into a structured set of six mission areas. This classification draws on the methodological approach discussed by Mazzucato (2018; 2021), whereby missions must represent socially relevant, analytically identifiable, and empirically grounded domains of public purpose. The six mission identified are:

childhood and family vulnerability;
ageing and long-term care;
labour-market exclusion and NEET vulnerability;
inner areas and access to services;
legality and safety;
housing deprivation and neighbourhood fragility.

Each mission was assigned a priority score (0–1–2) for each region using a robust, replicable, three-dimensional assessment model. The first dimension is related to the severity of current conditions, evaluates whether regions are significantly worse than the national average for a given indicator. This comparative approach reflects the territorial benchmarking tradition in regional studies (Iammarino et al., 2019). Thresholds were applied to classify deviations above 20% as critical, between 5% and 20% as moderately critical, and below 5% as non-critical.

The second dimension, the changing trend over the past decade, examines whether regional trajectories diverge from national patterns. This longitudinal approach reflects the notion, central to mission-oriented innovation policy, that the capacity for transformation depends not only on absolute levels but also on dynamic trends. Indicators were classified as critical when regional improvements lagged behind national improvements (for resource indicators) or when vulnerabilities worsened or improved less rapidly than the national average (for problem indicators). Divergences greater than 20 percentage points signalled critical issues.

The last considered dimension, the structural weight of indicators, recognizes that some indicators (as child poverty, labour irregularity, access to essential services, organized crime, and long-term care expenditure) are foundational determinants of social inclusion (Osborne et al., 2016): if these indicators were weak, the mission was automatically assigned a critical dimension.

The combination of these three dimensions yielded a mission priority classification where 2–3 critical dimensions indicated high priority (2), one critical dimension indicated medium priority (1), and no critical dimensions indicated low priority (0). This classification allowed for a systematic comparison across regions and formed the basis for subsequent clustering.

3.2. Mission-Based Regional Clustering

Using the resulting mission priority scores, the study grouped regions into four mission-based clusters, reflecting recurring patterns of social vulnerability. Clustering allowed for identifying territorially coherent mission profiles rather than treating each region in isolation, aligning with the literature on territorial systems and regional advantage (Asheim et al., 2011). The clusters are:

- Southern Complex Regions (Sicily, Calabria, Campania, Apulia), characterized by multi-dimensional vulnerabilities across missions related to childhood poverty, ageing fragility, labour exclusion, legality, and urban deprivation.
- Inner Areas and Demographic Fragility (Basilicata, Molise, Abruzzo, Umbria, Aosta Valley, Trentino-Alto Adige, Sardinia), where ageing and accessibility issues dominate.
- Mature and Polarized North (Piedmont, Liguria, Lombardy, Veneto, Friuli-Venezia Giulia), with widespread ageing, inner-area accessibility issues, and metropolitan housing challenges.
- Complex Centre (Tuscany, Emilia-Romagna, Marche, Lazio), featuring diverse but consistent vulnerabilities in childhood poverty, labour-market detachment, and inner-area fragility.

Clustering served two purposes: (1) identifying territorial patterns that reflect deep structural logics, and (2) creating a basis for cluster-level coherence assessments.

3.3. Mapping and Classifying Project-Level Investments

A dataset of regional projects from Open-Cohesion database, for the programming cycle 2021-2027, related to the thematic area ‘Social inclusion and health’ was then analysed to classify each investment into the six missions. Classification relied on a mission-specific semantic dictionary constructed through an iterative refinement process that incorporated thematic keywords. Projects that could not be reliably assigned to missions (due to technical, administrative, or cross-sectoral nature) will be documented separately, providing insight into potential blind spots in policy design.

Investments were aggregated at both regional and cluster levels and normalized as percentages of total regional or cluster investment. This generated a detailed portrait of how resources are currently allocated across missions.

The core analytical contribution of the methodology is the development of a coherence matrix, which evaluates alignment between mission priorities (needs) and mission-specific

investments (responses). This approach reflects the normative principles of a purpose-oriented policymaking, which emphasize the alignment of purpose, strategy, resources, and evaluation (Mazzucato, 2018).

The coherence matrix integrates: mission priority levels; investment intensity (mission investment share); deviation from national investment patterns (delta); underfunding conditions at regional and cluster levels.

Through the combination of these dimensions, missions were classified into four coherence categories:

- Coherent when high-priority missions received adequate investments;
- Underfunded mismatch when high-priority missions received disproportionately low investments;
- Overfunded when low-priority missions absorbed substantial resources;
- Neutral when investments aligned moderately with needs.

4. Preliminary results

The empirical analysis conducted offers a comprehensive description of Italy's territorial social inclusion landscape. By combining mission-based regional analysis, cluster-level vulnerability structures, investment distributions, and the coherence matrix, the results give a complete and evidence-based picture of how well mission-oriented needs and policy responses are aligned or how often they are not.

Figure 1 shows a very uneven distribution of social inclusion needs across different areas.

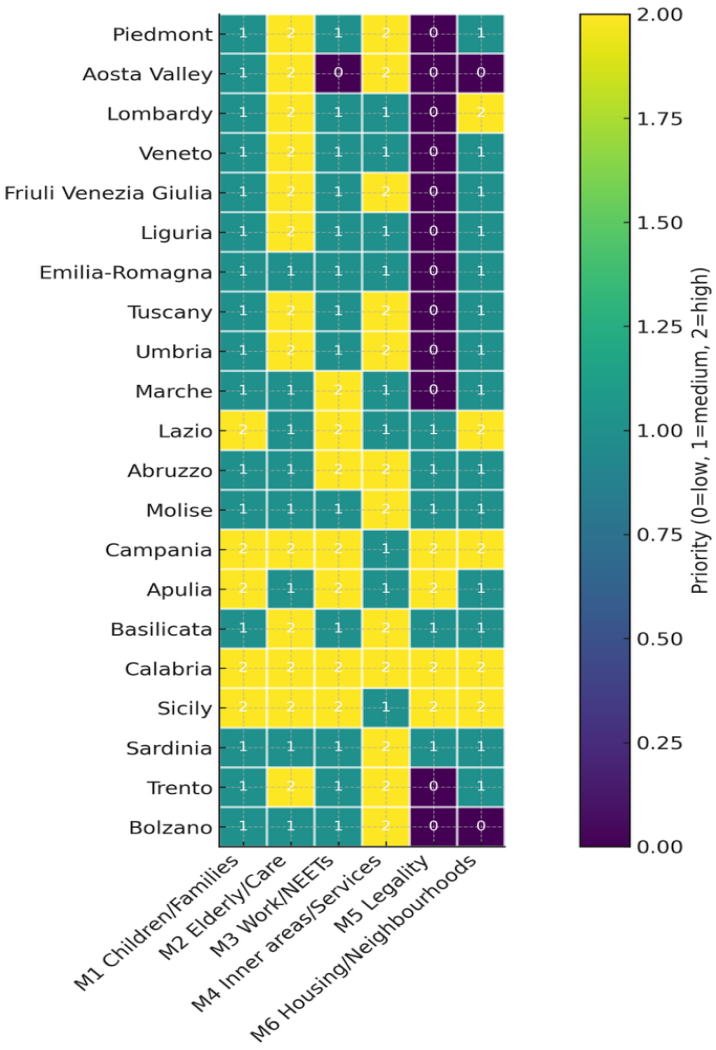

Figure 1. Regional Priorities Analysis

Southern regions such as Calabria, Sicily, Campania, and Apulia display consistently high priority levels (2) across multiple mission areas, including childhood and family deprivation (M1), labour exclusion and NEET vulnerability (M3), legality and safety (M5), and housing and neighbourhood fragility (M6). This confirms the presence of cumulative, mutually reinforcing vulnerabilities characteristic of complex, path-dependent regional systems.

These regions have structural disadvantages including long-term poverty, lack of jobs, inadequate assistance systems, and being around criminal networks. On the other hand, a group of regions that are mostly in the Inner Areas and the mountainous belt, such as Basilicata, Molise, Abruzzo, Umbria, Aosta Valley, and the autonomous provinces of Trento and Bolzano, place a high value on M2 (elderly care) and M4 (access to services). These patterns are linked to demographic decline, aging, depopulation, and weak infrastructure, which are all problems that peripheral regions have had for a long time. In the northern industrial areas of Lombardy, Piedmont, Veneto, Liguria, and Friuli-Venezia Giulia, the situation is different. For example, missions M1 and M3 are not as important, but missions M2 (aging) and M6 (housing/urban polarization) are more critical.

Figure 2 translates regional priority profiles into four coherent territorial clusters. This representation captures the systemic logic of vulnerability rather than its region-specific manifestations.

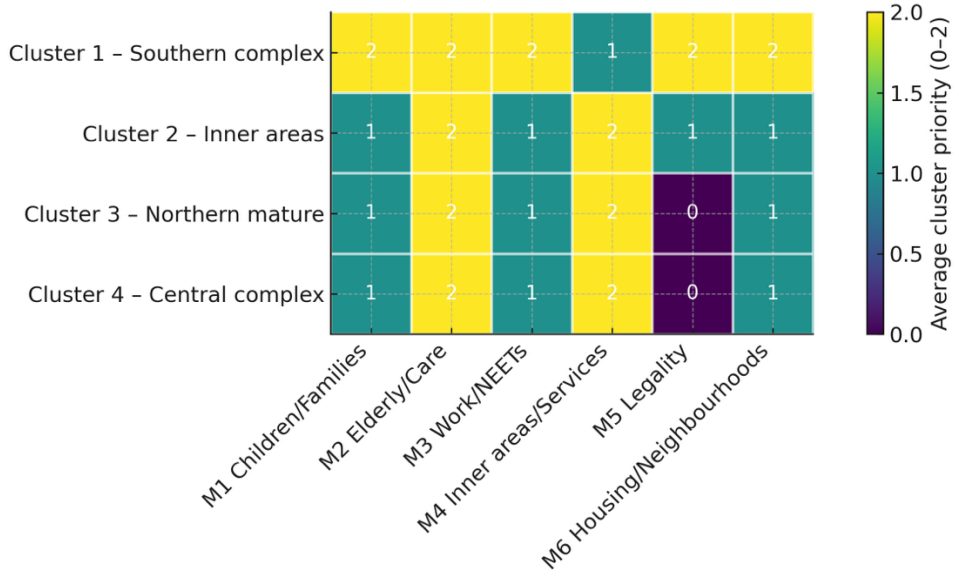

Figure 2. Clustering of priority missions

The Southern Complex Cluster (Cluster 1: Calabria, Sicily, Campania, Apulia) demonstrates uniformly elevated mission priorities across all dimensions except M4. This reflects a condition of systemic and overlapping fragility, where social, economic, and institutional deficits coalesce to form a complex challenge requiring multisectoral and multi-actor interventions.

The Inner Areas Cluster (Cluster 2: Abruzzo, Molise, Basilicata, Sardinia, Umbria, Trentino-Alto Adige, Aosta Valley) is characterised by very strong priorities in M2 and M4, confirming the deep influence of demographic transitions and spatial inaccessibility. The cluster's relative stability in the remaining missions illustrates that certain vulnerabilities are territorial in essence and resistant to sector-based policy solutions.

The Mature North Cluster (Cluster 3: Piedmont, Liguria, Lombardy, Veneto, Friuli-Venezia Giulia) shows a pattern of moderate to high vulnerabilities in M2, M4, and M6. These regions face a paradox typical of advanced economies: while performing strongly on aggregate socio-economic indicators, they exhibit emerging fragilities in elderly care, peripheral service provision, and metropolitan cohesion.

The Complex Centre Cluster (Cluster 4: Emilia-Romagna, Tuscany, Marche, Lazio) presents a hybrid pattern, combining urban vulnerabilities (Lazio) with inner-area fragilities (Marche and Tuscany). M1, M3, and M4 emerge as the most consistent missions, highlighting the tension between labour-market transitions, educational/childhood fragility, and territorial inequalities.

Figure 3, the heatmap of investment shares by mission and region, reveals a striking misalignment between regional needs and the allocation of public resources.

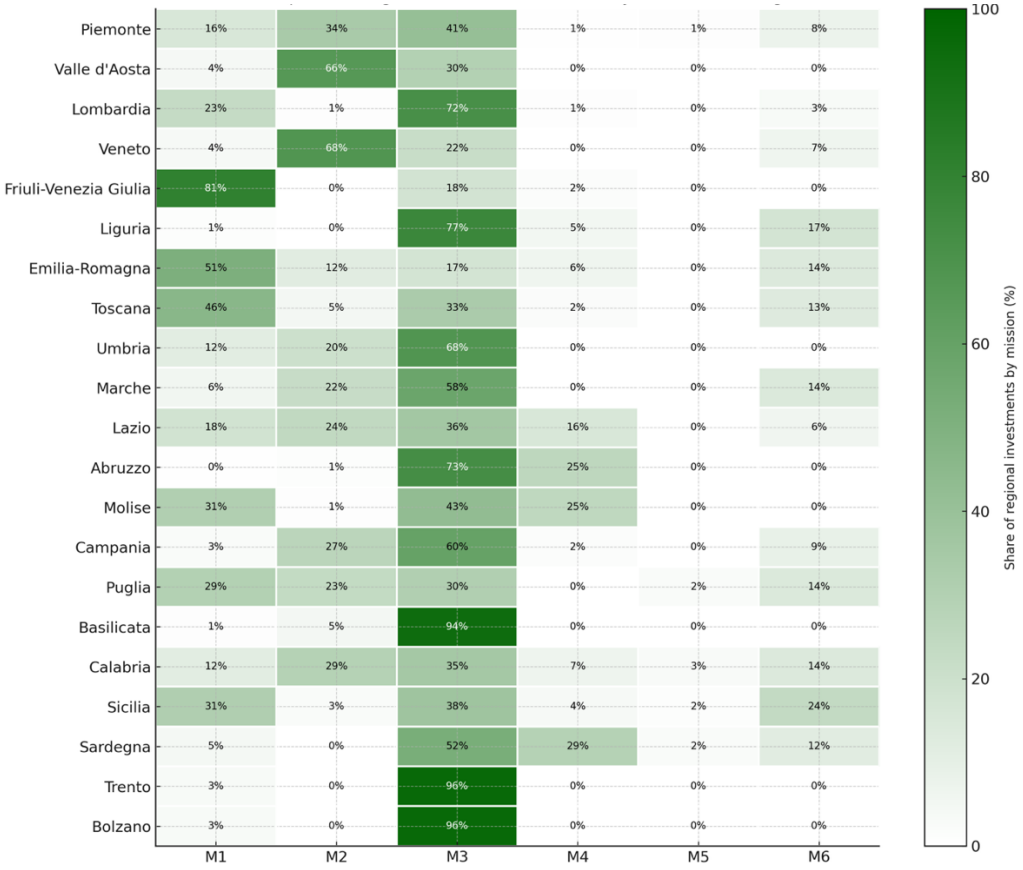

Figure 3. Co-creation of Project Value

Across numerous regions, investments are mostly in M3 (Labour/NEET), and in certain cases, they make up more than 70–90% of all regional spending. This pattern shows that long-standing labor policy tools are slow to change, but it doesn't match up with the mission goals we talked about earlier, especially in areas where other problems are more serious. The excessive investment in M3 demonstrates path dependency and sectoral rigidity, which contradicts mission-oriented policy concepts that necessitate directionality and coordinated investment across domains.

On the other hand, missions like M5 (Legality) and M4 (Inner places/Services) get very little or no funding in most places, even though they are very important to many regions, especially in the South and Inner Areas. This indicates that significant systemic issues continue to be inadequately handled at the institutional level, prompting apprehensions over the efficacy of existing governance structures.

Another interesting discovery is that Friuli-Venezia Giulia has a very unique profile, with more than 80% of its resources going to M1 (Children and Families). This may indicate a determined strategic focus, implying that mission-specific specialization is feasible.

Overall, the investment heatmap shows how inadequately diversified, sectorally fragmented, and not purpose-aligned public spending still is.

Finally, figure 4 integrates mission needs, investment shares, and deviations from national investment averages. It provides the most definitive assessment of alignment between territorial vulnerabilities and public action.

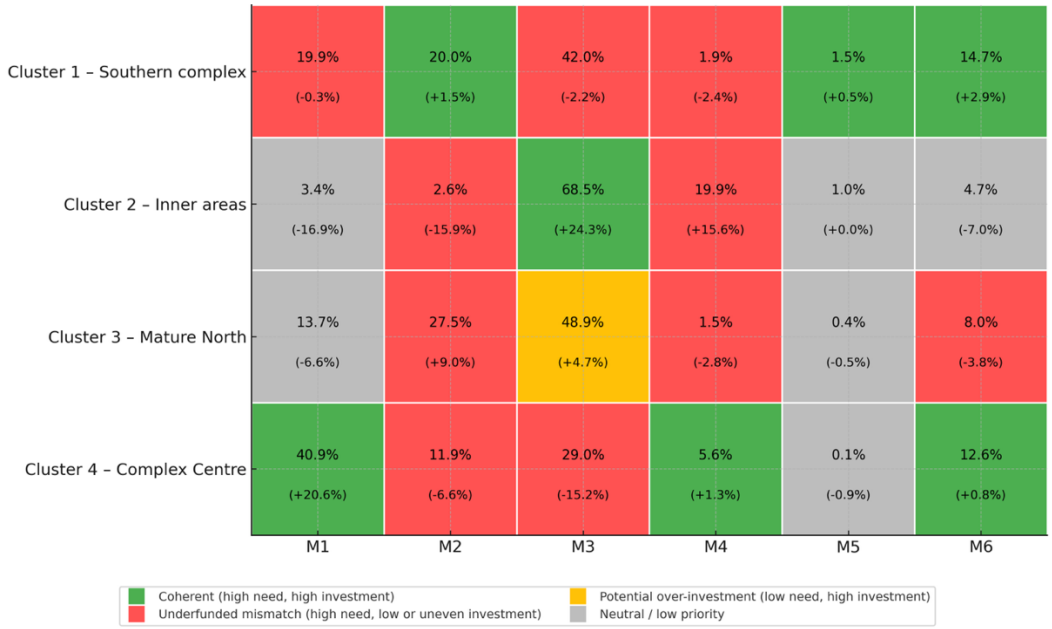

Figure 4. Gap Analysis

There are systematic misalignments in all four clusters:

- Cluster 1 (Southern Complex Regions): even though there are serious, overlapping vulnerabilities, high-priority missions like M1, M3, M5, and M6 are not getting enough money or are getting it in an uneven way. Investment levels are not high enough to meet the structural depth of vulnerabilities. This shows that governance is fragmented, and institutions don't work together well.
- Cluster 2 (Inner Areas): the most surprising fact is that M2 (Elderly/Care) is chronically underfunded, even though it is the cluster's most important purpose. It gets much less money than the national average. The investment surplus in M4 (+15.6%) is due to periodic territorial initiatives, but it doesn't make up for the systemic deficits in long-term care infrastructures.
- Cluster 3 (Mature North): this group shows a mix of too much investment in M3 (where vulnerabilities are low) and too little investment in M2 and M6 (where vulnerabilities are rising). The mismatch shows that mature economies are facing new problems that public policies haven't yet dealt with.
- Cluster 4 (Complex Centre): the Centre has the most internal variation. M1 and M4 are in sync, but M3, a mission that has been shown to be weak in Lazio and Marche, is still underfunded, which makes it less likely that systematic, mission-driven reforms will happen.

5. Conclusions

The research aims to examine if Italy's regional investment trends correspond with the mission-specific social inclusion requirements indicated by OT9 indicators, and how purpose-driven ecosystems could function as governance frameworks to rectify discrepancies. The findings offer a definitive and strong response through an integrated technique that includes mission diagnostics, geographical clustering, investment mapping, and coherence evaluation. Italy's current policy landscape shows a lot of systematic inconsistency between the requirements of different regions and how resources are distributed.

The mission-based diagnostics showed that the regions are very different from each other. For example, the Southern regions are very fragile in many ways, the Inner Areas have demographic and infrastructure problems, and the Mature North is starting to have social and

spatial issues. The investment analysis revealed that public resources do not correspond to this differentiated geography; rather, they adhere to path-dependent trends, especially with regard to excessive funding for labor-market interventions, while structural mission domains such as legality, long-term care, childhood poverty, and access to inner areas remain significantly underfunded.

The coherence matrix verified the structural characteristics of these misalignments. No group shows that needs and investments are fully aligned. Instead, there are underfunded high-priority missions and overfunded low-priority missions in all territorial configurations. This shows that administration is fragmented and there is no coordination based on missions. These results immediately corroborate the principal theoretical assertion of the study: purpose-ecosystems are essential governance frameworks for reconciling purpose-oriented policies based on missions' priorities with localized social inclusion requirements.

In this context, purpose-driven ecosystems operate as the multi-level, polycentric, adaptable, and participative governance framework necessary for transforming missions into coherent, context-sensitive actions. They represent the tenets of purpose-driven innovation policy, the relational basis of public service logic, and the spatial awareness of place-based development.

Keywords: Purpose Ecosystems; entrepreneurial university; social inclusion

Sostenibilità tra forma e sostanza: analisi dell'Earnings Management nelle B-Corp italiane

Danilo Boffa[1]

1. Introduzione

La questione del rapporto indissolubile tra la natura dell'azienda e i propri fini è da sempre imperniato nel dibattito scientifico economico-aziendale. Le riflessioni attorno a tale relazione identitaria fondamentale si riducono ad una questione sostanziale che richiama il dualismo teorico tra il soggettivismo e l'oggettivismo (Paolone & D'Amico, 2017), ovvero, come ricorda tra gli altri Ferrando, se l'azienda debba essere considerata come un attore del sistema economico e sociale autonomo e, pertanto, dotato di propri fini, o invece come lo strumento attraverso il quale specifici soggetti perseguono i propri interessi (Ferrando, 2020).

Muovendo dagli elementi definitori dell'azienda, relativamente alla sua natura e alle sue finalità, la più autorevole letteratura la definisce come un istituto economico-sociale (Paolone & D'Amico, 2017), la cui attività risulta essere di significativo interesse per la società, abbracciando imprescindibilmente una dimensione etica che ne incorpora la dimensione economica e sociale, contribuendo a definirne obiettivi e strategie (Ruisi, 2010).

A tal riguardo, citando tra gli altri Borgonovi, il concetto stesso di "istituto" – fondamentale nella dottrina economico-aziendale italiana, tedesca e centro-europea – consente di operare una distinzione di fondo tra le motivazioni prime per le quali nascono determinate tipologie di istituti, i quali possono essere di ordine economico (come per l'impresa moderna), o non economico, (come ad esempio per la famiglia o per l'ente pubblico), dalle dimensioni rilevanti per il loro funzionamento (ad esempio la dimensione economica risulta essere rilevante anche per istituti che non sono mosse da motivazioni di ordine economico, e viceversa quelle giuridiche, etiche, ecc., sono rilevanti in istituti che si muovono seguendo motivazioni di ordine economico) (Borgonovi, 2014). Ulteriormente, l'autore sottolinea come le decisioni assunte dall'azienda, ancorché quelle che si fondano sul principio della convenienza economica, sottostanno a talune regole che risolvono le relazioni tra le persone ed i gruppi sociali, le quali possono essere o codificate (nei sistemi di diritto formale) o consolidate nei comportamenti sociali e quindi uniformemente accettate senza necessità di obblighi giuridici (Borgonovi, 2014) .

Di fatto, pur nelle significative differenze fondative che caratterizzano le diverse scuole di pensiero , la disciplina dell'Economia Aziendale, nell'obiettivo di definire l'azienda, la identifica come istituto le cui finalità sono ben lontane da quelle del profitto nel breve termine, ma che invece abbraccia finalità di lungo termine risultanti dall'integrazione di interessi diversi e divergenti e orientati al mantenimento di un equilibrio istituzionale nel lungo periodo.

Tale paradigma, tuttavia, sembra aver subito un processo di decoupling perdendosi progressivamente nel tempo con lo sviluppo economico capitalistico, fino a convogliare in una "fallacia" (e.g.: Reiman, 1981) come definita da diversi autori, secondo cui la crescita economica risulterebbe endemicamente iniqua, instabile e nel medio-lungo termine dannosa per l'ambiente e per l'umanità.

Negli ultimi due decenni, il panorama imprenditoriale globale ha assistito a una crescente pressione da parte di stakeholder, investitori e policy-maker affinché le imprese trascendano il paradigma della massimizzazione del valore per gli azionisti (shareholder value) (Friedman,

[1] Ricercatore, ECON-06/A, Università degli Studi di Teramo; dboffa@unite.it – corresponding author.

2007) e, in particolare la crisi finanziaria del 2008, unita alla crescente urgenza delle sfide climatiche e sociali, ha accelerato la domanda di modelli di business più etici, responsabili e sostenibili (Welford e Frost, 2006; Dias et al., 2016). In questo contesto, la Corporate Social Responsibility (CSR) è evoluta da attività filantropica marginale a elemento strategico centrale (Kim, 2022).

Tuttavia, la diffusione crescente di strumenti come il reporting non-finanziario e di sostenibilità ha portato con sé lo scetticismo diffuso riguardo al tema del cosiddetto "greenwashing" (Gatti et al., 2019), ovvero la pratica di utilizzare la comunicazione di sostenibilità come strumento per distogliere l'attenzione da performance ambientali, sociali o etiche discutibili (Boiral et al., 2017). La letteratura ha evidenziato come le imprese possano adottare una "CSR Masquerade" (Prutina, 2015), un approccio opportunistico in cui l'impegno sociale dichiarato non è pienamente integrato nella governance e nelle pratiche aziendali (Forcadell e Aracil, 2021).

Questa tensione tra impegno dichiarato e performance effettiva è particolarmente rilevante nel campo della trasparenza finanziaria. L'Earnings Management (EM), definito come l'alterazione discrezionale dei risultati finanziari da parte dei manager per influenzare le percezioni degli stakeholder (Schipper, 1989; Prencipe e Viarengo, 2022), rappresenta una delle principali minacce all'integrità del reporting aziendale. L'asimmetria informativa, connaturata al rapporto tra insiders (manager) e outsiders (stakeholder), crea l'opportunità per tali manipolazioni (Baskaran et al., 2020).

Per rispondere a questa esigenza di credibilità, sono emersi nuovi modelli organizzativi e standard di certificazione. Tra questi, la certificazione B-Corp (Certified B-Corporation) si distingue come uno degli standard globali tra i più innovativi e risulta essere fortemente imperniati sulla "buona governance". Gestita dall'ente no-profit B-Lab, la certificazione B-Corp valuta le aziende in termini di performance sociale e ambientale in senso ampio e di governance – e, dunque, anche di trasparenza –, richiedendo il soddisfacimento di requisiti specifici dettati da un assessment rigoroso (il B Impact Assessment), la modifica dello statuto societario per includere la considerazione degli stakeholder (stakeholder governance) e la pubblicazione di un documento di reporting non-finanziario con cadenza annuale.

In modo parallelo rispetto al "movimento" B-Corp, in alcuni ordinamenti sono emerse forme giuridiche inquadrabili nella definizione di "benefit corporation" (come ad es.: le Low-Profit Limited Liability Company – L3C introdotte nel 2008 nello Stato del Vermont e le Social Purpose Corporation – SPC in California, Washington, Florisa. in Italia, le "Società Benefit" (SB) sono state introdotte con la L. 208/2015). Sebbene la letteratura recente (es. Prencipe et al., 2025) abbia iniziato a indagare la relazione tra l'adozione dello status giuridico di BC e le pratiche di EM (spesso con risultati controintuitivi che suggeriscono un potenziale aumento dell'opportunismo manageriale), rimane un vuoto significativo riguardo all'efficacia della certificazione volontaria B-Corp.

La certificazione B-Corp, a differenza dello status legale di Società Benefit, implica un processo di verifica e audit esterno da parte di B-Lab. Questo studio si propone di colmare questo gap, indagando se la certificazione B-Corp rappresenti un meccanismo efficace per aumentare la qualità dell'accounting e del reporting.

L'obiettivo primario di questo studio è analizzare se le imprese italiane che ottengono la certificazione B-Corp mostrino una riduzione nelle pratiche di Earnings Management successivamente all'ottenimento della certificazione. La nostra research question, pertanto, è la seguente: La certificazione B-Corp, agendo come meccanismo di commitment e di scrutiny esterno, riduce l'opportunismo manageriale misurato attraverso le pratiche di EM?

Si ipotizza dunque che il processo rigoroso e i requisiti di trasparenza imposti da B-Lab agiscano come un vincolo credibile (costly signal) sulla discrezionalità manageriale, spingendo le imprese certificate verso una maggiore integrità del reporting finanziario. Questo studio mira a

dimostrare l'efficacia della certificazione come strumento non solo di performance di sostenibilità, ma anche di trasparenza economico-finanziaria.

2. Framework Teorico e Sviluppo delle Ipotesi

La relazione tra impegno verso lo sviluppo sostenibile e qualità del reporting (assenza di EM) è complessa e la letteratura esistente offre risultati ambigui (Ehsan et al., 2020; Velte, 2024). Come delineato da Prencipe et al. (2025) nel contesto delle Società Benefit, emergono due prospettive teoriche contrapposte per interpretare questa relazione, che adattiamo al contesto delle B-Corp certificate.

2.1. La Prospettiva dell'Opportunismo Manageriale (Agency Theory)

La prima prospettiva, radicata nella teoria dell'agenzia, suggerisce che i manager possano utilizzare l'impegno nella CSR in modo opportunistico (Prior et al., 2008; Mahrani e Soewarno, 2018). In questa visione, la certificazione B-Corp potrebbe essere ricercata da manager che desiderano costruire una "reputazione etica" (Hasler, 2014) da usare come scudo per mascherare comportamenti opportunistici, incluso l'EM (Palacios-Manzano et al., 2021). L'investimento in una certificazione "socialmente responsabile" potrebbe servire a deviare l'attenzione degli stakeholder (Javed et al., 2020) o a ridurre il loro scrutinio (Janning et al., 2020), concedendo ai manager maggiore libertà per manipolare i bilanci.

Studi recenti che analizzano forme ibride, come le Società Benefit legali, hanno trovato supporto empirico per questa visione, rilevando un'associazione positiva tra l'adozione dello status di BC e l'EM (Prencipe et al., 2025). Questo suggerisce che l'impegno formale verso obiettivi sociali, se non accompagnato da un adeguato monitoraggio, può creare tensioni che i manager risolvono opportunisticamente (Ehsan et al., 2022; Mion, 2020). Se questa prospettiva fosse valida, ci aspetteremmo che la certificazione B-Corp non abbia alcun effetto sull'EM, o addirittura lo aumenti.

2.2. La Prospettiva della Strategia a Lungo Termine: Stakeholder, Legitimacy e Signaling Theory

La seconda prospettiva, che guida il nostro studio, si basa su un'integrazione della teoria degli stakeholder, della teoria della legittimità e della teoria della segnalazione.

La Stakeholder Theory postula che le imprese socialmente responsabili mirino a costruire relazioni fiduciarie e a lungo termine con tutti i loro portatori di interesse (Ehsan et al., 2020). La trasparenza e l'integrità del reporting finanziario sono fondamentali per mantenere questa fiducia (Gras-Gil et al., 2016). In questa ottica, l'EM è antitetico alla logica B-Corp, poiché eroderebbe la fiducia degli stakeholder e vanificherebbe gli investimenti fatti per ottenere la certificazione.

La Legitimacy Theory suggerisce che le imprese adottano pratiche come la certificazione B-Corp per ottenere o mantenere la legittimità sociale (Del Baldo, 2019). La certificazione funge, pertanto, da "segnale" di adesione a un sistema di valori etici (André, 2012). Per essere efficace, questa legittimità deve essere mantenuta attraverso la coerenza tra valori dichiarati (trasparenza B-Corp) e azioni (reporting finanziario non manipolato).

Stakeholder e Legitimacy Theory sono profondamente legate da un nesso logico-deduttivo: alcuni autori sostengono che considerare le due teorie come totalmente distinte sarebbe errato perché entrambe sono radicate nella Political Economy Theory e sono teorie sistemiche che si concentrano sul ruolo delle relazioni tra organizzazioni, Stato, individui e gruppi (Deegan, 2002; Gray et al., 1996). Questi due approcci teorici sono, pertanto, collegati sociologicamente, a causa dell'ampliamento e crescente considerazione degli stakeholder come controparti nel contratto sociale tra imprese e società (Deegan, 2002).

Infine, la Signaling Theory (Connelly et al., 2011) riveste un ruolo cruciale nella costruzione del framework. L'ottenimento della certificazione B-Corp è un processo costoso, complesso e volontario. Rappresenta un "segnale credibile" (costly signal) inviato al mercato per distinguersi dai concorrenti che praticano "greenwashing". Affinché questo segnale sia efficace e mantenga il suo valore (ad esempio, nell'attrarre "impact investors" (Gangi et al., 2022) o talenti, l'impresa deve dimostrare un allineamento comportamentale. La certificazione B-Corp, con i suoi requisiti di audit e di reporting pubblico (gestiti da B-Lab), agisce come un meccanismo di bonding e monitoring che riduce l'asimmetria informativa (Shi et al., 2024; Anderson et al., 2024) e vincola i manager a un comportamento trasparente.

2.3. Ipotesi di ricerca

A differenza dello status legale di Società Benefit (Prencipe et al., 2025), che può essere adottato con la modifica dello statuto e che comporta minori controlli esterni, la certificazione B-Corp richiede una verifica ex-ante (il BIA) e ongoing (la ricertificazione triennale). Per tale ragione, si ipotizza che questo rigoroso processo di enforcement esterno da parte di B-Lab sia il fattore discriminante che allinea l'impegno dichiarato con la qualità dei processi di accountability.

Mentre la prospettiva dell'opportunismo manageriale non può essere scartata a priori, il presente studio si basa sulla prospettiva della strategia a lungo termine e della "segnalazione credibile". Attraverso tale studio si ipotizza che le B-Corp certificate, avendo investito risorse significative per segnalare il loro impegno etico, siano meno propense a mettere a rischio tale investimento attraverso pratiche di EM. La certificazione agisce come un meccanismo di governance che migliora la qualità dei processi di accounting e reporting.

Pertanto, formuliamo la seguente ipotesi:

H1: L'ottenimento della certificazione B-Corp è associato a una riduzione statisticamente significativa delle pratiche di Earnings Management nelle imprese italiane, rispetto a un campione di controllo di imprese non certificate.

3. Metodologia di ricerca

Per testare l'ipotesi di ricerca appena presentata, lo studio adotta un disegno di ricerca quantitativo basato su dati panel e un modello Difference-in-Differences (DiD).

3.1. Campione e raccolta dati

Il nostro campione di analisi sarà composto da due gruppi di imprese italiane per le quali saranno raccolti i dati economici e finanziari nel periodo 2015-2024:

- Gruppo trattato (Treated Group): Il gruppo di trattamento è costituito da tutte le imprese italiane che hanno ottenuto la certificazione B-Corp tra il 2018 e il 2022. L'elenco delle imprese e la data esatta della prima certificazione (l'evento di trattamento) sono stati estratti dal database ufficiale di B-Lab. Il dataset finale è di 152 imprese B-Corp selezionate.
- Gruppo di Controllo (Control Group): Il gruppo di controllo è formato da imprese italiane non B-Corp con caratteristiche simili alle imprese B-Corp selezionate, sulla base di una serie di variabili.

Il processo di selezione del gruppo di imprese di controllo avviene mediante una prima selezione casuale di 5000 imprese tra il totale delle imprese italiane. Successivamente, per garantire la validità dell'analisi DiD e trattare i possibili self-selection bias (in quanto le imprese che scelgono di diventare B-Corp sono intrinsecamente diverse), il gruppo di controllo viene affinato utilizzando un modello di Propensity Score Matching (PSM). Il modello si fonda sulla definizione dei due gruppi definiti come segue:

- Costruendo una variabile binaria T (treatment) che determina se una osservazione è sottoposta al trattamento oppure no;
- La variabile assume valore T = 1 se l'unità osservata è stata sottoposta al trattamento, mentre T = 0 se l'unità osservata non è trattata.

A questo punto viene applicato un modello di regressione di tipo probit/logit con T come variabile dipendente e una serie di caratteristiche come variabili indipendenti, al fine di stimare la teorica probabilità di ciascuna osserva-zione di essere sottoposta a trattamento, includendo x variabili come determinanti capaci di influenzare tale probabilità:

$$T = Costante + Controlli + \varepsilon$$

La funzione di propensity score risultante ha T come variabile dipendente e x come variabili indipendenti:

$$p(x) = prob(T = 1|x) = E(T|x)$$

Dove il propensity score è la probabilità condizionata di essere sottoposti al trattamento date le x caratteristiche pretrattamento.

Conseguentemente, le imprese non B-Corp vengono virtualmente "abbinate" 1:N con le imprese B-Corp sulla base di covariate pre-trattamento (il vettore Controlli rilevate nell'anno precedente alla certificazione), quali: settore industriale (ATECO), dimensione (logaritmo degli asset totali), redditività netta (ROE), leva finanziaria (Leverage), età, localizzazione geografica.

Sulla base del risultato del PSM, ossia il valore di probabilità che un'impresa del gruppo di controllo possa "subire il trattamento" (diventare B-Corp sulla base delle covariate) sarà costruito il gruppo di controllo, affinché esso risulti quanto più vicino possibile al gruppo di imprese trattate, riducendo così o possibili effetti spuri.

I dati finanziari e anagrafici necessari per l'analisi (sia per il matching PSM che per il modello DiD) sono estratti dal database AIDA di Bureau van Dijk (BvD), che fornisce una copertura completa delle società italiane (Prencipe et al., 2025).

Il campione finale, dopo un'ultima fase di trattamento e pulitura dei casi che presentano missing values, costituirà un panel dataset bilanciato composto dalle imprese B-Corp (treated group) e dal loro campione di controllo (matched group), osservati per un decennio, in modo che per ciascun caso siano osservabili un minimo di 3 anni prima e un minimo di 3 anni dopo l'evento di certificazione.

3.2. Variabile dipendente: Earnings Management (EM)

In linea con la letteratura recente che cerca di superare i limiti dei modelli tradizionali (es.: Jones, 1991; Dechow et al., 1995), misureremo l'Earnings Management (EM) utilizzando il modello di conditional earnings sviluppato da Stubben (2010).

$$\begin{aligned}\Delta AR_{it} = \alpha + \beta_1 \Delta R_{it} + \beta_2 \Delta R_{it} \times SIZE_{it} + \beta_3 \Delta R_{it} \times AGE_{it} + \beta_4 \Delta R_{it} \times AGEsq_{it} \\ + \beta_5 \Delta R_{it} \times GRRp_{it} + \beta_6 \Delta R_{it} \times GRRn_{it} + \beta_7 \Delta R_{it} \times GRM_{it} \\ + \beta_8 \Delta R_{it} \times GRMsq_{it} + \varepsilon_{it}\end{aligned}$$

Dove Δ è la variazione annuale; *AR* sono i crediti; *R* è il fatturato totale; *SIZE* è il logaritmo naturale degli asset totali; *AGE* è il logaritmo naturale del tempo trascorso dalla fondazione delle aziende; *GRRp* rappresenta il prodotto della variazione dei ricavi (*R*) aggiustata per la mediana dell'industria e di una variabile binaria che assume il valore di 1 quando la variazione corretta per la mediana dei ricavi è presente nell'anno t per l'azienda $i > 0$, altrimenti 0; *GRRn* rappresenta la variazione mediana dei ricavi (*R*) aggiustata per il settore per una specifica impresa. Viene

ulteriormente moltiplicata per una variabile fittizia che assume il valore di 1 se la variazione mediana aggiustata per il settore dei ricavi nell'anno t per l'azienda $i < 0$ e 0 altrimenti; GRM è il margine lordo mediano aggiustato per l'azienda nel settore; *AGE* e *GRM* sono quadrati e indicati rispettivamente come *AGEsq* e *GRMsq*.

L'entità dei residui ottenuti dal modello di guadagni condizionati funge da approssimazione dei crediti o delle acquisizioni discrezionali (DA_{it}) anomali. Questa variabile è di interesse primario in questo studio e funge da proxy per l'EM.

Pertanto, questa variabile è stata utilizzata per condurre la nostra analisi primaria basata sulla DiD.

Il modello appena presentato è stato scelto per la sua robustezza e in quanto presenta un minor grado di distorsione nel rilevare la manipolazione degli accruals basata sui ricavi (Prencipe et al., 2025). Il modello di Stubben (2010) stima i ricavi "attesi" (non discrezionali) di un'impresa in un dato periodo e, di conseguenza, i discretional accruals (*DA*) sono calcolati come la differenza tra i ricavi effettivi e i ricavi attesi.

La nostra variabile dipendente è rappresentata dal valore assoluto dei discretional accruals (|*DA*|) derivati dal modello di Stubben (2010). Il valore assoluto è utilizzato perché i manager possono manipolare gli utili sia verso l'alto (income-increasing) che verso il basso (income-decreasing) (Zang, 2012), ed entrambe le pratiche indicano una bassa qualità del reporting. Un valore più alto di |*DA*| indica un maggiore livello di Earnings Management.

3.3. Modello di Analisi: Difference-in-Differences (DiD)

Per valutare l'impatto causale della certificazione B-Corp sulla riduzione dell'EM, utilizzeremo un modello Difference-in-Differences (DiD) con effetti fissi (Fixed Effects). Il modello DiD permette di isolare l'effetto del trattamento (certificazione) confrontando l'evoluzione dell'EM nel gruppo trattato (B-Corp) prima e dopo la certificazione, rispetto all'evoluzione dell'EM nello stesso periodo nel gruppo di controllo (non B-Corp).

La specifica del nostro modello econometrico sarà la seguente:

$$EM_{it} = \beta_0 + \delta(BC_i * PC_t) + \beta_1(BC_i) + \beta_2(PC_t) + \gamma'(Controlli_{it}) + \alpha_i + \theta_t + \epsilon_{it}$$

Dove:

EM_{it}: È la nostra misura di Earnings Management (Stubben (2010) per l'impresa i nell'anno t.

BC_i: È una variabile dummy che assume valore 1 se l'impresa i appartiene al gruppo trattato (B-Corp certificate) e 0 se appartiene al gruppo di controllo (matchato).

PC_t: È una variabile dummy che assume valore 1 per gli anni successivi all'anno della certificazione (trattamento) e 0 per gli anni precedenti.

$BC_i * PC_t$: È il termine di interazione DiD, il nostro coefficiente di interesse. Il coefficiente δ (delta) cattura l'effetto medio del trattamento (certificazione B-Corp) sul livello di EM.

$Controlli_{it}$: È un vettore di variabili di controllo standard della letteratura sull'EM per assorbire ulteriori fonti di eterogeneità. Tale vettore è costituito dalle covariate utilizzate per il Propensity Score Matching (PSM).

α_i: Rappresenta gli effetti fissi a livello di impresa (firm fixed effects), per controllare tutte le caratteristiche inosservabili e costanti nel tempo specifiche di ciascuna impresa (es. cultura aziendale).

θ_t: Rappresenta gli effetti fissi a livello di anno (year fixed effects), per controllare gli eventi a livello macroeconomico che impattano tutte le imprese (es. cicli economici, cambiamenti normativi).

ϵ_{it}: È il termine di errore.

La nostra ipotesi (H1) sarà supportata se il coefficiente risulterà negativo e statisticamente significativo. Un coefficiente negativo indicherebbe che, dopo la certificazione, le B-Corp (gruppo trattato) hanno ridotto l'EM in misura significativamente maggiore rispetto a quanto fatto dal gruppo di controllo nello stesso periodo.

Saranno applicati, inoltre, ulteriori modelli per testare la robustezza della relazione e dei risultati, inclusa la verifica dell'assunto dei parallel trends (verificando che non sia significativo negli anni pre-trattamento) e l'utilizzo di misure alternative di EM (es. Modified Jones Model (Dechow et al., 1995)).

4. Risultati attesi e implicazioni

Questo studio si attende di trovare relazione positiva e significativa tra l'adozione del modello B-Corp e la qualità del reporting e della trasparenza, ipotizzando che i livelli di EM scendano dopo l'adozione del modello B-Corp. Ipotizziamo, pertanto, che il coefficiente (delta) del modello DiD sia negativo e significativo, dimostrando che la certificazione B-Corp è un meccanismo efficace nel ridurre l'Earnings Management.

Attraverso i risultati attesi dello studio ci si propone di approfondire le seguenti implicazioni teoriche: da un lato, la relazione ipotizzata avrebbe implicazioni significative per il dibattito accademico sulla relazione tra responsabilità sociale e impegno verso la sostenibilità e qualità del reporting (Ehsan et al., 2020).

Ulteriormente, i risultati attesi supporterebbero le teorie attraverso le quali lo studio deduttivamente interpreta il fenomeno come presentate nel paragrafo 2, confermando come gli standard di sostenibilità volontari, se sufficientemente rigorosi e supportati da meccanismi di enforcement esterni (l'audit di B-Lab), possono allineare gli incentivi manageriali alla trasparenza a lungo termine (Stakeholder Theory) e agire come segnali credibili (Signaling Theory) che distinguono le imprese "genuine" da quelle che praticano "greenwashing", confermandone la legittimità ad operare (Legimacy Theory).

Con riferimento alla prospettiva del Managerial Opportunism, i risultati attesi si porrebbero in contrasto con la prospettiva dell'opportunismo manageriale, o quantomeno ne definirebbero i limiti. Suggerirebbero che, sebbene l'adozione di uno status legale possa essere usata opportunisticamente (come rilevato da Prencipe et al., 2025), la certificazione volontaria e verificata agisce come un vincolo più forte.

Inoltre, lo studio evidenzia la dicotomia tratra certificazione (B-Corp) e "Status Legale" (BC/SB): questo studio contribuirebbe a chiarire la confusione concettuale e di impatto tra i due modelli, evidenziando l'importanza dei meccanismi di verifica e monitoraggio.

Infine, lo studio propone talune implicazioni pratiche: con riferimento ai manager e le imprese, il verificarsi della relazione ipotizzata dimostrerebbe che l'ottenimento della certificazione B-Corp non è solo un esercizio di marketing, ma un impegno strategico che richiede (e probabilmente induce) un miglioramento tangibile nei processi di governance interna e di reporting finanziario.

Ulteriormente, il segnale che la certificazione rappresenta fornirebbe agli investitori un'euristica decisionale: la certificazione B-Corp può essere considerata un proxy affidabile di un minor rischio di manipolazione contabile e di una maggiore trasparenza, riducendo l'asimmetria informativa. Tali implicazioni potrebbero contribuire ad informare informare i policy-maker rispetto all'efficacia di tali assessment volontari e di tali standard, al fine di favorire l'integrazione di questi modelli nel framework normativo sulla disclosure non-finanziaria.

Infine, i risultati dello studio confermerebbero il valore del processo di audit e di trasparenza richiesto dalla certificazione B-Corp, validando il suo ruolo nel promuovere un'economia più responsabile e trasparente.

5. Conclusioni

Questo studio si propone di investigare una questione centrale nel dibattito sulla sostenibilità aziendale: le certificazioni di sostenibilità, e in particolare la certificazione B-Corp, rappresentano un segnale di impegno reale verso la trasparenza o sono solo una forma sofisticata di "greenwashing"?

Adottando una metodologia robusta (DiD su un campione matchato PSM) e una proxy consolidata di misurazione dell'Earnings Management (Stubben, 2010), questo studio mira a dimostrare empiricamente che le imprese italiane certificate B-Corp riducono significativamente le manipolazioni contabili dopo aver ottenuto la certificazione.

Ci aspettiamo di concludere che la certificazione B-Corp non è un "CSR Masquerade", ma un efficace meccanismo di governance che, attraverso la verifica esterna e l'impegno pubblico, allinea gli obiettivi di sostenibilità con l'integrità e la qualità del reporting finanziario. Questo studio cerca di fornire una prova tangibile che i modelli ibridi, come il modello B-Corp, fungono da "costly signal" di impegno concreto verso la sostenibilità. Tale impegno non può sottostare al compromesso di dovere o volere mascherare performance non reali, tentando di apparire virtuosi o di utilizzare tale segnale come strumento strategico di posizionamento e di differenziazione. La trasparenza e l'accountability rappresentano parte integrante di tale impegno e sono un perno fondamentale della buona governance orientata allo sviluppo sostenibile.

From beneficiaries to agents of change: exploring the role of social enterprises in community transformation in Kenya

Erica Negro[1], Giacomo Ciambotti[2], Maddalena Scribanis[3]

1. Introduction

As the world confronts unprecedented social, environmental, and economic challenges that are hindering progress toward the Sustainable Development Goals (SDGs), the need to understand, support, and leverage the potential of innovative businesses that prioritize both people and the planet has never been more critical (WEF, 2024; Negri et al., 2023). Social enterprises (SEs) have emerged as pivotal actors to develop highly innovative solutions to critical social and environmental challenges. Defined as organizations whose purpose is to achieve a social mission through market mechanisms (Santos, 2012), SEs, combining social and economic goals in the same organizational "hybrid" form, are increasingly relevant also in African economies for their transformative role and capacity to address societal grand challenges (Ciambotti et al., 2025; Dey et al., 2016; see also Tobias et al., 2013; Mair et al., 2016).

Literature on SEs has grown rapidly in the last years, especially investigating hybrid business models (Davies and Doherty, 2019; Santos et al., 2015), strategies to scale impact (Bocken et al. 2016; Ciambotti et al., 2023; Lall and Park 2022) and governance mechanisms (Battilana et al., 2015). Moreover, in Sub-Saharan Africa, social enterprises often fill institutional voids by mobilizing local actors around livelihood and environmental missions (Littlewood et al., 2025). Yet, the mechanisms through which beneficiaries evolve from recipients to agents of transformation remain underexplored (Lorenzo-Afable et al., 2020; Lashitew et al., 2020; 2024; see also Ridley-Duff, 2012)

Despite their crucial role, literature that amplifies the voices of beneficiaries remains scarce. Social entrepreneurship research typically adopts a top-down management perspective, where beneficiaries are viewed as passive recipients of value, and social issues are often framed from entrepreneurial and organizational viewpoints, emphasizing resource allocation, opportunity recognition, and the role of entrepreneurs as change agents (Hervieux and Voltan, 2018).

Recent research has emphasized the understanding that social change emerges from the collective efforts of various actors within social entrepreneurship (Cameron, 2018). Within social enterprise literature, a stream of scholarship is now focused on the empowerment of beneficiaries as a leading aspect for social enterprises. This is particularly relevant for the cases of Work Integration Social Enterprises (Battilana et al., 2015; Farmer et al., 2021) or fair trade social enterprises (Kim, 2025; Ciambotti et al., 2023).

However, the literature is largely limited in terms of the processes through which beneficiaries are activated to disseminate and scale impact at the community level, in order to achieve transformative and long-term change. The fact that the group of beneficiaries is involved

[2] Assistant Professor, ECON-06/A, Università Cattolica del Sacro Cuore di Milano; giacomo.ciambotti@unicatt.it

[3] Ph.D. Candidate, ECON-06/A, Università Cattolica del Sacro Cuore di Milano; maddalena.scribanis@unicatt.it

in defining the processes for creating impact does not necessarily translate into a lasting impact that extends to the community. Previous literature perspectives assume that there is alignment between social enterprise and beneficiary actors, but this is not always the case. There might be a tradeoff between the organizational actions, perceptions, goals, and the beneficiaries' commitment and efforts, for instance, in terms of "temporal misalignment" (future vs long-present) or "intent misalignment" (SE vs beneficiaries), "Impact scope" misalignment (single beneficiary group vs community) (Kim et al., 2019; Kannothra et al., 2018).

This research aims to unveil how and why SEs generate and scale impact to the local communities through the participation and integration of their beneficiaries. To address this question, we conducted a qualitative inductive study in Kenya, focusing on social enterprises that work in close collaboration with their beneficiaries to carry out their activities and generate impact within the communities they serve. This research aims to explore the processes through which transformative and long-lasting change can be enabled, specifically by examining the interaction between social enterprises and their target beneficiaries in local community settings in developing countries. In doing so, we investigate engagement and activation practices adopted not only by the enterprises themselves, but also by representatives of the beneficiary groups. Through a field visit and semi-structured interviews, we collected a total of 50 interviews, together with secondary data, notes, pictures and videos which enables data triangulation. The sample includes both social enterprises and cooperatives, as well as community-based organizations. The main sectors of operation include coffee production (e.g., Gitwe Farmers Cooperative and Ritho Farmers Cooperative in the Kiambu district), honey production (see figure 1) (e.g., Baringo Honey, MACODEV CBO, and Apiculture Venture), and agriculture in rural areas (including horticulture, fruit, herbs, and dried fruit). Additional operational areas include ethical fashion (e.g., Kazuri Beads and Tribearth) and waste management, with social enterprises active in coastal or urban settings, particularly near major landfill sites in Nairobi (e.g., Bottle Logistics and Africa Collect Textiles).

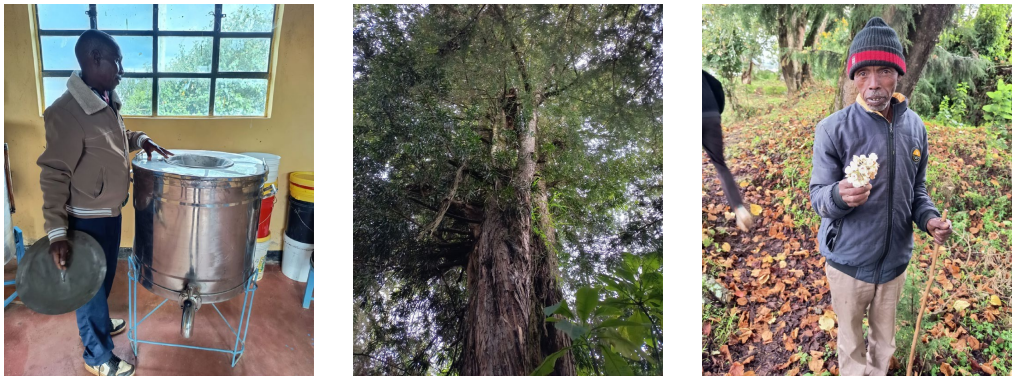

Figure 1. #SE8 Honey Community-Based Organization representative and one of the beneficiary/supplier groups' leaders

The extended abstract proceeds as follows: we first illustrate some relevant theoretical underpinnings, to then synthetize the preliminary findings and highlight major contributions and implications for theory and practice.

2. Brief theoretical background

Recent scholarship in social entrepreneurship has shifted attention from firm-level dynamics to the relational and participatory dimensions that shape how social enterprises (SEs) interact with and involve their beneficiaries (Saebi et al., 2019; Ciambotti et al., 2025). This shift reflects a growing interest in understanding how social change emerges from the collective interplay of

actors within SE ecosystems (Cameron, 2018; Kannothra et al., 2018), and how this interaction can contribute to transformative and sustained impact at the community level (Tobias et al., 2013).

A key development in this stream is the triadic perspective introduced by Kim (2025), which moves beyond the traditional dyadic view of SEs and beneficiaries by incorporating the role of external evaluators. This framework recognizes the active agency of beneficiaries, who can influence both the process and outcomes of social impact initiatives by aligning or misaligning with organizational goals and by leveraging communication with third-party evaluators. This perspective highlights the complexity of the impact creation process, where agency is distributed across multiple actors and embedded within specific social and institutional contexts.

The question of agency activation is particularly salient in contexts characterized by poverty and inequality. As shown by Kim et al. (2019), beneficiaries often operate under a "long-present" temporal logic, where the future is not disconnected from the present, but rather unfolds through incremental and cyclical actions. This contrasts with the future-oriented logic typically adopted by SEs, leading to temporal misalignment that can hinder coordination and shared vision. Nevertheless, when short-term improvements are structured to produce interconnected gains, they may serve as stepping stones for broader developmental processes.

The literature also emphasizes the importance of value appropriation by stakeholders as a foundation for legitimacy and entitlement in value distribution (Bacq & Aguilera, 2022). Yet, participation is not without its challenges. As Ruebottom (2025) notes, the type of "participation work" that SEs engage in, whether open or protective, has consequences for both inclusivity and the reproduction or disruption of community inequalities. This raises critical questions about how social enterprises design participatory processes that can contribute to systemic, community-level transformation.

Against this backdrop, our study seeks to understand the conditions under which beneficiary participation becomes a driver of transformative, community-level impact. It interrogates how SEs can activate a form of agency that mobilizes collective action and supports sustained change, even in contexts marked by temporal, intentional, and structural misalignments between enterprises and their target groups.

3. Research method

3.1. Research setting and sampling

This research adopts a qualitative and inductive approach to investigate how social enterprises engage with their beneficiaries to activate agency and generate transformative community-level impact. The study is grounded in the interpretive tradition, aiming to uncover situated meanings and processes emerging from the field (Gehman et al., 2018; Miles and Huberman, 1994).

Data collection was conducted between July and August 2025 across different regions of Kenya, a country characterized by vast economic, social and political challenges (Kolk and Rivera-Santos 2018; Lashitew et al. 2020; Zoogah et al. 2015), and severe resource constraints such as limited access to financial resources, information technologies, human resources, and raw materials, as well as policy and infrastructure deficits (Ciambotti and Pedrini 2021; George et al. 2016). At the same time, many African countries are experiencing rapid economic and population growth and increasing urbanization as young people leave rural areas to seek better lives in towns and cities (African Economic Outlook 2019). Recent estimates report that there are approximately 44,000 SEs in Kenya (British Council 2017) and policies have been developed to support their establishment and growth (OECD/EU 2017).

The Kenyan context provides therefore a fertile context due to the presence of diverse community-based organizations and networks of social enterprises and vibrant hybrid organizations, community entrepreneurship traditions, and active government and NGO support for inclusive enterprise models.

3.2. Data collection and analysis

We conducted 50 semi-structured interviews with key informants, including representatives from 30 social enterprises (SEs) (see table 1) and 15 community representatives (CRs) (see table 2), who hold leadership or coordination roles within beneficiary groups.

SE#	Social Enterprise	Product	Role	Location
SE#1	Gitwe Farmers Cooperative	Coffee	Secretary manager	Kiambu
SE#2	Ritho Farmers Cooperative	Coffee	Secretary manager	Kiambu
SE#3	Afriwomen Connect	Financial services	Founder	Nairobi
SE#4	Jumatatu Farmers Cooperative	Coffee	Chairman	Kabazi
			Secretary	Kabazi
SE#5	Blessed Business Handicrafts	Handicrafts	Founder	Nakuru
SE#6	Baringo Honey	Honey	Founder	Baringo
SE#7	Karunga Women Group	Handicraft (wool)	Founder	Karunga
SE#8	MACODEV CBO	Honey	Production manager	Mariashoni

CR#13	Omina Otsieno Enterprise	Brass artisans	Member (SE leader)	Kibera
CR#14	Omina Otsieno Enterprise	Brass artisans	Chairman	Kibera
CR#15	Bottle Logistics	Waste collector	Glass waste supplier	Dandora dumpsite

Table 2. List of Community Representatives sample

The interview protocol was designed to explore key themes such as engagement strategies, perceptions of agency, mechanisms of participation, and the translation of individual involvement into broader community outcomes. Interviews were conducted in person, in English or local languages with translation when necessary, and lasted between 45 and 90 minutes. All interviews were audio-recorded, transcribed, and complemented by field notes and on-site observations.

Data are being analyzed using the Gioia methodology (Gioia et al., 2013), which enables the systematic development of grounded theoretical insights. The analysis process involves identifying first-order concepts derived from participants' own terms, abstracting them into second-order themes, and organizing them into aggregate dimensions to construct a structured

representation of the underlying processes. Collaborative coding and data triangulation will be employed to ensure analytical rigor and enhance the trustworthiness of the emerging findings.

4. Preliminary findings and contributions

Preliminary analysis of the 50 interviews conducted across Kenya between July and August 2025 reveals a set of evolving strategies adopted by social enterprises (SEs) to foster transformative change within the communities they serve. These strategies are not static but reflect a shared learning process between SEs and their beneficiaries, varying across different stages of enterprise development.

A key finding is that beneficiary engagement unfolds as a gradual and dynamic process. In the early stages, engagement is often instrumental, with SEs relying heavily on existing community leaders (typically chairpersons or local influencers) to mobilize participation. Most social enterprises reported that, when launching their operations, the first step in working with and for the benefit of the community was to meet directly with community leaders to gain their approval for the enterprise's vision, as well as for the rationale and modalities of community involvement. As emphasized by representatives from SE#6, SE#14, and SE#25, "without such approval, operating within the local context would not have been possible".

While effective initially, this approach often exposes the initiative to risks of power asymmetries and individual interest domination, which can limit inclusive participation and hinder impact scalability. In particular, the main challenges reported by social enterprises concern the difficulty of truly engaging and activating community leaders, who often occupy a merely institutional role within community dynamics. Additional obstacles include self-interested behavior and the dominance of personal or political agendas among these leaders, which undermine efforts to foster meaningful and long-term community engagement aimed at transformative, rather than superficial, change.

Over time, SEs begin to adapt their strategies. A more selective and structured approach to activation emerges, where Community Representatives (CRs) are identified and trained based on their capacity for inclusive leadership, community mediation, and peer influence. These CRs are not chosen arbitrarily but are recognized for their ability to represent diverse interests, foster trust, and act as positive role models. In several cases, SEs invest in strengthening their relationship with CRs, described as built on shared vision, trust, and long-term partnership, and even adapt their business models accordingly, recognizing the CR's role in balancing social mission and economic sustainability in hybrid organizational settings. The data reveals different approaches to community engagement. One approach involves working through the leaders of beneficiary groups within the social enterprise, leveraging individual activation that is detached from political logics of involvement. This model emphasizes the potential to foster not just a single role model but multiple figures within the community who can drive engagement by initiating moments of dialogue and peer exchange. Under the guidance of the social enterprise, these group leaders have proven effective in activating "dormant" members, reducing internal marginalization, often rooted in age, gender, or ethnic differences, and promoting the adoption of positive practices, such as in agriculture.

On the other hand, some organizations have adopted a different model by introducing a designated representative or officer from the social enterprise, selected from within the community based on their expertise, contextual knowledge, and leadership qualities, who is trained to monitor motivation levels within the beneficiary group and, in some cases, to serve as a trainer, for example as an agronomist. These varied approaches appear to enable community activation at different paces and in distinct ways, particularly by fostering dialogue around existing and potential social impact, encouraging collective recognition of key impact drivers, and strengthening the community's capacity to collaborate toward broader and more transformative change.

The progressive shift in engagement practices reflects an underlying alignment with the "long present" temporal logic (Kim et al., 2019), whereby incremental and short-term achievements (often visualized and communicated through tools such as demo farms or pilot projects) are used to build momentum toward broader, long-term transformation. This stepwise approach builds trust, fosters a sense of belonging, and gradually activates individual and collective agency across the community.

In relation to the research question, findings suggest that the agency of beneficiaries is most effectively activated when SEs provide a clearly defined role for CRs in the process of social value creation. This activation is not achieved solely through community legitimacy or positional authority but through the attribution of responsibility, recognition, and opportunity to shape the initiative, confirming the insight of Bacq and Aguilera (2022), on the link between value appropriation, legitimacy, and entitlement.

From a theoretical perspective, this study contributes to literature on beneficiary engagement in social entrepreneurship by illustrating how agency is cultivated not as a static trait, but as a relational and evolving process, contingent on leadership configuration, trust-building mechanisms, and institutional learning. It also nuances the triadic perspective (Kim, 2025), showing that while initial alignment with local leaders may facilitate early participation, scaling impact requires deeper, more representative, and distributed forms of engagement. Finally, the findings enrich debates on temporal alignment in impact strategies, highlighting the operational relevance of the "long present" as a bridging logic for collective transformation.

5. Research limitations and future research

This study, while offering novel insights, is subject to certain limitations. First, the contextual specificity of Kenya limits the generalizability of findings to other socio-institutional environments; future research should conduct comparative studies across diverse African or Global South contexts.

Second, as the data reflects early-stage analysis, longitudinal observation would be valuable to capture how engagement dynamics evolve and sustain over time.

Third, this research primarily focuses on SE–beneficiary interactions; future work could include other ecosystem actors (donors, regulators, NGOs) to analyze how multi-stakeholder interdependencies shape community transformation.

Finally, quantitative validation or mixed-method approaches could strengthen causal explanations regarding how specific engagement mechanisms translate into measurable social impact outcomes.

6. Conclusion

This study advances understanding of how social enterprises in Kenya activate the agency of beneficiaries to drive transformative community change. By moving beyond managerial and firm-centric paradigms, it emphasizes relational, temporal, and contextual dimensions of social impact.

Findings suggest that transformation emerges not merely from delivering social value, but from co-producing it through inclusive participation, distributed leadership, and temporal alignment with local worldviews. The study underscores the importance of recognizing beneficiaries as co-creators—agents capable of reshaping institutional arrangements and sustaining long-term change.

Theoretically, this work contributes to the growing body of scholarship that redefines social entrepreneurship as a collective and participatory process rather than an individualistic one. Practically, it offers actionable insights for social enterprises and policymakers seeking to design engagement models that foster empowerment, trust, and durable impact at the community level.

Keywords: Social entrepreneurship; engagement practices; community entrepreneurship

Costi-benefici della sostenibilità: Evidenze dall'Impatto delle Certificazioni B-Corp sulle performance di vendita

Laura Ferraro[1], Franco E. Rubino[2]

1. Introduzione

Negli ultimi anni la consapevolezza delle questioni di sostenibilità è aumentata notevolmente. Tra gli stakeholder, i consumatori mostrano un crescente interesse per il consumo sostenibile e diventano più consapevoli delle conseguenze delle proprie azioni (Giesler e Veresiu, 2014; Bianchi et al., 2020; Bergianti, 2025). Il consumo sostenibile implica soddisfare i bisogni umani fondamentali senza eccessi, ponendo l'accento sulla sostenibilità ambientale e sul benessere delle generazioni future (Quoquab e Mohammad, 2020). Questo approccio comprende scelte consapevoli sullo stile di vita, come preferire prodotti che limitano le emissioni di sostanze tossiche, praticare il riciclo e il riutilizzo per minimizzare i rifiuti e adottare uno stile di vita a basso impatto (Laroche et al., 2011; Spielmann, 2021). Leonelli et al. (2025) mostrano che i consumatori preferiscono acquistare prodotti sostenibili. Inoltre, scoprono che i consumatori non consultano direttamente i bilanci di sostenibilità per informarsi sulle iniziative sostenibili. Allora, in che modo i consumatori integrano la sostenibilità nelle loro decisioni di acquisto? Come riconoscono le informazioni ESG pertinenti per orientare le loro scelte? Queste domande sono importanti perché Leonelli et al. (2025) evidenziano che i consumatori incontrano diverse difficoltà nell'ottenere le informazioni ESG delle imprese. Tuttavia, una volta acquisite, tendono a integrarle nelle loro decisioni di acquisto.

Allo stesso tempo, le aziende si impegnano ad adottare pratiche sostenibili (Villela et al., 2019).

Cerchiamo di rispondere a queste domande esaminando se la certificazione sostenibile di terze parti stimoli gli acquisti dei consumatori da parte di aziende attente ai criteri di sostenibilità. Nel nostro studio analizziamo le variazioni nelle vendite conseguenti all'ottenimento della certificazione B Corp da parte delle aziende. Focalizzarsi su tali certificazioni è fondamentale per due motivi. Primo, è abbastanza facile per i consumatori riconoscere la certificazione, poiché le aziende certificate B Corp possono utilizzare un logo B Corp ben visibile sui loro prodotti. Ciò rende l'acquisizione di informazioni molto più semplice, poiché i consumatori non devono impegnarsi molto a cercare attivamente tali informazioni. Secondo, tali certificazioni esterne sottopongono le attività sostenibili a una valutazione approfondita, che conferisce una validazione sostanziale alle affermazioni di sostenibilità delle aziende. La certificazione B Corp si è affermata come uno strumento strategico per colmare l'asimmetria informativa tra le aziende e gli stakeholder (Parker et al., 2019; Paelman et al., 2021; Lepkowska-White et al., 2023).

Secondo la teoria dei segnali (Spence, 1973; Connelly et al., 2011), in mercati saturi di affermazioni di greenwashing, le certificazioni di terze parti agiscono come segnali affidabili e ad alto costo di qualità, che, teoricamente, dovrebbero generare premi di mercato e aumentare la fidelizzazione dei clienti (Parkinson, 1975; Elité e Teyssier, 2016).

[2] Professore ordinario, ECON-06/A, Università della Calabria; franco.rubino@unical.it – corresponding author

Usiamo un campione di aziende B Corp italiane in un panel che copre il periodo dal 2019 al 2023. L'Italia rappresenta un contesto empirico ideale, come hub europeo di primo piano, per il movimento B Corp. Sul piano metodologico, questo lavoro va oltre una mera correlazione. Utilizzando un modello a effetti fissi per controllare l'eterogeneità non osservata, testiamo la validità della teoria dei segnali nel contesto della sostenibilità.

I risultati empirici forniscono prove a sostegno dell'ipotesi del surplus di valore. Riscontriamo che la certificazione B Corp aumenta il volume di vendite, confermando la sua funzione di potente segnale di mercato. I nostri risultati si mantengono anche in diversi test di robustezza. Inoltre, mentre osserviamo un aumento marginale dei COGS, che riflette il costo tangibile di "pulire" il processo produttivo, questo è più che compensato dall'incremento del margine lordo di profitto. Ciò suggerisce che la certificazione permette alle aziende di aumentare il volume di vendita, superando i costi di sostenibilità. Infine, l'analisi dell'eterogeneità rivela un nuovo effetto di amplificazione urbana: l'impatto positivo sulle vendite è più marcato per le aziende situate in aree metropolitane ad alta densità, probabilmente a causa di una maggiore concentrazione di consumatori attenti alla sostenibilità.

Questo studio contribuisce alla letteratura esistente sulla sostenibilità aziendale e sulla performance finanziaria. Innanzitutto, va oltre l'analisi tradizionale della redditività netta (ROA/ROE) concentrandosi sull'efficienza operativa e sulla struttura dei costi. Decomponendo l'impatto finanziario in vendite, costi delle merci vendute e margine lordo, evidenziamo il trade-off specifico tra i costi di conformità e i benefici della differenziazione di mercato, confermando l'ipotesi di un surplus di valore. In secondo luogo, testiamo esplicitamente la teoria dei segnali nel mercato italiano, dimostrando che la certificazione B Corp funge da meccanismo chiave per ridurre l'asimmetria informativa e sbloccare i premi di mercato. In terzo luogo, scopriamo l'effetto di amplificazione urbana, aggiungendo un aspetto geografico all'analisi spesso trascurato negli studi precedenti. Infine, forniamo robuste evidenze empiriche dall'Italia, un importante hub del movimento europeo delle B Corp.

2. Stato dell'arte, quadro teorico e sviluppo dell'ipotesi

2.1. B Corps and B Corp certification

B Corp è una certificazione rilasciata alle aziende che adottano pratiche sostenibili (Ferraro et al., 2025). È accessibile a tutte le imprese a livello mondiale ed è gestita da B Lab, un'organizzazione non profit statunitense fondata nel 2006, tramite un questionario di 215 domande (B Lab, 2024). B Lab definisce le pratiche sostenibili per le aziende in cinque aree chiave: ambiente, lavoratori, comunità, clienti e governance (B Lab, 2024). Successivamente valuta quanto bene le aziende implementano queste pratiche attraverso la B Impact Assessment (BIA), che esamina le pratiche con impatto positivo sulla società e sull'ambiente (Blasi & Sedita, 2021). Per ottenere la certificazione, le aziende devono (i) ottenere almeno 80 punti su 200, (ii) impegnarsi legalmente a una governance degli stakeholder (dove consentito dalla legge nazionale) e (iii) divulgare pubblicamente le informazioni sull'impatto delle loro pratiche (B Lab, 2024).

L'interesse accademico per le B Corp è cresciuto negli ultimi anni. Le prime ricerche si sono focalizzate sugli aspetti motivazionali della certificazione (Hickman et al., 2014; Chen e Kelly, 2015; Kim et al., 2016; Diez-Busto et al., 2022), sottolineando il ruolo della leadership fondata sui valori e la distinzione nel mercato. Altri studi hanno esaminato le dimensioni di governance e di operatività, come la configurazione strutturale delle cinque aree di impatto (Gazzola et al., 2019), gli effetti longitudinali della certificazione (Villela et al., 2019) e i meccanismi di responsabilità orientati agli stakeholder (Nigri et al., 2020). Bianchi (2020) ha analizzato le motivazioni degli stakeholder nella scelta delle B Corps, evidenziando che le ragioni principali per supportarle sono: a) responsabilità sociale e ambientale, b) soddisfazione personale e c) salute e qualità della vita. Le performance ambientali e sociali sono state analizzate sia da una

prospettiva aziendale che settoriale. Liute e De Giacomo (2022) hanno utilizzato un framework triple bottom line per valutare le pratiche ambientali delle B Corps nel Regno Unito, mentre Cantele et al. (2021) hanno esaminato gli antecedenti organizzativi delle performance di sostenibilità. Anche la dimensione sociale ha ricevuto attenzione: Ardito et al. (2021) e Contreras et al. (2022) si sono focalizzati sull'equità di genere, sul comportamento innovativo e sulla cultura aziendale. Di recente, Boni et al. (2023) hanno esaminato come le B Corp contribuiscano agli Obiettivi di Sviluppo Sostenibile (SDGs) e hanno confrontato il loro impatto con quello delle imprese non certificate.

2.2. Certificazione B Corp e sales gap

Focalizzandosi specificamente sull'impatto della certificazione B Corp sulle performance finanziarie, le evidenze empiriche restano miste (Chen e Kelly, 2015; Romi et al., 2018; Gazzola et al., 2019; Parker et al., 2019; Richardson e O'Higgins, 2019; Paelman et al., 2021; Ferioli et al., 2022; Lee et al., 2023; Bringas-Fernandez et al., 2024).

Alcuni studi evidenziano un legame positivo. Gazzola et al. (2019) e Paelman et al. (2021) hanno riscontrato, rispettivamente, correlazioni positive con il reddito netto e con la crescita del fatturato, suggerendo che le aziende più sostenibili sono anche le più redditizie. Ferioli et al. (2022) hanno inoltre confermato una performance finanziaria superiore delle aziende certificate nel settore della moda in Italia. Chen e Kelly (2015) hanno analizzato la crescita dei ricavi delle B Corp e hanno riscontrato un aumento statisticamente significativo superiore alla crescita media delle aziende pubbliche dello stesso settore SIC, ma prive di certificazione. Tuttavia, non hanno riscontrato una differenza notevole nella crescita dei ricavi rispetto alle aziende private non B Corp.

Altri forniscono evidenze negative o neutrali. Parker et al. (2019) hanno studiato l'impatto della certificazione B Corp sui tassi di crescita a breve termine e hanno riscontrato un rallentamento della crescita, più pronunciato nelle aziende più piccole e più giovani. Tendenze simili sono state osservate da Pollack et al. (2021) e da Bringas-Fernandez et al. (2024), che hanno riportato rendimenti economici inferiori o l'assenza di differenze statisticamente significative tra le aziende certificate e quelle non certificate. La stessa tendenza è stata riscontrata da Richardson e O'Higgins (2019) e da Lee et al. (2023), i quali hanno concluso che, sebbene la certificazione produca risultati non finanziari positivi, le evidenze sull'impatto diretto sulle performance finanziarie sono scarse. Nonostante l'aumento della letteratura disponibile, rimane un divario significativo.

Al massimo delle nostre conoscenze, nessun studio ha indagato direttamente l'impatto della certificazione B Corp sulle performance di vendita delle aziende, tenendo conto anche di altri elementi, come il costo del venduto (COGS) e l'utile lordo (Gross Profit).

L'unica eccezione parziale è rappresentata dal lavoro di Romi et al. (2018), che ha analizzato se essere una B Corp influisce sulla produttività dei dipendenti e sulla crescita delle vendite. Per quanto riguarda il primo aspetto, non si è riscontrata una differenza significativa nella produttività dei dipendenti tra le B Corp e le altre aziende senza certificazione. Tuttavia, la produttività è significativamente più alta nelle B Corps, dove il trattamento dei dipendenti è riconosciuto come "un'area di eccellenza". In termini di crescita delle vendite, le B Corps mostrano tassi di crescita superiori rispetto ai loro omologhi tradizionali. In particolare, le B Corps che si distinguono per l'attenzione al consumatore registrano una crescita delle vendite notevolmente superiore. Il nostro studio mira a colmare questa lacuna analizzando se la certificazione funge da un efficace segnale di mercato che stimola le performance di vendita.

2.3. Quadro teorico e sviluppo dell'ipotesi di ricerca

Questo studio si basa sulla teoria dei segnali (Spence, 1973), che fornisce una spiegazione solida del perché le aziende divulgano volontariamente informazioni oltre i requisiti normativi (Salvi et al., 2021), in particolare per mitigare le asimmetrie informative tra gli insider (aziende) e gli outsider (consumatori e stakeholder). In mercati in cui la qualità del prodotto o gli attributi etici non sono osservabili, l'asimmetria informativa genera attriti (Salvi et al., 2021). Grazie alla crescente consapevolezza e all'informazione dei consumatori, le certificazioni sono diventate uno strumento utile per guidare le loro scelte d'acquisto. Le certificazioni rappresentano un importante veicolo di informazione, permettendo alle aziende di comunicare direttamente i propri valori e i propri metodi di produzione. Inoltre, la certificazione incoraggia le aziende a investire nella misurazione dell'impatto sociale, portando a decisioni più informate, a una maggiore credibilità e a esternalità positive di carattere sociale e ambientale (Paelman et al., 2021; Bringas-Fernandez et al., 2024).

Nel contesto della sostenibilità, le certificazioni di terze parti costituiscono un mezzo essenziale di comunicazione. Come osservato da Elité e Teyssier (2016), le certificazioni di terze parti sono significativamente più efficaci nel ridurre lo scetticismo rispetto alle affermazioni aziendali non supportate da prove. Inoltre, Rajgopal et al. (2025) affermano che la sostenibilità delle aziende spesso manca di sostanza economica ed è prevalentemente simbolica. Dal momento che la certificazione B Corp richiede una valutazione da parte di terzi, è importante focalizzarsi su di essa per assicurarsi che i risultati non siano influenzati dal greenwashing. Il rigoroso processo di valutazione richiesto da B Lab funge da 'segnale costoso', convalidando l'impegno dell'azienda nei confronti degli standard sociali e ambientali. Tale certificazione riduce l'asimmetria informativa sulla condotta etica dell'azienda, favorendo la fiducia dei consumatori e riducendo lo sforzo cognitivo necessario nelle decisioni di acquisto. Coinvolgendo un revisore esterno per verificare le proprie pratiche, le B Corps segnalano la loro qualità e affidabilità, il che, secondo la teoria, dovrebbe tradursi in un vantaggio competitivo sul mercato.

Partendo dal presupposto che la certificazione B Corp funge da segnale credibile di affidabilità, differenzia i prodotti e si allinea alla crescente consapevolezza dei consumatori, riteniamo che le aziende certificate registreranno prestazioni di vendita superiori. In particolare, la riduzione dell'asimmetria informativa dovrebbe favorire la preferenza dei consumatori e l'incidenza degli acquisti. Pertanto, formuliamo la seguente ipotesi:

H1: La certificazione B Corp ha un'influenza positiva sulle prestazioni di vendita di un'azienda.

3. Metodologia

3.1. Selezione del campione

Per verificare la nostra ipotesi, il campione include aziende B Corp italiane certificate in diversi settori entro dicembre 2023. Le aziende sono state selezionate dal sito ufficiale di B Lab, filtrando quelle con sede in Italia. Per garantire la coerenza dei dati in questa analisi, sono stati consultati anche i siti web delle aziende. Abbiamo raccolto i dati contabili e finanziari delle B Corp dai database di AIDA e di Moodie. In particolare, abbiamo considerato il periodo dal 2019 al 2023, dato che il 2019 è stato il primo anno in cui i dati sono stati resi disponibili. La raccolta si è fermata al 2023 perché, al momento della raccolta, molte aziende non avevano ancora dati per il 2024. Alla fine del 2023, in Italia c'erano 243 B Corps. Il nostro dataset inizia con 221 B Corp. Abbiamo scelto le B Corp italiane perché l'Italia è stata il primo paese europeo ad adottare la legge sulle Benefit Corporation, con la Legge di Stabilità n. 208 del 28 dicembre 2015. Le aziende che perseguono la certificazione B Corp entro tre anni devono anche diventare benefit corporation, se non lo sono già.

3.2. Specificazione del modello e variabili di misurazione

Per testare la nostra ipotesi, eseguiamo la seguente equazione di regressione (OLS):

$$(1) \quad Sales_{i,t} = \beta_0 + \beta_1 BCorp_{i,t} + \beta_2 ROA_{i,t-1} + \beta_3 Size_{i,t} + \beta_4 Tangibility_{i,t} + \beta_5 CR_{i,t} + \beta_6 \frac{D}{E_{ratio_{i,t}}} + e_{i,t}$$

La variabile dipendente, Vendite, rappresenta il fatturato netto annuale rapportato alle attività totali. Moody's Analytics definisce le vendite come il totale dei ricavi generati dalle attività operative dell'azienda (fatturato netto).

In analisi aggiuntive, abbiamo utilizzato misure alternative: l'utile lordo (Gross Profit - GP) e il costo del bene venduto (Cost of Goods Sold - COGS). La prima rappresenta la redditività lorda dell'azienda prima di spese operative, interessi e tasse. I COGS sono i costi diretti sostenuti per produrre i beni o servizi venduti dall'azienda.

La nostra principale variabile di interesse è B Corp: è uguale a 1 per gli anni successivi all'ottenimento della certificazione B Corp da parte di un'azienda e a 0 prima di allora.

Includiamo diverse variabili di controllo.

Controlliamo il ROA ritardato (ROA), definito come l'utile prima delle voci straordinarie rapportato alle attività medie, poiché la redditività dell'anno precedente potrebbe influenzare le vendite dell'anno corrente (ad esempio, le perdite dell'anno precedente potrebbero indurre le imprese a spingere di più sulle vendite attraverso la deflazione dei prezzi, come evidenziato da Roychowdhury nel 2006). Inoltre, le aziende più redditizie potrebbero avere opportunità di investimento migliori (Heras-Saizarbitoria et al., 2011; Bose et al., 2022), che potrebbero generare vendite più elevate.

La dimensione (Size) è il logaritmo naturale delle attività totali dell'azienda. Le grandi aziende sono probabilmente soggette a una pressione maggiore per investire in pratiche sostenibili, data la loro maggiore disponibilità di risorse (Arora et al., 2021).

La tangibilità (Tangibility) è il rapporto tra gli impianti, le proprietà e le attrezzature nette di un'azienda e il suo totale delle attività. Campello (2007) dimostra che la tangibilità degli asset può influenzare le vendite in determinate condizioni.

CR (Current Ratio) sta per rapporto di liquidità ed è calcolato come attività correnti divise per passività correnti.

Il rapporto D/E indica il rapporto tra il debito totale e il capitale proprio (D/E Ratio) e rappresenta la proporzione di finanziamento dell'azienda proveniente dal capitale di debito rispetto al capitale proprio.

Appendix A elenca le definizioni di tutte le variabili. Includiamo gli effetti fissi per firm, year e clusterizziamo gli standard errors a livello aziendale (company level). Winsorizziamo le variabili continue ai livelli del 1% e del 99%.

4. Risultati e discussioni

La Tabella 1 presenta i risultati delle statistiche descrittive relative alle variabili utilizzate nel nostro studio.

Nel Panel A, presentiamo le statistiche riassuntive delle variabili chiave sull'intero campione. Come mostrato nella tabella, la variabile dipendente – Vendite – ha una media dell'1,041%, indicando vendite generalmente positive nelle B Corps. Inoltre, la principale variabile indipendente, B Corp, ha una media di 0,659. Infine, per quanto riguarda le variabili di controllo, ROA, Dimensione, Tangibilità, CR e D/E Ratio hanno valori medi rispettivamente di 4,539%, 15,789%, 0,156%, 1,880% e 1,459%.

Il panel B fornisce statistiche descrittive separatamente per le B Corp non ancora certificate e per le stesse B Corp certificate, utilizzando le differenze del test t univariato. Si osserva che la B Corp certificata ha una media di vendite più alta (1,095%) rispetto a quando non era certificata

(0,936%). Le B Corp certificate presentano anche valori più elevati di ROA e Dimensione – rispettivamente 5,338% e 15,875% – rispetto a quelli registrati prima della certificazione. Al contrario, le B Corp certificate hanno un rapporto D/E inferiore (1,377%) rispetto a quello prima della certificazione (1,617%).

Panel A: Statistiche riassuntive

La tabella sopra riporta le statistiche riassuntive relative alle variabili chiave utilizzate nel nostro studio. Tutte le variabili sono definite nell'Appendice A e sono state winsorizzate ai livelli dell'1% e del 99%.

Panel B: Univariate (t-test) differences

Variable	N	Mean	Median	Std Dev	Min	Max	p25	p75
SALES	520	1.041	0.931	0.665	0.206	2.263	0.627	1.296

Tangibility	520	0.156	0.077	0.168	0.003	0.471	0.021	0.265
CR	520	1.880	1.510	1.271	0.625	4.107	1.143	2.304
D/E Ratio	520	1.459	0.625	2.723	0.015	5.300	0.220	1.495

	Pre-Certification		Post-Certification			
Variables	N	Mean	N	Mean	Diff	t-stat
SALES	177	0.936	343	1.095	-0.159	-2.601
Size	177	15.621	343	15.875	-2.255	-1.264
Tangibility	177	0.156	343	0.152	0.012	0.785
CR	177	1.965	343	1.837	0.128	1.093
D/E Ratio	177	1.617	343	1.377	0.239	0.950

La tabella sopra fornisce statistiche descrittive distinguendo le aziende certificate B Corp e le aziende non certificate. Tutte le variabili sono definite nell'Appendice A e sono state winsorizzate ai livelli dell'1% e del 99%.

Tabella 1. Statistica Descrittiva

La Tabella 2 riporta la correlazione di Pearson. Le due misure, Vendite e B Corp, sono significativamente e positivamente correlate. I risultati univariati sopra forniscono una prima evidenza che la certificazione B Corp influisce positivamente sulle vendite delle aziende. Poiché B Corp è la nostra variabile principale, i risultati indicano che la certificazione B Corp funge da segnale di fiducia per i consumatori, influenzando positivamente le vendite. Per quanto riguarda l'analisi di correlazione, i risultati mostrano che la multicollinearità non costituisce un problema. Il coefficiente di correlazione più forte si osserva tra le variabili di controllo Tangibilità e Dimensione, pari a 0,408. Gujarati (1995) e Kennedy (1999) suggeriscono che i problemi di multicollinearità non si verificano quando il coefficiente di correlazione è inferiore a ±0,8 o ±0,9. Inoltre, nella Colonna 2, abbiamo valutato la potenziale multicollinearità utilizzando l'analisi del fattore di inflazione della varianza (VIF). La multicollinearità è considerata irrilevante quando i

valori di VIF sono inferiori alla soglia critica di 10 (Gujarati, 1995). Il valore più alto è rappresentato dalla variabile Dimensione (8,33). In un test di robustezza, abbiamo rimosso la variabile di controllo Dimensione e ottenuto risultati simili. Pertanto, si può concludere che la multicollinearità non costituisce un problema nell'interpretazione dei risultati di questo studio.
La tabella 2 presenta le correlazioni di Pearson tra le variabili chiave utilizzate nel nostro studio. Inoltre, la Colonna 2 riporta il fattore di inflazione della varianza. Tutte le variabili sono definite nell'Appendice A. Sono state winsorizzate ai livelli del 1% e del 99%.

Tabella 2. Matrice di correlazione di Pearson e VIF

La Tabella 3 presenta i risultati dell'equazione di regressione principale (1). Evidenzia una relazione positiva e statisticamente significativa tra le aziende con certificazione B Corp e le loro

Variables	**VIF**	**SALES**	**BCorp**	**ROA**	**Size**	**Tang**	**CR**	**D/E**
SALES		1						
BCorp	2.97	**0.114**	1					
ROA	1.16	**0.237**	**0.079**	1				
Size	8.33	**-0.314**	0.055	**-0.089**	1			
Tang	2.28	**-0.147**	-0.034	0.006	**0.408**	1		
CR	3.53	-0.029	-0.048	**0.159**	-0.025	**-0.223**	1

vendite. La colonna 1 mostra i risultati senza variabili di controllo (Coefficiente su B Corp = 0,088**), mentre la colonna 2 mostra i risultati del modello di regressione completo (Coefficiente su B Corp = 0,142***). Entrambe le colonne confermano l'ipotesi formulata in questo studio. Questo risultato illustra come le aziende che ottengono la certificazione B Corp siano in grado di raggiungere un livello di vendite superiore. Questo risultato si allinea anche con ricerche precedenti che dimostrano come, grazie alla certificazione B Corp, le aziende ottengano migliori performance finanziarie e redditività (Gazzola et al., 2019; Paeleman et al., 2021; Ferioli et al., 2022). A differenza di studi precedenti, abbiamo utilizzato le vendite anziché il ROA o altre misure di redditività, poiché si tratta di effetti indiretti o risultati. Inoltre, possono essere più suscettibili a manipolazioni contabili. Tuttavia, le vendite sono meno soggette a manipolazioni e sono direttamente collegate alla sostenibilità. I risultati, in linea con la teoria del segnale, dimostrano che la certificazione B Corp funge da segnale costoso che le aziende usano per attrarre i consumatori e comunicare informazioni sulle proprie pratiche sostenibili. Una comunicazione aggiuntiva con i consumatori riduce l'asimmetria informativa tra aziende e consumatori, consentendo alle aziende di coinvolgere un numero maggiore di clienti. Di conseguenza, i consumatori tendono a preferire i prodotti e i servizi certificati rispetto a quelli non certificati.

La tabella 3 mostra l'impatto della certificazione B-Lab sulle vendite dell'impresa, secondo l'equazione di regressione (1). La colonna (1) presenta i risultati senza includere le variabili di controllo, mentre la colonna (2) mostra i risultati del modello di regressione completo. Tutte le variabili sono definite in Appendice A. Sono stati inclusi effetti fissi per impresa e per anno, e gli errori standard sono stati raggruppati a livello di impresa. Tutte le variabili continue sono state trattate mediante la winsorizzazione ai livelli del 1% e del 99%. ***, ** e * indicano rispettivamente significatività statistica al livello del 99%, 95% e 90%.

Tabella 3. L'impatto della certificazione B Corp sulle vendite delle aziende

Per sostenere la nostra tesi iniziale, sono già stati eseguiti alcuni test di robustezza e ne sono previsti altri in futuro.

Abbiamo condotto un'analisi aggiuntiva decomponendo la variabile dipendente Vendite nei suoi due componenti principali: Margine Lordo (ML) e Costo delle Merci Vendute (CMV). Questa decomposizione ci permette di capire se l'aumento delle vendite è principalmente guidato da un 'effetto markup' (prezzi più alti) o da un 'effetto volume' (aumento della produzione e delle quantità vendute). I risultati, mostrati nella Tabella 4, Sezione A, indicano un'associazione positiva e significativa tra la certificazione B Corp e sia il CMV (Coefficiente su B Corp = 0,017*) sia il ML (Coefficiente su B Corp = 0,117***). La decomposizione delle vendite in ML e CMV offre un'analisi interessante sul trade-off tra costi e benefici della sostenibilità. Innanzitutto, confrontando i coefficienti per il CMV, si osserva una riduzione di entità dal periodo pre-certificazione (Tabella 5, Sezione B, Coefficiente su B Corp = 0,036***) al periodo post-

certificazione (Coefficiente su B Corp = 0,017*). Questa traiettoria suggerisce che il costo è più elevato durante la fase preparatoria, in cui le aziende investono intensamente per aggiornare le filiere e i processi per rispettare gli standard rigorosi di B Lab. Una volta certificate, le aziende sembrano raggiungere una stabilizzazione operativa o beneficiare di economie di scala, poiché l'aumento del volume di vendite diluisce l'incidenza dei costi di produzione sostenibile. In secondo luogo, e più importante, l'impatto post-certificazione sul ML (Coefficiente su B Corp = 0,117***) è proporzionalmente maggiore rispetto all'impatto sul CMV (Coefficiente su B Corp = 0,017*). Questa differenza indica che la certificazione B Corp genera un surplus di valore. Di conseguenza, i guadagni di fatturato derivanti dall'effetto markup e dalla crescita del volume superano i costi incrementali.

Questa scoperta mette in discussione la visione tradizionale della sostenibilità come un costo netto, dimostrando invece che, per le B Corp, l'efficienza nel catturare valore supera il costo di conformità. Questa conclusione ha importanti implicazioni teoriche per la teoria dei segnali. Sebbene le pratiche sostenibili comportino un aumento marginale dei costi operativi, la certificazione funge da segnale di mercato che sblocca un maggiore potere sui prezzi per le aziende e, di preferenza, per i consumatori. Ciò si allinea a quanto rilevato da Bianchi et al. (2020), secondo cui i valori sociali e ambientali dei consumatori sono i principali driver dell'aumento della spesa e della preferenza per le B Corp.

R-squared	0.006

La tabella sopra mostra i risultati di un'analisi aggiuntiva in cui sostituiamo e scomponiamo le nostre vendite dipendenti. In particolare, nel Panel A, esaminiamo il Costo del Venduto (COGS) nella Colonna 1 e il Margine Lordo (GP) nella Colonna 2. Il Panel B si concentra sul COGS delle aziende prima della certificazione. Tutti i modelli includono variabili di controllo, che non sono elencate per brevità. Tutte le variabili sono definite nell'Appendice A. Consideriamo gli effetti fissi e raggruppiamo gli errori standard per impresa. Winsorizziamo tutte le variabili continue ai livelli del 1% e del 99%. ***, ** e * indicano rispettivamente significatività statistica al livello del 99%, del 95% e del 90%.

Tabella 4. Analisi Aggiuntive

Infine, si indaga sull'effetto della certificazione B Corp in diverse aree geografiche italiane. Concentrandosi su aziende situate in aree metropolitane altamente popolate come Roma, Milano e Napoli, si riscontra un coefficiente pari a 0,172** (Tabella 5, Panel A), superiore in magnitudine rispetto a quello del modello di base (Coeff. su B Corp = 0,142***). Sebbene la significatività statistica si limiti al livello del 5% ($p < 0,05$), probabilmente a causa della ridotta dimensione del campione nel cluster urbano, l'entità economica più elevata fornisce un insight cruciale. Suggerisce che la certificazione B Corp agisca come un motore di mercato più forte nelle grandi città. Ciò si allinea con il concetto di ambienti urbani che concentrano una quota maggiore di consumatori con preferenze pro-sociali e potere d'acquisto (Laroche et al., 2001). Le reti informative più dense nei centri metropolitani favoriscono la diffusione del segnale di sostenibilità, aiutando le aziende certificate a ottenere un riconoscimento reputazionale superiore alla media nazionale.

Panel A: Concentrandosi solo sulle regioni che ospitano le tre città più popolose: Roma, Milano e Napoli.

Il Panel A evidenzia l'impatto delle B Corp sulle vendite nelle tre città più popolose italiane: Roma, Milano e Napoli. Il Panel B mostra l'impatto della certificazione B Corp sulle vendite di tutte le B Corp, escludendo quelle nelle tre città più popolose. Tutti i modelli includono variabili di controllo, che non sono elencate per brevità. Tutte le variabili sono definite nell'Appendice A. Sono stati applicati effetti fissi e gli errori standard sono stati raggruppati a livello aziendale. Abbiamo winsorizzato tutte le variabili continue ai livelli del 1% e del 99%. ***, ** e * indicano rispettivamente significatività statistica ai livelli del 99%, 95% e 90%.

Tabella 5. Cross-Sectional test

5. Limiti della ricerca

La principale limitazione riguarda la composizione del campione, che comprende solo le B Corps italiane, riducendo la generalizzabilità dei risultati e rendendo difficile trarre conclusioni per altre regioni. Tuttavia, queste limitazioni non compromettono la qualità complessiva dello studio e offrono spunti preziosi per future ricerche. Infatti, studi futuri potrebbero includere B Corps di altri paesi. Riconosciamo che il nostro modello di regressione esclude variabili di controllo che ricerche precedenti su aziende quotate in borsa hanno incorporato. Dato che il nostro campione è composto da imprese private, le analisi sono limitate dai dati disponibili nei database AIDA e Moodie. Pur riconoscendo questa limitazione, riteniamo che i nostri risultati offrano un contributo nuovo e prezioso alla letteratura sulla sostenibilità e sulle organizzazioni ibride.

Appendice A: Variabili

NOMI DELLE VARIABILI	DEFINIZIONI
B CORP	Indicator variable equal to one starting the year a company receives the B Corp certification and zero before that.
SALES	Total sales scaled by total assets.
COGS	A firm's Cost of Goods Sold, scaled by total assets.
GP	A firm's Gross Profit, measured as the company's gross profitability scaled by total assets
CR	Current Ratio, calculated as current assets divided by current liabilities.
ROA	Return on Assets, calculated as Net Income scaled by average assets.
SIZE	Natural logarithm of the firm's total assets.
TANG	Tangibility, it refer to net plant, property and equipment scaled by total assets.
D/E	**Total Debt scaled by total Equity**

Developing Patient Engagement KPIs for Performance Management in Primary Healthcare Setting: A Digital-Driven Framework

Giulia Cattafi[1], Monica Giancotti[2], Marianna Mauro[3], Giorgia Rotundo[4]

1. Background and Conceptual Development

Performance measurement represents a strategic cornerstone for public healthcare organizations, as it supports continuous improvement, accountability, and evidence-based decision-making. Yet, "what cannot be measured cannot be improved," and in the domain of primary healthcare this principle has critical implications. Recent empirical evidence from Italian Local Health Authorities (LHAs) indicates a marked scarcity of robust patient engagement (PE) key performance indicators (KPIs) within performance plans, and where such indicators exist, they are often generic, inconsistently defined, or disconnected from established conceptual domains.

This gap is particularly problematic because patient engagement—encompassing cognitive, behavioural, and emotional dimensions—has been widely recognized as a determinant of care quality, adherence, self-management, and ultimately system-level sustainability. In the transition toward digital-era governance, the integration of PE metrics within performance management systems requires not only conceptual clarity but also reliable, standardized measurement tools, supported by digital technologies capable of enabling real-time data collection and monitoring.

2. Aims

This research-in-progress aims to:

- address the current measurement gap observed in LHA performance plans by offering a structured, actionable set of PE KPIs for primary healthcare, grounded in the three core domains of patient engagement (cognitive, behavioural, emotional), capable of supporting performance evaluation and strategic decision-making;
- design a digital-enabled measurement model identifying data sources, collection methods, and digital tools necessary for monitoring such indicators over time.

3. Methodological Framework

The study adopts a sequential mixed-methods design.

- Phase 1 – Systematic Document Analysis (completed):

Building on prior analysis of all 110 Italian LHAs' performance plans, we confirm the limited and inconsistent presence of PE-related indicators. Indicators were extracted, categorized,

[1] Post-doctoral Researcher, ECON-06/A, Magna Graecia University; giulia.cattafi@unicz.it

[2] Researcher, ECON-06/A, Magna Graecia University; mgiancotti@unicz.it – corresponding author

[3] Full Professor, ECON-06/A, Magna Graecia University; mauro@unicz.it

[4] Post-doctoral Researcher, ECON-06/A, Magna Graecia University; grotundo@unicz.it

and mapped against existing PE frameworks, highlighting substantial conceptual and operational fragmentation.

- Phase 2 – Conceptual Development of PE KPIs (ongoing):

A structured literature review and expert consultations are being used to define a preliminary set of PE indicators aligned with: Cognitive engagement (awareness, health literacy, informed decision- making); behavioural engagement (adherence, self-management behaviours, proactive use of services), emotional engagement (satisfaction, relational continuity).

- Phase 3 – Digital-Driven Measurement Model (ongoing):

To ensure feasibility and real-time applicability, each KPI will be associated with: specific digital data sources (mobile apps, electronic health records), collection processes (patient-reported digital surveys), and monitoring dashboards enabling continuous performance assessment.

This phase leverages digital-era governance principles (interoperability, real-time data flows, user- centric systems) to enhance the measurability and utility of PE indicators.

4. Expected results

The project is expected to deliver:

- a validated set of PE KPIs explicitly linked to the cognitive, behavioural, and emotional domains;
- a digital monitoring framework demonstrating how these indicators can be systematically collected and integrated into primary healthcare performance management and measurement systems;
- a practical roadmap for LHAs to incorporate PE metrics into performance plans, strengthening patient-centered governance;
- insights into barriers and enablers related to data availability, standardization, and organizational digital maturity.

Preliminary evidence confirms the urgent need for standardized, patient-centred indicators capable of capturing how public healthcare organizations engage, inform, and empower patients. The proposed framework aims to bridge the gap between policy ambitions of patient-centeredness and the operational reality of performance measurement.

5. Contribution

This research advances the debate on patient-centered performance management by providing:

- a conceptually grounded and operationally feasible KPI system;
- an explicit integration of digital technologies into PE measurement;
- and a scalable model that can inform national strategies and organizational practices in primary healthcare.

By offering measurable, digital-enabled KPIs, this study supports the evolution of primary care toward more transparent, accountable, and patient-engaging performance systems.

6. Author Contribution

Marianna Mauro and Monica Giancotti conceived and designed the research project. Giulia Cattafi and Giorgia Rotundo were responsible for the extraction of performance plans of Italian Local Health Authorities (LHAs) and conducted the first phase of document analysis aimed at identifying patient engagement indicators (Phase 1 – Systematic Document Analysis). Monica Giancotti led the conceptualization and development of the study results, with particular reference

to the definition of patient engagement KPIs (Phase 2 – Conceptual Development of PE KPIs). All authors are jointly involved in the ongoing development of the digital-driven measurement framework (Phase 3 – Digital-Driven Measurement Model). The writing of the extended abstract is the result of a collaborative effort among all authors.

Keywords: Patient engagement; key performance indicators; performance management; primary care

Addressing SDGs unintentionally while managing the COVID-19 crisis: Insights from Italian Healthcare

Benedetta Siboni[1], Paola Canestrini[2], Abeer Hassan[3]

1. Introduction

Including SDGs in the organisations' management and accounting allows decision-makers and managers to effectively account for which dimensions of well-being they affect and contribute. Thus, in the last decade many organisations have engaged with the SDGs within their practices (Bebbington, Unerman, 2020) and attempts to account for and be accountable for environmental and social impacts have proliferated, accompanied by intellectual efforts of scholars (Laine et al., 2022).

Health providers hold decisive characteristics for SDGs achievement as they act on the community's health and beyond. Indeed, their public action impact at the spatial level, addressing the needs of different stakeholders, and at the inter-temporal level, affecting the citizens' health of today but also of tomorrow (Gherardi et al., 2021). Moreover, they contribute to reducing inequalities between territories, moving and employing many people, addressing gender and diversity issues, developing advanced technologies, producing non-recyclable waste and cooperating within a vast stakeholder network. The health sector already uses non-financial measurement systems to plan and assess its objectives (Mitchell et al., 2021) and accounting scholars show that the rewriting of accounting practices in this sector has already begun, supported by new frameworks of social and moral responsibility (Vesty et al., 2023). However, as stated by Cavicchi et al. (2022), SDGs engagement in this sector is recent, and the management and accounting literature on this topic has not yet flourished. The few existing studies (e.g. Busco et al., 2020) affirm that the health sector generally addresses Goals No. 3 (health and well-being), No. 4 (quality education), No. 5 (gender equality), No. 8 (decent work and economic growth), and No. 9 (industry innovation and infrastructure). Notwithstanding, little is known if the health sector explicitly pursues SDGs. Moreover, despite SDGs are increasingly relevant in healthcare accountability, they are still weakly embedded in strategic planning, management accounting, and reporting (Cavicchi et al., 2022).

Worldwide, the COVID-19 pandemic represented a disrupted progress toward the SDGs (Parker, 2020), and it intensified accountability demands (urgency, resource reallocation, legitimacy pressures). According to Hörisch (2021), the pandemic posed a significant threat to attaining the SDGs, yet it also presents certain opportunities within specific SDG domains. The author discerns patterns indicating the opportunities or threats associated with various SDGs. The identified patterns shed light on the SDGs requiring additional efforts for achievement in the aftermath of the pandemic. In these circumstances, accounting for health providers has become increasingly visible and contested during the pandemic health crisis, hence requiring a shift from

a technical practice to one that embraces social and moral values (Vesty et al., 2023). Indeed, the pandemic has been defined as a wicked problem, characterised by dramatic, inconsistent, unpredictable and uncertain events – turbulent times –generating a complex and constrained context featuring high levels of complexity, uncertainty and divergence, often caused by information scarcity and data-related problems (Phillips et al., 2023), whereby resolving one aspect develops other issues and inhibits planning strategies to prevent adverse outcomes. In addition, a wicked problem is characterised by a conflict about the values involved and disagreement about the possible solutions or principles that should guide improvements (Head, 2022) or different positions to accommodate (Warner et al., 2021). In this context, the SDGs lens helps navigate the complexity and adverse effects experienced during grand challenges, as the COVID-19 pandemic has been defined (Carnegie et al., 2023; Rinaldi, 2022). However, applying the SDGs lens to wicked problems is often scant in empirical research, especially when dealing with health issues (e.g. Bennich et al., 2020). Furthermore, the actions for achieving the organisation's objectives do not often consider the interactions between the SDGs, thus missing the holistic sense of the UN's SDGs 2030 Agenda (Nilsson et al., 2016).

Considering these gaps, the current research aims to investigate the SDGs engagement of Italian healthcare providers from the planning phase during and after the COVID-19 pandemic. Research questions (RQs) are:

- RQ1: Do healthcare organisations' crisis management and return-to-normalcy decisions relate to multiple SDGs? And if so, how?
- RQ2: Do and how interconnections, synergies, and trade-offs among SDGs emerge through these decisions?
- RQ3: Are managers aware of the SDG-related consequences of their actions?

To answer these RQs we refer to the Emancipatory Accounting Theory (EAT), considering accounting as socially and morally embedded practice (e.g. Carnegie et al., 2023) and the potential for unintended emancipatory outcomes. Through a multiple case study applying qualitative methods (group interview and documentary analysis), the paper explores the variety of SDGs addressed by a sample of Italian health providers in managing the health crisis and normalcy return planning.

Given that accounting must be empirically studied in the contexts in which it operates (Carnegie et al., 2023), this research considers Italy as one of the first countries intensely touched by the virus (Worldometer, 2020), hence experimenting a situation of great complexity, intense uncertainty and dynamism which prevented from identifying linearity between solutions and consequences, predicting present and future effects, in a context of contrast between important values essential for the survival of human beings (i.e., closures to protect the health of vulnerable people vs. continuation of commercial activities).

Our paper offers an original and innovative contribution to advancing understanding of SDG engagement among health providers, addressing a gap that, to our knowledge, has not been explored in prior research. Its significance lies in its potential to shape scholarly thinking, inform knowledge development, and enhance policy and practice related to SDG engagement in healthcare and beyond. The study is rigorous, employing robust and appropriate concepts, analytical approaches, theoretical frameworks, and methodologies.

2. Theoretical framework

Recent research stressed the multidimensionality of the accounting practice, however, adding a social and moral responsibility nuance (Carnegie et al., 2023). Given that accounting is not neutral or impersonal but results from a human operation, its processes display a plurality of

values and interests involved in the organisations' decisions. Indeed, it discloses or hides the prioritisation of values and groups of beneficiaries of certain services, goods and treatments and others who are excluded. It can reveal conflicts and compromises, but it's still about choosing what to give visibility to (Grossi et al., 2023).

Prior SDGs accounting research applies various theories to explain organisations' viewpoints, including, for example, impression management (Boiral, 2016), greenwashing (Hassan et al., 2020) and legitimacy (Adler et al., 2018). However, the lack of a comprehensive theoretical model cannot motivate organisations to identify a strategy to deal with UNSDGs. Therefore, this paper contributes to the debate and introduces emancipatory accounting theory (EAT).

EAT supports that power relations in society have an influence on how things are understood (Field, 2018). Hence, this theory foresees to enhance the participation of other sectors of society, who would otherwise not participate in decision-making (Xolislie and Bekithemba, 2021). It promotes equality and equity in all its forms, advocates social justice, freedom, peace and team spirit, and changes people's hearts and minds (Foulger, 2010) it is essential to set conditions necessary to emancipate people to confront the lived realties.

Notably within the realm of accounting discourse the EAT studies of Tinker (1984, 1985) recognize an actual accounting indications that has focus on social influence. EAT can reflect the concern, through communication and democratic practice, to align diverse progressive interests, identities and projects. Therefore, any accounting is understood to encompass both emancipatory and oppressive dimensions and these and their relative influence can change so that accounting can become more (or less) emancipatory (e.g. Brown et al., 2015; Gallhofer et al., 2015; Dillard et al., 2016). The recent study of Martinez and Himick, (2023) reinforce the concept by explaining that accounting's emancipatory is about revealing the inner working of a dominant system and the conflicts that it glosses over by rethinking the fundamental theoretical foundations of accounting and society.

Many recent studies discussed the possibility of adopting EAT in social/nature accounting. These studies support the idea that the emerging area of social accounting research provides an excellent starting point for developing a more refined emancipatory tool: a pragmatic means of social as well as a theoretical construct which is not entirely grounded in a critical discourse (Galhofer and Haslam, 2019; Maroun and Atkins, 2018).

In this study, we are joining the same debate to bring this literature into analysing ways in which social accounting can be framed to address UNSDGs. We believe that social accounting that provides details on how organisations are taking a dynamic approach to conservation could, potentially, lead to ecological and environmental improvements that leads to the implementation of EAT. In doing so, we are addressing the research gap highlighted by Cuckston (2018) that is more studies that searches for emancipatory elements and behaviours is necessary to isolate best practice and define examples that companies can follow. Indeed, further work is needed in reporting practices to explore and develop stronger theoretical frameworks that can lead to transformational activities, which we suggest in our current study.

3. Research method

3.1. Institutional setting and sample (IRCCSs)

Italian public health is guaranteed by the National Health Service (NHS), whose health care and research driving force are the IRCCSs (Istituti di Ricovero e Cura a Carattere Scientifico). IRCCSs are hospitals of excellence with a peculiar characteristic that also distinguish them from each other: each IRCCS specialises in a single disciplinary field (mono-thematic IRCCS) or

integrates several fields (poly-thematic IRCCS). To date, in Italy there are 53 IRCCS: 23 are public institutes, while 30 are private.

IRCCS have been essential in assistance, research and knowledge sharing during the COVID-19 emergency (January 2020-March 2022), innovating research and health care during the pandemic. Indeed, in 2020, the central government funded them with 7 million euros to advance knowledge on the virus, treatments and vaccines (Italian Ministry of Health, 2020). Thus, the pandemic has accentuated their pre-eminent position in the NHS.

This paper explores the presence of SDGs in strategic decisions and planned activities undertaken by a sample of three IRCCS for COVID-19 management and normalcy return. The IRCCS studied are based in the same region (Emilia Romagna), which is considered a benchmark and comparable to many Central/Northern European regions while being one of the early and substantially impacted by the pandemic. The IRCCS studied are the Polyclinc of Sant'Orsola (PSO), the Rizzoli Orthopaedic Institute (ROI) and the Romagna scientific Institute for the Study and treatment of Tumors (RIST). They have been chosen because located in the same territorial basin hence sharing the same regional regulatory context as well as representing the diversity of such institutes based on legal form, specialisation, size, etc. The first is a public university hospital, an example of large and poly-thematic IRCCS (specialised oncohematology and transplants). The last two represent stand-alone and mono-thematic IRCCSs of different sizes operating in diverse areas. Specifically, ROI is public and specialised in orthopaedics and traumatology, while RIST is private and specialised in tumours.

3.2. Data source and analysis

The current research applies two qualitative methods to analyse the SDGs' presence in pandemic management and normalcy return planning in the IRCCSs: a semi-structured group interview with the sample of IRCCSs (PSO, RIST and ROI) and a documentary analysis of the performance plans of PSO and ROI (RIST is private hence have no obligation to publish a performance plan). The research adopts Yin's (2014) six-stage case study process (plan, design, prepare, collect, analyse, and share) to ensure scientific rigour and justify the findings.

Sampling was not expanded to other IRCCS based on the conceptual density or sufficiency principle, whereby data collection stops when it reaches a sufficient or adequate depth of understanding to satisfy the research design's hypotheses and grasp the phenomenon's complexity (Nelson, 2016). This concept favours the quality of the data collected (their richness, depth, diversity and complexity), over the quantity of data collected (Fusch, Ness 2015). Hence, an 'across-method triangulation' has been applied as a combination of different techniques on empirical units, so that the defects of one technique become the strengths for the application of the other (Denzin, 1970). Data collected by different methods and researchers enhance results triangulation, which allows different outputs to be reached, whose merger strengthens the validity of the findings (Bloor, 2001).

The group interview involves the Chief Executive Officers (CEOs), who are in the best position to disclose strategic and managerial decisions (Caldarelli et al., 2013). The interviews were conducted in a group context in a formal setting, following an interview guide (Qu and Dumay, 2011), using a structured question format that have been developed using prior studies. Interviews enable researchers to understand the interviewees' experiences and viewpoints (Rowley, 2012). A group interview is a research technique that collects data from a group of people interacting with the moderator on a predetermined topic. This technique acknowledges the researcher's active role in creating the group discussion for data collection purposes (Morgan, 1996). The circular discussion allows for managing all points of view, guaranteeing time savings

(Qu & Dumay, 2011). The interview guide does not expressively address the SDGs for not conditioning the answers. It explored (a) the activities decisive in tackling the health emergency and the main criticalities, (b) the lessons learned between the first phase of the emergency management and subsequent ones, (c) the strategic directions to face the pandemic evolution and to deal with further emergencies in the future and (d) the role IRCCSs will play in National Recovery and Resilience Plan implementation and within the future NHS setup.

The group interview took the form of an online round table carried out on the 24th of September 2021 and lasted 1 hour and 10 minutes in an event open to citizens within an academic initiative to bring research and civil society closer. The discussion was transcribed and sent to interviewees for validation. Then, the authors proceeded with the manual thematic analysis of the transcripts, identifying (i) the interventions implemented during the health crisis and the subsequent phases, (ii) their consequences on the macro-micro level and (iii) SDGs interconnections.

The documentary analysis identifies the SDGs in the strategic decisions and planned activities envisaged by the institutes after the COVID-19 outbreak for normalcy return planning in the performance plans of the two public IRCCSs. Derived from the ad-hoc method mapping SDGs into policies of the EU Commission (see Miola et al., 2019, p. 21), it verifies whether PSO and ROI decisions and activities can be connected to the 169 targets of the 17 SDGs, considering their missions as research hospitals.

Documentary analysis permits observing the type of information disclosed, dealing with and quantifying a large volume of qualitative information. Indeed, it focuses on the quantity of observed characteristics within a text and enables the interpretation and contextualisation of meanings (Bowen, 2009). The current study considers the performance plans published by PSO and ROI on their website for the 2021-2023 triennial, which is the period immediately following the COVID-19 outbreak. They articulate strategic decisions in four performance dimensions: health care, internal process, research, and economic sustainability.

The documentary analysis requires understanding the meaning of the performance plans content, assigning the appropriate SDG targets and identifying the type of information disclosed. The single observation of a target corresponds to a Goal cited in the performance plans. Hence, it derives the identification of the SDGs present in the performance plans and the frequency count.

Both the analysis of the interviews and PPs presuppose a subjective interpretation by the analyst to link the text content with the SDGs. An exact match has not been sought, but it has been considered that the IRCCSs alone cannot, for example, solve hunger in the world or create partnerships for global development explicitly aimed at developing countries as prescribed by some of the SDGs. Instead, the Agenda contains guiding principles on some topics (e.g. sensitivity to gender issues that generate inequalities, attention to the consumption of non-renewable natural resources, the creation of inter-organisations networks and alliances for pursuing purposes from which it benefits the entire community), whose declinations of meaning are contained in the targets.

4. Findings

Concerning RQ1, the study identifies several SDGs in the decisions and actions for health crisis management and normalcy return planning of the IRCCSs' sample. As outlined in Table 1, interview reveals that pandemic management addressed 6 Goals: besides SDG No. 3, it involves economic growth (No. 8), innovation (No. 9), sustainable urban contexts (No. 11), solid institutions (No. 16) and partnership (No. 17). The issues mainly overlooked in pandemic

management relate to the Agenda's pillar of people and the dimension of environmental protection.

Goal	***1. Reduce poverty***	***3. Health and well-being***	***4. Quality education***	***5. Gender equality***

Table 1. SDGs found detailed per pillar and dimension of sustainable development

Considering how the SDGs are being pursued, some decisions and actions corresponding to SDGs have different impacts, which can be read through a micro-meso-macro lens (e.g. Osborne et al., 2021). This also contributes to answering RQ2 concerning SDG interconnections. The activities set by IRCCSs touch on some SDGs more than others, and they do not always focus on single issues separately or ignore their relationships and interdependencies. Indeed, in pandemic management, some interventions involve more than one Goal per time, and their outcome is consistent at the micro-macro levels. For instance, at the micro level, IRCCSs reorganise internal spaces, processes, and assistance paths. Also, in compliance with the social distancing requirements, they extend the laboratories' access hours, introduce homeworking, and revise project schedules. Accordingly, the abovementioned interventions impacted employees, patients and their families. Indeed, they contribute to ensuring good health and well-being (Goal No. 3),

enhancing working conditions and maintaining economic growth (No. 8) and making human settlements and communities safe and resilient (No. 11). At the meso level, the institutes cooperate for knowledge sharing on COVID-19 with an extensive network of local, national and international institutes, aligning with the partnerships advocated by Goal No. 17. Other interventions have a broader scope, impacting at a macro level. They include prioritising COVID-19 in treatment and research, contributing to advancing knowledge on an unprecedented topic for society's well-being. Indeed, all IRCCSs insert COVID-19 among their research lines. Also, as an alternative to ordinary projects suspended by the pandemic, they launch original remote trials and develop new medical devices. Besides Goal No. 3, these interventions create resilient infrastructures that promote innovation (No. 9).

Conversely, other interventions do not always have positive outcomes. It is the case of establishing home-working for some employees or alternating workstations and deferring screening activities, non-urgent surgeries, and ordinary projects. Such interventions successfully limit the virus spread among workers, patients and their families (micro level) and pursue several Goals. Nonetheless, they result in postponing treatable diseases (macro level), worsening some working conditions (meso level) and partially counteracting the pursuit of the same Goals. The interviewees are aware of the repercussions of these choices. Still, they admit that they could not plan better solutions, given the constraints of the emergency regulations and the information scarcity, as stated by the PSO's CEO:

Our IRCCS [...] must respond to all the population diseases. In the pandemic, efficiency in health care was a diktat to guarantee a universalistic NHS. [...] So now we have to chase after the missed diagnoses, we find more patients at an advanced stage of the disease, which, if caught earlier, would have been treatable; we have endless waiting lists, etc.

The documentary analysis reveals 51 observations of SDGs targets within ROI's performance plan and 61 observations within PSO's performance plan, covering 12 Goals out of 17 (Figure 1). This broadens the range of Goals the health sector can address, as IRCCSs do not involve just those strictly related to their mission but may have wider repercussions. Conversely, it emerges that the Goals not covered concern the environment and the exploitation of natural resources, as well as ending hunger.

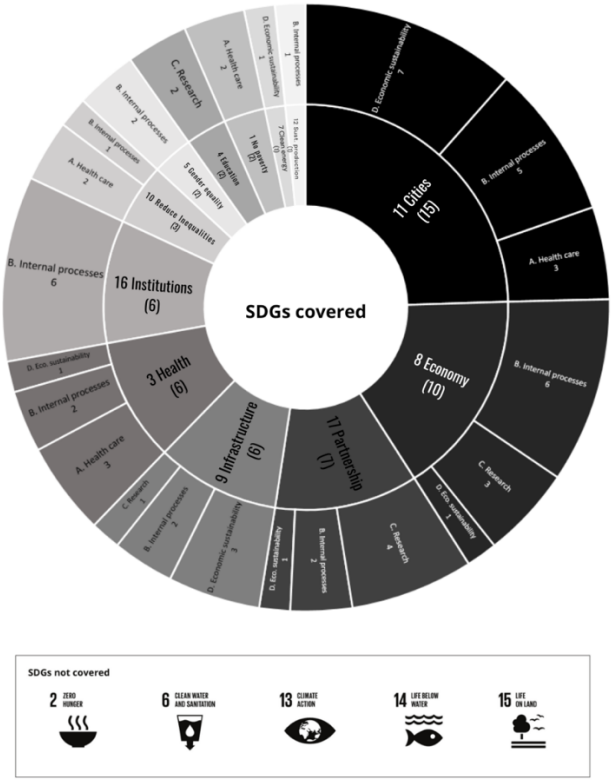

Figure 1. SDGs across the performance dimensions (target frequencies)

As Fig. 1 shows, the interconnection between SDGs also emerges from the documentary analysis (RQ2). Like pandemic management, in defining the new normalcy, ROI and PSO address various Goals concurrently to guarantee their high-quality services throughout the territory and strengthen research networks, drawing on the lessons learnt from the pandemic experience. This result aligns with the SDGs literature (e.g., Abhayawansa et al., 2021), which considers the set of Goals as a coherent whole, highlighting the interconnections among different issues, and providing an integrated framework to address the most pressing global challenge.

As for RQ3, none of the interviewees directly mention the pursuit of the SDGs, nor one of the performance plans analysed contain any deliberated statement about pursuing the UN SDGs' Agenda. Hence, this study reveals that SDGs may be pursued even if not expressly declared. Thus, organisations' engagement in SDGs may not require full awareness since each organisation directly or transversally addresses the SDGs by pursuing its mission. Possible explanations are the lack of an SDG-managerial culture or that pursuing the SDGs at a strategic level is not required by law. However, SDGs are progressively widespread in all societies, and their themes touch the organisations' actions, even if not in a conscious way by the managers. Two considerations derive from some SDGs' frequency and relevance for internal processes. On the one hand, for the IRCCS government, some sustainability issues are decisive for their mission and are relevant for internal consistency. Contrary to previous research evidence, since SDGs engagement is unintentional among these IRCCSs, it is unlikely that they cherry-pick the Goals relevant to their mission or those they wish to unveil, discarding the others. On the other hand, organisations willing to address SDGs for building future resilient and sustainable public services (Osborne & Strokosch, 2021) should introduce them into their strategy and incorporate an SDGs culture into their mission

and values. Accordingly, the Agenda engagement goes beyond the reporting process (Guthrie et al., 2020). Besides, given that SDGs are still not explicitly encapsulated in many organisations' strategic decisions, it may indicate a lack of awareness of the several areas on which the organisations' action can impact and the interconnections, synergies and compounding effects with positive or adverse outcomes. To raise this awareness, therefore, further actions are needed to promote SDGs encapsulation in organisation management and accounting.

5. Conclusions

While acknowledging a certain amount of subjectivity engaged in empirical work and the impossibility of representing the complex variety that characterises these institutes on the Italian territory, this study holds six main findings. (1) The decisions and actions set by IRCCSs for health crisis management and normalcy return planning involve several SDGs, (2) although not intentionally, and (3) some are not primarily connected to their mission. (4) The actions implemented by IRCCSs pertain to multiple SDGs, highlighting interconnections, trade-offs and adverse effects. (5) The range of SDGs involved in normalcy return planning increases compared to health crisis management, and (6) the most recurring SDGs are functional to the internal consistency of IRCCSs.

This study makes a novel and meaningful contribution to the management and accounting literature by deepening insight into how health providers engagement with the SDGs, addressing an area that has received little to no prior attention. It is significant in its potential to inform academic debate, expand existing knowledge, and support the development of policy and practice concerning SDGs engagement within healthcare and other sectors. The paper is methodologically sound, drawing on well-established and appropriate concepts, theoretical perspectives, and analytical approaches to ensure rigor.

The paper contributes, specifically, to the literature by providing evidence on the management and accounting of health providers, shedding light on SDGs' engagement in turbulent times addressing wicked problems, and providing examples of the variety of SDGs the health sector can address. Indeed, reading organisations' management and accounting through the SDGs lens helps understand the positive and negative impact of strategic decisions and interventions. Further, analysing their impacts on the micro-macro levels allows for considering what a specific action entails at a systemic level and for multiple publics (Warner et al., 2021). This confirms the heuristic role of SDGs in clarifying alternative positions and specific aims to achieve (Vesty et al., 2023), perhaps at the expense of others. Accordingly, it reinforces the potential of using the SDGs to read organisations' outcomes across all 17 Goals.

Furthermore, the SDGs found in the health crisis management of the IRCCS studied predominantly comprise the pillars of prosperity, along with the dimensions of economic growth and social inclusion. The pillar of people is more present in normalcy return than in health crisis management, while the environmental dimension appears almost forgotten both during the emergency and in defining the new normalcy. Among the paper's contributions is the suggestion of an additional pillar, that of pandemic, and another dimension, that of preparing for unpredictable events. Therefore, reading IRCCSs' decisions and activities for health crisis management and normalcy return planning through the SDGs sheds light on the sustainability issues related to these institutes' mission. However, their management and accounting are not composed of values oriented towards sharing a vision of peace based, for example, on respect for life, freedom, justice, and human rights or the creation of partnerships in the health sector for global development explicitly aimed at developing countries or the protection of the planet and its natural resources. Indeed, the pandemic prioritised health issues and relegated planet protection

and environmental matters to a non-central position or a deferrable problem within the health sector, hence flattening future generations' prosperity chances to the advantage of the current one.

Hence, on the one hand, this study demonstrates how it is possible to adhere to sustainability principles without being aware of them nor explicitly planning such adherence. SDGs engagement is underestimated by considering only those who explicitly assert it. Hence, SDGs research should imply both latent or explicit engagement within organisations' management and accounting. Besides that, the lack of awareness of the several areas on which the organisations' action can impact and the interconnections, synergies and compounding effects with positive or adverse outcomes requires further actions to promote SDGs encapsulation in organisation management and accounting. On the other hand, this research reveals that such institutes do not embody the institutional role of pursuing sustainability prescribed especially for public organisations by the Agenda. Consequently, the results agree that COVID-19 has induced the redefinition of sustainability as the intersection of economy, environment, society and human health (Hakovirta, Denuwara, 2020). Also, it confirms the path to social and moral nuances that accounting takes.

The current study is affected by some limitations related mainly to generalising the results. Firstly, IRCCSs have peculiarities related to the Italian context, and the research concerns a small sample of institutes located in the same region. The prompt reaction of the IRCCSs studied to the pandemic can derive from the region considered, traditionally virtuous in health provision, or justified by the IRCCSs qualification, assigned to hospitals of excellence. Therefore, these results cannot be extended to the entire IRCCSs distributed throughout Italy, nor to health providers in general, as they are the outcome of an exploratory study. Secondly, the study analyses the period immediately following the COVID-19 outbreak without considering previous time horizons that could have embedded other SDGs and allowed for tracking changes (Siboni & Canestrini, 2024). Indeed, the research focuses on the COVID-19 era, an extraordinary event that has altered the regular management of the health sector.

Consequently, further research is required. Other studies might apply similar mappings to a larger group of institutes working in the health sector to discover their engagement with SDGs. Longitudinal research can explore SDGs involvement in strategic planning before and after the pandemic. These studies could reveal best practices to share, enhance the SDGs culture, increase knowledge, and encourage broader SDGs engagement in the sector. Finally, further investigation should engage with SDGs impact measurements to assist institutes in the health sector.

La regolamentazione dell'intelligenza artificiale in sanità: il modello italiano tra governance pubblica e innovazione responsabile

Luigina Paglieri[1], Fabiana Scalabrini[2], Andrea Bonomi Savignon[3], Denita Cepiku[4]

1. Introduzione

L'intelligenza artificiale rappresenta una delle trasformazioni più significative che il settore sanitario contemporaneo sta affrontando, con implicazioni dirette sulla qualità diagnostica, l'efficienza operativa e la responsabilità clinica. Negli ultimi tre anni, l'adozione di algoritmi per la diagnostica medica assistita, sistemi di supporto decisionale clinico, piattaforme di monitoraggio dei pazienti e strumenti di triage ha conosciuto diffusione esponenziale, creando contemporaneamente opportunità sostanziali di miglioramento della qualità assistenziale e rischi concreti quali bias algoritmico non controllato, violazione della privacy, erosione della responsabilità medica individuale e ineguaglianza nell'accesso alle tecnologie. Questa dualità ha stimolato, a livello internazionale, un processo complesso e ancora in evoluzione di normazione dell'IA in ambito sanitario. Il dibattito accademico sulla governance del SSN sottolinea da tempo l'importanza di strumenti orientati all'autonomia responsabile e alla misurazione sistematica delle performance come basi per governare l'innovazione (Borgonovi, 2000; Borgonovi, 2022).

La comunità internazionale ha avviato nei ultimi tre anni un processo di regolazione che riflette visioni strategiche diverse. La Commissione Europea ha adottato nel giugno 2024 l'Artificial Intelligence Act (AI Act), primo quadro legislativo comprensivo a livello mondiale basato su approccio "risk-based" che differenzia i requisiti normativi secondo il grado di rischio per diritti, sicurezza e salute dei cittadini. Parallelamente, singoli Stati hanno elaborato strategie che talora integrano il framework europeo, talora si differenziano significativamente. L'Italia, con la Legge 23 settembre 2025, n. 132, ha inserito disposizioni che recepiscono l'AI Act europeo ma aggiungono elementi di originalità significativa: governance pubblica multilivello, ownership statale degli algoritmi core, sandbox regolatori, uso esteso di dati sintetici, accentuazione della responsabilità medica, auditing continuo.

La gara pubblica indetta da Agenas (Agenzia Nazionale per i Servizi Sanitari Regionali) per la realizzazione di una piattaforma nazionale di IA in sanità, finanziata con risorse del Piano Nazionale di Ripresa e Resilienza, rappresenta un esperimento di public procurement innovativo con implicazioni strategiche che trascendono il contesto nazionale. Tuttavia, rimane ancora incerto come tale modello si posizionerà rispetto alle esperienze internazionali consolidate e se avrà effettiva capacità di generare un impatto sostenuto nel tempo.

La presente ricerca intende rispondere a: come il modello italiano di governance dell'IA in sanità, strutturato dalla Legge 132/2025 e dalla piattaforma Agenas, si colloca nel contesto normativo internazionale? Quali sono i suoi punti di forza distintivi e quali criticità restano irrisolte? Quali

insegnamenti empirici emergono dall'implementazione di sistemi di IA responsabili nelle democrazie europee?

2. Lo stato dell'arte: sfide normative globali dell'IA in sanità

2.1. Origini e contesto della questione normativa

Lo sviluppo dell'intelligenza artificiale in ambito sanitario ha generato, dal 2018 in poi, una crescente consapevolezza della necessità di una governance normativa più articolata rispetto ai quadri regolatori preesistenti, disegnati per dispositivi medici tradizionali e per software sanitario statico. Questa consapevolezza è nata dall'osservazione di tre fenomeni concomitanti: la capacità dei sistemi IA di mutare comportamento nel tempo attraverso il retraining continuato, la difficoltà nell'interpretare il "ragionamento" di algoritmi complessi (cosiddetto problema dell'explainability) e l'emergenza empirica di bias sistematici negli algoritmi quando applicati a sottogruppi demografici non adeguatamente rappresentati nei dati di addestramento (Schmidt et al., 2024).

La letteratura accademica internazionale ha iniziato a studiare ed organizzare sistematicamente queste problematiche a partire dal 2020. Studi in epidemiologia e medicina hanno documentato casi concreti di fallimento: algoritmi di triage ospedaliero che discriminavano I pazienti afroamericani, sistemi diagnostici radiologici sviluppati su casistiche prevalentemente caucasiche che perdevano precisione in altre popolazioni, piattaforme di monitoraggio domiciliare che generavano falsi allarmi nei pazienti con comorbidità non rappresentate nei dati di training (Zhang et al., 2023). Parallelamente, il campo del diritto medico e del diritto sanitario ha iniziato a interrogarsi sulla responsabilità civile quando un medico si affida a un algoritmo che produce danno: è responsabile il medico che ha scelto di usare il sistema? Il produttore del software? L'ospedale che ha implementato la soluzione senza adeguato testing territoriale?

Queste incertezze hanno stimolato enti regolatori nazionali, agenzie europee e organizzazioni internazionali a formulare linee guida dapprima settoriali e poi progressivamente comprensive. La FDA negli USA ha pubblicato nel 2021 guidance su algoritmi medici, enfatizzando real-world performance monitoring. L'European Medicines Agency ha avviato nel 2023 dialogo con industrie per standardizzazione dei requisiti. Tuttavia, fino al 2024, non esisteva quadro normativo europeo unitario e cogente. Questa lacuna ha generato una situazione di "regulatory fragmentation" in cui aziende che operavano a livello europeo dovevano conformarsi a requisiti disomogenei.

2.2. Letteratura internazionale e architetture normative emergenti

La recente rassegna sistematica di Schmidt et al. (2024), pubblicata su Nature Medicine, fornisce la mappatura più comprensiva dei modelli normativi IA in sanità a livello globale, analizzando documentazione normativa e policy da 47 paesi. Gli autori producono una tassonomia ordinata lungo due assi principali: il grado di centralizzazione dell'autorità regolatoria (da centrali/federali a decentrate/locali) e il timing della validazione richiesta (ex-ante, cioè prima dell'uso clinico, versus ex-post, cioè basata sul monitoraggio del real-world evidence). Dalle loro analisi emergono conclusioni fondamentali: nessun modello è manifestamente superiore agli altri, ma ogni riflette trade-off culturalmente e istituzionalmente specifici tra velocità di innovazione e protezione del paziente. Modelli che enfatizzano centralizzazione e validazione ex ante (come Unione europea, Francia e Italia nel nuovo assetto) producono generalmente tecnologia più robusta dal punto di vista della sicurezza e garantiscono accesso più equo tra diversi contesti geografici e socioeconomici, ma comportano time-to-market significativamente prolungato e

barriere all'entry più elevate per innovatori più piccoli. Modelli che invece privilegiano decentralizzazione e validazione ex post (Regno Unito, Stati Uniti, Corea del Sud) accelerano l'innovazione e consentono un accesso rapido a soluzioni, ma generano diseguaglianza geografica e socioeconomica nell'accesso e comportano rischi maggiori di danno ai pazienti durante la fase di learning clinico reale.

Zhang et al. (2023), in una rassegna decennale sull'evoluzione della normativa dell'IA medica, offrono analisi di casi di fallimento implementativo. L'insegnamento principale che emerge è che assenza di governance robusta e coinvolgimento inadeguato di clinician stakeholder nel design normativo sono predittori significativi di fallimento progettuale. Quando cioè processi decisionali su regolazione dell'IA in sanità escludono medici, infermieri, responsabili di reparti clinici dal tavolo delle decisioni, la tecnologia che ne risulta spesso non è adatta alla pratica clinica reale, genera friction con flussi di lavoro consolidati, e quindi viene scarsamente adottata.

La letteratura internazionale distingue inoltre tra due approcci fondamentali alla questione della "black box" algoritmica. Un primo approccio, prevalente in Europa e Giappone, richiede che gli algoritmi siano interpretabili e che le loro decisioni siano tracciabili e spiegabili ai clinici e ai pazienti. Un secondo approccio, più frequente negli Stati Uniti, accetta algoritmi "black box" a patto che la loro performance venga validata empiricamente su dataset reali indipendenti e che venga implementato un rigoroso monitoring post-deployment (Caruana et al., 2015; Lorenzini et al., 2023).

2.3. Modelli specifici e loro caratteristiche

La Commissione Europea, con l'AI Act adottato nel giugno 2024, ha stabilito un quadro armonico basato su risk stratification. Sistemi IA classificati come "ad alto rischio" per salute e sicurezza (tra cui molte applicazioni sanitarie) devono soddisfare una serie di obblighi: documentazione tecnica completa, dataset di training documentato, controllo ex ante prima di commercializzazione, sistema di auditing ex post, capacità di interruzione ("off switch") controllata da utenti umani, supervisione umana significativa non meramente formale. Tuttavia, il quadro europeo lascia un margine considerevole di implementazione nazionale: non prevede l'approvazione centralizzata per singoli algoritmi (che rimane competenza delle autorità nazionali), non specifica chi conduce la validazione iniziale (se agenzia pubblica o ente privato notificato), non fornisce linee guida dettagliate su standard di performance accettabili (es., quale sensibilità e specificità minime richieste). Questo lascia spazi di interpretazione che diversi paesi europei hanno colmato in modi diversi.

La Germania con il suo sistema DiGA (Digitale Gesundheitsanwendungen, applicazioni sanitarie digitali) ha deciso di accelerare significativamente il percorso autorizzativo, consentendo il rimborso di soluzioni digitali in fase di raccolta di evidenze, generando feedback clinico iterativo durante l'uso reale. Questo approccio, documentato da studi empirici, accelera l'availability di soluzioni innovative, ma comporta rischi di validazione incompleta all'ingresso e può generare situazioni in cui i pazienti sono sottoposti a tecnologie non sufficientemente dimostrate (Krinke et al., 2022).

La Francia, con il sistema PECAN (Parcours d'Évaluation Clinique des Applications Numériques), offre un percorso di fast-track regolatorio parallelo al sistema standard, insieme a sandboxes sperimentali, con particolare enfasi sulla protezione della privacy e sulla tracciabilità dei dati. La documentazione ufficiale del sistema francese mostra un'architettura intermedia tra il rigore europeo e la velocità anglosassone (Ministère des Solidarités et de la Santé, 2024).

Il Regno Unito ha adottato un approccio esplicitamente "pro-innovazione" con regolazione leggera e oversight settoriale diffuso, preferibilmente attraverso autoregolazione dell'industria e

supervisione posteriore piuttosto che approvazione ex ante. Questo approccio, descritto nel White Paper governativo del 2023, mira a posizionare il Regno Unito come centro di innovazione in IA, ritenendo che la regolazione eccessiva sposti innovatori verso altri paesi (UK Government, 2023).

Gli Stati Uniti, attraverso la FDA (Food and Drug Administration), hanno elaborato linee guida per gli algoritmi medici che privilegiano la real-world evidence e la validazione continua post-deployment, con una flessibilità significativa su quali algoritmi richiedono approvazione preventiva e quali possono essere monitorati successivamente. Documentazione FDA mostra approccio pragmatico focalizzato sulla performance misurabile piuttosto che su aspetti di explainability (FDA, 2023).

Il Canada sta sviluppando un modello basato su auditing continuo coordinato da una figura di "AI Data Commissioner" che verifica periodicamente comportamento e impatto degli algoritmi nel tempo. Il Giappone mantiene approccio più conservatore rispetto ai paesi anglosassoni, con enfasi su validazione rigorosa e security-by-design. La Corea del Sud ha scelto un modello ministeriale accelerato con enfasi sulla rapidità, considerando l'IA come componente strategica della competitività nazionale (OECD, 2024; IMF, 2023).

2.4. Integrazione della prospettiva nazionale italiana

Parallelamente alle dinamiche internazionali, il contesto sanitario italiano ha affrontato la questione dell'IA digitale attraverso le lenti della ricerca accademica e della pratica clinica. La letteratura italiana su politica sanitaria, organizzazione ospedaliera e management ha documentato come la digitalizzazione dei servizi sanitari sia un processo complesso caratterizzato da resistenze professionali, frammentazione regionale, vincoli di finanziamento e difficoltà di change management. Questi studi forniscono un contesto essenziale per comprendere perché il modello italiano adottato per l'IA è strutturato com'è.

Studi empirici su ospedali italiani hanno evidenziato che fattori determinanti per il successo dell'implementazione di tecnologie digitali (inclusa l'IA) includono: accettazione da parte di medici e infermieri, qualità della formazione e dell'onboarding, allineamento tra l'architettura normativa e la pratica organizzativa effettiva, leadership manageriale robusto. Crucialmente, la ricerca mostra una correlazione significativa tra il successo dell'implementazione e la presenza di una governance normativa chiara, stabile e condivisa con gli operatori clinici, esattamente ciò che la Legge 132/2025 intende fornire strutturalmente (De Domenico,et al., 2024).

Un'altra dimensione rilevante della ricerca italiana riguarda la cybersecurity. Con la progressiva digitalizzazione, le vulnerabilità agli attacchi informatici hanno raggiunto livelli critici, soprattutto nei servizi di urgenza e emergenza. La ricerca condotta da associazioni professionali ospedaliere ha raccomandato l'implementazione di principi di "security by design", audit esterni regolari, penetration testing sistematici, un incident response plan definito e formazione continua del personale. Questi insegnamenti sono stati incorporati negli obblighi che la Legge 132/2025 pone su Agenas nella gestione della piattaforma nazionale (Macinati, 2023).

La riflessione sulla responsabilità gestionale nel contesto digitalizzato della sanità italiana ha generato un'ulteriore letteratura rilevante. Il tema cruciale è: con l'inserimento di algoritmi nei processi decisionali clinici, come cambia la catena di responsabilità? Studi recenti raccomandano di ancorare le responsabilità nel contesto clinico concreto, definendo chiaramente gli endpoint clinici di interesse, sottoponendo nuove soluzioni a sperimentazione controllata su sottogruppi prima della diffusione generale, implementando un monitoring continuo con capacità di interruzione rapida se i dati post-implementazione rivelano problemi. Questi principi costituiscono il fondamento della logica dei sandbox regolatori previsti dalla Legge 132/2025 (Cimbali, 2023; Comite, 2025).

Infine, è evidente che l'applicazione pratica richiederà anche un profondo percorso di trasformazione delle competenze nel Sistema Sanitario Italiano, già avviato con l'introduzione della leva digitale. La figura del manager sanitario di nuova generazione deve essere 'trasformativa', capace di recuperare autonomia gestionale, anticipare gli eventi ed elaborare strategie condivise per uscire dalla cultura dell'emergenza e affrontare in modo proattivo le trasformazioni imposte dall'intelligenza artificiale e dalla digitalizzazione (Borgonovi, 2025).

3. Il contesto nazionale: la Legge 132/2025, Agenas e l'assetto normativo italiano

3.1. Struttura della legge e principi fondamentali

La Legge 23 settembre 2025, n. 132, intitolata "Disposizioni e Deleghe al Governo in Materia di Intelligenza Artificiale", rappresenta l'articolazione nazionale del recepimento dell'AI Act europeo, ma con aggiunte di significato sostanziale che riflettono scelte strategiche consapevoli sulla governance dell'IA in sanità. La legge non si limita a trasporre obblighi europei ma aggiunge tre componenti di originalità distintiva.

Primo, prevede governance pubblica strutturata a livelli multipli, coinvolgendo simultaneamente ACN (Agenzia Cybersicurezza Nazionale), AgID (Agenzia per l'Italia Digitale), Agenas (Agenzia Nazionale per i Servizi Sanitari Regionali), Garante Privacy e società scientifiche. Crucialmente, questi soggetti non assolvono ruoli meramente regolativi nel senso di "veto-power"; assolvono piuttosto funzioni di coordinamento positivo dello sviluppo dell'IA sanitaria. Non è quindi un modello dominantemente restrittivo, ma piuttosto di "governance collaborativa", in cui lo Stato promuove attivamente la ricerca, lo sviluppo e il deployment di IA affidabile e socialmente responsabile, accompagnando il percorso con supervisione robusta.

Secondo, la legge introduce ownership pubblica e controllo strategico degli algoritmi core attraverso una piattaforma nazionale gestita da Agenas. È un'infrastruttura critica del servizio sanitario, di proprietà statale, analogamente ai servizi di assistenza ospedaliera essenziali. La gara pubblica lanciata per il PNRR prevede che il vincitore sviluppi soluzioni interoperabili in formato aperto, laddove tecnicamente fattibile, accessibili a tutte le regioni italiane, con governance trasparente. Parallelamente, la legge autorizza sandbox regolatori in cui sviluppatori pubblici e privati possono sperimentare soluzioni con rigore metodologico, senza gravami regolatori completi, durante la fase pilota.

Terzo, la legge promuove l'uso esteso di dati sintetici. Per affrontare i due vincoli che tradizionalmente hanno ostacolato la ricerca sull'IA sanitaria in Italia, a causa di vincoli di riservatezza che rendono lento l'accesso ai dati reali, e lentezza dei processi di autorizzazione da parte di comitati etici, la legge autorizza esplicitamente la creazione di dataset sintetici che replicano la distribuzione statistica dei dati reali senza contenere informazioni identificabili di pazienti individuali. Scelta pionieristica in Europa, questo approccio consente ai ricercatori di addestrare modelli robusti, testare algoritmi, effettuare validazione metodologica senza attendere mesi o anni per l'accesso a dati clinici reali, preservando simultaneamente la privacy individuale (Aindo, 2025).

3.2. Il ruolo di Agenas: funzioni, architettura, aspettative

Nel nuovo assetto, Agenas diviene il fulcro centrale dell'intero sistema di governance dell'IA sanitaria italiana. Le funzioni assegnate sono molteplici e complesse: responsabile di procurare e gestire tecnicamente la piattaforma nazionale, coordinare i sandbox sperimentali regionali, amministrare gli dataset sintetici, fornire formazione standardizzata agli operatori sui sistemi implementati, condurre auditing continuo sulle performance algoritmiche monitorando I bias per

sottogruppi demografici, facilitare l'interoperabilità tra sistemi informativi regionali eterogenei, fornire supporto metodologico ai clinici che implementano algoritmi.

Questo ruolo centralizzato rappresenta una scelta strategica di posizionamento che è sostanzialmente unica in Europa per il suo grado di integrazione. La Germania, con DiGA, ha un ruolo più passivo di rimborso. La Francia, con PECAN, ha un coordinamento light. Il Regno Unito e gli Stati Uniti affidano responsabilità a molteplici enti senza un coordinamento centrale. Il modello italiano, invece, richiede a un'agenzia sanitaria pubblica di svolgere una funzione attiva di governance positiva, non solo di filtro normativo.

Questa scelta comporta sia opportunità che rischi. Tra le opportunità: coordinamento effettivo tra regioni con capacità molto eterogenea, preservazione della sovranità tecnologica italiana rispetto a soluzioni estere, possibilità di raccogliere empiricamente dati comparativi sull'implementazione e sugli esiti, riduzione delle diseguaglianze geografiche nell'accesso. Tra i rischi: concentrazione di responsabilità che espone Agenas a vulnerabilità reputazionali, possibile slittamento temporale nell'implementazione con perdita di momentum, resistenze organizzative da parte di regioni che vedano Agenas come intrusione nella loro autonomia, incertezze sulla sostenibilità economica post-PNRR, quando il finanziamento iniziale sarà esaurito.

4. Metodologia di ricerca

4.1. Design della ricerca

Questo articolo adotta una metodologia di comparazione strutturata di policy integrata con sintesi narrativa della letteratura scientifica e analisi di documenti normativi. L'approccio combina metodi comparativi di policy analysis (Merton, 1987) con la mappatura della letteratura empirica secondo le linee guida PRISMA adattate alla narrative review (Popay et al., 2006). La comparazione si articola in tre dimensioni analitiche fondamentali: (i) struttura della governance dell'IA (centralizzazione vs. decentramento decisionale), (ii) timing della validazione normativa richiesta (ex-ante vs. ex-post), (iii) carattere della proprietà e del controllo degli algoritmi (pubblico vs. privato vs. misto).

4.2. Selezione dei casi e giustificazione

La comparazione internazionale include nove contesti selezionati su base di criteri espliciti: (i) rappresentatività geografica (Europa, Nord America, Asia), (ii) diversità di modelli normativi (centralizzato, decentralizzato, misto), (iii) disponibilità di documentazione normativa ufficiale e letteratura scientifica, (iv) rilevanza diretta per il dibattito europeo e italiano. I contesti analizzati sono: Unione Europea (AI Act quadro armonico), Italia (Legge 132/2025 focus principale), Germania (DiGA approccio accelerato), Francia (PECAN fast-track e sandbox), Regno Unito (pro-innovation approach), Stati Uniti (FDA real-world evidence), Canada (auditing continuo), Corea del Sud (accelerazione ministeriale), Giappone (conservatorismo e sicurezza).

5. Risultati: analisi comparativa dei modelli normativi

5.1. Quadro tassonomico dei modelli emergenti

L'analisi della letteratura e dei documenti normativi individua quattro modelli distinti che caratterizzano il panorama globale. La categorizzazione è basata su due assi principali: grado di centralizzazione dell'autorità decisionale (asse orizzontale, da centrale a decentrato) e timing della validazione richiesta (asse verticale, da ex ante a ex post).

Modello risk-based centralizzato (UE, Italia, Francia). Questo modello classifica sistemi IA secondo il grado di rischio per la salute e i diritti, imponendo obblighi crescenti: documentazione tecnica completa, testing su dataset indipendenti, auditing ex ante prima dell'uso clinico, monitoraggio continuo ex post, explainability, supervisione umana. L'Unione europea con l'AI Act rappresenta il framework armonico, ma consente l'implementazione nazionale. Italia si differenzia mediante l'ownership pubblica degli algoritmi core, sandbox espliciti e formalizzazione dei dati sintetici. Francia combina l'approccio risk-based con il fast-track per soluzioni a basso-medio rischio.

Modello accelerato iterativo (Germania DiGA, Corea). Questo approccio privilegia rimborso rapido di soluzioni digitali in fase di raccolta evidence, generando feedback clinico continuo durante l'uso reale. La Germania consente accesso a soluzioni digitali con evidenza preliminare, monitorando poi impatto post-deployment per decidere se continuare rimborso. La Corea persegue una strategia ministeriale di rapida adozione, considerando l'IA come priorità nazionale di competizione. Benefici di questo modello: innovazione accelerata, accesso rapido ai benefici, engagement della comunità clinica nel testing reale. Rischi: validazione incompleta all'ingresso, possibilità di danno durante il learning clinico, diseguaglianza nell'accesso durante la fase iniziale.

Modello pro-innovazione decentralizzato (Regno Unito, USA). Questo modello affida l'oversight ad agenzie settoriali con una regolazione leggera e una preferenza per l'autoregolazione industriale e la supervisione posteriore. Nel Regno Unito, il governo ha esplicitamente scelto un approccio "pro-innovation", volto a ridurre le barriere normative per posizionare il paese come centro dell'innovazione. Negli USA, la FDA offre guidance su algoritmi medici, ma con flessibilità significativa su quali richiedono approvazione preventiva. Benefici: agilità amministrativa, stimolo all'innovazione, attrattiva per imprese innovative. Rischi: assenza di controllo ex ante porta a disuguaglianze geografiche e socioeconomiche, la protezione da rischi ignoti è debole, la responsabilità legale rimane ambigua.

Modello ibrido auditing-centrico (Canada, Giappone). Canada propone un modello basato su auditing continuo coordinato da una figura di "AI Data Commissioner" che verifica periodicamente il comportamento e l'impatto degli algoritmi nel tempo, con la capacità di intervenire se emergono problemi. Il Giappone mantiene un approccio conservatore, con enfasi sulla validazione rigorosa e sulla security-by-design, raggiungendo un equilibrio tra protezione e innovazione ragionevole. Questi modelli rappresentano posizionamenti intermedi tra estremi di regolazione e libertà.

5.2. Trade-off normativi sistematici e posizionamento dell'Italia

L'analisi comparativa rivela trade-off normativi sistematici ai quali ogni governo si confronta, e le scelte effettuate nel posizionamento di diversi paesi. La riflessione sulle scelte di policy tra decentramento e centralizzazione richiama direttamente l'impostazione di Borgonovi sul bilanciamento tra efficacia, efficienza e responsabilità sociale (Borgonovi, 2022).

Trade-off tra velocità di innovazione e protezione del paziente. Modelli accelerati (Germania DiGA, Corea) consentono l'accesso rapido a soluzioni innovative con benefici immediati, ma comportano rischi di danno ai pazienti durante fasi di validazione incompleta. Modelli conservativi ex ante (UE pura, Francia normativa) proteggono meglio da rischi ignoti, ma ritardano i benefici e aumentano i costi di innovazione. L'Italia tenta un posizionamento intermedio mediante sandbox regolatori che riducono i tempi rispetto all'approccio europeo puro (da 24-36 mesi potenzialmente a 18-24 mesi), consentendo la sperimentazione controllata senza un peso regolatorio completo, ma riducendo però il gap innovativo rispetto ai modelli accelerati.

Trade-off tra innovazione privata ed equità d'accesso. I modelli privatizzati (UK, USA, Germania) consentono un'innovazione rapida, ma generano disuguaglianze geografiche e socioeconomiche significative: gli ospedali ricchi e le università prestigiose accedono prima alle soluzioni migliori, mentre gli ospedali piccoli e le aree rurali rimangono indietro. Modelli con proprietà pubblica (Italia) garantiscono un accesso più omogeneo tra regioni e livelli di ospedale, preservando la sovranità, ma richiedono investimenti fiscali sostenuti e l'assolvimento di funzioni gestionali che il pubblico potrebbe non sempre svolgere in modo efficiente. L'Italia fa una scelta consapevole di privilegiare l'equità e la sovranità rispetto alla velocità privata.

Trade-off tra velocità di approvazione e qualità della soluzione. Modelli con approvazione centralizzata ex ante (UE, Francia, Italia) producono generalmente tecnologia più robusta perché sottoposta a valutazione rigorosa, ma i tempi autorizzativi si prolungano. Modelli decentralizzati (UK, USA) consentono sperimentazioni parallele e multiple, che possono accelerare il learning, ma generano inconsistenza tra le giurisdizioni e minore garanzia sulla qualità minima.

Trade-off tra trasparenza algoritmica e innovabilità. Modelli che richiedono l'explainability degli algoritmi (UE, Francia, Italia) migliorano la fiducia e l'accountability e consentono la supervisione clinica informata, ma possono rallentare l'implementazione di algoritmi "black box" che potrebbero presentare prestazioni superiori. Modelli che accettano black box, purché validati empiricamente (USA), offrono soluzioni potenzialmente più accurate, ma riducono l'intelligibilità per i clinici.

L'Italia, attraverso la Legge 132/2025 e il modello Agenas, ha effettuato scelte consapevoli su questi trade-off: ha scelto di privilegiare protezione robusta, equità di accesso e sovranità statale rispetto alla velocità massimale di innovazione; ha scelto di mantenere il requisito di supervisione clinica e di interpretabilità; ha scelto di investire pubblicamente in infrastruttura anziché lasciare l'innovazione unicamente al settore privato. Queste scelte riflettono una visione dell'IA come "bene comune sanitario" più che come "commodity innovativa privata", coerente con la natura del servizio sanitario italiano.

5.3. Tabella sintetica comparativa

Dimensione	**UE (AI Act)**	**Italia (L. 132/2025)**	**Germania (DiGA)**	**Francia (PECAN)**	**Regno Unito**	**USA (FDA)**	**Canada**	**Corea**	**Giappone**

6. Discussione: integrazione tra evidenza internazionale, letteratura accademica e scelte italiane

6.1. Coerenza tra insegnamenti della ricerca internazionale e design della Legge 132/2025

L'analisi rivela convergenza significativa tra insegnamenti della letteratura accademica internazionale, evidenze empiriche da implementazioni in altri paesi, e scelte legislative effettuate dalla Legge 132/2025. Questa convergenza non è casuale ma riflette, verosimilmente, un processo consultivo in cui decision-maker italiani hanno assimilato lezioni dalla letteratura e da esperienze di altri paesi.

Zhang et al. (2023) e Schmidt et al. (2024), sulla base di analisi decennali di implementazioni di IA in sanità, concordano nel sottolineare che governance chiara e stabile, accettazione professionale da parte di medici e infermieri, coinvolgimento esplicito di clinician stakeholder nel design di sistemi normativi sono prerequisiti cruciali di successo implementativo. La Legge 132/2025 incorpora direttamente questi insegnamenti: prevede obblighi formali di coinvolgimento di società scientifiche, richiede supervisione medica significativa non meramente formale, definisce chiaramente ruoli e responsabilità, stabilisce un processo di feedback da clinici agli sviluppatori durante la sperimentazione in sandbox.

De Domenico, Noto e Vermiglio (2022), in ricerca qualitativa-quantitativa su campioni ospedalieri italiani, identificano variabili critiche di adozione di tecnologie digitali: accettazione professionale, qualità della formazione e dell'onboarding, allineamento tra quadro normativo e pratica organizzativa. Dimostrano una correlazione positiva tra il successo dell'implementazione e la presenza di una governance normativa chiara. La Legge 132/2025 risponde direttamente a questi findings mediante obblighi su formazione standardizzata (funzione di Agenas), allineamento tra politica normativa e operatività clinica (attraverso coinvolgimento di società scientifiche), accessibilità delle soluzioni (mediante ownership pubblica che garantisce accesso omogeneo).

Macinati et al. (2021), sulla base di una ricerca FIASO-Mecosan sulla cybersecurity nella digital health, raccomandano: progettazione secondo i principi di "security by design" non come afterthought, audit esterni regolari, penetration testing sistematici, incident response plans definiti, formazione continua. Tutti questi elementi sono incorporati negli obblighi che la Legge 132/2025 pone su Agenas (supervisione ACN su security, requirement di audit continuo).

Comite (2025) analizza specificatamente rischi organizzativi della digital health assistita da IA e raccomanda di ancorare responsabilità nel contesto clinico concreto, definendo endpoint clinici chiaramente, sottoponendo soluzioni a sperimentazione controllata su sottogruppi prima di diffusione generale, implementando monitoraggio continuo con capacità di interruzione. Questi principi costituiscono esattamente il fondamento della logica dei sandbox regolatori italiani.

6.2. Posizionamento italiano nel paesaggio europeo e internazionale

L'Italia, con la Legge 132/2025 e il programma Agenas, effettua un posizionamento normativo distintivo nel panorama europeo. Non è scelta "conservatrice" in senso inibitorio, né "anti-innovazione" nel senso di ostacolo deliberato al progresso. È piuttosto un approccio consapevole di "innovazione responsabile": accogliere i benefici potenziali dell'IA, accompagnandoli con governance robusta, trasparenza procedurale, protezione esplicita dei diritti dei pazienti, superamento delle diseguaglianze di accesso geografiche e socioeconomiche.

L'Italia si distingue nel contesto europeo per tre scelte originali. Primo, l'ownership pubblica degli algoritmi core è unica in Europa per estensione e formalizzazione. Mentre Germania, Francia e UK consentono soluzioni private e pubbliche in parallelismo, con la public procurement di soluzioni private, l'Italia decide che gli algoritmi strategici siano di proprietà statale. Questa scelta, rara in Europa e ancor più rara a livello globale, riflette la visione dell'IA medica come parte dell'infrastruttura sanitaria critica, analoga ai servizi ospedalieri. Ha implicazioni di sovranità (Italia non dipende da fornitori esteri per capacità tecnologiche critiche), equità (algoritmi sono accessibili a tutte le regioni indipendentemente dalle capacità finanziarie), accountability (proprietà pubblica facilita la responsabilità verso i cittadini).

Secondo, l'uso esteso di dati sintetici è formalizzato nel framework normativo italiano. Mentre altri paesi sperimentano con dati sintetici, l'Italia li autorizza esplicitamente come strumento di ricerca e sviluppo. Questo consente ai ricercatori pubblici e accademici di addestrare modelli robusti senza attendere mesi per l'accesso a dati reali, accelerando l'innovazione pur preservando la privacy.

Terzo, la centralità della supervisione clinica non è soltanto verbale. La Legge 132/2025 richiede che ogni algoritmo implementato nel SSN rimanga sotto la supervisione esplicita di un medico responsabile, non come formalità amministrativa, bensì come elemento funzionale del decision-making. Questa scelta ha implicazioni significative: protegge l'autonomia decisionale clinica, consente una supervisione umana genuina anziché illusoria e mantiene il medico come agente morale responsabile.

6.3. Criticità residue e rischi implementativi

Malgrado i punti di forza e la coerenza con la letteratura internazionale, persistono criticità significative che la ricerca deve evidenziare con franchezza. Alcuni rischi sono inerenti al modello; altri derivano da incertezze di implementazione.

Rischi di tipo economico-finanziario. Il finanziamento PNRR della piattaforma Agenas è limitato (50 milioni di euro per tre anni 2024-2027). Tuttavia, il sostenimento di una piattaforma nazionale di IA sanitaria comporta costi ricorrenti significativi: development, maintenance,

security patching, monitoring continuo, aggiornamento di algoritmi, supporto agli utenti clinici. Come Agenas assicurerà l'operatività della piattaforma dopo l'esaurimento del finanziamento PNRR? Non esiste formalmente risposta a questa domanda nei documenti pubblici consultati. La letteratura italiana sulle digital health project failures (Macinati, 2023) identifica l'assenza di un modello economico sostenibile oltre la fase pilota come fattore predittivo significativo di fallimento progettuale.

Rischi di attuazione su un territorio eterogeneo. Il Servizio Sanitario Nazionale italiano è notoriamente frammentato tra regioni con capacità molto diverse: dal Nord ultramoderno e digitalizzato al Sud, con deficit strutturali di infrastrutture digitali, personale e formazione. Come Agenas coordinerà l'implementazione in questo territorio? Come garantirà che gli algoritmi sviluppati con casistiche del Nord (dove la concentrazione di ospedali universitari e centri di eccellenza) funzionino equamente al Sud? La letteratura italiana documenta ampiamente come la frammentazione sia un vincolo storico che ha ostacolato la digitalizzazione nazionale. La Legge 132/2025 non affronta esplicitamente questo; si assume implicitamente che Agenas avrà la capacità di affrontare l'eterogeneità regionale, un'assunzione ottimistica che richiede una verifica empirica.

Rischi di bias e generalizzabilità. Se gli algoritmi sono sviluppati e validati su dati concentrati geograficamente (es., negli ospedali universitari della Lombardia) e poi deployati nazionalmente, il rischio di bias demografico è alto. La letteratura internazionale documenta che gli algoritmi addestrati su casistiche prevalentemente settentrionali o di istituti di eccellenza perdono performance quando applicati a contesti diversi. Come Agenas affronterà questo? Richiederà retraining locale? Testing sui sottogruppi prima della diffusione generale? Non sono chiare le risposte nei documenti attuali.

Rischi di responsabilità civile irrisolti. Con supervisione medica e ownership pubblica, chi è responsabile in caso di danno al paziente? Il medico che ha scelto di usare l'algoritmo? L'ospedale che l'ha implementato? Agenas che l'ha fornito? Lo sviluppatore privato se esterno? Nessun framework giurisprudenziale consolidato esiste a livello europeo in merito, e la letteratura legale internazionale identifica tale incertezza come un ostacolo significativo all'adozione clinica dell'IA.

Rischi di slittamenti temporali e perdita di momentum. I processi di gara per le infrastrutture pubbliche digitali in Italia presentano, storicamente, rischi di slittamenti temporali significativi. Se la gara Agenas si protrae oltre le timeline attualmente previste, il rischio di perdita di momentum politico e finanziario è concreto.

6.4. Contributi al dibattito europeo e replicabilità del modello

L'esperienza italiana offre al dibattito europeo insegnamenti contrastanti ma rilevanti. Da un lato, dimostra che è possibile conciliare innovazione responsabile con governance pubblica robusta, senza necessariamente sacrificare velocità assoluta: sandbox regolatori italiani promettono di abbreviare tempi di approvazione rispetto a un framework europeo puro, facilitando l'innovazione anche quando l'ownership rimane pubblica. Questo contraddice la narrativa che la governance pubblica sia necessariamente lenta.

Da un altro lato, il modello italiano mostra che la governance pubblica efficace richiede un investimento sostenuto e una capacità gestionale che non tutti i paesi europei possiedono in misura eguale. Un'agenzia come Agenas può funzionare efficacemente in un contesto italiano grazie alla storia del Servizio Sanitario Nazionale unificato, alla tradizione di ricerca sanitaria accademica solida e alla disponibilità di risorse. Il modello potrebbe essere replicabile in Spagna, in Portogallo e nei Paesi Nordici, che condividono caratteristiche strutturali simili. Sarebbe probabilmente

ingestibile in contesti con una maggiore frammentazione amministrativa (es., alcuni paesi dell'Est europeo con una capacità statale più debole).

L'esperienza Agenas costituirà, nei prossimi tre-cinque anni, banco di prova cruciale. Se l'implementazione procedesse secondo piani e generasse benefici clinici misurabili con tempi autorizzativi ragionevoli (18-24 mesi), diventerebbe modello exportable e influenzerebbe la policy europea verso una maggiore governance pubblica. Se, al contrario, slittamenti temporali e problemi organizzativi si prolungassero, comporterebbe la delegittimazione dell'intero approccio di governance pubblica a livello europeo, rafforzando narrative di privatizzazione.

7. Conclusioni

La Legge 132/2025 e il programma Agenas rappresentano un tentativo ambizioso e originalissimo, nel contesto europeo del governo pubblico, consapevole e responsabile dell'IA in sanità. Questa originalità risiede nella combinazione unica di: governance pubblica robusta, ownership statale degli algoritmi core, supervisione clinica centralizzata, sperimentazione controllata tramite sandbox, formalizzazione di dati sintetici.

L'analisi storica e comparativa produce la conclusione che il posizionamento italiano emerge come risposta coerente e informata alle lezioni della letteratura accademica internazionale. Studi su fallimenti implementativi, ricerche sui fattori determinanti successo o insuccesso di digital health, analisi di modelli normativi globali, tutti suggeriscono che governance chiara, coinvolgimento clinico, infrastruttura pubblica robusta, sovranità nazionale sono elementi che aumentano la probabilità di successo. La Legge 132/2025 e Agenas rappresentano trasposizione di questi insegnamenti in assetto normativo e organizzativo concreto.

I contributi che l'Italia può offrire al dibattito globale sono significativi. Primo, dimostra che l'innovazione responsabile nell'IA sanitaria è un obiettivo raggiungibile senza rinunciare a una velocità ragionevole. I sandbox regolatori italiani sono disegnati per abbreviare I tempi di approvazione rispetto a un framework europeo puro, pur mantenendo garanzie di protezione robuste. Secondo, dimostra che la governance pubblica dell'IA non è necessariamente contraddittoria con l'innovazione: l'investimento pubblico in infrastruttura può generare un'innovazione accelerata proprio come la privatizzazione, con il beneficio aggiuntivo dell'equità di accesso. Terzo, offre un modello replicabile per le democrazie sanitarie europee che intendano preservare la sovranità tecnologica e l'equità in un'era di dipendenza da algoritmi proprietari di grandi tech corporations.

Il prossimo capitolo della storia italiana di IA sanitaria dipenderà dall'esecuzione effettiva: dalla gestione della gara Agenas, dai risultati empirici dei pilot territoriali, dal feedback che I clinici forniranno durante l'implementazione, dalla sostenibilità economica che il sistema dimostrerà. La comunità scientifica, la ricerca accademica in ambito sanitario e le organizzazioni professionali mediche avranno un ruolo cruciale nel documentare sistematicamente questo processo, nell'identificare problemi durante l'implementazione e nell'offrire insegnamenti tempestivi per la correzione di rotta. Solo attraverso questo monitoraggio e questo feedback continuo, il modello italiano potrà tradursi da promessa teorica in realtà operativa di beneficio pubblico.

7.1. Limitazioni della ricerca

Questa ricerca presenta limitazioni riconosciute che circoscrivono l'ambito di validità delle conclusioni. Primo, la Legge 132/2025 è di recentissima attuazione (settembre 2025) e la piattaforma Agenas è in fase di gara; pertanto, dati empirici di impatto reale su pazienti, clinici e

sistemi ospedalieri sono assenti. Questo significa che le analisi sono prospettiche, basate su intenzioni normative e design teorico più che su outcomes misurati nella pratica. La ricerca offre quindi la valutazione della coerenza interna del modello e l'allineamento con l'evidenza internazionale, non la validazione empirica dell'effettività. Secondo, l'accesso alla documentazione normativa e alla letteratura scientifica è ineguale tra paesi: mentre i modelli europei sono ben documentati, i modelli francesi, giapponesi, coreani rimangono scarsamente coperti dalla letteratura scientifica peer-reviewed in inglese; informazioni provengono da documenti governativi non sempre trasparenti. Questo comporta un'analisi meno profonda di questi contesti. Terzo, la ricerca è prevalentemente qualitativa; la standardizzazione degli indicatori di outcome (efficacia clinica, sicurezza, equità di accesso, velocità di innovazione) tra paesi rimane altamente problematica, impedendo la meta-analisi quantitativa rigorosa di dati comparativi. Infine, la prospettiva è esplicitamente europeacentrica; sebbene contesti nordamericani e asiatici siano inclusi, l'analisi potrebbe sottostare a elementi di realtà locale che caratterizzano specificamente questi modelli.

Queste limitazioni suggeriscono che la ricerca dovrebbe essere intesa come primo contributo per analizzare una domanda complessa e multidimensionale, che apre numerose possibilità di approfondimento: valutazione empirica dei primi anni di implementazione della Legge 132/2025 e Agenas, raccogliendo dati su tempi autorizzativi reali, outcomes clinici di algoritmi implementati, feedback di clinici e pazienti, analisi dei modelli francese, giapponese, coreano con accesso a fonti in lingua nazionale e a esperti locali, analisi economica comparativa dei costi di diversi modelli normativi, ricerca qualitativa con stakeholder italiani (clinici, pazienti, manager ospedalieri, esperti di IA) su percezioni e criticità che emergono durante implementazione.

Parole chiave: Intelligenza artificiale; sanità digitale; governance normativa; politica sanitaria comparata; piattaforme pubbliche; responsabilità medica; digital health

Benessere, leadership e sostenibilità: verso un modello italiano di leadership compassionevole

Federico Lega[1], Francesca Ferrè[2], Luisa Paolina Rizzi[3], Marianna Ginocchietti[4], Elisa Ducoli[5], Michela Filippi[6], Paolo Gubitta[7], Elena Fanton[8], Claudio Costa[9]

1. Introduzione

Il sistema sanitario italiano sta vivendo una fase di profonda trasformazione, segnata da criticità gestionali e da una crescente difficoltà nel mantenere sostenibilità e qualità dei servizi di cura. La situazione è ulteriormente aggravata da limiti infrastrutturali, dall'aumento della richiesta di assistenza e dalla complessità nel trattenere i professionisti. Il Servizio Sanitario Nazionale è pertanto chiamato a fronteggiare simultaneamente numerosi cambiamenti di carattere demografico, epidemiologico e professionale.

In particolare, l'invecchiamento della popolazione rappresenta una delle principali sfide: la quota di cittadini con età superiore ai 65 anni ha raggiunto il 23,8% rispetto a una media UE del 21,1 (OECD, 2023). A ciò si accompagna un'aspettativa di vita sempre più elevata e un quadro epidemiologico caratterizzato dalla crescente prevalenza di patologie croniche (OECD, 2023), (De Vries et al., 2023).

Parallelamente, il sistema sanitario italiano deve far fronte a una significativa carenza di professionisti sanitari, con valori medi sensibilmente inferiori rispetto alla media OCSE (Cartabellotta et al., 2025). L'Organizzazione Mondiale della Sanità ha stimato che entro il 2030 mancheranno a livello globale circa 14 milioni di operatori sanitari (De Vries et al., 2023). La scarsità di personale, unità all'aumento della domanda dei servizi, determina una pressione crescente sulle organizzazioni sanitarie e sui professionisti rimasti in servizio, chiamati a "fare di più con meno" (Viotti e Converso, 2016).

Le ragioni che spingono i professionisti ad abbandonare il lavoro sono complesse e multifattoriali, riconducibili a dimensioni individuali, organizzative e di sistema (De Vries et al., 2023). Le nuove generazioni, inoltre, mostrano una minore disponibilità ad accettare elevati livelli di stress o condizioni di lavoro poco conciliabili con la vita privata (De Vries et al., 2023) (Loft e Jensen, 2020) (Enea et al., 2024). Questo fenomeno, unito alla maggiore qualificazione

professionale dei giovani, accresce la loro propensione alla mobilità e al cambiamento (Loft e Jensen, 2020; Enea et al., 2024). Coloro che restano nel sistema sperimentano spesso un aggravio di carichi e turni prolungati, con effetti negativi sulla salute fisica, sul burnout e sulla soddisfazione lavorativa, fattori che a loro volta incidono sull'intention to leave (Loft e Jensen, 2020; Clari et al., 2024) (De Simone e Planta, 2017). La letteratura indica infatti che tra il 12% e il 64% degli infermieri manifesta l'intenzione di lasciare il proprio posto di lavoro (Loft e Jensen, 2020), con correlazioni significative rispetto a soddisfazione lavorativa, stress, burnout, equilibrio vita-lavoro e retribuzione (Loft e Jensen, 2020; De Simone e Planta, 2017; Bagnasco et al., 2023).

Il malessere del personale si manifesta anche attraverso indicatori indiretti, come l'aumento delle richieste di limitazioni al lavoro – cresciute del 60% nel 2022 rispetto al 2019 (Colombo et al., 2025) – e il tasso di assenteismo dovuto a permessi, malattie o congedi (Colombo et al., 2025). Questi fenomeni, oltre a segnalare un deterioramento del benessere organizzativo, incidono in modo rilevante sulla produttività e sulla qualità dell'assistenza.

In questo contesto, l'obiettivo organizzativo-aziendale diventa quello di attrarre e mantenere (retention) il personale sanitario, rappresentando una priorità strategica per la sostenibilità del SSN. Diversi studi evidenziano come i manager e i dirigenti sanitari svolgano un ruolo determinante nel prevenire l'abbandono del lavoro, influenzano direttamente la motivazione e il benessere dei professionisti (De Vries et al., 2023; Bagnasco et al., 2023). Lo stile di leadership si conferma infatti una variabile predittiva degli esiti sul paziente e del benessere degli operatori (Bagnasco et al., 2023; Mete et al., 2022).

2. Sviluppo concettuale

Davanti a problemi nuovi ci chiediamo se i modelli organizzativo-aziendali rispondenti ad esigenze di aumento della performance (paradigma del management by objective tipo del New Public Management), possano essere ancora l'unica e dominante risposta o se sia necessario esplorare ed integrare modelli nuovi, in particolare quelli nati e sviluppati in contesti di alta professionalizzazione come i contesti assistenziali. Tra i modelli che stanno riscuotendo attenzione è la compassionate leadership.

La compassionate leadership mira a creare una dimensione culturale basata sul supporto tra colleghi, dirigenti e collaboratori in un ambiente dove ci si prende cura dell'altro. Le sue potenzialità sono particolarmente evidenti nel settore sanitario, dove il personale è particolarmente esposto al rischio di burnout e stress lavoro-correlati. Come definito da Atkins e Parker (2012), essa si basa su quattro componenti fondamentali – attenzione, comprensione, empatia e azione – e mira a creare una cultura organizzativa fondata sul rispetto, sull'ascolto e sul supporto reciproco (Atkins e Parker, 2012)

Studi condotti da M. West nel Regno Unito (West e Chowla, 2017; West, 2021; West et al., 2022) e in altri contesti internazionali (Shuck et al., 2019; Paakkanen et al., 2021) hanno dimostrato che la compassionate leadership e, più in generale, la Compassion at Work, contribuisce a ridurre burnout e stress, a migliorare il clima organizzativo e la soddisfazione lavorativa, e a rafforzare la retention, nonché a migliorare gli esiti di cura. I compassionate leader grazie alla loro capacità di mettere in relazione le esperienze degli altri con le proprie sono in grado di comprendere i bisogni e i sentimenti e di percepirli simili alle proprie esperienze (Hopkinson, 2014). I leader compassionevoli creano un ambiente di lavoro positivo e collaborativo, in cui i dipendenti si sentono valorizzati e supportati. Questo approccio, caratterizzato da empatia e comprensione, non solo rafforza le relazioni interpersonali ma si traduce anche in un miglioramento delle prestazioni individuali e di gruppo (Cameron, 2011).

Questo approccio, particolarmente rilevante nel settore sanitario, risponde alla domanda cruciale: chi si prende cura di chi cura?

Il presente contributo si inserisce nel dibattito sulla sostenibilità del personale sanitario, proponendo una riflessione teorico-empirica su un progetto di ricerca in corso, "Compassionate Leadership: the Italian Way". Il progetto biennale mira a definire e validare un modello italiano di compassionate leadership, capace di integrare i valori fondativi della sanità pubblica con un approccio alla leadership orientato all'ascolto, all'empatia e alla cura reciproca, in coerenza con la cultura e la missione del SSN.

Sul piano teorico, il progetto contribuisce ad ampliare la letteratura sui modelli di leadership nel settore sanitario, ponendosi all'intersezione tra studi sul benessere organizzativo, sulla retention del personale e sulla leadership sostenibile. L'approccio proposto supera la prospettiva dominante di tipo prestazionale, trasformazionale o transazionale, per promuovere una visione rinnovata della dimensione relazionale e valoriale della leadership, centrata sulla cura reciproca e sull'equilibrio tra performance e benessere. In questa prospettiva, la ricerca si inserisce nel più ampio dibattito internazionale sulla revisione dei paradigmi introdotti dal New Public Management, offrendo una lettura aggiornata e coerente con la missione pubblica del SSN.

3. Obiettivi

L'obiettivo generale della ricerca è di indagare in modo sistematico il potenziale della leadership compassionevole come leva per la sostenibilità delle risorse umane e la qualità organizzativa nel SSN. Partendo dal riconoscimento che la retention dei professionisti rappresenta oggi una delle principali criticità del sistema, lo studio intende analizzare come pratiche di leadership fondate su attenzione, supporto e benessere possano incidere positivamente sul clima organizzativo, sulla soddisfazione lavorativa e sull'intenzione dei professionisti di rimanere nel proprio contesto di lavoro.

Gli obiettivi specifici si articolano su quattro assi strategici, coerenti con l'articolazione del progetto:

- Adattamento e validazione del modello italiano di Compassionate Leadership
- Tradurre e contestualizzare al sistema sanitario italiano il modello elaborato nel Regno Unito tenendo conto delle peculiarità culturali, linguistiche e organizzative del SSN.
- Costruire un framework teorico-operativo che identifichi comportamenti osservabili e competenze chiave di leadership compassionevole, utili per dirigenti, coordinatori e team sanitari.
- Validare gli strumenti di misurazione in lingua italiana per rilevare i livelli percepiti e agiti di compassionate leadership.
- Analisi empirica degli effetti della compassionate leadership
- Valutare l'impatto della leadership compassionevole su variabili organizzative (clima, fiducia, sicurezza psicologica) e individuali (benessere, burnout, soddisfazione lavorativa).
- Esaminare le relazioni tra leadership, benessere e intention to leave, verificando il ruolo di mediazione esercitato dalla soddisfazione lavorativa e dal senso di appartenenza.
- Identificare eventuali differenze in base a ruolo, anzianità e contesto organizzativo.
- Sperimentazione e apprendimento organizzativo
- Implementare un percorso di formazione e ricerca-azione in due aziende sanitarie locali partecipanti al progetto, rivolto a dirigenti e coordinatori.
- Favorire la diffusione di pratiche di leadership compassionevole attraverso workshop, laboratori di co-design ed esperienze riflessive supportate da moduli e-learning.
- Promuovere processi di apprendimento organizzativo e di diffusione culturale della cura reciproca.

- Produzione di evidenze e linee guida per la governance del personale sanitario

Nel complesso, la ricerca mira ad utilizzare un approccio di implementation science per offrire un contributo teorico e applicativo alla letteratura sulla leadership sanitaria e alle pratiche di gestione del capitale umano nelle organizzazioni pubbliche ad alta intensità professionale.

4. Quadro metodologico

Il progetto adotta un approccio di *implementation* science proponendo di studiare sistematicamente i determinanti e i processi che influenzano l'adozione, l'adattamento e la sostenibilità di interventi di leadership compassionevole. In particolare, tramite l'utilizzo di approcci *mixed-methods* mira a ottimizzare l'impatto della leadership compassionevole nella pratica reale. La metodologia è stata disegnata per garantire robustezza empirica, partecipazione dei professionisti e trasferibilità dei risultati all'interno del SSN.

La ricerca si articola nelle seguenti fasi, cronologicamente integrate:

- Adattamento e costruzione del modello italiano della leadership compassionevole
- Revisione sistematica della letteratura internazionale e traduzione del materiale formativo del National Health Service - UK.
- Contestualizzazione del modello attraverso focus group e workshop con dirigenti e coordinatori sanitari, per garantire coerenza culturale e operativa con il SSN.
- Implementazione e formazione
- Realizzazione di un percorso formativo rivolto a dirigenti, coordinatori e figure di middle management nelle aziende sanitarie coinvolte nel progetto.
- Il percorso prevede otto incontri formativi (4 ore ciascuno) integrati da moduli e- learning e sessioni di riflessione guidata, per facilitare la traduzione pratica dei principi della compassionate leadership.
- Validazione empirica
- Approccio quasi-sperimentale longitudinale con gruppo sperimentale (3 servizi assistenziali di 2 Ausl) e gruppo di controllo (3 servizi assistenziali di 1 Ausl).
- Analisi quantitativa: utilizzo di questionari validati a livello internazionale e tradotti in italiano (C@W-LBI, MBI-HSS, PERMA Profiler, Job Satisfaction, Intention to Leave), con raccolta dati in tre momenti.
- Analisi qualitativa: interviste semi-strutturate e focus group per esplorare percezioni, esperienze e cambiamenti organizzativi percepiti.
- Triangolazione dei dati per rafforzare l'affidabilità dei risultati e comprendere in profondità i meccanismi di cambiamento.
- Disseminazione e trasferimento del modello
- Restituzione dei risultati alle aziende partecipanti.
- Produzione di linee guida operative per l'adozione del modello in altri contesti regionali e nazionali.

5. Risultati conseguiti o attesi

Trattandosi di un progetto in corso recentemente avviato, i risultati della sperimentazione saranno disponibili solo dopo il primo anno, ma a breve saranno disponibili quelli relativi all'analisi sistematica della letteratura, con le relative implicazioni per il sistema sanitario italiano. Inoltre, fin da ora, sulla base del quadro teorico di riferimento e delle evidenze internazionali, è possibile delineare alcuni esiti attesi e le relative implicazioni scientifiche e organizzative.

Ci si attende che l'implementazione del modello italiano di compassionate leadership possa produrre effetti positivi su tre livelli:

- A livello individuale, un miglioramento del benessere psicologico, della soddisfazione lavorativa e del senso di appartenenza, accompagnato da una riduzione dei livelli di burnout e di stress lavoro-correlato. La leadership compassionevole, infatti, favorisce processi di riconoscimento reciproco e sostegno emotivo che incidono sulla motivazione intrinseca e sulla resilienza professionale (Buonomo et al., 2022).
- A livello organizzativo, un rafforzamento del clima interno, della collaborazione interprofessionale e della sicurezza psicologica del team, elementi che possono tradursi in una maggiore coesione e in una percezione più elevata di fiducia verso la leadership e
- l'istituzione di appartenenza (Buonomo et al., 2022).
- A livello sistemico, un contributo alla sostenibilità delle risorse umane nel SSN, attraverso la riduzione dell'intention to leave e dell'assenteismo, il miglioramento della retention (Chamanga et al., 2025)e, nel lungo periodo, l'aumento della capacità attrattiva delle organizzazioni sanitarie pubbliche.

In prospettiva, i risultati attesi potranno fornire evidenze empiriche originali sul nesso tra compassionate leadership, benessere organizzativo e retention, ancora poco esplorato nel contesto italiano.

Il progetto si propone inoltre di offrire strumenti concreti di misurazione e intervento, basati su evidenze scientifiche, che potranno essere trasferiti ad altre regioni e contesti organizzativi. Il valore della ricerca risiede quindi nella possibilità di integrare la dimensione relazionale della leadership con la sostenibilità manageriale del SSN, contribuendo a sviluppare una cultura organizzativa in cui la cura delle persone — pazienti e professionisti — diventi un principio guida della governance sanitaria. La prospettiva di lungo periodo è quella di consolidare un modello di leadership sostenibile, capace di attrarre, motivare e trattenere i professionisti della salute, promuovendo organizzazioni più umane, resilienti e orientate alla cura delle persone e di chi cura.

Sul piano manageriale e di policy, il progetto contribuisce a sviluppare strumenti concreti per la valutazione e lo sviluppo della leadership nei contesti sanitari pubblici. Le evidenze attese potranno orientare le strategie di human resource management i programmi di formazione manageriale, supportando le direzioni aziendali e regionali nella costruzione di ambienti di lavoro più attrattivi, sostenibili e centrati sul benessere del personale.

6. Conclusione

La riflessione proposta evidenzia come, nel quadro delle attuali tensioni del sistema sanitario italiano, la questione della sostenibilità del personale non possa più essere affrontata solo in termini di risorse o di vincoli normativi, ma richieda una rinnovata attenzione alle dimensioni relazionali e culturali della leadership.

Il progetto "Compassionate Leadership: the Italian Way" si colloca in questa prospettiva, con l'intento di esplorare empiricamente in che modo pratiche di leadership fondate su ascolto, empatia e attenzione al benessere possano contribuire a migliorare il clima organizzativo e a favorire la permanenza dei professionisti nel SSN. Pur essendo una ricerca ancora in corso di avvio, il suo valore potenziale risiede nella possibilità di fornire un modello di leadership coerente con la cultura e la missione pubblica della sanità italiana, offrendo strumenti utili alla governance del personale e alla formazione dei futuri leader sanitari.

L'obiettivo di lungo periodo non è soltanto validare un modello teorico, ma promuovere una riflessione più ampia sulla cura delle persone come competenza manageriale. In tale direzione, la compassionate leadership può rappresentare una leva concreta per sostenere il benessere

organizzativo e rafforzare la capacità del sistema sanitario di rispondere alle sfide di sostenibilità e qualità che lo attendono.

Parole chiave: Compassionate leadership; retention to leave; intention to stay; middle management; sanità

Ringraziamenti

Il presente contributo è stato sviluppato nell'ambito del Progetto "Compassionate Leadership: il modello italiano" co-finanziato da Regione Veneto, ed è il risultato della collaborazione tra i Partner coinvolti.

Network Governance and Managerial Innovation for Community-Based Healthcare: A Strategic Framework for Territorial Value Creation

Fiorella Pia Salvatore[1], Francesco Maria Nacci[2], Piervito Bianchi[3], Marco Taliento[4]

1. Introduction

The Italian National Health Service is undergoing a profound institutional and organisational transformation aimed at strengthening territorial healthcare organisations, improving equity, and increasing access to integrated socio-health services. The reform impetus, accelerated by the National Recovery and Resilience Plan (PNRR), Mission no. 6.1, has introduced innovative regulatory, managerial, and infrastructural models designed to support a shift from hospital-centric to community-based care. In this context, Case della Comunità (CdC) represent the cornerstone of a reconfigured network of primary and integrated care services. They embody an organisational logic inspired by hub-and-spoke architectures, multi-professional integration, and community engagement strategies, enabling personalised care pathways and continuous management of chronicity.

This evolving paradigm can be theoretically framed through network governance (Provan & Kenis, 2008), a model that emphasises horizontal coordination among autonomous yet interdependent actors, including local health authorities, municipalities, third-sector organisations, private accredited providers, and community networks. This network positions CdC as strategic nodes in collaborative networks where socio-health services are co-produced across institutional boundaries (Romiti et al., 2020; Giusti et al., 2025).

Network governance has been widely recognised for its capacity to address complex public problems through shared decision-making, distributed leadership, and the mobilisation of diverse knowledge bases (Ansell & Gash, 2008; Klijn & Koppenjan, 2016). In healthcare organisations, multi-actor networks have proven effective in improving continuity of care, coordination, and population health management (Ferlie et al., 2013; Goodwin, 2016). The Italian reform aligns with international evidence showing that integrated community care systems enhance health equity, reduce unnecessary hospitalisations, and foster patient-centred models of chronic care (WHO, 2018; Valentijn et al., 2013). Moreover, from a managerial standpoint, the operation of territorial healthcare organisations requires advanced tools such as multi-level performance management systems (Bevan & Hood, 2006), inter-organisational coordination mechanisms (O'Toole, 2015), shared budgeting processes (Bovaird, 2007), and digital integration platforms that enable data sharing, clinical information continuity, and population health analytics (Adler-Milstein & Jha, 2017). The use of these tools stresses the importance of such managerial innovation especially performance governance, digitalisation (e.g., FSE, DSS), and participatory evaluation as necessary enablers for territorial integration.

The theoretical framework is further strengthened by the lens of Community Governance and Building (Zazzera, 2021) and Citizen Involvement Models (Longo & Barsanti, 2022), which highlight the centrality of community engagement initiatives in enhancing legitimacy, co-creation of value, and responsiveness to local needs. This resonates with international research showing that community participation improves health outcomes, increases trust, and strengthens accountability mechanisms in public services (Bussu & Galanti, 2018; Renedo & Marston, 2015).

The "leadership in the plural" (Kjellström et al., 2024), is a notion deepened in this work in progress and aligned with collaborative leadership theories (Huxham & Vangen, 2000; Denis et al., 2012). In particular, the concept developed by Kjellström et al., (2024) represents a significant evolution in leadership theory, particularly within public-sector contexts characterised by complexity, professional hybridity, and multi-actor interdependence. Contrary to traditional leadership models centred on the actions of a single, formally designated leader, plural leadership conceptualises leadership as an emergent, relational, and collective process distributed across multiple actors, roles, and organisational boundaries. This view departs from individualistic and heroic paradigms by framing leadership as an ongoing practice rather than a static positional attribute. In plural leadership, authority, influence, and decision-making capacity are dispersed and negotiated through interactions among organisational members. Theoretically, leadership in the plural aligns closely with concepts of distributed leadership, which emphasises how leadership is enacted through shared practices embedded in social and organisational routines rather than exercised solely by individuals occupying hierarchical positions (Spillane, 2006).

Plural leadership has become an essential organisational logic in healthcare organisations where clinical, managerial, and community actors should collectively coordinate care pathways, allocate resources, and negotiate governance arrangements across institutional boundaries. In these complex environments, no single leader or profession monopolises the knowledge, authority, or legitimacy needed to steer interdependent service networks. Instead, leadership emerges as a collective, relational accomplishment distributed across heterogeneous actors who contribute distinct epistemic resources and institutional mandates. The plural-leadership framework articulated by Denis et al., (2012) conceptualises leadership as a dynamic and situated process generated through the interaction of multiple leaders rather than through hierarchical command, offering a theoretical foundation particularly suited to territorial and community-based healthcare systems.

The capacity of plural leadership to integrate diverse expertise is strengthened by relational coordination, which stresses that shared goals, shared knowledge, and mutual respect are necessary to align high-interdependence tasks such as chronic-care management and community participation (Gittell, 2002; Gittell et al., 2016). Yet, the epistemic cultures that characterise clinical professions, administrative actors, and community groups differ significantly, shaping what is considered legitimate evidence and appropriate care (Knorr-Cetina, 1999). Effective plural leadership requires mediating these epistemic divides, often through boundary spanning-roles and practices that enable communication, translation, and negotiation across organisational interfaces. Tushman's (1977) foundational work on boundary roles demonstrates how individuals positioned at organisational peripheries facilitate the flow of information and innovation across groups, a mechanism that has since been shown to be vital in integrated healthcare organisations and multi-organisational networks.

In healthcare, these boundary-spanning functions are frequently fulfilled by hybrid professionals who combine clinical, managerial, and sometimes community-oriented responsibilities (Noordegraaf, 2015; Hendrikx, 2017). Their hybrid identity equips them to navigate multiple institutional logics and reduce friction between professional autonomy, cost-efficiency imperatives, and community needs. Contemporary research on institutional complexity reinforces this point, noting that plural leadership is most effective when actors can interpret, blend, and selectively activate institutional logics to support joint decision-making and integrated service delivery (Thacher & Rein, 2004; Greenwood et al., 2011). However, plural leadership is

not inherently benign. Collaborative governance research warns that without supportive structures, clear role definitions, shared accountability frameworks, and facilitative leadership, multi-actor collaboration can produce coordination overload, role ambiguity or symbolic participation (Huxham & Vangen, 2013; Emerson & Nabatchi, 2015). In the territorial network of healthcare organisations this risk could be amplified by entrenched professional hierarchies, informational asymmetries, and the fragmentation of digital and organisational infrastructures. Therefore, plural leadership must be supported by concrete integrative mechanisms: jointly developed care pathways, digital boundary objects such as shared electronic records, regular cross-professional routines, and spaces for inter-organisational sensemaking (Oborn et al., 2011; Kellogg, 2009). When these enabling conditions are present, plural leadership becomes a powerful integrative force, transforming diverse epistemic communities into coordinated and community-responsive territorial healthcare networks capable of generating sustainable public value.

The main aim of this study situates its inquiry within the broader debates on public value, network capabilities, and co-production (Osborne, Radnor & Strokosch, 2016; Moore, 1995), recognising that collaborative territorial healthcare networks contribute to social, economic, and health outcomes essential for sustainable public governance.

The remainder of the work is organized as follows: Section 2 details the methodological design; Section 3 presents the expected results and conceptual model; Section 4 discusses theoretical and managerial implications by developing conclusions, limitations, and directions for future research.

2. Method

The study adopts a conceptual–analytical and exploratory research design, appropriate for examining emergent organisational forms and governance arrangements within complex public-sector organisations. This design enables the construction of a theoretically grounded yet empirically informed framework for interpreting the governance of territorial healthcare networks, with a specific focus on the CdC. Methodologically, the research follows a multi-strand strategy that integrates documentary analysis, systematic literature review, case-based reasoning, and framework synthesis in order to derive robust conceptual categories and evaluative instruments.

First, the qualitative document analysis was carried out on national legislation, PNRR policy acts, regional decrees, local organisational guidelines, and programmatic documents defining the operational characteristics of the CdC model. This phase ensures that the conceptualisation of territorial healthcare networks is grounded in the actual normative and strategic architecture shaping their implementation. Following established approaches in public administration research (Bowen, 2009), document analysis is used not only to extract formal policy content but also to interpret underlying governance logics, institutional priorities, and managerial assumptions.

Secondly, the study conducts a literature review across major scientific databases (Scopus, Web of Science, PubMed). The review spans international scholarship on network governance, integrated care, co-production, public value, community engagement, digital health, and inter-organisational collaboration. This step provides the theoretical scaffolding necessary to situate the Italian reforms within broader global debates on health-system transformation and to identify key analytical constructs such as coordination mechanisms, collaborative advantage, and performance governance. Furthermore, to explore how these theoretical principles manifest in practice, the study draws on case-based reasoning, incorporating case studies from selected Italian local healthcare authorities (Aziende Sanitarie Locali) and territorial socio-sanitary networks. The inclusion of case elements aims to capture the managerial practices, leadership structures, digital infrastructures, and community engagement strategies emerging in the early implementation of CdC. This approach aligns with the tradition of case study research in public management and

health policy (Yin, 2017), enabling sensitivity to context-specific dynamics while supporting analytic generalisation. The fourth phase involves framework synthesis, through which insights from both the literature and case-based evidence are integrated into a multi-dimensional analytical model. This synthesis clarifies the interrelations among governance modes, managerial tools, network capabilities, and community participation in shaping territorial performance.

Finally, drawing on public-value chain methodologies (Bryson, Crosby, & Bloomberg, 2014) and established integrated-care evaluation frameworks, this work in progress engages in the development of performance indicators and analytical tools. The resulting evaluative architecture is intended to measure multiple dimensions of network performance, including inter-organisational collaboration intensity, integration and continuity of care, resource optimisation, equity outcomes, and population well-being. This set of methods will aim to support the assessment of territorial healthcare networks not merely as organisational units but as collaborative systems generating public value.

3. Results

The expected results of the study point toward a coherent and mutually reinforcing set of findings that collectively illuminate how territorial healthcare networks and, particularly CdC, can be effectively governed and assessed within a network-governance paradigm. Emerging evidence suggests that the CdC model exhibits a high degree of structural and functional convergence with the principles of network governance, which emphasise collaborative coordination, distributed authority, and inter-organisational interdependence. Taking into account the multidimensional complexity of healthcare organisations' needs, no single hierarchical actor can ensure effective territorial care delivery on its own; rather, performance depends on the capacity of multiple organisations and professional groups to collaborate, share information, and jointly pursue population-health objectives.

A conceptual representation of these expected findings is provided in Figure 1, which offers a visual synthesis of the systemic configuration underpinning territorial healthcare governance. The diagram places Network Governance at the apex, illustrating its function as the overarching logic guiding organisational behaviour across the system. The flow into Territorial Healthcare Networks reflects the translation of governance principles into operational structures. The horizontal articulation of Managerial Innovation and Community Engagement act as lateral forces shaping CdC performance, while Digital Transformation enables integration. At the base, Performance Evaluation captures the cumulative outcomes generated by the system. As a whole, the diagram conveys a cascading yet interactive model, aligning with contemporary research that positions territorial care as a dynamic ecosystem where governance, organisational capabilities, social participation, and digital infrastructures collectively shape performance.

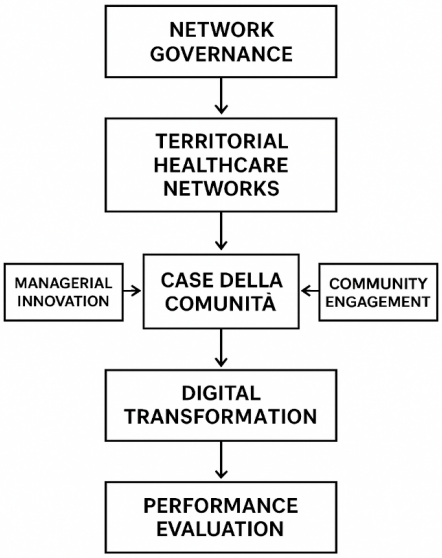

Figure 1. Diagram of territorial healthcare network governance and performance pathways

Within this governance architecture, the results are expected to highlight the importance of a distinct set of managerial tools that enable operationalisation of collaborative arrangements. These include shared performance frameworks, joint planning and budgeting mechanisms, interoperable digital platforms for real-time information exchange, participatory governance instruments supporting co-production, and leadership models grounded in distributed responsibility rather than hierarchical control. A further key result concerns the development of a multidimensional performance evaluation framework capable of capturing the complexity of territorial healthcare networks. The study is expected to propose macro-level indicators related to public value creation (equity, accessibility, population well-being), meso-level measures focused on organisational functioning and coordination intensity, and micro-level indicators assessing continuity of care, patient experiences, and personalised care trajectories. This tripartite approach is consistent with integrated-care evaluation models and reflects the need to assess territorial healthcare organisations as systemic entities rather than a collection of organisational units. The results also highlight the critical role of leadership and trust as behavioural determinants of network performance. Leadership should emerge not as a singular function but as a plural, distributed process mediated by relational dynamics among municipalities, local health authorities, third-sector organisations, and community actors.

In addition, the results highlight the centrality of digital health infrastructures as enablers of integrated territorial care. Tools such as the Fascicolo Sanitario Elettronico, decision-support systems, and data analytics platforms support population stratification, predictive modelling, care personalisation, and inter-organisational coordination. Because digital maturity is associated with improvements in quality, efficiency, and integration, digital transformation is anticipated to represent a foundational condition for the functioning of territorial healthcare organisations.

4. Discussion and conclusions

The research proposes a comprehensive and multi-layered conceptual framework that links governance models, organisational architecture, managerial tools, community engagement, digital infrastructures, and performance evaluation within territorial healthcare networks. By articulating the interdependencies among these dimensions, this work in progress contributes to

the theoretical consolidation of territorial healthcare organisations as a networked public-service ecosystem, moving beyond traditional hierarchical models of healthcare facilities. The previous Figure 1 visually synthesises this architecture, reinforcing the interpretive centrality of the CdC as bridging structures that mediate between policy intentions, organisational dynamics, and community-generated value.

Overall, this work aims to advance understanding in several domains. First of all, in the network governance theory, by situating territorial healthcare within collaborative, multi-actor structures, and in the community-based health systems, by foregrounding the value of community engagement initiatives as components of governance rather than peripheral add-ons. Moreover, collaborative and plural leadership should be developed through the recognition of shared leadership as a determinant of network performance, just as the digital-health organisational strategies should be developed by identifying digital infrastructures as enabling conditions rather than mere technological supports. Finally, the measurement of public value, by proposing a multidimensional evaluation architecture capable of broadly capturing systemic outcomes at the micro, meso, and macro levels, could be developed in future research.

However, despite these contributions, the study presents limitations that must be acknowledged. The framework is predominantly conceptual and exploratory, and while informed by empirical cases, it does not yet include a full-scale, systematic empirical validation across multiple territorial contexts. Given the substantial heterogeneity of Italian regional health systems, future research should critically assess how the proposed model performs across diverse implementation environments. Moreover, while the framework integrates digital infrastructures as enabling conditions, the field of digital-health ecosystems is rapidly evolving. Artificial intelligence, predictive analytics, and data-sharing protocols raise ethical, technical, and governance challenges that exceed the scope of the present conceptualisation. Future studies should explore how algorithmic decision support, interoperability standards, and digital equity concerns reshape network governance. The conceptual framework implicitly assumes a positive relationship between network governance and performance outcomes, but empirical studies show that networks can also produce coordination overload, ambiguous accountability, and decision paralysis. Thus, a number of critical perspectives should be developed by examining the conditions under which networks fail, fragment, or devolve into symbolic implementation.

Building on these limitations, comparative, multi-region studies should assess the applicability of the framework in heterogeneous operational contexts, identifying conditions for success and failure. The development of statistically validated indicators and predictive models could enhance evaluative precision and support evidence-based policy decisions. Thus, research using participatory action research, deliberative processes, and social network analysis could illuminate community governance dynamics in greater depth. Further analysis of distributed leadership and relational coordination can help identify competencies, behaviours, and organisational cultures that sustain collaborative advantage for the territorial healthcare organisations.

In conclusion, while the present work in progress provides a conceptual foundation for analysing governance and performance within territorial healthcare networks, further empirical and theoretical research is required to validate, refine, and operationalise the proposed framework. The model offers a promising starting point for advancing both academic scholarship and policy practice, supporting the development of territorial healthcare organisations capable of delivering integrated, equitable, and community-oriented public value.

Keywords: Territorial healthcare organisations; network governance; public value; plural leadership

Mappare i bisogni per governare il cambiamento: un modello di network governance per le Case della Comunità

Marta Russotto[1], Marco Ferretti[2], Benedetta Pini[3]

1. Introduzione

Alla luce dei profondi mutamenti che stanno interessando il sistema di welfare italiano, i quali aprono la strada a visioni organizzative capaci di riconoscere la natura complessa, relazionale e riflessiva dei sistemi sociosanitari, diventa cruciale rileggere le aziende e le reti di tutela della salute come sistemi complessi, adattivi, capaci di apprendere, evolvere e rispondere in modo flessibile alle esigenze mutevoli della comunità (Plsek e Greenhalgh, 2001; Grossi, 2019). In contesti in cui si agisce con persone per persone, diventa una condizione abilitante e imprescindibile inserire la dimensione relazionale per pensare e valutare il valore pubblico generato dalle politiche e dai servizi sanitari territoriali (Folgheraiter, 2003). In questa cornice, le Case della Comunità (CdC) si configurano come un'evoluzione del modello di assistenza sociosanitaria precedentemente rappresentato dalle Case della Salute (CdS). Introdotte dal Decreto Ministeriale 77/2022, si presentano come architrave della riorganizzazione dell'assistenza territoriale, con la finalità di offrire servizi sanitari e sociali in modo integrato e coordinato. Questa ridefinizione mira a superare la frammentazione dell'offerta esistente (Maciocco, 2018) e promuovere al contempo una visione intersettoriale e partecipativa dell'assistenza (Costa e Donato, 2023) e della salute individuale e collettiva, configurando le CdC come dispositivi strategici capaci di leggere le disuguaglianze sociali e territoriali e integrare cura e partecipazione (Costa, 2023).

Nonostante il potenziale innovativo delle CdC, la loro effettiva capacità di coordinamento nel territorio risulta ancora limitata, compromettendone l'efficacia soprattutto nelle aree più remote (Costa et al., 2022). Attualmente, queste strutture stanno attraversando una fase di transizione organizzativa: il modello prevalente è ancora quello delle CdS, ma il DM 77/2022 ha introdotto nuovi standard qualitativi, quantitativi, strumentali e tecnologici per l'assistenza territoriale. Il presente progetto di ricerca si colloca proprio in questo delicato passaggio, analizzando e accompagnando l'evoluzione da CdS a CdC. Il modello organizzativo delle CdC si configura come un'iniziativa complessa che richiede un approccio di governance reticolare e inclusivo.

L'obiettivo generale è, per l'appunto, la definizione di un modello organizzativo per le CdC capace di garantire un coordinamento inter-organizzativo efficace. Tale coordinamento non è un esito spontaneo dell'aggregazione di strutture o della co-localizzazione fisica, bensì l'effetto di meccanismi di governance (strutturati, relazionali e informativo-digitali) progettati, sostenuti e adattati ai contesti (Provan e Kenis, 2008).

Il presente elaborato propone un disegno di ricerca multi-caso incentrato su quattro diverse strutture del contesto di Parma e provincia. L'analisi quantitativa e qualitativa dei quattro cotesti differenti mira a definire un modello scalabile e replicabile.

Lo studio è pertanto guidato dalle seguenti domande di ricerca:

[1] Dottoranda di ricerca, ECON-06, Università di Parma; marta.russotto@unipr.it – corresponding author

[2] Professore associato, ECON-06, Università di Parma; marco.ferretti@unipr.it

[3] Dottoranda di ricerca, IEGE-01/A, Università di Parma; benedetta.pini@unipr.it

- Quali meccanismi di governance e di coordinamento, strutturali, relazionali e informativo, rendono efficace l'integrazione sociosanitaria nelle Case della Comunità?
- Come, tali meccanismi, variano e si combinano nei diversi contesti?

Trattandosi di uno studio in fase preliminare ed esplorativa, non si intende fornire risposte definitive a tali domande. Tuttavia, l'analisi comparativa delle quattro strutture prese in esame, delineata successivamente, consentirà di elaborare una prima rappresentazione dei processi di coordinamento tra gli attori coinvolti, costituendo una base per la successiva definizione del modello organizzativo.

2. Quadro teorico

In questo scenario di cambiamento, la collaborative (Ansell & Gash, 2008) e la network governance (Provan e Kenis, 2008) integrate con i principi di co-produzione e co-creazione di valore nei servizi pubblici (Moore, 1997; Bovaird, 2007; Osborne et.al., 2016) appaiono come linee guida per l'intero processo di analisi e definizione di un modello guidato da un approccio partecipativo che coinvolgerà attivamente la popolazione (Baraldi et al., 2015) nella rilevazione dei bisogni e nella co-progettazione del servizio.

Il funzionamento efficace delle CdC, poggia sulla capacità di coordinare attori, risorse e competenze provenienti da settori diversi (sanità, sociale, amministrazione locale, associazionismo). La gestione di tali network inter-organizzativi impone la necessità di compiere scelte strategiche e consapevoli su più aspetti: modalità di governance, meccanismi di coordinamento, ruolo della fiducia tra gli attori coinvolti o ancora trade-off tra gli obiettivi di efficienza, inclusione e legittimità delle decisioni (Emerson et.al., 2012). Questo filone teorico permette di focalizzarsi sui meccanismi concreti (es. accordi, interfacce, ruoli di confine, routine) che consentono alle CdC di funzionare come punti di integrazione e non come semplici contenitori fisici di servizi.

Nell'ambito della sanità territoriale e dell'integrazione sociosanitaria, la qualità e l'appropriatezza dei servizi sono direttamente correlate al grado di coinvolgimento degli utenti e della comunità (Buoso e Viscomi, 2024). La co-produzione è intesa non come volontarismo, ma come routine organizzativa che modifica flussi informativi, aspettative e responsabilità, con impatti misurabili su accessibilità, continuità e appropriatezza (Sicilia et.al., 2015; Osborne et.al., 2016).

Il modello di governance concepito per le CdC richiede, per tanto, un processo decisionale ibrido che riconosca l'asimmetria intrinseca del potere e delle responsabilità nel settore sanitario. Se infatti, da un lato l'inclusione di cittadinanza, utenza e associazioni può aumentare la democratizzazione (Ansell et.al., 2020) e la legittimità delle decisioni, dall'altro lato la sostenibilità organizzativa e finanziaria rimane responsabilità primaria dell'attore pubblico che detiene il mandato istituzionale. In questa prospettiva di network governance, il processo partecipativo assume una funzione di co-creazione di proposte (Nasi et.sl., 2024), l'utenza e le associazioni agiscono come fornitori di conoscenza situata (data la conoscenza specifica delle esigenze locali e dell'esperienza d'uso del servizio), tale conoscenza è integrata dall'ente pubblico con la propria conoscenza tecnica, legale e di fattibilità. La decisione finale è quindi frutto di una negoziazione mediata (Thomson e Perry, 2006; Nicolini, 2013), dove l'autorità, pur mantenendo il potere di veto o di modifica, è istituzionalmente vincolata a considerare, rispondere e giustificare le proprie azioni rispetto agli input ricevuti dalla rete (Battini, 2011). La co-produzione di decisioni e servizi permette così, una migliore corrispondenza tra le esigenze della comunità e le risposte fornite dal sistema sociosanitario, influendo direttamente sulla performance di rete (Mauro e Campanale, 2018).

Gray (1989) concepiva la collaborazione con una visione integrativa, rappresentandola come un processo in cui le parti, con visioni differenti, affrontano in modo costruttivo le loro divergenze e riescono a trovare soluzioni che superano i confini delle rispettive percezioni di ciò che è

realizzabile. Affinché la collaborazione evolva in una co-produzione efficace, è quindi necessario che gli elementi integrativi (es. relazioni personali, fiducia reciproca, impegni informali) non prevalgano sugli elementi aggregativi (che si manifestano nei ruoli organizzativi formali e nelle strutture rigide). Il modello deve quindi trovare il giusto equilibrio tra integrazione e aggregazione (Ring e Van de Ven, 1994) formalizzando così il processo attraverso i meccanismi di governance espliciti (Ansell e Gash, 2008). Tale processo di collaborazione e co-produzione deve essere inteso come "iterativo e ciclico" (Ring e Van de Ven, 1994), riconoscendo che l'apprendimento, l'adattamento e la negoziazione sono essenziali per il successo a lungo termine di una prospettiva integrativa (Thomson e Perry, 2008) in un ambiente complesso e in evoluzione come quello sociosanitario. Altra determinante da integrare nel modello è infatti, la dinamicità del contesto sociosanitario così che possa conferire la capacità di adattarsi alle eterogeneità sociodemografiche e logistiche dei diversi scenari. È necessario prevedere flessibilità e sensibilità (Sangiorgi et.al., 2024) nell'applicazione di meccanismi di rete, al fine di garantire una replicabilità in contesti differenti del modello sviluppato (Valentini 2024).

3. Metodologia

Il disegno di ricerca adotta la strategia di multiple case study, ritenuta particolarmente efficace per analizzare fenomeni complessi all'interno dei loro contesti reali (Yin, 2009). Questa scelta metodologica permette di rafforzare la validità esterna e la robustezza delle conclusioni consentendo un confronto sistemico, una ricerca di pattern comuni e un aumento della capacità di generalizzazione teorica (Scapens,1992).

Su questa premessa il modello ipotizzato parte da una mappatura dei bisogni sanitari e sociosanitari di diverse realtà del Comune di Parma e della sua provincia, attraverso la selezione di quattro strutture in contesti territoriali distinti: urbano, rurale e montano. I tre partner principali del progetto sono: il Comune di Parma che svolgerà il ruolo di coordinamento tra gli attori del territorio garantendo al contempo un allineamento con le politiche sociali e sanitarie locali, l'AUSL di Parma che rappresenta l'attore principale nell'organizzazione e nell'erogazione dei servizi sanitari e sociosanitari e l'Università di Parma che fornirà supporto scientifico e metodologico. Un ruolo cruciale sarà inoltre ricoperto dagli Enti del Terzo Settore e dalla cittadinanza attiva, il cui coinvolgimento nella progettazione e nell'erogazione dei servizi di assistenza sanitaria e di welfare locale rappresenta un elemento cardine (Abimbola, 2020; De Weger et al., 2022; Van der Knaap et al., 2019).

In questa fase iniziale si è consapevoli che la selezione delle CdC è parziale; infatti, l'ampliamento dei casi verrà ripreso in uno stadio successivo del lavoro.

In questa tappa sono state individuate le seguenti strutture: la Casa della Comunità Lubiana San Lazzaro rappresentativa del contesto urbano; la Casa della Salute di San Secondo e la Casa della Salute di Langhirano espressione del territorio rurale; e la Casa della Salute di Tizzano-Val Parma, che incarna le specificità del contesto montano.

Il disegno di ricerca empirica combina una indagine quantitativa e una indagine qualitativa sugli stakeholder organizzativi e comunitari, secondo una logica multi-caso. Questa impostazione consente un'analisi approfondita utile per cogliere la percezione dei servizi, i bisogni emergenti e le dinamiche relazionali tra gli stakeholder (Ugolini et.al., 2020).

La survey sarà somministrata a un campione di residenti nei diversi contesti (urbano, rurale, montano), stratificati per Comune e frazioni, reclutati tramite sportelli delle Case della Comunità, medici di medicina generale, Terzo settore e canali on line.

La componente qualitativa prevede: (i) focus group con le professionalità già presenti nelle équipe multiprofessionali che operano nelle strutture (medici di medicina generale, infermieri di comunità/familiari, assistenti sociali, responsabili CdC, dirigenti distrettuali e rappresentanti del Terzo Settore), organizzati per setting assistenziali e tematiche specifiche; (ii) interviste semi-strutturate rivolte ai policy maker e ai rappresentanti del Terzo Settore; (iii) e questionari

strutturati, distinti in due versioni: uno rivolto alla cittadinanza e l'altro destinato agli operatori sociosanitari delle Case della Salute/Comunità.

Il questionario rivolto ai cittadini del Comune di Parma e della sua provincia sarà somministrato con l'obiettivo di raccogliere in modo partecipativo percezioni, bisogni e proposte rispetto ai servizi territoriali, rappresentativo delle principali aree territoriali (urbana, rurale e montana). La somministrazione agli operatori permetterà invece di integrare una valutazione esterna basata sull'esperienza e sulla percezione degli utenti, con una valutazione interna fondata sulla prospettiva organizzativa dei lavoratori pubblici. Questa differenziazione consentirà di raccogliere dati da target eterogenei e complementari, anche rispetto ai focus group, e di costruire una lettura multilivello della qualità, dell'efficacia e dell'aderenza dei sevizi ai bisogni della comunità.

L'utilizzo combinato di diversi strumenti di rilevazione rappresenta un ulteriore vantaggio strategico, poiché consente di cogliere la complessità dell'innovazione nei servizi sociosanitari, raccogliere prospettive eterogenee da parte degli stakeholder coinvolti (Greenhalgh et.al., 2017) e promuovere soluzioni collaborative più aderenti ai bisogni reali delle comunità (Jagosh et.al., 2012).

La componente quantitativa fornirà invece un inquadramento contestuale dei bisogni sanitari e sociosanitari della popolazione di riferimento. Quest'ultima però risulta più complessa, in quanto si focalizza sull'analisi dei dati epidemiologici e amministrativi, il che implica la gestione di dati sensibili riferiti ai singoli cittadini, con potenziali implicazioni per la tutela della privacy. Per affrontare questa criticità, sarà necessario coinvolgere il Responsabile della Protezione dei Dati (DPO), al fine di definire modalità sicure e conformi per l'accesso e l'elaborazione di tali informazioni. Si ipotizza, in collaborazione con i Medici di Medicina Generale (MMG), di avviare una procedura per la raccolta del consenso informato da parte dei cittadini, valutando contestualmente la possibilità di aggregazione e anonimizzazione dei dati raccolti, in quanto il trattamento delle informazioni sanitarie richiede misure specifiche di salvaguardia e il rispetto delle regole in materia di consenso e protezione, essenziale per garantire fiducia e legittimità nel processo di analisi (European Union Agency for Fundamental Rights, 2018). Questa fase rappresenta un passaggio delicato e al contempo strategico, in quanto condizionerà la qualità e la profondità dell'analisi dei bisogni sanitari e sociosanitari della popolazione.

Per migliorare ulteriormente la credibilità dei risultati e la robustezza del disegno di ricerca, verrà applicata una strategia di triangolazione su diversi livelli, a partire dalle fonti e dai metodi di rilevazione così da consentire il confronto delle diverse prospettive degli stakeholders. Anche i ricercatori interverranno nella fase triangolazione della teoria per confrontare le letture dei risultati e integrarle a diversi filoni teorici, ridurre la soggettività, identificare i pattern ricorrenti e rafforzare la validità teorica (Halkias et.al., 2022).

L'analisi seguirà così una logica within-case e cross-case, con pattern matching (Yin, 2009) tra configurazioni teoriche e pattern empirici osservati. L'utilizzo di Qualitative Comparative Analysis (QCA) (Ragin, 1993) permetterà di indagare come diverse combinazioni di condizioni (assetti di governance, caratteristiche dei contesti, intensità della partecipazione) si associano agli esiti di integrazione, accesso ed equità (Cucari, 2019; Thomann e Ege, 2020). Qualora siano disponibili dei dati relazionali sufficientemente densi, sarà inoltre impiegata una Social Network Analysis per descrivere la struttura della rete (grado, densità, centralità) e collegarla ai risultati in termini di valore pubblico (Da Silvia et.al., 2022).

La Tabella 1, riportata di seguito, illustra sinteticamente le diverse fasi metodologiche previste all'interno del progetto.

FASE	OBIETTIVO	STRUMENTO

Mappatura del contesto	Identificazione dei servizi esistenti e degli attori principali nell'ecosistema del servizio sanitario di Parma	Ricerca documentale, revisione delle politiche e analisi della letteratura
Selezione dei casi studio	Cogliere le variabili tra i centri sanitari urbani, rurali e montani	Mappatura degli stakeholder
Indagine partecipativa	Comprensione delle esigenze locali e delle percezioni relative ai servizi	Interviste semi-strutturate, focus group e questionari
Analisi quantitativa	Analisi dei dati dei servizi presi in esami	Dati epidemiologici (AUSL); dati amministrativi e demografici (Comune)
Progettazione e implementazione del modello delle CdC	Modello di governance partecipativo replicabile	Integrazione e analisi dei dataset

Tabella 1. Fasi del progetto

4. Risultati attesi

Sebbene il lavoro empirico sia nella sua fase iniziale, sia l'inquadramento teorico che l'analisi dei quattro casi territoriali mostrano come le CdC assumano configurazioni profondamente differenziate in base alle caratteristiche demografiche, geografiche e organizzative dei contesti in cui operano.

Nel contesto urbano della Casa della Comunità Lubiana San Lazzaro, l'elevata densità abitativa e l'eterogeneità sociodemografica producono una domanda ampia, diversificata e spesso complessa. La vicinanza all'Azienda Ospedaliero-Universitaria della città la rende un nodo cruciale della rete territoriale, facilitando la continuità assistenziale ma generando al contempo flussi consistenti che possono tradursi in congestione e sovraccarico operativo. L'offerta è articolata (medicina generale, specialistica, infermieristica di comunità, percorsi per fragilità, prevenzione e screening) e integra in modo strutturato funzioni sociali grazie alla collaborazione con il Comune e il Terzo Settore. Da tale configurazione emergono bisogni specifici: monitoraggio continuo dei carichi di attività, coordinamento più solido dei flussi con l'ospedale, capacità di anticipare la domanda attraverso pattern di accesso e fasce orarie critiche.

Nel contesto rurale in cui si trova la Casa della Salute di San Secondo si presenta una ridotta densità abitativa con una distribuzione della popolazione su un territorio ampio, che richiede un modello multisede e un coordinamento istituzionale stretto tra i comuni limitrofi. La sede opera come polo integrato, garantendo prossimità attraverso medicina generale, ambulatori infermieristici, attività preventive e sportelli PUA (Punto Unico di Accesso) e sportelli ADI (Assistenza Domiciliare Integrata). L'integrazione sociosanitaria è consolidata, ma il territorio presenta criticità specifiche legate alla limitata disponibilità di specialistiche e alla necessità di rafforzare le risorse professionali. Da queste dinamiche emergono bisogni legati alla lettura fine delle differenze intra-territoriali, alla garanzia di continuità assistenziale per anziani e famiglie multiproblematiche e a una programmazione più accurata delle specialistiche per evitare disallineamenti e ridondanze tra sanitario e sociale.

Sempre nel contesto rurale, la Casa della Salute di Langhirano rappresenta un punto di riferimento per i comuni montani e rurali adiacenti. L'offerta è complessa e diversificata, si configura infatti quasi come un piccolo hub territoriale. I servizi includono Medicina Generale e Pediatria, una ricca gamma di ambulatori specialistici (Disturbi Cognitivi e Demenze, Ostetricia, SerDP, Psicologia Clinica, Medicina dello Sport ecc.), sportello PUA e un Ambulatorio Infermieristico e un Ambulatorio Integrato per la Cronicità (a gestione infermieristica). La struttura ospita anche servizi ad alta intensità come l'Ospedale di Comunità, l'Hospice, il CSM (Centro di Salute Mentale) e la Neuropsichiatria d'Infanzia e Adolescenza. Tale configurazione pone al centro come bisogni primari il coordinamento logistico e inter-professionale su un vasto territorio di competenza per garantire continuità assistenziale tra i servizi ad alta e bassa intensità.

Infine, nel contesto montano della Casa della Salute di Tizzano–Lagrimone si evidenziano invece condizioni strutturali differenti: bassa densità abitativa, popolazione anziana, isolamento geografico e difficoltà di collegamento. La CdS, insieme al presidio per la continuità assistenziale, costituisce un presidio essenziale per ridurre gli spostamenti verso la città capoluogo di Parma. L'offerta (medicina generale, infermieristica di comunità, presa in carico delle cronicità, ADI, punto prelievi e alcune specialistiche) si concentra sul contrasto all'isolamento e sul valore della domiciliarità. Le criticità riguardano la carenza di personale, la complessità logistica e la difficoltà nel garantire continuità specialistica. I bisogni emergenti includono il rafforzamento della continuità assistenziale nelle fasce critiche, il potenziamento della presa in carico delle cronicità, il coordinamento delle équipe mobili e una programmazione specialistica coerente con i vincoli territoriali.

Una prima lettura integrata dei quattro contesti evidenzia come le CdC non possano essere pensate secondo logiche uniformi: ciascun territorio presenta configurazioni specifiche della domanda e gradi diversi di complessità organizzativa, che richiedono strumenti capaci di adattarsi alla variabilità locale.

Nel contesto del comune di Parma (meno nella provincia), si riscontra la presenza di un'infrastruttura sanitaria territoriale avanzata (Ugolini et al., 2020), all'interno della quale sono già in corso sperimentazioni di nuove forme di governance dei servizi, fondate sulla riflessività critica degli operatori e dei cittadini. Ne è l'esempio il Patto Sociale di Parma, un accordo partecipato tra Comune, Aziende Sanitarie, Università, Terzo Settore e altri attori per coordinare politiche sociali e sanitarie, promuovendo inclusione, prossimità e sostegno alle persone fragili. L'Osservatorio del Patto Sociale è lo strumento di monitoraggio e analisi che supporta la cabina di regia nel valutare l'efficacia delle azioni e proporre miglioramenti per il welfare cittadino; promuove processi di co-costruzione del sapere tra professionisti, utenti e comunità, con l'obiettivo di generare nuove pratiche trasformative e modalità di interazione tra istituzioni, professionisti e cittadini (Osservatorio del Patto Sociale, 2025). In questo spazio di riflessione il presente studio potrebbe tradurre tali dinamiche in un cambiamento concreto, valorizzando gli incontri già esistenti delle équipe multiprofessionali e trasformandoli da momenti di riflessione e confronto interno a occasioni strategiche per la raccolta e l'analisi dei bisogni della comunità in cui il servizio è inserito. In questo scenario le équipe multiprofessionali assumerebbero un ruolo di traduzione delle evidenze in azioni concrete di miglioramento e co-progettazione dei servizi, anche attraverso una rielaborazione costante della propria pratica professionale (Schön, 2017). Creare così uno spazio generativo, capace di orientare l'azione sociosanitaria in modo più aderente e responsivo alle esigenze locali (Gramigna et.al., 2022). Ciò permetterebbe di andare oltre la gestione dei singoli casi, di includere l'interpretazione dei dati e di restituirli alla comunità generando processi di apprendimento organizzativo e innovazione sociale (Ceccarelli, 2023).

In tale direzione, si potrebbe prevedere la creazione di un Osservatorio Digitale Territoriale (ODT), concepito come ambiente dinamico per la raccolta, l'organizzazione e l'analisi continua dei dati relativi ai bisogni sanitari, sociali e organizzativi del territorio specifico di riferimento. L'ODT rappresenterebbe non solo uno strumento tecnico, ma un dispositivo abilitante per la governance riflessiva delle Case della Comunità, capace di alimentare un circuito informativo

multidirezionale tra cittadini, operatori e istituzioni e di sostenere un processo decisionale continuo e informato.

Esso faciliterebbe la capacità delle CdC di anticipare la domanda, modulare l'offerta e orientare le risorse in modo più equo ed efficace. A tal fine, l'aggregazione e l'anonimizzazione di fonti eterogenee di dati (come dati epidemiologici, amministrativi e derivanti dalle indagini sul campo) in un'unica architettura informativa garantirebbe trasparenza, tracciabilità e sicurezza, nel pieno rispetto della normativa sulla protezione dei dati personali (GDPR 2016/679). L'integrazione dei dati abiliterebbe così le analisi multilivello che intercettano sia le dinamiche strutturali sia le traiettorie emergenti dei bisogni locali.

Dispositivi partecipativi di questo tipo contribuirebbero a ridurre le asimmetrie informative e a valorizzare i saperi situati, in coerenza con i principi della co-produzione e della governance collaborativa (Emerson et al., 2012; Nabatchi & Leighninger, 2015).

5. Discussione

Collocato nella fase preliminare e fondato sull'analisi della letteratura, il presente studio, seppure privo di evidenze empiriche, mira a inquadrare un modello organizzativo per le CdC proponendo uno schema decisionale ibrido in grado di bilanciare l'inclusività della rete con la responsabilità decisionale dell'AUSL. La sfida metodologica è rappresentata dalla configurazione di un disegno di ricerca multiple case study capace di cogliere le esigenze di adattamento alle specificità locali (Provan e Kenis, 2008), necessarie per garantire la replicabilità del modello.

Tale configurazione mira, perciò, a generare valore pubblico attraverso l'attivazione di performance multidimensionali, capaci di coniugare efficienza organizzativa, equità distributiva e accessibilità ai servizi (Porter, 2010). In tale prospettiva, le CdC si configurano come dispositivi di prossimità in grado di intercettare i bisogni complessi e promuovere una presa in carico integrata, soprattutto nei contesti territoriali più fragili; tali strutture ben radicate e coordinate riescono inoltre a contribuire alla riduzione degli accessi inappropriati al Pronto Soccorso (Ugolini et.al., 2020), obiettivo coerente con le finalità del DM 77/2022. Tuttavia, per distinguere correlazioni da causalità, è necessario disporre di dati granulari che tengano conto delle variabili contestuali (Olier et.al., 2023), rafforzando così la capacità valutativa del sistema. In questo senso, la valutazione delle performance non può limitarsi a indicatori quantitativi, ma deve includere dimensioni di valore percepito, prossimità e impatto sociale, in un'ottica di accountability e miglioramento continuo (Nuti e Vainieri, 2020).

La necessità di misurare e gestire il valore generato introduce un terzo filone teorico: Management Control e il concetto di Data-Enabled Plublic Value (Gagliardo et.al., 2024). In tale ottica, l'informazione non è vista solo come rendicontazione ex post, ma come leva per decisioni quotidiane (Argyris, 1996) e per l'apprendimento adattivo del network in contesti inter-organizzativi (Kraatz, 1998; Coghlan e Coughlan, 2015). Questo aspetto si lega con l'innovazione digitale e l'introduzione di nuovi strumenti digitali, la cui adozione nei sistemi sociosanitari non può prescindere da un disegno organizzativo, coerente e con un valore percepito da parte di professionisti e cittadini (Miccu, 2021; Costantini et.al., 2024). In assenza di tali elementi, molte soluzioni rischiano di essere abbandonate o di non scalare efficacemente (Greenhalgh et.al., 2017). La scalabilità, infatti, richiede una governance dei dati solita, capacità di integrazione tra attori e sostenibilità degli oneri organizzativi (Portz et.al., 2024).

La governance multilivello delle Case della Comunità necessita quindi di meccanismi di apprendimento e accountability per armonizzare gli standard nazionali con le autonomie regionali e aziendali (Natali et.al.,2023). Questo approccio, che mette in rete approcci e attori, è in grado di promuovere una visione sistemica e intersettoriale della salute (World Health Organization, 2023).

Il contributo del lavoro è rappresentato dall'articolazione di un modello di governance delle Case della Comunità che trae fondamento da una mappatura partecipata e periodica dei bisogni.

Attraverso un disegno multi-caso che include contesti urbani, rurali e montani, si analizza come le diverse configurazioni di rete (NAO, lead organization, shared governance) si combinano con le specificità territoriali per abilitare integrazione sociosanitaria, accessibilità ed equità. Si ipotizza un cruscotto di indicatori multilivello per la misurazione del valore pubblico e si propone l'istituzionalizzazione di un Osservatorio Digitale Territoriale quale dispositivo di apprendimento e di governo. In tal senso, il lavoro intende offrire un riferimento pratico per dirigenti pubblici e policy maker impegnati nel ridisegno della sanità territoriale.

I principali limiti del progetto riguardano la fase esplorativa e la numerosità dei casi per cui i lavori successivi includeranno analisi cross-case sistematiche (pattern matching/QCA), misure longitudinali e la valutazione degli effetti organizzativi (accountability, sostenibilità degli oneri). La replicabilità del modello dipenderà dalle condizioni abilitanti (commitment, data governance, competenze di facilitazione) e dalla capacità di bilanciare inclusività e responsabilità.

Parole chiave: Case della Comunità; integrazione sociosanitaria; network governance; co-produzione; valore pubblico; welfare territoriale

Oltre la Rational Choice: la transizione dei modelli di pianificazione nelle ASL della Puglia

Antonio Nisio[1], Grazia Dicuonzo[2], Michele De Filippis[3]

1. Inquadramento teorico: la crisi del modello razionale e la necessità di nuovi paradigmi

Le teorie economiche e di management classiche hanno posto al centro dei loro sviluppi il principio dell'intelligenza razionale, o rational choice (Smith, 1776; Mill, 1844). Le dimensioni cognitive, computazionali e analitiche hanno alimentato i modelli matematico-formali incentrati sulla massimizzazione dell'efficienza operativa e della quantità di output (Taylor, 1911; von Neumann & Morgenstern, 1944; Simon, 1947). Tale approccio ha favorito l'affermarsi del modello "ospedalocentrico" e la governance sanitaria ha avuto come obiettivi principali la massimizzazione degli output erogati e la riduzione dei costi. La salute è stata trattata come qualsiasi commodity, da misurare in termini puramente prestazionali (Cifalinò et al., 2020).

A partire dalla fine del secolo scorso questo approccio ha mostrato tutti i suoi limiti. Il bisogno di salute è cambiato profondamente e vi è stato un incremento della complessità: l'aumento esponenziale delle cronicità, l'invecchiamento progressivo della popolazione e la nascita di nuove vulnerabilità socio-sanitarie. In tale contesto, il modello ospedalocentrico, adatto alla cura delle acuzie, si è mostrato, in ragione della sua rigidità e frammentazione, inadeguato e insostenibile per le cronicità e per il sostegno socio-sanitario (Ciasullo et al., 2020). Ha mostrato tutti i suoi limiti nella capacità di fornire una risposta efficace e di qualità e di rendere il sistema sostenibile (Dicuonzo et al., 2025).

Al fine di realizzare un'organizzazione e una gestione del sistema sanitario e, nel suo ambito, delle aziende, negli ultimi decenni si è andato affermando il paradigma delle intelligenze multiple (Gardner 1983; Goleman 1995; Kahneman 2011). In campo manageriale e, nello specifico, nell'analisi dei PIAO, possiamo classificare le seguenti intelligenze:

- L'Intelligenza Razionale (Rational Choice) si basa sulle dimensioni cognitiva, computazionale e analitica. Attraverso di essa si misurano, si calcolano, si ottimizzano le risorse e si definiscono gli standard quantitativi.
- L'Intelligenza Emotiva (Goleman, 1995) riguarda la capacità di riconoscere e gestire le emozioni proprie e altrui. Nel management sanitario, si traduce nell'umanizzazione delle cure (Busch et al., 2019; Todres et al., 2009) e nell'attenzione al paziente, nel mettere al centro del processo di diagnosi e cura la dignità della persona, nel mostrare empatia nella relazione di cura, nel supportare psicologicamente.
- L'Intelligenza Relazionale e Sociale consiste nella capacità di costruire reti e connessioni tra soggetti diversi attraverso l'integrazione tra ospedale e territorio, il dialogo tra medici di base e specialisti, il coinvolgimento delle associazioni di volontariato e delle famiglie.

- L'Intelligenza Sistemica (One Health) è la capacità di vedere il quadro d'insieme e le interconnessioni tra elementi apparentemente distanti, ad esempio comprendendo che la salute umana dipende da quella animale e ambientale, o che investire oggi in prevenzione ambientale riduce i costi oncologici negli anni o per la salute pubblica.
- L'Intelligenza Contestuale (o Situazionale) è la capacità di adattare le soluzioni standard alle specificità del territorio, ad esempio non applicando le norme in modo adempimentale, ma calandole nella realtà geografica e sociale locale.
- L'Intelligenza Narrativa (Sensemaking) è la capacità di applicare il principio della coerenza ai documenti di programmazione per presentare un quadro comprensibile di come creare valore pubblico, collegando in modo unitario i singoli obiettivi. che superando, l'approccio tayloristico-weberiano, analizza il funzionamento delle aziende alla luce delle dimensioni comportamentali e organizzative, che tengono conto anche dei fattori emotivi (la relazione di cura, la fiducia), relazionali l'integrazione tra professionisti, il rapporto con il territorio) e sistemici (l'interconnessione tra la salute umana, animale e ambientale, secondo l'approccio One Health) (Zinsstag et al., 2011; Atlas, 2013).

Le aziende sanitarie, in questa ottica, sono considerate come "sistemi complessi adattivi" (Borgonovi, 2008; Plsek & Greenhalgh, 2001; Lipsitz, 2012), la cui capacità di creare valore non è semplicemente data dalla quantità di prestazioni prodotte ed erogate, ma dalla capacità di generare impatti multidimensionali (outcome) che includono equità, inclusione sociale e benessere percepito (Bland, 2019; Burns et al., 2024). È invece necessario recuperare la dimensione etica e sociale dell'azienda pubblica, che non trova la sua legittimazione nel pareggio di bilancio, bensì nella capacità di rispondere ai bisogni complessi della comunità (Leardini, 2012).

In questo quadro, le teorie contemporanee del decision making contribuiscono a chiarire il legame tra le intelligenze multiple e la programmazione. La letteratura organizzativa ha infatti superato da tempo l'idea della decisione come atto pienamente razionale (March & Simon, 1958; Simon, 1977), mostrando come le scelte nei sistemi complessi derivino da processi incrementali (Lindblom, 1959), non lineari, distribuiti e fortemente dipendenti dal contesto, in una logica adattiva necessaria alla sostenibilità degli attuali sistemi sanitari resilienti (Braithwaite et al., 2023).

Nelle aziende sanitarie, ciò implica che la programmazione – e in particolare la costruzione dei PIAO – non possa basarsi esclusivamente su criteri ottimizzanti tipici della rational choice, ma richieda un approccio in cui le diverse forme di intelligenza orientino l'analisi del problema, la cooperazione tra gli attori e i processi di sensemaking collaborativo (Weick, 1995; Mintzberg, 1976). L'integrazione di intelligenze diventa, quindi, un prerequisito per assumere decisioni efficaci, coerenti con la complessità dei bisogni e capaci di generare valore pubblico, attraverso logiche non più transazionali, ma di co-creazione e di governance collaborativa (Osborne et al., 2023; Torfing et al., 2024).

2. Il contesto di riferimento: PNRR, DM 77/2022 e la sfida della pianificazione

Il Piano Nazionale di Ripresa e Resilienza (PNRR), Missione 6, e il successivo D.M. 77/2022 rappresentano la risposta istituzionale a queste nuove esigenze in Italia, definendo nuove logiche e strumenti di governance che, superando la visione parziale sulle singole dimensioni della performance, conducano ad una misurazione e valutazione integrata del Valore Pubblico (Deidda Gagliardo et al., 2021; Meynhardt, 2009), che si focalizzi su una convergenza tra qualità erogata, qualità percepita e integrazione multiprofessionale.

La riforma presenta un nuovo disegno gestionale e organizzativo basato sulla centralità del paziente e sulla prossimità: Case della Comunità (CdC), Ospedali di Comunità (OdC) e Centrali Operative Territoriali (COT) saranno i nodi di una rete che sposta il baricentro della cura dal territorio all'ospedale (Fortino et al., 2024). È, tuttavia, necessario evitare che anche questa

riforma ricada nelle patologie del passato, cioè realizzare strutture che diventino "cattedrali nel deserto" senza modificare i modelli gestionali di presa in carico. Il Piano Integrato di Attività e Organizzazione (PIAO) può rappresentare un tentativo di porre a sistema la programmazione in una prospettiva di valore pubblico (Nisio et al., 2025) e costituire lo strumento per declinare la strategia nazionale e regionale nei piani e nei programmi delle singole aziende sanitarie.

La domanda di ricerca che guida il presente lavoro è dunque la seguente: i PIAO delle Aziende Sanitarie Locali (ASL), chiamati a governare questa transizione epocale, stanno evolvendo verso modelli di pianificazione basati sulle intelligenze multiple e sul Valore Pubblico, o rimangono ancorati a logiche di mero adempimento burocratico e al rational choice?

3. Obiettivi della ricerca e approccio metodologico

Lo studio si inserisce nel più ampio Progetto GRINS (Growing Resilient, INclusive and Sustainable - Spoke 2), che si propone di sviluppare nuove logiche e strumenti per la misurazione del valore e della performance pubblica. L'indagine empirica, con l'obiettivo di colmare il divario tra il nuovo modello di assistenza sanitaria territoriale e le logiche e gli strumenti di pianificazione, programmazione e controllo attualmente in vigore, ha adottato un approccio qualitativo basato sulla Content Analysis dei Piani Integrati di Attività e Organizzazione 2025-2027. Oggetto di analisi, allo scopo di delineare il quadro delle modalità di pianificazione, è la totalità delle Aziende Sanitarie Locali della Regione Puglia: ASL Bari, ASL Foggia, ASL Lecce, ASL Taranto, ASL Brindisi e ASL BAT (Barletta-Andria-Trani).

La ricerca adotta un approccio misto (mixed-method) articolato in fasi coerenti con il progetto GRINS.

- Fase 1 - Definizione del Framework (Deduttiva): In questa fase è previsto lo sviluppo di una matrice di valutazione articolata in tre livelli, costruita ispirandosi ai modelli multidimensionali internazionali (Arah et al., 2006; Senn et al., 2021) e all'analisi normativa del DM 77/2022. Il modello identifica:
  - Livello Macro (Abilitatori e Valore Pubblico): Impatto sociale, equità, sostenibilità e fiducia, al di là della mera sommatoria delle prestazioni, evidenziati attraverso obiettivi spia, quali, ad esempio, l'accessibilità per le fasce deboli, l'approccio One Health e la medicina di genere (Dicuonzo et al., 2025).
  - Livello Meso (Governance di Rete): Integrazione ospedale-territorio, PDTA, coordinamento tramite COT e capacità relazionali della rete (approccio relazionale) (Levesque & Sutherland, 2017).
  - Livello Micro (Operatività): Accessibilità, presa in carico, qualità percepita e dell'esperienza del paziente, umanizzazione delle cure, uso della tecnologia (telemedicina) come fattore di inclusione (Ahlgren & Lind, 2023).
- Fase 2 - Analisi dei PIAO (Induttiva): Content Analysis dei Piani Integrati di Attività e Organizzazione 2025-2027 delle ASL Bari, Foggia, Lecce e Taranto. I documenti sono stati analizzati utilizzando il framework Micro-Meso-Macro come griglia per valutare il grado di coerenza tra quanto dichiarato nella programmazione e le dimensioni del valore pubblico definite dal framework del progetto GRINS e dalla letteratura sulle Intelligenze Multiple (Impatto sulla salute, Equità e Inclusione, Fiducia e Soddisfazione, Sostenibilità).

4. Principali risultati (Work in Progress)

L'analisi comparata tra il modello teorico e i documenti programmatici restituisce un quadro di un sistema sanitario regionale in una fase di delicata transizione, in cui sono compresenti elementi innovativi e resistenze burocratiche.

Il primo dato che emerge con nettezza è l'isomorfismo strutturale e la persistenza della Rational Choice. Infatti, si rileva un'evidente omogeneità nella pianificazione delle infrastrutture

fisiche. Tutti i PIAO oggetto di analisi mostrano un'attenzione accesa alla compliance con le prescrizioni del DM 77/2022. Gli indicatori di output tipici della rational choice (numero di Case di Comunità da attivare, numero di COT da implementare, percentuali di completamento dei lavori edilizi) sono nettamente prevalenti. Ad esempio, l'ASL di Bari e l'ASL di Taranto riportano nel dettaglio la pianificazione per la realizzazione degli investimenti del PNRR. Gli obiettivi di output, quali la realizzazione di infrastrutture fisiche e tecnologiche, sono considerati come traguardi finali piuttosto che come determinanti dell'impatto sul miglioramento della salute. Vi è una prevalenza della dimensione procedurale, attenta al rispetto delle normative e degli indirizzi nazionali, rispetto a quella relazionale. Ad esempio, si stabilisce che dovrà essere realizzato un certo numero di Case di Comunità, ma non si definisce come verranno modificate le interazioni tra medici di famiglia, specialisti e pazienti.

Il Valore Pubblico è ancora definito in modo formale. Infatti, la sezione 2.1. "Valore Pubblico" presenta le principali criticità. Spesso, e in particolare nei PIAO dell'ASL Brindisi e dell'ASL BAT , gli obiettivi di Valore Pubblico tendono a sovrapporsi a quelli della performance organizzativa (mantenimento dell'equilibrio economico, rispetto dei tempi di pagamento o di erogazione dei LEA). Sebbene importanti, questi attengono all'efficacia interna e non all'efficacia sociale esterna. Latitano quasi ovunque indicatori di outcome di salute a lungo termine correlati alle nuove strutture territoriali. Ad esempio, non vi sono indicatori e target espliciti che misurino l'impatto delle COT sulla riduzione del tasso di ospedalizzazione. Il Valore Pubblico rischia così di essere un'enunciazione teorica, una sorta di "etichetta vuota" (box-ticking), priva di una reale capacità di orientare le decisioni strategiche verso il bene comune (Burns et al., 2024).

Nonostante il quadro delineato, si riscontrano alcuni interessanti elementi di introduzione di intelligenze manageriali più evolute, capaci di leggere e interpretare i bisogni e le problematiche specifici delle collettività e dei territori. Esempi in tale senso sono i seguenti.

La pianificazione dell'ASL Foggia mostra una forte consapevolezza delle specificità orografiche del Gargano e dei Monti Dauni. In una logica di intelligenza contestuale e di capacità adattiva, la tecnologia non è considerata un fine, ma un mezzo per incrementare l'equità nell'accesso alle cure. Ad esempio, il progetto di telemedicina non è considerato solo un'innovazione tecnica, ma è soprattutto uno strumento per ridurre le disuguaglianze territoriali, garantendo il diritto alla salute dei cittadini residenti nelle aree interne.

Nel PIAO di Lecce si riscontra un'attenzione maggiore ai temi dell'umanizzazione e dell'accessibilità "soft". Un esempio significativo è la consapevolezza che i progetti di miglioramento dell'efficienza digitale, se non accompagnati dall'implementazione di servizi di facilitazione digitale per gli utenti anziani e fragili, possono generare nuove barriere (digital divide). Questo dimostra un'attenzione all'User Experience che va oltre la semplice erogazione della prestazione clinica, promuovendo un approccio integrato e inclusivo all'uso delle tecnologie digitali. Tale attenzione può essere considerata un atto di cura relazionale (Bland, 2019).

Dall'analisi del PIAO dell'ASL BAT emerge un'attenzione alla gestione del capitale umano e al benessere organizzativo. Nelle procedure di valutazione della performance individuale, che, se pur ancora caratterizzate da formalismo, includono accanto agli obiettivi di risultato anche comportamenti organizzativi attesi. Anche la trasparenza e l'anticorruzione non sono perseguite in ossequio a norme imperative, ma costituiscono il prerequisito etico del valore pubblico, necessario per costruire fiducia nella cittadinanza.

Nel documento dell'ASL Brindisi è posta particolare attenzione all'integrazione tra ospedale e territorio nella gestione del farmaco. La gestione della farmaceutica territoriale e la continuità dei percorsi non sono solo un obiettivo di riduzione dei costi, ma anche di garanzia dell'accesso alle cure per i pazienti cronici. L'intenzione di governare la "filiera" della salute indica un'intelligenza sistemica volta a collegare i diversi ambiti aziendali.

Un altro esempio è dato dal PIAO dell'ASL Taranto, in cui l'inquinamento ambientale è identificato come una determinante critica per la salute, poiché è correlato all'incidenza di patologie tumorali. Pertanto, nella programmazione 2025-2027 vi è l'integrazione di obiettivi

specifici di sanità pubblica, come l'investimento PNC-PRACSI su 'Salute, ambiente, biodiversità e clima' con il potenziamento della sorveglianza epidemiologica attraverso l'aggiornamento del Registro Tumori. Ciò rappresenta un superamento della Rational Choice, in quanto sposta l'attenzione dall'efficacia interna (curare bene il paziente) all'efficacia sistemica (agire sulle cause ambientali della malattia).

Anche nel PIAO dell'ASL Bari si rinvengono segnali di superamento del paradigma puramente razionale. Infatti, vi sono obiettivi specifici legati al progetto "Intelligenza Emotiva" per la prevenzione delle dipendenze nelle scuole , nonché l'istituzionalizzazione della "Valutazione Partecipativa" e l'attenzione alla medicina di genere nella formazione. Ciò indica che, pur in un contesto di prevalenza della compliance normativa, l'intelligenza emotiva e relazionale inizia a farsi strada come leva operativa.

5. Discussione sui primi risultati

Le evidenze empiriche mostrano un marcato disallineamento temporale e concettuale tra la dimensione strutturale e quelle organizzativa e gestionale. Le ASL pugliesi viaggiano a due velocità; paiono rapide ed efficienti nella costruzione della parte hardware (edifici, tecnologie, procedure amministrative), più incerte e lente nel design e nell'implementazione della parte software (modelli relazionali, cultura della presa in carico, valutazione d'impatto). Nella struttura dei PIAO il rational choice è predominante: nonostante l'ipertrofia dei documenti, densi di tabelle e riferimenti normativi, la visione politica e sociale non è pienamente enunciata.

Tale approccio burocratico è spiegabile alla luce della teoria della razionalità limitata (Simon, 1947), come recentemente rielaborata negli studi sul comportamento decisionale nelle organizzazioni sanitarie pubbliche (Bellé et al., 2024). I decision makers delle ASL (direttori generali, staff di pianificazione) operano in un ambiente in cui si riscontrano informative, pressioni temporali stringenti (scadenze PNRR) e modelli assistenziali ad elevata complessità organizzativa (Fortino et al., 2024). Ciò non rende possibile la massimizzazione di una funzione di utilità globale come richiesto dalla Rational Choice. I decisori sono soggetti a bias cognitivi sistematici e a "rumore" (noise) decisionale, ovvero a una variabilità casuale, incoerente e indesiderata nei giudizi professionali che riduce la qualità della governance, determinando ingiustizia, imprevedibilità e spreco di risorse (Kahneman et al., 2021; Bellé et al., 2024).

Ciò porta il management sanitario ad abbandonare la ricerca di soluzioni ottimali per ripiegare su soluzioni 'soddisfacenti' (satisficing). Dall'analisi del contesto pugliese attuale, ciò si manifesta nella prevalenza della compliance formale. L'approccio adempimentale nei processi e nei contenuti della pianificazione (Nisio et al., 2025) surroga la razionalità trasformando la pianificazione in una strategia difensiva per gestire l'eccessivo "carico amministrativo" (administrative burden), che sottrae risorse alla creazione di valore pubblico (Cantarelli et al., 2024; Moynihan et al., 2018).

In tal modo l'ente ottiene la legittimazione procedurale al fine di ridurre la complessità interna, ma ignora i reali bisogni di salute, per cui la definizione e la misura del valore pubblico sono considerate un puro box-ticking, senza alcun impatto sui beneficiari finali (Burns et al., 2024; Ahlgren & Lind, 2023), in una logica di "compliance cosmetica", priva di impatto reale (Ilea & Ilea, 2024).

La complessità sistematica è derubricata a mera complicazione burocratica e non vengono proposti modelli di governo delle relazioni sistemiche. La dimensione del sensemaking organizzativo risulta deficitaria: i piani elencano un insieme di obiettivi disgiunti (fare 3 COT, assumere 5 infermieri, ridurre le liste d'attesa del 10%), per i quali non è indicato come possano convergere per creare valore pubblico per una comunità specifica (Levesque & Sutherland, 2017).

Tuttavia, vi sono segnali di innovazione che lasciano intravedere una transizione in fieri. Nel complessivo approccio burocratico, per rispondere al nuovo insieme di bisogni, vi sono primi esempi di utilizzo delle intelligenze multiple.

6. Conclusioni e prospettive

Lo studio conferma che la riforma dell'assistenza territoriale in Puglia è, al momento, orientata a garantire l'avanzamento fisico delle realizzazioni previste dal PNRR e dal DM 77. Per far sì che la riforma abbia un impatto positivo sul benessere della collettività e degli individui, è necessario un cambio di paradigma negli strumenti di governance e di accountability pubblica (Mussari et al., 2022), intesa non come mero adempimento formale, ma come assunzione di responsabilità sociale verso il territorio, che deve orientare le scelte strategiche fin dalla loro genesi (Leardini et al., 2014). Il PIAO non può restare un mero adempimento; deve evolversi in un vero strumento di pianificazione integrata che attivi l'intelligenza manageriale distribuita (Akgün et al., 2007). In questa prospettiva, il progetto GRINS può fornire un contributo rilevante, poiché il framework multilivello proposto (Micro-Meso-Macro) e la libreria dinamica di indicatori in fase di sviluppo non sono meri esercizi accademici, bensì supporti cognitivi per il management sanitario (Dicuonzo et al., 2025).Gli indicatori validati per misurare le prestazioni e gli impatti ai tre livelli consentono ai manager di interpretare e valorizzare le dimensioni immateriali che oggi sfuggono alla pianificazione. È pertanto necessario mantenere il rigore analitico della rational choice per garantire la sostenibilità economica, ma considerarlo strumentale alla generazione del valore pubblico che può essere generato attraverso le intelligenze multiple. Solo in questo modo la nuova rete territoriale potrà andare oltre gli aspetti infrastrutturali e rendere le diverse articolazioni previste dal DM 77/2022 (Case e Ospedali di Comunità, COT, centrali operative) nodi di un'unica rete di assistenza di prossimità. In definitiva, è necessario superare la logica dell'adempimento per generare un vero ecosistema di salute e di coesione sociale.

Parole chiave: Intelligenze multiple, valore pubblico, pianificazione integrata

Enabling Human-Centric Healthcare: How Enabling Technologies Support Patient Humanization, Participation and Empowerment in Industry 5.0 perspective

Ilaria Elisa Vannini[1], Michela Piccarozzi[2], Maria Grazia Provenzano[3]

1. Introduction

In the current economic and social scenario, we are experiencing the coexistence of two industrial revolutions: Industry 4.0 (I4.0) and Industry 5.0 (I5.0). While I4.0 has seen production processes at the centre of the revolution, with the introduction of enabling technologies such as Additive Manufacturing, Augmented Reality, Autonomous Robots, Big Data and Analytics, Cloud, Cybersecurity, Horizontal and Vertical System Integration, Internet of Things (IoT) and Simulation (Rüßmann et al., 2015; Brunelli et al., 2017; Bortolini et al., 2018; Romeo et al., 2018; Büchi et al., 2020; Leong et al., 2020; Mubarok, 2020) and improvement factors (Martinelli et al., 2021; Wan et al. 2015; Ardito et al., 2019), I5.0 is based on some fundamentals standard to the previous version but represents an evolution aimed at bringing people back to the centre of business management (Sindhwani et al., 2022; Xu et al., 2021). In this context, I5.0 is based on the affirmation of the fundamental role of technology and innovation in achieving not only the effectiveness and efficiency of production processes, but above all in affirming the centrality of people, resilience and sustainability in its three pillars (Xu et al., 2021; Leng et al., 2022; Ríos et al., 2024).

This centrality and fundamental focus of I5.0 are evident in numerous studies and definitions that affirm that this is the real revolution currently underway (Nahavandi, 2019; Paschek et al., 2022; Piccarozzi et al., 2024a; Ghobakhloo et al., 2024). At the same time, it can be said that I5.0 has retained some distinctive aspects of I4.0, such as enabling technologies, innovative and heterogeneous tools designed to support businesses in achieving production effectiveness and efficiency, as well as continuous improvement and management cost containment (Müller et al., 2020; Maddikunta et al., 2022).

In I5.0, too, enabling technologies play a central role. We can identify not only those typical of I4.0 already mentioned, but also other, more innovative ones, such as Artificial Intelligence (AI), modern digital twins and collaborative robotics (cobots) (Maddikunta et al., 2022; Piccarozzi et al., 2024a). These enabling technologies fulfil and seek to achieve the new and challenging objectives of I5.0 related to human centrality, primarily enabling human-machine integration in physical but also digital environments (Bartoloni et al.,2022) to foster deeper collaboration and enable improved working conditions oriented towards well-being (Piccarozzi et al., 2024b) as well as participation and empowerment (Alves et al., 2023; Ivanov, 2023).

This transformation is affecting all sectors, not only purely industrial ones, and is also spreading to contexts with high human capital intensity, such as healthcare (Gomathi et al., 2023; Basulo-Ribeiro and Teixeira, 2024). In this context, digitalisation has been driving profound and

radical changes in service quality, efficiency, and, above all, in improving patient access to care (Menvielle et al., 2017; Gjellebæk et al., 2020).

In this sense, technologies have the role of redefining the relationship between patients and the healthcare system, allowing for the introduction and dissemination of new human-centred approaches and models of care (Calvillo et al., 2013) that are capable not only of managing but also of adopting a predictive and personalised approach (Basulo-Ribeiro et al., 2024; Taj and Jhanjhi, 2022), with a significant contribution especially during the pandemic period (Khan et al., 2020; Golinelli et al., 2020).

It is precisely because of this contribution that we now talk about Healthcare 5.0 (Mohanta et al., 2019; Wazid et al., 2022), i.e. the application of I5.0 principles to the healthcare sector through innovative technologies and approaches capable of elevating the system to the centrality of the human being (Basulo-Ribeiro et al., 2024; Tandel et al., 2024). As with I4.0, enabling technologies also represent a concrete operational lever that can support healthcare professionals in their interactions with patients, helping increase trust and effective communication (Khan et al.,2024), as well as empathy and collaboration (Ríos et al., 2024).

Although the topic is widely discussed and there is growing interest in studying and exploring the application dynamics of I5.0 in various sectors, the literature still highlights a significant gap. In particular, there is a need to investigate in greater depth the link and impact of enabling technologies on patients and patient management, going beyond technical and organisational studies (Maddikunta et al., 2022; Basulo-Ribeiro et al., 2024). In this context, this research aims to investigate enabling technologies and their contribution to humanisation, participation, and patient empowerment.

Humanisation of care refers to the practice of treating patients not merely as clinical cases but as whole persons whose dignity, emotional needs, and individual experiences are respected and integrated into their care processes, fostering empathetic and respectful relationships between patients and providers (Reyes Téllez et al., 2024; Hickmann et al., 2022).

Patient participation denotes the active involvement of patients in decisions affecting their health, including sharing information, expressing preferences, and engaging collaboratively with clinicians in care planning and treatment choices. (Sahlsten et al., 2008; Castro et al., 2016).

Patient empowerment is a broader concept encompassing both a process and an outcome in which patients acquire the knowledge, skills, confidence, and authority to manage their health and healthcare decisions, shifting the balance of power toward patients and enabling autonomous, informed action (Bravo et al., 2015; Hickmann et al., 2022).

In light of these considerations, this research aims to answer the following question: which enabling technologies are currently in use, and how can they strengthen the human dimension of the healthcare system, promoting a truly person-centred model of care?

Specifically, we will analyse the role of enabling technologies in the two dimensions of humanisation and patient participation/empowerment.

Through a systematic review of the literature and a content analysis of the selected papers, we present the initial results and highlight the main implications for the topic.

2. Methodology

The research (work in progress) is based on a systematic review of the literature (Tranfield et al., 2003; Macpherson and Holt, 2007; Deng, 2012). This methodology allowed us to extract, using a rigorous and replicable approach, the main contributions in the literature on I5.0, Healthcare, and patient management. The Scopus database was selected for the bibliographic analysis as it represents the most commonly used sources in management studies (Newbert, 2007; Merli et al., 2018; Sassanelli et al., 2019). Scopus was chosen because of its role as the world's leading archive of peer-reviewed publications (de la Cruz-Lovera et al., 2019).

The selection of papers was conducted through a series of screening steps. The keywords searched were “Industry 5.0”, “Healthcare” (and/or) “patient”. The analysis returned 3,042 articles.

In the second phase, papers on “Business, management and accounting” were selected using a thematic filter in the Scopus database, yielding 89 papers. Subsequently, it was decided to choose only articles and reviews from double-blind peer-reviewed journals to increase the robustness and reliability of the contributions under analysis, resulting in a sample of 34 articles.

The final stage involved reviewing the abstracts to determine which studies to include or exclude based on their relevance to the research question and the topics addressed. The final sample consisted of 21 papers.

Through a content analysis process (Mayring et al., 2004), the enabling technologies in the sample of papers were identified. Each article was then classified according to its main contribution in the two areas of reference (humanisation, participation and empowerment). The research results were collected and organised in a database to facilitate subsequent analysis and any comparisons between variables.

3. Results

The analysis of the papers identified recurring enabling technologies and their contributions to patient empowerment, participation and humanisation. As shown in Table 1, Augmented/Virtual Reality (AR/VR) is the most cited technology, followed by Artificial Intelligence (AI). Blockchain, Cloud, and others have fewer applications. The technologies are often presented together and/or analysed separately in the same paper.

Enabling technology	**Occurrence in papers**	**%**
AR/VR	12	38%
AI	10	32%
Blockchain	4	13%
5G	1	3%
6G	1	3%
Cloud	1	3%
Digital Twin	1	3%
IoT	1	3%
Wearable Devices	1	3%

Table 1. Enabling technologies emerging from the literature

The most commonly used technologies (AR/VR and AI) appear to be capable of guiding management towards I5.0 principles (Maddikunta et al., 2022; Ríos et al., 2024), helping to change and improve the relationship with the patient.

Analysis of the papers also revealed the areas these technologies can support, distinguishing between empowerment and participation and the humanisation of the patient. Table 2 presents the results on recurrence across the papers.

Contributions	**Number of articles**	**%**
Empowerment and participation	9	43%
Humanisation	3	14%
Not evident	9	43%
Total	21	100%

Table 2. Contributions emerging from the analysis

Empowerment and participation are the outcomes that technologies seem to support most frequently (9 studies, equal to 43% of the sample). Also, a small percentage of articles also highlights the contribution to humanisation achieved through the direct or indirect application of enabling technologies (14% of the sample). It also emerges that a large proportion of the articles (43% of the sample) do not identify any implications and/or impact of technologies in the areas observed. (i.e. Agrawal et al., 2025; Satpayeva et al., 2025; Abdel-Basset et al., 2021; Beauvais et al., 2021).

Finally, the analysis made it possible trace and link individual technologies to different contributions in order to verify which ones contribute most and to what extent, and support the two contributions. The link does not always emerge clearly from the research and is not always explicitly stated by the authors; it often derives from a general assessment and analysis of the technology.

Table 3 shows the results.

Contributions	**Enabling technology**	**Number of articles**	**%**
Empowerment and participation	AI	8	35%
	AR/VR	6	26%
	Blockchain	4	17%
	5G	1	4%
	Wearable devices	1	4%
	Digital Twin	1	4%
	Iot	1	4%
	Cloud	1	4%
Humanisation	AR/VR	3	100%

Table 3. Details of the technologies supporting the contributions

The results show that, for the first dimension, empowerment and participation, AI is considered the most influential and driving technology, followed by AR/VR and Blockchain. Others enabling play only a marginal role. Regarding humanisation, AR/VR emerges as the most prevalent technology.

4. Discussion

The results show how enabling technologies have begun to contribute to and guide healthcare management towards the guiding principles of I5.0. Analysis of the literature reveals an apparent involvement of certain technologies across the various dimensions investigated. First and foremost, AR/VR appears in both the general analysis (Table 1) and the study of individual dimensions (Table 3). These technologies support the patient relationship by creating interactive and personalised experiences, helping build rapport and trust with the healthcare system, not only with healthcare professionals (Pillai et al., 2019; Basulo-Ribeiro et al., 2024; Narkhede et al., 2025; Manayath et al.,2024).

At the same time, AI also provides valuable support, especially in data analysis (think of the development of Big Data use in the healthcare sector) and predictive modelling (Ghobakhloo et al., 2025; Tandel et al., 2024), contributing, in this case, too, to the personalisation of patient care.

According to the literature review, other technologies, although they interact to a lesser extent, help create and develop the background necessary for the proper functioning of the former. Blockchain, cloud computing, and 5G support the collection, analysis, and sharing of data, contributing to security and ensuring the privacy of sensitive data (Sabuncu & Bilgehan, 2024; Gaur et al., 2024; Visvizi et al., 2025; Murmu, et al., 2025). Wearable devices and digital twin represent additional tools which, by interacting more directly with patients, can contribute to better interaction with healthcare professionals and the healthcare system (Manayath et al., 2024; Taj et al., 2022).

At the same time, these technologies play a role in supporting the two contributions investigated by the analysis: empowerment and participation, and humanisation, even if there is no strong, concrete and measurable link.

Empowerment and participation —the significant contribution that emerged from the analysis —are translated through various uses of technology. First of all, the direct involvement of the patient in decision-making processes (Gaur et al., 2025). This allows the patient to actively participate in managing their relationship with the healthcare system, increasing involvement and empathy, shifting from a passive to an active role (Verma et al., 2023; Kumar and Mallipeddi, 2022; Taj and Jhanjhi, 2022). This increases patient confidence, which is also fuelled by the rigour and transparency of the data (i.e. Visvizi et al., 2025; Ghobakhloo et al., 2025; Murmu et al., 2025). Cloud, Blockchain and 5G are the technologies directly involved in this specific aspect, contributing to improving the reliability and sharing of data not only within the healthcare system itself, but also and above all concerning the patient (i.e. Sabuncu & Bilgehan, 2024; Visvizi et al.,2025).

Therefore, empowerment and participation are based on the patient's immersive involvement in the healthcare process, supported in part by tools such as AR/VR (Gaur et al., 2025).

As regards humanisation, simulations and immersive experiences also convey a new relationship and a greater level of interaction and empathy with the healthcare professional, contributing to greater patient awareness and certainty regarding treatment and the care pathway (Narkhede et al., 2025). The patient's emotional involvement and close relationship (Khan et al., 2024; Manayath et al., 2024; Sharma et al., 2024) are also highlighted.

As evidenced by the results, we can hypothesise a link between enabling technologies, contributions in terms of empowerment, participation and humanisation in the I5.0 scenario. However, it should be noted that several studies do not directly highlight the contributions of

technologies but instead focus on mere digitisation and the technical and structural aspects of the healthcare system in general (Satpayeva et al., 2025; Abdel-Basset et al., 2021; Beauvais et al., 2021) or specific as for instance the supply chain (Agrawal et al., 2025; Chakraborty et al., 2025; Fares et al., 2025).

5. Implications

Although still in its early stages, the analysis conducted allows for the formulation of both theoretical and managerial implications.

From a theoretical point of view, the paper addresses a gap in the literature that calls for further studies, not only theoretical but, above all, empirical. The paper therefore seeks to contribute to the debate by providing some theoretical food for thought, emerging from the analysis of the system, which will guide future research into a more in-depth and targeted study of I5.0, enabling technologies and contributions for patients, not only in terms of empowerment, participation and humanisation, but also in general as an improvement and support for the patient-healthcare system relationship.

From a managerial point of view, the implications lie in the potential of technological and innovative tools to support the healthcare system, both overall and in the specific patient relationship.

This is primarily for managers, who can see early evidence of innovation's contribution to outlining new human-centred management models aligned with the I5.0 vision. Managers can draw numerous conclusions regarding management, organisation and leadership to steer healthcare and relationships towards new, more participatory, humanised and transparent scenarios.

But that's not all. The implications may also affect policymakers in defining guidelines and rules that support the transition to the new dictates of I5.0 and raise awareness of this new industrial revolution, which is known but not yet concretely applied in various fields.

6. Conclusions

Based on this initial, partial analysis, it is possible to outline a preliminary scenario and some summary considerations. I5.0 represents an innovation and evolution compared beyond the previous I4.0 framework, which is not yet fully understood or applied. The analysis reveals only a partial awareness and implementation of I5.0's guidelines and objectives, particularly within the healthcare sector.

Digitalisation has permeated all sectors and is now firmly established. However, there is still a lack of clear and structured management of its processes and tools, and their positive effects are often not fully appreciated.

Although I5.0 is not widely known, its technologies have practical applications within the healthcare sector. Analysis shows that there are some tools that are integrated into the healthcare system, with contributes in terms of empowerment, participation and humanisation. Enabling technologies such as AR/VR and AI are the main drivers of this revolutionary wave, capable of supporting the patient relationship and helping build a system centred on people and their needs.

Similarly, they support data transparency and reliability as well as data management. At the same time, it is important to emphasise that no close and, above all, objectively assessable link between the various technologies and the dimensions analysed can be identified as yet.

Although the study provides some preliminary considerations, the paper's main limitations should be noted. Some limitations are methodological. The systematic review of the literature, as mentioned in the relevant section, is the result of choices and selections made by the authors, which may have limited the composition of the sample (e.g., by selecting a single database and applying various thematic filters).

Furthermore, the lack of empirical application limits the generalisation of the results.

This work should therefore be regarded as a work in progress, which will subsequently be developed by first expanding the methodological features of the system to provide a broader basis for evaluation. The results will then be integrated and compared with an empirical test based on interviews to analyse the current state of technology implementation in the healthcare sector. This dual comparison, both theoretical and empirical, will enable an evaluation of the state of the art in the literature and, simultaneously, in practice. Such a comparison may support the development of business models and management practices aimed at achieving, from an I5.0 perspective, the objectives of empowerment, participation and humanisation. A further interesting direction for future research is the development of metrics and indicators capable of objectively and unambiguously assessing the contribution of technologies both to the analysed areas and to the objectives of Industry 5.0.

Keywords: Industry 5.0; healthcare; patient; enabling technologies; humanisation; participation; empowerment

Verso un sistema di indicatori di performance per la Supply Chain ospedaliera: evidenze da un'analisi multi-caso

Giulia Interlandi[1], Valeria Belvedere[2], Stefano Villa[3]

1. Introduzione

Nel contesto sanitario, il termine Supply Chain Management (SCM) indica l'insieme di informazioni, forniture e risorse finanziarie impiegate per l'acquisizione e la movimentazione di beni dal fornitore all'utilizzatore finale, con l'obiettivo di migliorare gli esiti clinici e, al contempo, contenere i costi (De Vries et al., 2011; Moons et al., 2019). Il processo di Supply Chain interna delle aziende sanitarie si caratterizza per tre macro-fasi: (i) acquisti e gestione degli ordini, (ii) gestione dei magazzini e (iii) distribuzione e consumo a livello di reparto (Villa, 2010; Moons et al., 2019). La gestione della Supply Chain pone una forte enfasi sull'integrazione dei processi: la logica di fondo si basa sulla convinzione che il coordinamento e l'integrazione rappresentino driver essenziali per il miglioramento complessivo delle performance (De Vries & Huijsman, 2011).

Tuttavia, considerando la limitatezza delle risorse disponibili (personale medico e infermieristico, spazi di stoccaggio, forniture, ecc.) e l'elevata variabilità dei processi, legata sia alle caratteristiche dei pazienti sia alle preferenze dei medici, una delle sfide principali nella gestione della Supply Chain sanitaria consiste nel promuovere la cooperazione tra stakeholder diversi, spesso portatori di interessi eterogenei e potenzialmente divergenti (Moons et al., 2019). Tale complessità risulta ancora più evidente se si considera che l'integrazione della Supply Chain, pur essendo riconosciuta come leva strategica, incontra barriere organizzative, tecnologiche e regolatorie che ne limitano l'effettiva implementazione.

Ad esempio, Belvedere e colleghi (2022), suggeriscono come, nonostante le aziende sanitarie italiane presentino un elevato livello di maturità rispetto ai progetti di integrazione, questi ultimi rimangano concentrati prevalentemente sui beni più complessi e costosi, come dispositivi medici e materiali per sala operatoria. Le pratiche di integrazione più adottate includono approcci come Just in Time, pianificazione collaborativa e conto deposito, evidenziando come le aziende cerchino partner in grado di garantire elevati standard di affidabilità e tempestività dei servizi logistici. Allo stesso tempo, lo studio sottolinea come la standardizzazione dei processi, il commitment del top management e la rilevanza strategica attribuita alla funzione logistica rappresentino condizioni abilitanti fondamentali, mentre permangono barriere significative legate ai costi tecnologici e alla difficoltà di integrazione dei sistemi informativi con quelli dei fornitori (Belvedere et al., 2022).

Facendo riferimento al modello di valutazione delle performance della Supply Chain nelle aziende sanitarie pubbliche sviluppato da Lega et al. (2013), è possibile individuare tre dimensioni fondamentali di performance della Supply Chain interna: standard di servizio, efficienza nella

[3] Professore ordinario, ECON-06/A, Università Cattolica del Sacro Cuore e CERISMAS – Centro di Ricerche e Studi in Management Sanitario; stefano.villa@unicatt.it

gestione delle scorte e costi operativi (Figura 1). La complessità operativa e la frammentazione dei dati rendono tuttavia difficile individuare indicatori di performance (Key Performance Indicators, KPI) universalmente applicabili e in grado di misurare in modo efficace le prestazioni relative a queste tre dimensioni. In linea con questa osservazione, studi recenti evidenziano come la letteratura manchi ancora di un approccio metodologico consolidato per la selezione di KPI specifici per la Supply Chain interna delle aziende sanitarie, invitando pertanto la comunità scientifica a sviluppare modelli generali per la misurazione delle performance (Moons et al., 2019). In questo quadro si inserisce anche il contributo di Belvedere et al. (2022), che mostra come la capacità stessa di percepire benefici e barriere ai progetti di integrazione dipenda dall'esperienza maturata dalle aziende nei progetti implementati, suggerendo la necessità di strumenti di misurazione più sistematici e comparabili.

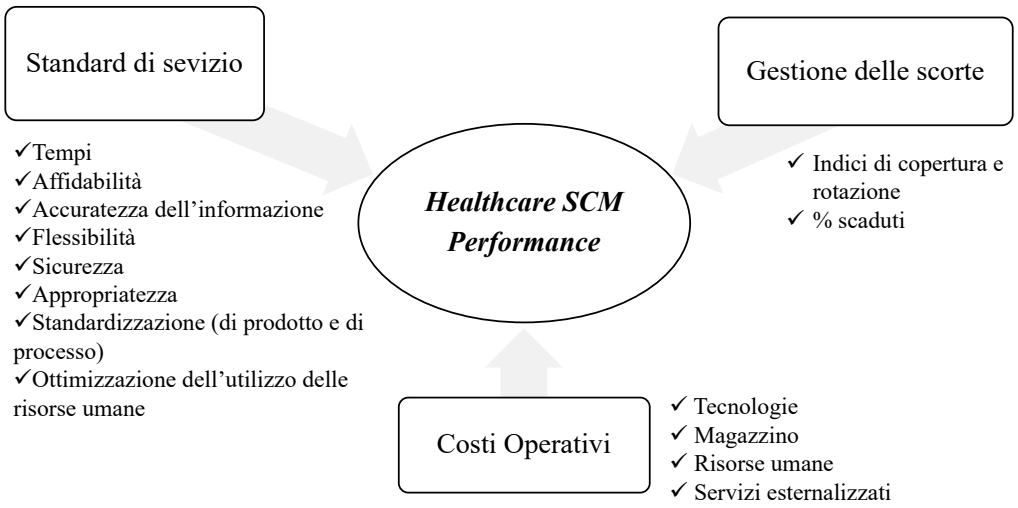

Figura 1. Dimensioni di performance nella Supply Chain interna alle strutture sanitarie, fonte: adattato da Lega, Marsilio, Villa (2013)

2. Obiettivi e metodologia

Alla luce di queste criticità, il presente studio si propone di definire un set di KPI per la Supply Chain interna di aziende sanitarie, utilizzando un approccio multicaso. Sono state analizzate quattro aziende sanitarie italiane, attraverso un protocollo di ricerca articolato in quattro fasi principali:

- Revisione della letteratura
- Validazione degli indicatori con focus group con esperti
- Misurazione degli indicatori
- Questionario

Nella prima fase, è stata condotta una revisione sistematica della letteratura, finalizzata a individuare un elenco preliminare di indicatori, classificati in relazione alle tre macrofasi del processo di Supply Chain Management: (i) gestione degli acquisti e degli ordini; (ii) gestione dei magazzini; (iii) attività a livello di reparto.

La seconda fase ha previsto la validazione dell'elenco di KPI tramite il contributo di tre esperti qualificati: il Direttore della Logistica e della Gestione Magazzini di un'Azienda Sanitaria Locale, il Direttore delle Operations e della Supply Chain di un ospedale pubblico universitario e il Direttore della Supply Chain Management di un gruppo ospedaliero privato.

Nel corso della terza fase, ciascuna azienda ha applicato i KPI validati ai propri dati interni. I risultati ottenuti sono stati successivamente discussi nel corso di quattro incontri, svoltisi nell'arco di otto mesi, con l'obiettivo di riflettere collettivamente sull'applicabilità e sulla rilevanza operativa degli indicatori individuati.

La quarta fase ha previsto la somministrazione di un questionario ai responsabili della logistica delle aziende partecipanti, con un duplice obiettivo: da un lato, valutare la rilevanza strategica delle tre dimensioni ritenute determinanti per le performance della Supply Chain ospedaliera interna (standard di servizio, efficienza nella gestione delle scorte, controllo dei costi operativi); dall'altro, stimare i livelli di validità, misurabilità, rilevanza e operatività dei KPI emersi nelle fasi precedenti.

I dati raccolti tramite questionario sono stati successivamente confrontati con le evidenze emerse nelle prime tre fasi del protocollo (revisione della letteratura, validazione degli esperti e misurazione degli indicatori). Tale confronto ha consentito di verificare la coerenza tra gli indicatori ritenuti prioritari dai rispondenti e quelli effettivamente misurati dalle aziende analizzate. Sulla base di questa triangolazione è stato costruito il cruscotto finale dei KPI, costituito dagli indicatori che presentano i punteggi più elevati in termini di validità, misurabilità, rilevanza strategica e operatività.

3. Risultati

L'analisi dei dati raccolti tramite il questionario mostra una chiara predominanza di indicatori afferenti alla gestione delle scorte rispetto a quelli relativi al monitoraggio della qualità del servizio erogato ai reparti. In particolare, gli esperti di supply chain coinvolti nello studio attribuiscono valori elevati di validità, misurabilità, rilevanza e operatività agli indicatori relativi alla gestione delle scorte, mentre assegnano punteggi significativamente inferiori agli indicatori orientati alla valutazione degli standard di servizio. Ciò suggerisce che, a livello operativo, la dimensione di gestione delle scorte risulta misurata in modo più sistematico e strutturato rispetto alla dimensione di servizio a reparto.

La Tabella 1 presenta la graduatoria degli indicatori di performance sulla base del valore sintetico ottenuto dalla combinazione (tramite prodotto) dei punteggi attribuiti alle quattro dimensioni valutative, ciascuna misurata su scala Likert 1–5. L'esame della graduatoria evidenzia come le prime posizioni siano occupate da indicatori direttamente collegati all'efficienza delle attività di magazzino, confermando la centralità operativa attribuita ai processi di gestione delle scorte.

Graduatoria	Indicatore	Punteggio
1°	Tasso di copertura prodotti a scorta	306
2°	Indice di rotazione	297
3°	Numero referenze gestite a scorta	296
4°	Valore medio di inventario di magazzino (Euro)	272
5°	Valore referenze gestite a scorta (Euro)	256
6°	Numero di richieste da evadere al gg	232
7°	Numero medio giornaliero richieste da CDC di prodotti a scorta	204
8°	Numero di linee (righe) di ordine (valore settimanale)	198
9°	Frequenza media consegna a reparto	196

10°	Tempo medio consegna materiali da ordine a fornitore per prodotti a scorta (lead time)	176
11°	Numero medio giornaliero referenze contenute in richiesta da reparto	167
12°	Numero medio ordini a fornitori emessi quotidianamente	166
13°	Numero medio giornaliero richieste da CDC di prodotti a transito	161
14°	% richieste urgenti di acquisto	149

Tabella 1. Graduatoria degli indicatori della Supply Chain interna sulla base del valore di sintesi
