I punteggi relativamente bassi attribuiti alla misurabilità degli indicatori orientati alle attività di reparto contribuiscono a spiegare la marginalità di questi ultimi nella graduatoria. Tra gli indicatori meno misurabili figurano: il consumo settimanale dipartimentale (2,4/5), i ritardi nella distribuzione ai reparti clinici (3,6/5), la percentuale di richieste urgenti (3,4/5) e il numero di eventi di stock-out a livello di reparto (3,0/5).

Tuttavia, l'analisi delle valutazioni riguardanti le dimensioni di performance rivela un orientamento differente. Come sintetizzato nella Tabella 2, i rispondenti attribuiscono valori medi elevati alla rilevanza strategica degli standard di servizio, in particolare ai tempi (4,13), all'affidabilità e completezza delle forniture (4,38) e all'accuratezza delle informazioni logistiche e cliniche (4,38). La rilevanza attribuita alla dimensione dell'efficientamento nella gestione delle scorte (4,0) risulta anch'essa elevata, mentre le dimensioni connesse ai costi operativi presentano maggiore eterogeneità.

Il confronto tra le due analisi rivela un elemento di rilievo: nonostante gli standard di servizio siano riconosciuti come dimensione strategicamente prioritaria, gli indicatori deputati a misurarli presentano livelli di misurabilità sensibilmente inferiori rispetto agli indicatori di gestione delle scorte. Tale discrepanza indica un disallineamento tra priorità dichiarate e capacità effettive di monitoraggio, evidenziando come le aziende ospedaliere dispongano di sistemi informativi e processi maturi per la misurazione delle performance di magazzino, ma non per una valutazione altrettanto sistematica della qualità del servizio erogato ai reparti.

Questa evidenza risulta coerente anche con la tipologia dei progetti di miglioramento attualmente in corso nelle quattro aziende sanitarie coinvolte, che si concentrano prevalentemente su iniziative legate alla gestione delle scorte, quali:

- ottimizzazione degli spazi di magazzino;
- miglioramento della pianificazione e delle capacità previsionali;
- consolidamento delle partnership con i fornitori;
- automazione dei processi logistici;
- standardizzazione delle referenze.

Nel complesso, i risultati emersi evidenziano un divario strutturale tra la rilevanza strategica attribuita agli standard di servizio e la loro effettiva misurazione all'interno dei sistemi di performance management della supply chain ospedaliera. Tale gap rappresenta un nodo critico per l'evoluzione dei modelli di monitoraggio e per l'allineamento tra obiettivi strategici e prassi operative.

Dimensioni di performance	**Valore medio**
Standard di servizio	
Tempi	4,13
Affidabilità/completezza	4,38

Accuratezza dell'informazione logistica e clinica	4,38
Flessibilità	3,5
Semplificazione di prodotto (e.g. # referenze)	3,63
Ottimizzazione delle attività logistiche di reparto	3,75
Efficientamento nella gestione delle scorte	
Efficientamento nella gestione delle scorte	4
Costi operativi	
Tecnologie	3,5
Valore dello scaduto	4
Costo del magazzino	3,13
Risorse umane	3,88
Trasporto	3,5

Tabella 2. Valutazione della rilevanza strategica delle dimensioni di performance Supply Chain interna alle strutture sanitarie (scala 1–5)

Il confronto tra le due analisi rivela un elemento di rilievo: nonostante gli standard di servizio siano riconosciuti come dimensione strategicamente prioritaria, gli indicatori deputati a misurarli presentano livelli di misurabilità sensibilmente inferiori rispetto agli indicatori di gestione delle scorte. Tale discrepanza indica un disallineamento tra priorità dichiarate e capacità effettive di monitoraggio, evidenziando come le aziende ospedaliere dispongano di sistemi informativi e processi maturi per la misurazione delle performance di magazzino, ma non per una valutazione altrettanto sistematica della qualità del servizio erogato ai reparti.

Questa evidenza risulta coerente anche con la tipologia dei progetti di miglioramento attualmente in corso nelle quattro aziende sanitarie coinvolte, che si concentrano prevalentemente su iniziative legate alla gestione delle scorte, quali:

- ottimizzazione degli spazi di magazzino;
- miglioramento della pianificazione e delle capacità previsionali;
- consolidamento delle partnership con i fornitori;
- automazione dei processi logistici;
- standardizzazione delle referenze.

Nel complesso, i risultati emersi evidenziano un divario strutturale tra la rilevanza strategica attribuita agli standard di servizio e la loro effettiva misurazione all'interno dei sistemi di performance management della supply chain ospedaliera. Tale gap rappresenta un nodo critico per l'evoluzione dei modelli di monitoraggio e per l'allineamento tra obiettivi strategici e prassi operative.

3. Discussione

La letteratura disponibile sui Key Performance Indicators (KPI) applicabili alla Supply Chain ospedaliera interna, sebbene in progressivo ampliamento, rimane caratterizzata da una significativa eterogeneità metodologica e da un livello ancora limitato di consolidamento empirico (Si et al., 2017; Langarizadeh et al., 2024). Numerosi contributi si concentrano sull'identificazione di liste di indicatori potenzialmente rilevanti, ma raramente forniscono un'evidenza sistematica riguardo alla loro effettiva applicabilità operativa o alla loro misurabilità all'interno dei diversi sistemi informativi ospedalieri. Una criticità ricorrente riguarda, inoltre, la definizione di metodologie condivise per la selezione degli indicatori e per la valutazione delle

dimensioni sottostanti, incluse validità, rilevanza, misurabilità e operatività (Langarizadeh et al., 2024).

Il presente studio si propone di indagare la rilevanza strategica delle dimensioni di performance della Supply Chain interna alle aziende sanitarie e la validità, misurabilità, rilevanza e operatività degli indicatori utilizzati per misurarle. I risultati mettono in luce una dinamica particolarmente significativa: gli indicatori relativi alla gestione delle scorte ottengono sistematicamente punteggi elevati in tutte le dimensioni valutative (validità, misurabilità, rilevanza e operatività), mentre gli indicatori riferiti agli standard di servizio a reparto risultano caratterizzati da una misurabilità sensibilmente inferiore. Tale evidenza ha conseguenze rilevanti. In primo luogo, essa contribuisce a spiegare perché le pratiche di monitoraggio e i progetti di miglioramento nei quattro ospedali analizzati si concentrino prevalentemente sulle attività di magazzino: la disponibilità di dati affidabili per tale ambito è infatti maggiore, mentre il monitoraggio sistematico dei processi a livello di reparto risulta ostacolato da limiti informativi e da una minore integrazione tra i sistemi clinici e logistici.

Parallelamente, il questionario somministrato agli esperti evidenzia come la dimensione ritenuta strategicamente prioritaria sia quella degli standard di servizio. I punteggi molto elevati attribuiti a variabili quali tempi di servizio, affidabilità e accuratezza informativa dimostrano una consapevolezza diffusa dell'importanza del contributo logistico alla qualità dell'assistenza clinica. Tuttavia, il divario tra tale rilevanza strategica percepita e ciò che viene effettivamente misurato indica l'esistenza di un disallineamento strutturale tra aspettative e capacità operative.

Le implicazioni di questo disallineamento sono molteplici. Da un lato, l'assenza di indicatori robusti e tempestivamente disponibili per i servizi a reparto può limitare la possibilità di valutare l'impatto dei processi logistici sugli esiti clinici. Dall'altro, essa può contribuire a mantenere un orientamento gestionale e investimenti tecnologici concentrati sulla sola efficienza delle scorte, trascurando dimensioni cruciali quali l'affidabilità del servizio ai reparti, la puntualità delle consegne o la flessibilità nelle risposte logistico-cliniche. In questo senso, lo studio mette in evidenza la necessità di rafforzare gli strumenti di misurazione orientati al servizio, promuovendo sistemi informativi più integrati e una maggiore collaborazione tra funzione logistica e funzioni cliniche.

4. Conclusioni

Le evidenze emerse dal presente studio mostrano in modo chiaro l'esistenza di un disallineamento tra gli obiettivi strategici dichiarati dalle aziende sanitarie e le pratiche di misurazione effettivamente implementate. Sebbene i responsabili della Supply Chain attribuiscano la massima rilevanza strategica agli standard di servizio erogati ai reparti, gli indicatori più maturi, misurabili e utilizzati nella pratica riguardano prevalentemente l'efficienza della gestione delle scorte. Tale risultato suggerisce che le capacità di monitoraggio delle performance sono influenzate, in misura significativa, dalla disponibilità e dalla qualità dei dati presenti nei sistemi informativi, i quali risultano maggiormente sviluppati per i processi di magazzino rispetto ai processi prossimi all'attività clinica.

Questo disallineamento indica la necessità di avviare interventi di riprogettazione dei sistemi di Supply Chain ospedaliera orientati a migliorare l'integrazione dei dati, la trasparenza informativa e la capacità di misurare in maniera sistematica gli effetti logistici sui processi clinici. In particolare, emergono tre direttrici di intervento:

- Potenziamento dell'interconnessione tra sistemi informativi, al fine di integrare i dati clinici e logistici e supportare indicatori focalizzati sul livello di servizio.
- Allineamento tra attività di magazzino e processi di reparto, con l'obiettivo di rendere la performance logistica maggiormente aderente ai bisogni operativi delle unità cliniche.
- Integrazione tra processi logistici e gestione dei flussi dei pazienti, nell'ottica di rafforzare la coerenza complessiva tra organizzazione dei servizi, esigenze cliniche e disponibilità di risorse.

Nel contesto del sistema sanitario italiano, tali interventi richiedono un ruolo attivo dei livelli istituzionali regionali, responsabili del coordinamento degli ospedali e della promozione di sistemi di monitoraggio standardizzati. Un approccio integrato alla misurazione delle performance della Supply Chain rappresenta infatti una leva fondamentale per migliorare l'efficienza operativa, la qualità del servizio offerto ai reparti e, in ultima analisi, il valore complessivo generato per i pazienti.

Il cuore green della sanità: la sfida dell'eco-innovazione per i middle managers

Luca Piubello Orsini[1], Vincenzo Riso[2], Stefano Landi[3], Chiara Leardini[4]

1. Introduzione

Il settore sanitario è riconosciuto quale ambito caratterizzato da un rilevante impatto ambientale, annoverando la responsabilità del 5,2% delle emissioni globali di gas serra (GHG). Nello specifico, le attività che presentano la più elevata impronta carbonica sono le operazioni ad alta intensità energetica, quali il condizionamento degli ambienti, l'illuminazione e l'utilizzo di apparecchiature mediche, nonché i cicli di produzione e smaltimento di farmaci, dispositivi medici e materiali monouso (Dolcini et al., 2025). Le attività sanitarie danno, pertanto, origine a un vero e proprio "paradosso ambientale" (Mousa, Fernandez-Crehuet, et al., 2025-b): il settore, sebbene abbia il mandato istituzionale di tutelare e promuovere la salute, si configura al contempo come un rilevante agente inquinante, il cui impatto ambientale compromette in maniera sistematica gli stessi esiti di salute che esso si prefigge di garantire.

In risposta a questa criticità, a partire dall'ultimo decennio si osserva un crescente impegno da parte delle organizzazioni sanitarie sia europee che americane verso la riduzione della propria carbon footprint. Tale impegno, volto al conseguimento di obiettivi di sostenibilità ambientale, si concretizza nello sforzo di implementare eco-innovazioni (Mousa et al., 2025-a). Queste ultime costituiscono un fenomeno multidimensionale che si manifesta attraverso lo sviluppo di nuovi servizi e tecnologie di processo, unitamente al miglioramento delle strutture organizzative e dei sistemi amministrativi. Essa integra, inoltre, interventi strategici finalizzati a orientare il comportamento organizzativo verso pratiche quali l'adozione di principi di sostenibilità, la riduzione delle emissioni, l'ottimizzazione dell'uso di materiali e risorse, e il ricorso a materie prime ecologiche (Romano et al., 2024).

La letteratura di ambito manageriale evidenzia come il coinvolgimento attivo e l'impegno visibile degli organi di vertice e del top management unitamente al loro sostegno inequivocabile rappresentano fattori cruciali per l'implementazione di tali innovazioni all'interno delle aziende sanitarie (Chiarini & Vagnoni, 2016). Tale dinamica è ulteriormente potenziata da alcune specifiche caratteristiche di leadership, in particolare la leadership etica (che riesce ad orientare i processi decisionali verso principi di integrità e responsabilità) e la leadership per il cambiamento culturale, fondamentale per guidare l'evoluzione dei valori e dei comportamenti organizzativi verso nuovi paradigmi (Cavicchi & Vagnoni, 2017). In parallelo, la letteratura evidenzia come la diversità delle competenze, dei background e delle prospettive all'interno del top management team, quando combinata con una progettazione organica e articolata dei sistemi di controllo direzionale, eserciti un influsso significativo sul successo delle iniziative di sostenibilità (van Schie, 2024). Tale sinergia favorisce infatti una visione multidimensionale delle sfide e delle opportunità, consentendo di integrare gli obiettivi di performance ambientale con le performance

cliniche ed economico-finanziarie, con un orientamento al conseguimento di risultati di lungo periodo (Mousa, Fernandez-Crehuet, et al., 2025 -a). In questo contesto, sebbene la letteratura abbia dedicato ampio spazio al ruolo del top management, è stata riservata limitata considerazione alla funzione del middle management quale driver per l'implementazione di eco-innovazioni. Ciononostante, il middle manager esercita un ruolo determinante nel tessuto organizzativo delle aziende sanitarie. Nel loro percorso di sviluppo, queste ultime si sono evolute verso quella che Mintzberg (1980) denomina "burocrazia professionale", ossia un tipo di configurazione organizzativa caratterizzata dalla presenza di un nucleo operativo consistente, composto in larga parte da professionisti, in cui il coordinamento avviene tramite la condivisione di standard predeterminati e l'autorità si basa non sulla gerarchia, ma sul potere della competenza. Pertanto, le aziende che operano nel settore sanitario sono fisiologicamente organizzazioni «piatte» (con una gerarchia molto corta), in cui lo sviluppo di (eco-) innovazioni non può prescindere dal coinvolgimento e dalla responsabilità dei middle manager (Currie & Procter, 2005; Gullmark et al., 2025). Sotto il profilo delle attività svolte, il middle management esercita una duplice funzione. Con riferimento alle attività top-down, esso assolve al ruolo di tradurre operativamente le decisioni del top management, mediando tra la visione strategica e la sua implementazione nei processi clinico-organizzativi mediante l'adattamento contestuale delle decisioni, la sensibilizzazione del personale e l'integrazione dei criteri ambientali nelle routine operative (Tarakci et al., 2023). Parallelamente, in ottica bottom-up, le attività ascendenti (upwards) si distinguono in due fondamentali processi: la sintesi informativa, e la promozione attiva di alternative innovative (Chen et al., 2017), ampliando lo spettro decisionale a disposizione del top management.

Nella più recente analisi comparativa condotta da Bobini et al. (2024) emerge come la sostenibilità stia assumendo un ruolo sempre più strutturale nei modelli di governance delle aziende sanitarie. Tale evoluzione riflette un progressivo passaggio da approcci frammentati a una visione sistemica, in cui le dimensioni strategiche, organizzative e culturali risultano integrate in un quadro coerente di orientamento alla sostenibilità. Il presente studio, quindi, si colloca nel più ampio alveo di questa riflessione, approfondendo il ruolo dei middle manager nella traduzione operativa dei principi di sostenibilità e ponendosi, quindi, l'obiettivo di rispondere alla seguente domanda di ricerca: come può il middle management favorire i processi di eco-innovazione all'interno delle aziende sanitarie?

Si procede, di seguito, con la presentazione della metodologia, dei risultati, della loro discussione e delle riflessioni conclusive.

2. Metodologia

Attraverso un approccio qualitativo, lo studio si pone l'obiettivo di esplorare in profondità il ruolo dei middle manager nella promozione delle pratiche di eco-innovazione nelle aziende sanitarie pubbliche. In linea con la prospettiva interpretativa (Gioia et al., 2013), la ricerca si è fondata sull'analisi di quattordici interviste semi-strutturate condotte con middle managers operanti in differenti funzioni organizzative, selezionati attraverso l'approccio del purposeful sampling per la loro esperienza diretta nella gestione di processi innovativi (Patton, 2002).

In fase preliminare è stato costruito, quindi, un protocollo di intervista al fine di garantire coerenza metodologica e comparabilità tra le interviste. L'elaborazione del protocollo ha seguito un processo graduale di definizione teorica e operativa. In dettaglio, è stata dapprima condotta una revisione della letteratura sui temi dell'eco-innovazione, della leadership per i middle managers e del cambiamento organizzativo in ambito sanitario, con l'obiettivo di individuare le dimensioni concettuali più rilevanti per l'indagine. Da questa analisi sono emerse tre aree tematiche principali: (i) la propensione individuale al cambiamento e le rappresentazioni del proprio ruolo manageriale (Currie & Procter, 2005); (ii) le pratiche, iniziative e le modalità con cui vengono sviluppate, comunicate e legittimate all'interno delle strutture (Mousa et al, 2025)

(iii) le condizioni organizzative e culturali che possono abilitare o ostacolare la diffusione di comportamenti (Cavicchi & Vagnoni, 2017).

Partendo da queste basi, è stato elaborato un questionario composto da domande aperte. Tale strumento è stato suddiviso in segmenti che riflettono le tre aree tematiche stabilite in precedenza ed è stato concepito con una struttura adattabile, in modo da rispecchiare il lessico e il vissuto di ciascun partecipante all'intervista. Ciascun segmento includeva sia inviti alla narrazione (Es. "Qual è stato il momento più significativo della sua carriera fino ad oggi?") sia domande di approfondimento (Es. "Qual è, secondo lei, il ruolo della sostenibilità nel futuro della sanità?"), pensate per stimolare una discussione ponderata e portare alla luce casi concreti tratti dalla loro esperienza professionale quotidiana.

Il metodo d'indagine è stato sottoposto a una validazione interna, attraverso sessioni di confronto tra il gruppo di ricerca, finalizzate ad accertare la chiarezza e la congruenza concettuale. Successivamente, due interviste sperimentali (pilota) hanno permesso di affinare l'esposizione dei quesiti, eliminando la terminologia troppo specialistica e incoraggiando risposte più dettagliate.

Lo strumento finale ha permesso di ottenere una raccolta dati uniforme, assicurando contemporaneamente ai soggetti intervistati la libertà di esprimersi, un elemento che ha favorito l'emersione di interpretazioni e punti di vista diversi in relazione ai temi dell'innovazione e della sostenibilità nel contesto sanitario. Le interviste sono state condotte tra aprile e ottobre 2025 e la durata media è stata di circa 50 minuti, come riportato in tabella 1.

Tabella 1. Elenco delle interviste

Le interviste sono state registrate e integralmente trascritte, preservando il lessico originale per non alterare le sfumature linguistiche e concettuali.

Le trascrizioni sono poi state analizzate secondo il metodo Gioia (Gioia et al., 2013). In un primo passaggio, le interviste sono state lette e codificate indipendentemente da più ricercatori, al fine di identificare concetti di primo ordine, derivati direttamente dal linguaggio degli intervistati. In una seconda fase, i concetti affini sono stati raggruppati in categorie di secondo ordine, più astratte e interpretative. Attraverso un processo abduttivo e iterativo, l'analisi è evoluta verso la definizione di temi aggregati in grado di rappresentare i meccanismi attraverso cui i middle manager interpretano, traducono e implementano le logiche di innovazione e sostenibilità nei loro contesti organizzativi.

Il confronto costante tra dati e teoria ha permesso di affinare progressivamente la struttura concettuale e di garantire la coerenza interna dell'analisi, contribuendo a ridurre la soggettività interpretativa e rafforzando la consistenza dei risultati (De Villiers et al., 2019).

3. Risultati

L'analisi empirica ha permesso di approfondire il ruolo dei middle manager nel favorire l'adozione di pratiche di eco-innovazione all'interno delle aziende sanitarie pubbliche. A fronte di una maggiore attenzione verso la sostenibilità nel sistema sanitario, l'obiettivo dell'indagine è stato comprendere come questi attori, collocati nella fascia intermedia della struttura organizzativa, possano contribuire alla diffusione di comportamenti e soluzioni orientati alla sostenibilità ambientale. Come anticipato nella sezione metodologica, le interviste hanno esplorato il loro approccio al cambiamento, la sensibilità personale rispetto ai temi ambientali e le modalità attraverso cui tali orientamenti si traducono – o meno – in azioni concrete.

L'analisi ha messo in luce come il middle management possa costituire un nodo strategico nei processi di transizione verso modelli organizzativi più sostenibili. In virtù della loro posizione intermedia, questi attori si trovano in una condizione privilegiata per tradurre gli indirizzi strategici in pratiche operative, ma anche per far emergere dal basso soluzioni innovative che possono essere successivamente captate e istituzionalizzate dal top management. Diversi intervistati hanno sottolineato come le idee di miglioramento nascano spesso nei reparti, "dove si vedono gli sprechi ogni giorno e si può intervenire subito" (intervistato 9), e come la possibilità di sperimentare anche piccole modifiche nelle procedure possa produrre effetti duraturi sull'organizzazione. In questo senso, il middle management si configura come un potenziale abilitatore di eco-innovazione, capace di proporre e modellare comportamenti sostenibili che, una volta legittimati, possono essere diffusi e standardizzati nei diversi contesti aziendali.

La capacità di orientare l'organizzazione verso la sostenibilità dipende tuttavia dall'approccio che i middle manager adottano nei confronti del cambiamento e dalla loro sensibilità al tema ambientale. I manager più innovativi interpretano il proprio ruolo come un percorso evolutivo e aperto all'apprendimento. Come afferma un intervistato, "ritengo il cambiamento importante perché non possiamo pensare che le cose restino sempre uguali" (intervistato 4). Al contrario, nei contesti in cui prevale una visione più statica e conservativa, il cambiamento tende a essere percepito non come una leva di apprendimento, ma come un'imposizione esterna o un adempimento tecnico, spesso vissuto con cautela. In queste situazioni, l'innovazione è associata più alla necessità di adeguarsi che al desiderio di migliorare.

Anche la sensibilità ambientale emerge come una variabile discriminante. Un intervistato ci propone il suo leitmotiv ovvero "curare meglio, sprecando meno" (intervistato 10) mostrando come la sostenibilità possa essere concepita non come un obiettivo a sé ma come un principio guida che orienta in modo naturale scelte e priorità operative. Al contrario, se percepita come qualcosa di distante dalla pratica clinica e quotidiana, assume un ruolo marginale, difficile da tradurre in azioni concrete.

Volgendo l'attenzione al modo con cui i diversi middle managers intervistati hanno affrontato il tema della sostenibilità e dell'innovazione nelle interviste, è possibile individuare almeno tre profili ricorrenti, distinti per il loro grado di apertura al cambiamento e per il livello di consapevolezza nei confronti della sostenibilità ambientale.

Il primo gruppo è rappresentato dai manager adattivi, ovvero manager con una propensione limitata all'innovazione e un atteggiamento perlopiù reattivo: si adeguano ai cambiamenti solo quando questi sono richiesti dalla direzione o comunque imposti, senza però farsi promotori di iniziative proprie. Sembra quindi prevalere una mentalità conservatrice ed orientata a garantire la continuità operativa piuttosto che sperimentare nuovi approcci, come ad esempio: "Il green è importante, ma nella nostra realtà è difficile capire come applicarlo davvero" (intervistato 5) e "Il cambiamento deve essere ragionato e condiviso, altrimenti crea solo confusione" (intervistato 6).

Pur riconoscendo l'importanza della sostenibilità, questi manager la interpretano come un compito aggiuntivo rispetto alle loro responsabilità giornaliere, invece di considerarla una leva strategica per ottimizzare i processi. L'innovazione, quindi, è ricevuta passivamente e solo raramente si traduce in iniziative che nascono spontaneamente o sono promosse a livello condiviso.

La seconda categoria è rappresentata dai manager innovativi non-green, i quali esibiscono una marcata propensione al cambiamento e un chiaro focus sull'efficienza organizzativa, ma dimostrano una sensibilità ambientale ancora moderata. Questi profili si distinguono per la loro capacità di introdurre soluzioni gestionali o tecnologiche che mirano primariamente a migliorare la performance economica e operativa – ad esempio riducendo i costi, i tempi di esecuzione o le inefficienze – anziché focalizzarsi sulla mitigazione dell'impatto ambientale. Come afferma un intervistato, "L'innovazione serve a migliorare i processi, poi il green viene dopo" (intervistato 7). Un altro precisa che "la sostenibilità è importante, ma io mi concentro sulla qualità e sulla sicurezza, poi se questo riduce anche gli sprechi, tanto meglio" (intervistato 8). Appare evidente come l'innovazione sia orientata soprattutto all'efficienza e al miglioramento continuo, ma senza un collegamento con la sostenibilità ambientale. La sensibilità "ecologica", se così possiamo dire (quando presente), emerge in modo indiretto, quasi come un effetto collaterale della buona gestione e non come un obiettivo consapevolmente perseguito.

Cosa diversa, invece, per l'ultimo gruppo, più ristretto, di eco-innovatori, ovvero manager che uniscono una forte propensione al cambiamento dei processi a una profonda consapevolezza ambientale, trasformando la loro attenzione ecologica in iniziative concrete, spesso nate spontaneamente e indipendenti da direttive formali.

Le loro iniziative riguardano il riutilizzo di materiali sanitari, la progettazione di circuiti di riciclo con i fornitori o la promozione di comportamenti sostenibili tra i professionisti. Un intervistato racconta: "Cerchiamo sempre di far girare meno il materiale, meno rifiuti, meno sprechi, lo condivido pienamente" (intervistato 9). Un altro sottolinea la dimensione culturale di questo impegno: "convincere il personale che non è solo una questione di rifiuti, ma di rispetto per ciò che facciamo e per l'ambiente in cui lavoriamo" (intervistato 10). Gli eco-innovatori non percepiscono la sostenibilità come un vincolo esterno, ma la considerano parte integrante della propria missione professionale. In questo modo, agiscono come veri trasformatori unendo competenze tecniche, autonomia decisionale e motivazione che permettono di tradurre l'impegno personale in azioni organizzative concrete.

Andando più in profondità rispetto ai fattori individuali e organizzativi che abilitano la propensione ad eco-innovare è emerso come elemento caratterizzante la sensibilità personale,

nonché l'esperienza personale maturata in contesti attenti ai temi ambientali (es. di vita privata, di comunità). Sul tema, gli intervistati affermano "Mi sento spinto più da una responsabilità verso la comunità che da un obbligo formale" (intervistato 10) e "la motivazione personale è fondamentale: se non ci credi tu, non puoi trasmetterlo agli altri" (intervistato 12), sottolineando come l'adesione valoriale sia il principale motore del cambiamento. Volgendo l'attenzione al piano organizzativo, invece, appaiono come determinanti l'autonomia operativa, la legittimazione interna e la presenza di reti relazionali solide, che favoriscono la diffusione delle pratiche green e aiutano a superare le rigidità burocratiche. Tuttavia, il contesto istituzionale appare ancora poco orientato a promuovere la sostenibilità in modo sistematico: la formazione è limitata, i sistemi di valutazione raramente considerano criteri ambientali e molte iniziative restano affidate alla sensibilità dei singoli: difatti, come commenta un intervistato, "mi informo come posso, ma è più una curiosità personale che qualcosa di istituzionale" (intervistato 14).

Il panorama che emerge dall'analisi mostra un sistema ancora in fase di definizione, dove la transizione green procede più per impulso individuale che attraverso strategie concepite e strutturate intenzionalmente. Nonostante ciò, il middle management si rivela un attore cruciale per la traduzione della sostenibilità da principio astratto a pratica organizzativa. Attraverso la loro azione quotidiana, i middle manager fungono da ponte tra strategia e operatività, favorendo la sperimentazione, la legittimazione e la diffusione di soluzioni che possono orientare le strutture sanitarie verso modelli di gestione più consapevoli e sostenibili.

3. Discussione dei risultati

L'analisi condotta permette di osservare come il middle management rappresenti uno snodo cruciale nei processi di eco-innovazione nelle aziende sanitarie pubbliche. Coerentemente con quanto declinato da Bobini et al. (2024), dove la sostenibilità è letta come processo sistemico che richiede governance multilivello e strumenti di misurazione condivisi, anche le nostre evidenze confermano l'importanza delle condizioni organizzative — autonomia, legittimazione e reti — come prerequisiti per un'eco-innovazione effettiva. Infatti, in linea con la letteratura sui middle managers nelle organizzazioni complesse (Currie & Procter, 2005; Floyd & Wooldridge, 1997; Tarakci et al., 2023), l'analisi mette in evidenza come i middle manager agiscono come attori-ponte, capaci di tradurre, adattare e reinterpretare gli indirizzi strategici in pratiche operative coerenti con i valori, le routine e i vincoli del contesto sanitario. La funzione di mediazione dei middle manager si esprime attraverso un duplice movimento organizzativo. I middle manager, da un lato, hanno il compito di trasmettere la visione strategica definita dal top management ai livelli operativi, convertendo i princìpi di sostenibilità in comportamenti giornalieri che siano coerenti con le pratiche cliniche e gestionali in uso. Dall'altro, essi indirizzano verso i livelli superiori le innovazioni che nascono spontaneamente all'interno dei reparti, dando valore a esperienze e soluzioni che spesso costituiscono le prime forme di sperimentazione della sostenibilità. Questa interazione bidirezionale ne conferma il ruolo di snodo cognitivo e relazionale (Nonaka & Takeuchi, 1995), rendendola capace di fungere simultaneamente da strumento di attuazione e da catalizzatore di innovazione. L'analisi qualitativa, tuttavia, mette in luce come l'eco-innovazione nel contesto sanitario non possa essere ridotta unicamente a un processo di natura tecnica o gestionale. Essa include una componente cognitiva e valoriale, che si basa sull'abilità dei middle manager di esaminare criticamente le consuete routine e di identificare quelle che possono essere definite come "zone grigie" di inefficienza, spreco o incoerenza rispetto ai criteri di sostenibilità. L'innovazione ambientale sembra scaturire proprio da questa consapevolezza riflessiva manifestata dalla disponibilità a mettere in discussione procedure consolidate e a rielaborarle in un'ottica ecologica.

Questo livello di consapevolezza si manifesta attraverso la curiosità e la volontà di progredire, qualità che trasformano la semplice propensione al cambiamento in una vera e propria competenza organizzativa. In questo senso, le evidenze raccolte ampliano la prospettiva di Mousa

et al. (2025), secondo cui il middle management esercita una leadership etica nel promuovere la sostenibilità: accanto alla dimensione morale, emerge la necessità di una curiosità riflessiva che consente di trasformare la sensibilità etica in pratica operativa.

Un ulteriore elemento che emerge dall'analisi riguarda la capacità di problematizzare le pratiche quotidiane, intesa come competenza cognitiva e riflessiva che consente ai middle manager di riconoscere le criticità implicite nei processi organizzativi. La messa in discussione dei problemi (problematizzazione) rappresenta l'avvio fondamentale del processo di innovazione: è grazie all'abilità di interrogare ciò che appare come consuetudinario o ineluttabile che si aprono le possibilità per il cambiamento. Ciò nonostante, i dati raccolti indicano che tale competenza diviene effettivamente produttiva solo nel momento in cui si fonde con una specifica sensibilità individuale nei confronti della sostenibilità ambientale. La capacità di avere spirito critico nelle riflessioni è sicuramente un fattore abilitante che può far nascere un'innovazione, ma intercetta il tema della sostenibilità solo quando si accompagna a un orientamento valoriale che aiuta a dare senso ai problemi. Nei casi osservati, la combinazione tra consapevolezza e sensibilità ambientale si traduce in pratiche concrete: per citare un esempio, accorgersi di uno spreco di materiali può diventare lo spunto per provare procedure diverse coinvolgendo colleghi o fornitori. Lo spirito critico, unito alla sensibilità, può permettere ai middle-manager di trasformare l'osservazione critica in azioni mirate, dando vita a piccole innovazioni sostenibili che, anche se nate in modo locale, possono diffondersi e generare effetti più ampi.

Nel complesso, i risultati mostrano che la sostenibilità in sanità non si impone dall'alto né nasce solo da vincoli normativi. Può invece emergere dal basso, come un processo riflessivo diffuso, messo in moto da professionisti capaci di guardare con occhio critico le routine e di tradurre questa consapevolezza in pratiche coerenti con i propri valori.

In questo senso, la capacità di problematizzare costituisce il presupposto cognitivo dell'eco-innovazione (la capacità di intercettare un problema e, quindi, un'opportunità), mentre la sensibilità personale ne rappresenta la condizione etica e motivazionale.

Nel contesto sanitario, tale dimensione assume un rilievo particolare. Sul piano organizzativo, le aziende sanitarie sono descritte come burocrazie professionali (Mintzberg, 1980), dove il sapere tecnico pesa più della gerarchia e l'autorevolezza nasce dalla competenza. In tali configurazioni organizzative, il cambiamento raramente arriva per imposizione: prende piuttosto forma attraverso percorsi di legittimazione culturale che si sviluppano nei livelli intermedi dell'organizzazione.

È qui che i middle manager assumono un ruolo chiave. Agiscono come mediatori culturali (Balogun & Johnson, 2004), capaci di tradurre i principi della sostenibilità nel linguaggio e nei valori della professione sanitaria. In questo modo riescono a mantenere saldo il riferimento all'etica della cura, ma al tempo stesso a trasformare le idee sull'ambiente in pratiche concrete e compatibili con la realtà operativa dei reparti.

L'eco-innovazione in sanità sembra emergere, quindi, come un processo di co-evoluzione tra struttura, cultura e agenti, in cui il middle management rappresenta il punto di raccordo tra strategia e operatività quotidiana.

I risultati consentono di precisare le condizioni che rendono i middle manager abilitatori o, al contrario, freni alla transizione verde. La prima condizione riguarda l'apertura al cambiamento, che emerge come base cognitiva dell'eco-innovazione. I manager attivi, curiosi e aperti a imparare dall'esperienza, riescono più facilmente a individuare dove i processi possono essere migliorati. Questo risultato sembra in linea con quanto evidenziato da Cavicchi e Vagnoni (2017) secondo cui la transizione verso la sostenibilità richiede un contesto organizzativo che favorisca curiosità, sperimentazione e apprendimento continuo. Gli intervistati hanno mostrato come questa apertura si traduce nella disponibilità a mettere in discussione le abitudini consolidate (dalla gestione delle risorse alla logistica dei rifiuti, fino all'uso dell'energia) e a introdurre modifiche graduali che, nel tempo, producono miglioramenti concreti. È importante considerare anche la traduzione della

sensibilità ambientale in azioni concrete, un passaggio tutt'altro che immediato anche per chi possiede una solida consapevolezza "green".

Dalle interviste emerge che la capacità di agire si sviluppa dall'intreccio tra fattori personali e condizioni organizzative.

Sul piano individuale, motivazione e senso di responsabilità verso la collettività spingono i manager a migliorare la qualità dei servizi, riducendo al tempo stesso l'impatto ambientale. Sul versante organizzativo, contano invece l'autonomia decisionale, la legittimazione interna e la solidità delle reti relazionali. L'autonomia consente di sperimentare anche in assenza di direttive formali, la legittimazione – fondata sulla credibilità professionale – favorisce fiducia e sostegno da parte dei colleghi e dei superiori, mentre le reti orizzontali permettono di diffondere le buone pratiche oltre i confini dei singoli reparti, alimentando processi di apprendimento collettivo.

Queste dinamiche richiamano la logica delle dynamic capabilities (Gullmark et al., 2025), secondo cui l'innovazione sostenibile nasce dalla capacità delle organizzazioni di apprendere, adattarsi e riallocare le proprie risorse in funzione di nuovi obiettivi condivisi.

La distinzione tra manager adattivi, innovativi non-green ed eco-innovatori consente di comprendere la varietà dei comportamenti osservati e la natura distribuita e relazionale dell'eco-innovazione in sanità. Abbiamo quindi delineato tre principali profili di middle manager. I più cauti, definiti adattivi, tendono a seguire le direttive senza metterle in discussione, mantenendo un atteggiamento prudente e orientato alla continuità. Gli innovativi non-green, invece, mostrano curiosità e propensione al cambiamento, ma concentrano i propri sforzi sull'efficienza e sui risultati, senza ancora integrare pienamente la sostenibilità nei loro obiettivi. Infine, gli eco-innovatori rappresentano una minoranza più visionaria: uniscono riflessività, consapevolezza ambientale e competenze operative, traducendo la sostenibilità in azioni e progetti concreti.

Quest'ulrima tipologia suggerisce che l'innovazione sostenibile non nasce per automatismo dalle politiche aziendali, ma dall'incontro tra motivazioni personali e necessità di innovazione. L'eco-innovazione, quindi, si sviluppa dal basso, nell'azione quotidiana dei manager, e si consolida attraverso l'apprendimento e la condivisione di esperienze. Il middle management, quindi, non svolge solo una funzione operativa, ma anche culturale: è nei livelli intermedi che la sostenibilità può prendere forma concreta, passando da valore dichiarato a pratica condivisa.

4. Riflessioni conclusive

Lo studio ha approfondito il ruolo del middle management nei processi di eco-innovazione all'interno delle aziende sanitarie pubbliche, esplorando come questi attori possano contribuire alla transizione verso modelli organizzativi più sostenibili. L'analisi ha evidenziato, infatti, la natura strategica, riflessiva e relazionale del ruolo del middle manager. I risultati mostrano che la sostenibilità non si diffonde soltanto attraverso direttive o piani operativi, ma si costruisce progressivamente nella quotidianità organizzativa, grazie alla capacità dei middle manager di tradurre principi astratti in pratiche contestuali, di stimolare l'apprendimento collettivo e di legittimare nuovi modelli di comportamento.

Inoltre, affinché le pratiche di sostenibilità possano concretamente emergere e diffondersi nel contesto organizzativo, è condizione necessaria ma non sufficiente una forte apertura al cambiamento che, per abbracciare il tema green, deve essere accompagnata da un approccio valoriale personale e da una sensibilità alle tematiche ambientali.

Sul piano teorico, il contributo principale dello studio risiede nell'ampliare la comprensione del middle management come attore cognitivo e istituzionale nei processi di eco-innovazione. La letteratura ha tradizionalmente descritto i middle manager come "semplici" mediatori delle strategie definite dal vertice, incaricati di tradurre la visione strategica in azione operativa (Floyd & Wooldridge, 1997; Currie & Procter, 2005). I risultati di questo studio mostrano invece che, nei contesti sanitari, il middle management non si limita a svolgere un ruolo di mediazione, ma assume una funzione di interpretazione attiva e rielaborazione valoriale. L'eco-innovazione può

essere letta come un processo diffuso, nel quale i middle manager individuano problemi, reinterpretano pratiche consolidate e ne promuovono l'adattamento in chiave sostenibile. Questa prospettiva amplia la visione tradizionale del middle manager, includendo una dimensione personale e culturale legata ai valori, alla sensibilità ambientale e alla capacità di mettere in discussione le abitudini organizzative.

Lo studio contribuisce a chiarire i meccanismi che sostengono la transizione sostenibile nelle aziende sanitarie. La distinzione tra manager adattivi, innovativi non-green ed eco-innovatori aiuta a comprendere la varietà interna del middle management e mostra come la propensione al cambiamento derivi dall'interazione tra motivazioni individuali e condizioni istituzionali. In questa prospettiva, l'eco-innovazione non è un evento isolato ma un percorso di apprendimento progressivo, che si alimenta di sperimentazione, riflessione e pratiche quotidiane.

La ricerca, inoltre, aiuta a comprendere meglio il dibattito sull'innovazione sostenibile in sanità mostrando come la struttura professionale e burocratica del settore condizioni profondamente i processi di cambiamento. In contesti dove la competenza tecnica e l'identità professionale dei clinici sono fortemente radicate, la sostenibilità non può essere imposta dall'alto. Si afferma, piuttosto, attraverso un lento processo di legittimazione culturale e di negoziazione del significato (Bobini et al., 2024). In questo percorso, i middle manager assumono un ruolo di mediazione interpretativa, traducendo i principi strategici in pratiche concrete e cercando un equilibrio tra logiche gestionali e valori professionali. La sostenibilità, in questo senso, nasce dall'incontro continuo tra visione e pratica quotidiana.

Oltre al contributo teorico, lo studio offre indicazioni utili per chi governa le aziende sanitarie e per le politiche pubbliche che mirano a integrare la sostenibilità nei processi di gestione. I risultati mostrano che le strategie "green" funzionano solo se coinvolgono attivamente i middle managers, che rappresentano l'anello di congiunzione tra la pianificazione e l'operatività. Riconoscere e sostenere la loro iniziativa significa creare contesti che favoriscano autonomia, sperimentazione e condivisione delle esperienze, evitando che le innovazioni restino episodi isolati.

La legittimazione istituzionale assume un ruolo chiave: senza un riconoscimento formale del contributo dei middle manager, i tentativi di innovazione rischiano di disperdersi. Allo stesso modo, la formazione sulla sostenibilità dovrebbe diventare parte dei percorsi di sviluppo professionale, combinando saperi tecnici, ambientali e gestionali, così da trasformare la sensibilità personale in competenza organizzativa.

Un ulteriore passo riguarda i sistemi di valutazione, che dovrebbero includere indicatori ambientali e dare visibilità a chi riesce a tradurre la sostenibilità in risultati misurabili, come la riduzione degli sprechi o il miglioramento dei processi. La creazione di reti trasversali e comunità di pratica, infine, può favorire la circolazione delle esperienze più efficaci, riducendo l'isolamento dei manager più attivi e rendendo replicabili le innovazioni locali.

Come ricordano Bobini et al. (2024), il cammino verso una sanità sostenibile non dipende solo da strumenti e policy, ma da una cultura manageriale capace di incorporare la sostenibilità nelle pratiche di ogni giorno. In questo scenario, la sostenibilità non è un compito delegabile ma un processo collettivo che richiede il contributo diffuso di chi lavora a diversi livelli dell'organizzazione. I middle manager, in particolare, non sono semplici esecutori, ma coideatori delle strategie, perché operano nello spazio dove le idee diventano azioni e le innovazioni si radicano nella pratica.

Lo studio presenta alcuni limiti. Il numero contenuto di interviste non consente ovviamente di estendere i risultati a tutto il sistema sanitario e la natura trasversale dell'indagine fotografa un momento specifico del cambiamento, senza coglierne l'evoluzione nel tempo. Inoltre, la scelta di concentrarsi sui middle manager lascia in secondo piano la prospettiva dei vertici e del personale clinico, che potrebbero offrire letture complementari.

Questi elementi aprono la strada a nuovi approfondimenti. Futuri studi potranno combinare metodi qualitativi e quantitativi per misurare la diffusione delle pratiche green e il loro impatto

organizzativo. Analisi longitudinali potranno invece osservare come cambiano nel tempo competenze e atteggiamenti, mentre confronti con contesti privati o internazionali aiuteranno a valutarne la trasferibilità. Infine, esplorare le relazioni tra top management, middle management e operatori sanitari potrà chiarire come si costruisce la coerenza tra la visione strategica e la pratica quotidiana, e in che modo forme di leadership distribuita possono sostenere una transizione più solida verso la sostenibilità.

Parole chiave: Middle management; sanità; innovazione green

1. Introduzione

Negli ultimi anni, il sistema sanitario italiano ha intrapreso un profondo processo di trasformazione che mira a superare la tradizionale frammentazione tra ospedale e territorio, orientandosi verso un modello di gestione per processi integrati. Tale approccio, consolidato anche a livello normativo dal Decreto Ministeriale n. 77/2022 promuove una visione della cura come continuum assistenziale, in cui la presa in carico del paziente si articola in modo coerente e coordinato nei diversi setting di cura. All'interno di questa prospettiva, la gestione per processi diventa non solo una modalità organizzativa, ma anche un paradigma interpretativo che consente di ripensare l'intera filiera assistenziale in termini di valore creato per il paziente, di efficienza nell'uso delle risorse e di sostenibilità del sistema pubblico (Borgonovi, 2018; Noto et al., 2023). Gli studi di gestione sanitaria hanno evidenziato come i modelli tradizionali di controllo per strutture verticali siano oggi inadeguati a rappresentare la complessità dei percorsi di cura e la natura interdipendente delle attività cliniche. L'attenzione si è progressivamente spostata verso logiche di controllo e misurazione per processi orizzontali, capaci di superare i confini organizzativi e professionali (Vinci et al., 2022). Ciò ha implicato un profondo rinnovamento dei sistemi di accountability e di allocazione delle risorse, in cui il focus non è più sul singolo reparto o servizio, bensì sull'intero percorso del paziente. In questa prospettiva, i Percorsi Diagnostico-Terapeutico-Assistenziali (PDTA) si configurano come strumenti operativi e cognitivi per realizzare l'integrazione tra livelli di cura, orientando i processi decisionali e gestionali verso obiettivi condivisi di efficacia clinica, qualità e sostenibilità (Rosa et al., 2024; Taddeini et al., 2024).

Parallelamente, gli studi di controllo di gestione nell'ambito sanitario hanno proposto metodi di analisi dei costi in grado di cogliere la dimensione longitudinale del percorso assistenziale. La misurazione dei costi per livelli di assistenza e per fattori produttivi (Cislaghi et al., 2014) e l'applicazione del Time-Driven Activity-Based Costing in ambito sanitario (e.g., Campanale et al., 2015; Landi et al., 2025) hanno consentito di stimare in modo più accurato il consumo di risorse lungo l'intero processo di cura, superando la visione parziale legata alle singole strutture. Questi strumenti rappresentano oggi un supporto essenziale per i decisori pubblici nella definizione di politiche basate sul valore (value-based healthcare - Møberg & Malmmose, 2025), in cui la sostenibilità economica è strettamente connessa alla capacità di generare outcome di salute rilevanti per il paziente.

All'interno di tale cornice teorica, il Patient Blood Management (PBM) rappresenta un campo di applicazione particolarmente significativo dei principi di gestione per processi. Il concetto di PBM, introdotto in letteratura nei primi anni 2000 (Isbister, 2015), è stato successivamente riconosciuto e promosso a livello internazionale. Nel 2010, l'Organizzazione Mondiale della Sanità (OMS), con la risoluzione WHA63.12, ha esortato tutti gli Stati membri a

implementareprogrammi nazionali di PBM, riconoscendone il potenziale in termini di miglioramento degli esiti clinici e di sostenibilità dei sistemi sanitari. Tale prospettiva è ulteriormente rafforzata in un documento recente dell'OMS (WHO, 2024), che inquadra il PBM non solo come insieme di pratiche cliniche, ma anche come modello organizzativo e di sanità pubblica, fondato su strutture di governance multilivello, sistemi di raccolta dei dati, riallocazione delle risorse e gestione del cambiamento culturale all'interno delle organizzazioni sanitarie. In Italia, il PBM è stato citato per la prima volta nel "Programma di autosufficienza nazionale del sangue" (Decreto 4 settembre 2012 – GU n. 241 del 15/10/2012) come strumento utile a perseguire l'autosufficienza nazionale. Tuttavia, a distanza di quindici anni, l'implementazione di tali programmi è risultata inferiore alle aspettative, tanto che nel 2021 l'OMS ha pubblicato una policy brief per sollecitare la piena adozione del PBM da parte dei Paesi membri, evidenziandone l'urgenza come standard globale di cura (WHO, 2021).

L'esperienza pionieristica della Western Australia, documentata in uno studio retrospettivo su oltre seicentomila pazienti ricoverati tra il 2008 e il 2014, ha mostrato come l'implementazione sistemica del PBM possa tradursi in un miglioramento significativo degli esiti clinici e in un risparmio economico rilevante. In quel contesto, il percorso ha determinato una riduzione del 41% delle unità di sangue trasfuse, un calo della mortalità ospedaliera del 28% e della durata media di degenza del 15%, con risparmi diretti e indiretti stimati tra 80 e 100 milioni di dollari australiani (Leahy et al., 2017). Tali risultati dimostrano come il PBM sia al tempo stesso una pratica clinica e una strategia di governance: un modello di gestione per processi che integra le dimensioni cliniche, organizzative ed economico-gestionali, producendo valore per il paziente e per il sistema sanitario.

L'approccio promosso dall'OMS evidenzia inoltre che il PBM, per essere efficace, deve essere concepito come un programma di salute pubblica e non come un intervento confinato all'ambito ospedaliero. La sua riuscita dipende dalla capacità di costruire una rete multiprofessionale e interistituzionale che connetta ospedale, territorio e medicina di base. La gestione ottimale del sangue del paziente implica infatti la diagnosi precoce dell'anemia, la correzione delle carenze marziali, la riduzione delle perdite ematiche intraoperatorie e il follow-up post-dimissione: un insieme di azioni che attraversano in modo trasversale l'intero percorso assistenziale e richiedono un coordinamento costante tra diversi attori e livelli di cura.

Come evidenziato anche dall'OMS, nonostante il crescente riconoscimento normativo e scientifico del PBM, la sua implementazione sistematica nei sistemi sanitari pubblici rimane limitata, in particolare per la complessità organizzativa richiesta e per la difficoltà di valutarne gli impatti economici lungo l'intero percorso assistenziale. La letteratura esistente si è prevalentemente focalizzata sugli esiti clinici del PBM (Agostini et al., 2025; Ercolani et al., 2023), mentre le sue potenzialità come leva di governance e di integrazione ospedale-territorio risultano ancora poco esplorate. Il presente contributo intende colmare tale gap analizzando il PBM come modello di gestione per processi, capace di supportare l'integrazione tra livelli di cura e di orientare il controllo di gestione verso una logica value-based.

2. Caso di studio

Il single case study in esame, sviluppato presso l'ASST Papa Giovanni XXIII di Bergamo, costituisce un esempio concreto di valutazione della fattibilità organizzativa ed economica dell'implementazione di un percorso di PBM integrato ospedale-territorio, prima dell'avvio operativo. Dal punto di vista metodologico, lo studio si configura come un proof of concept basato su un'analisi del contesto e su una valutazione ex ante degli impatti attesi. L'impostazione è coerente con l'approccio raccomandato dall'OMS, che identifica i programmi di PBM come interventi complessi da avviare attraverso progetti pilota e valutazioni preliminari di fattibilità, prima di una diffusione sistemica a livello aziendale o territoriale (WHO, 2024). L'iniziativa, coordinata dal Servizio di Immunoematologia e Medicina Trasfusionale (SIMT) in collaborazione

con la Direzione Aziendale, il Dipartimento di Anestesia e Rianimazione, il Laboratorio di Patologia Clinica e la Struttura Complessa di Ortopedia, è rivolta ai pazienti candidati a interventi ortopedici di maggiore complessità e nasce dall'esigenza di ridurre la prevalenza di anemia preoperatoria e la conseguente esposizione al rischio trasfusionale.

Il percorso proposto prevede l'identificazione precoce dei pazienti anemici mediante uno screening laboratoristico preoperatorio e la somministrazione di ferro endovenoso per la correzione della sideropenia. La peculiarità del modello risiede nell'estensione del trattamento al di fuori dell'ambito ospedaliero: la terapia potrà infatti essere somministrata non solo negli ambulatori del SIMT, ma anche nel polo territoriale, con il coinvolgimento attivo dei professionisti che operano nelle Case di Comunità. Questa integrazione sarà resa possibile grazie al supporto degli specialisti del SIMT, attraverso strumenti di teleconsulto e televisita, che consentiranno di supervisionare i trattamenti territoriali e di garantire la continuità clinica. Una volta normalizzato il bilancio marziale, il paziente sarà sottoposto all'intervento chirurgico e, successivamente, rivalutato in fase post-operatoria, con eventuale somministrazione aggiuntiva di ferro endovenoso per compensare le perdite intraoperatorie. Il percorso si concluderà con un follow-up a quaranta-cinque giorni dalla dimissione, gestito in collaborazione tra il medico di medicina generale e il SIMT, con possibilità di rivalutazione specialistica, se necessario.

L'inserimento delle Case di Comunità nel percorso PBM rappresenta un elemento innovativo che consente di tradurre operativamente il principio di prossimità promosso dal DM 77. In questo modo, il processo assistenziale si articola lungo un continuum che unisce ospedale e territorio, favorendo una presa in carico multidimensionale e riducendo la frammentazione tipica dei modelli tradizionali. L'utilizzo del teleconsulto rafforza la rete clinica, consentendo la supervisione specialistica dei trattamenti territoriali e consolidando la collaborazione interprofessionale. Tale strutturazione organizzativa configura un vero e proprio PDTA dell'anemia chirurgica, integrato e dinamico, capace di coniugare l'appropriatezza clinica, la sostenibilità economica e il miglioramento dell'esperienza del paziente.

Le stime derivanti dall'analisi di contesto condotta sull'attività 2024 della Struttura Complessa di Ortopedia, relativa ai pazienti candidati a chirurgia ortopedica maggiore (sostituzione protesica di anca e ginocchio), evidenziano i potenziali risultati attesi dall'avvio (imminente) del PBM. Circa il 23% dei pazienti del campione presentava anemia preoperatoria, con un consumo di 100 unità di sangue e una degenza media superiore di un giorno rispetto ai pazienti non anemici. La correzione preoperatoria dell'anemia avrebbe potuto prevenire 84 trasfusioni e generare un risparmio complessivo di circa 91 mila euro l'anno, a fronte di un costo di implementazione inferiore a 18 mila euro (Verzeroli et al., 2025). Tali stime, coerenti con le esperienze internazionali, consentono di simulare gli effetti potenziali dell'introduzione del PBM in termini non solo di miglioramento degli esiti post-operatori, ma soprattutto di riduzione delle trasfusioni, contenimento delle giornate di degenza e ottimizzazione dei costi, configurando il PBM come leva di integrazione dei processi clinico-assistenziali.

Dal punto di vista organizzativo, l'attivazione del PBM presso l'ASST Papa Giovanni XXIII ha favorito la costituzione di un gruppo di lavoro multiprofessionale e multidisciplinare, composto da medici, biologi, tecnici sanitari di laboratorio biomedico e infermieri, sia del Polo Ospedaliero che del Polo Territoriale, afferenti alla Medicina Trasfusionale, Medicina di Laboratorio, Anestesia e Rianimazione, Ortopedia, Cure Primarie, Direzione delle Professioni Sanitarie e Sociali, Direzione Sanitaria e Direzione Socio-Sanitaria. Tale configurazione rispecchia la logica della governance per processi clinici, in cui la responsabilità del percorso è condivisa tra più attori e la qualità dell'assistenza dipende dalla loro capacità di coordinamento. La collaborazione interprofessionale, sostenuta da sistemi informativi integrati, consente di monitorare l'intero ciclo assistenziale, standardizzare le procedure e generare conoscenza organizzativa utile al miglioramento continuo. Inoltre, l'estensione del PBM al polo territoriale contribuisce a ridisegnare le relazioni tra i diversi livelli di assistenza, introducendo un modello di integrazione basato sulla condivisione di competenze, responsabilità e informazioni. La

possibilità di gestire l'anemia preoperatoria a livello territoriale consente di anticipare la cura, migliorare l'aderenza terapeutica e ridurre il carico sulle strutture ospedaliere. Inoltre, la valorizzazione del ruolo del personale sanitario territoriale rafforza la capacità del sistema di intercettare precocemente i bisogni di salute e di offrire risposte coordinate e personalizzate.

L'esperienza bergamasca offre inoltre un'interessante prospettiva sulla dimensione economico-gestionale dei percorsi integrati. L'utilizzo di modalità di costing per processi, come il TDABC, consente di misurare con precisione il consumo di risorse lungo le diverse fasi del PBM, dalla diagnosi alla terapia e al follow-up, stimando il costo per paziente trattato e il risparmio derivante dalla riduzione delle trasfusioni e della degenza. In questo senso, il PBM può essere considerato un esempio concreto di value-based process management, in cui l'uso appropriato delle risorse coincide con il miglioramento degli outcome clinici e la riduzione del rischio per il paziente.

3. Conclusioni

In conclusione, l'esperienza del PBM presso l'ASST Papa Giovanni XXIII mostra come la gestione per processi possa tradursi in un approccio concreto di innovazione clinico-organizzativa e di integrazione ospedale-territorio. L'applicazione del PBM in un contesto che coinvolge contemporaneamente i livelli ospedaliero e territoriale dimostra la possibilità di generare outcome su tre dimensioni complementari: clinica, attraverso la riduzione dell'anemia preoperatoria e dell'esposizione trasfusionale; organizzativa, mediante il rafforzamento della collaborazione multiprofessionale e dell'integrazione ospedale-territorio; economico-gestionale, grazie alla possibilità di analizzare e governare i costi lungo il processo di cura anziché per singole unità organizzative.

Il progetto, ancora in fase di implementazione, si propone di contribuire alla letteratura e alla pratica manageriale offrendo un esempio di come i principi teorici della gestione per processi, dell'analisi dei costi e del value-based healthcare possano essere declinati operativamente in un percorso concreto di cura integrata. In particolare, da un punto di vista teorico, in continuità con il dibattito sulla gestione per processi e sui PDTA integrati ospedale-territorio, lo studio propone una lettura del PBM non solo come buona pratica clinica, ma come leva organizzativa trasversale che richiede collaborazione multidisciplinare, riallocazione delle risorse e strumenti di misurazione dei costi per processo, superando i tradizionali assetti per reparto.

In termini di implicazioni pratiche, il caso analizzato suggerisce come il PBM possa fungere da modello replicabile per policy maker e manager sanitari interessati a sviluppare percorsi integrati coerenti con il DM 77/2022. In particolare, l'estensione del PBM alle Case di Comunità e alla medicina generale evidenzia il potenziale del modello nel rafforzare la sanità di prossimità, migliorare l'appropriatezza clinica e supportare decisioni di allocazione delle risorse basate sul valore.

Più in generale, in un contesto caratterizzato dall'invecchiamento della popolazione e dall'aumento della domanda di interventi chirurgici, il PBM assume una valenza strategica, non solo per la gestione clinica del singolo paziente, ma anche per la sostenibilità complessiva del sistema sanitario. L'adozione di pratiche di gestione integrata consente di ridurre la domanda di trasfusioni, di ottimizzare l'uso delle scorte ematiche e di garantire una maggiore resilienza dei servizi in situazioni di carenza di risorse, come quelle registrate durante la pandemia da COVID-19.

La prospettiva offerta dal PBM si inserisce pienamente nella logica della sanità di iniziativa e del value-based healthcare, in cui l'obiettivo non è solo l'efficienza operativa, ma anche la creazione di valore per il paziente e per la comunità. In questo senso, la collaborazione tra il polo ospedaliero e il polo territoriale rappresenta una leva fondamentale per la costruzione di percorsi di cura sostenibili e orientati agli esiti. Il PBM, attraverso la sua struttura multiprofessionale e l'integrazione dei processi, può fungere da modello replicabile per altri percorsi, come quelli

dedicati alla gestione delle cronicità o delle fragilità, contribuendo alla diffusione di una cultura organizzativa basata sulla collaborazione e sulla responsabilità condivisa. Lo studio apre inoltre a future linee di ricerca orientate alla valutazione ex post degli esiti clinici ed economici del processo una volta implementato, nonché all'analisi della trasferibilità del modello ad altri contesti clinici e territoriali.

La valutazione multidimensionale dei servizi sanitari territoriali nella prospettiva "Citizen Care in Community"

Claudio Travaglini[1]

1. La valutazione delle cure territoriali

Il contributo propone considerazioni per un modello di gestione e valutazione multidimensionale per le cure primarie come "l'erogazione di servizi universalmente accessibili integrati, centrati sulla persona" con approccio applicabile anche alle cure intermedie ed ospedaliere: metteremo al centro il cittadino e configureremo attorno a lui il Piano di Salute Personale, espressione dell'ecosistema della cura

Proporremo un modello multidimensionale di valutazione degli interventi aggiungendo alle dimensioni di efficacia clinica e costo quelle di autonomia, soddisfazione, impatto sociale, impatto ambientale ed equità sociale complessiva.

La valutazione della performance dei servizi sanitari ha per oggetto tipicamente servizi erogati in ambiente (ospedaliero od ambulatoriale) specifico, controllato dall'erogatore in un punto preciso del territorio, a cui accede il cittadino. Utilizzeremo l'espressione cittadino evitando quelle di paziente, assistito od utente per sottolineare come stiamo parlando di una persona titolare di diritti e non

solo di necessità e che agisca per la tutela ed il recupero della propria salute.

Ciò deriva da un modello di separazione per cui il cittadino conduce la sua vita "normale" nelle comunità (famiglia, scuola, lavoro) e, se necessita di prestazioni di diagnosi, cura o riabilitazione, si rivolge ai servizi sanitari specifici e separati.

L'interazione del cittadino con il sistema di cura è interpretata con il concetto di "coproduzione", attivata nella relazione tra il servizio sanitario ed il cittadino, oggetto di crescente attenzione dalle discipline aziendali.

Introdurremo la "coproduzione estesa" non limitata alla collaborazione tra cittadino, famiglia ed equipe curante ma riferita alla "comunità curante" che rappresenta l'interpretazione operativa del "welfare di comunità".

In questo quadro il ricorso ai servizi ospedalieri di ricovero è da escludersi per le patologie croniche e rappresenta ipotesi residuale in cui si chiede al cittadino di "mettere in pausa" le proprie attività per dedicarsi esclusivamente alla cura della salute, non potendo provvedervi in altro modo.

All'organizzazione dei servizi sanitari pubblici è richiesto di "mettersi dalla parte dei cittadini" riducendo al massimo il proprio impatto socioeconomico su persone e famiglie attraverso la conciliazione di modelli e modalità di accesso.

L'attività delle cure primarie riguarda la popolazione su un territorio, deve adeguarsi alle caratteristiche geografiche, economiche e sociali quali densità di popolazione, condizioni dei trasporti, presenza di aree montane e periferiche, varietà di culture delle comunità e delle persone che ivi vivono e lavorano.

I professionisti trattano i cittadini secondo Piani Diagnostici Terapeutico

[1] Professoressa ordinaria, ECON-06/A, Università di Bologna; claudio.travaglini@unibo.it – corresponding author

Assistenziali (PDTA) ossia "sequenze standardizzate di prestazioni e attività sanitarie che coordinano il processo di cura per specifiche patologie, basato su evidenze scientifiche e adattato al contesto locale".

Il PDTA colloca nel tempo e suddivide le prestazioni per modalità di erogazione (ospedaliere, ambulatoriali, domiciliari) e tipologia di centro erogatore.

La traduzione del PDTA in un Piano Assistenziale Individualizzato (PAI) viene operata dal professionista di riferimento o dal "case manager" e concordata con il cittadino coproduttore che svolge un ruolo attivo (e non semplicisticamente "prescritto" ad un paziente passivo) con la famiglia ed il caregiver.

2. Profilo di Salute, Profilo di Risorse ed Ecosistema di Cura

Il mutamento dell'oggetto di riferimento (dal singolo assistito alla comunità) comporta l'adozione del Profilo di Salute, "una descrizione quantitativa e qualitativa della salute dei cittadini e dei fattori che la influenzano: identifica problemi, propone aree d'intervento e stimola l'azione»: se il profilo di salute rappresenta la diagnosi, della comunità il "progetto di salute" ne rappresenta l'ipotesi terapeutica.

Il progetto di salute è "strumento di programmazione, gestione e verifica che associa la stratificazione della popolazione alla classificazione del bisogno di salute identificando gli standard essenziali delle risposte cliniche e socioassistenziali, diagnostiche, riabilitative e di prevenzione".

Ma una comunità non è solo un insieme di bisogni: lo stesso sistema sociale presenta un sistema di risorse sanitarie e sociali, pubbliche e private, professionali e familiari, economiche e volontarie, formali ed informali, che provvedono ogni giorno ad offrire risposte ai bisogni sanitari e sociali delle persone.

Per ogni comunità (popolazione, territorio, struttura sociale) avremo un "Profilo delle Risorse" (non solo sociosanitarie) contrapposto al "Profilo di salute"

I sistemi di profili di salute e risorse, originano l'Ecosistema Globale della Cura, oggetto di analisi con cui co-produttore e case-manager devono confrontarsi.

Il rapporto di coproduzione tra cittadino e professionisti nel nostro approccio si trasforma in "coproduzione estesa" non limitata alla sola collaborazione tra singolo cittadino, famiglia ed equipe curante ma riferita alla comunità "curante".

La coproduzione estesa rappresenta l'interpretazione operativa del "welfare di comunità", un'aggregazione di risorse operante nello svolgersi della vita sociale della comunità che può esitare in una procedura formale di (co)progettazione.

Il posizionamento del cittadino sul territorio e nella comunità locale riconfigura l'ecosistema delle risorse: sviluppando l'approccio, "Citizen in Community Care" (CCC) intendendo non la cura non del "paziente" ma del "cittadino nella comunità".

L'approccio è applicabile a tutti i programmi di cura ma particolarmente adatto alla presa in carico territoriale domiciliare dei cittadini con patologie croniche per le quali le relazioni con l'ambiente sono più rilevanti e con maggiori effetti.

Disegniamo l'Ecosistema Personale della Cura attorno al cittadino: attraverso il Piano Assistenziale Individualizzato otteniamo il Piano di Salute Personale (PSP).

Parliamo di ecosistema poiché dobbiamo considerare tutti i soggetti sociali e comporli a sistema: essi non sono statici ed isolati ma interagiscono tra loro.

Il Piano di Salute Personale ricompone i percorsi di prevenzione, cura e riabilitazione, comprendendo la prevenzione secondaria e la riabilitazione che rappresentano il completamento dei segmenti in un unico Percorso.

3. Gli elementi dell'ecosistema della cura

Rappresentiamo gli elementi dell'ecosistema globale della cura con il cittadino al centro e per ogni cittadino i diversi ecosistemi personali tra loro connessi composti di elementi visti secondo prossimità, natura giuridica, livello di controllo.

Rappresentando l'ecosistema personale con al centro il cittadino, collochiamo successivamente in ordine decrescente di vicinanza logica i soggetti sul territorio:

1. la famiglia e/o i conviventi;
2. il caregiver professionale convivente o no;
3. gli amici e vicini prossimi.
4. Medici di Medicina Generale, Pediatri di Libera Scelta e Farmacie;
5. servizi sanitari pubblici territoriali (es. Case della Comunità);
6. servizi sanitari pubblici domiciliari (Assistenza Domiciliare Integrata);
7. servizi di telemedicina attivabili a domicilio del cittadino;
8. servizi di Assistenza Domiciliare (SAD) di enti locali pubblici o convenzionati;
9. Ospedali di Comunità;
10. Servizi ospedalieri.
11. Servizi sanitari territoriali privati;
12. Servizi sociosanitari di ricovero con componente di assistenza sanitaria;
13. presidi sanitari privati territoriali non convenzionati.
14. Enti locali ed altri enti pubblici rapporto con i cittadini.
15. soggetti formalizzati di terzo settore che svolgono attività sociali;
16. soggetti informali di terzo settore (gruppi spontanei).
17. altri soggetti privati (bar, negozi ed altri esercizi aperti al pubblico).

Nell'ecosistema personale gli elementi sono legati da relazioni sociali:

- affettive e familiari (il cittadino con la famiglia e gli amici);
- di coproduzione (il cittadino con il caregiver, l'ambiente ed i servizi);
- professionali (il cittadino con MMG, Infermiere, Farmacista, altri professionisti);
- organizzative (i servizi con la direzione);
- di collaborazione istituzionale (tra enti pubblici);
- economiche (il cittadino con i servizi privati);
- di condivisione sociale (il cittadino con aggregazioni non-profit);

che si incrociano e sovrappongono (il rapporto con i soggetti non-profit ha aspetti economici e quello con il Farmacista ha aspetti economici e professionali).

Una relazione sia alternativa che sovrapponibile a quelle sopra elencate è rappresentata da quella sulle reti sociali in cui cittadini interagiscono tra loro e con i professionisti per acquisire o trasmettere informazioni.

La gestione della multicanalità (in presenza, telefonica, nelle reti sociali) della comunicazione nella relazione tra professionisti ed unità organizzative non è sempre consapevole determinando l'assenza di una strategia di comunicazione.

Per interpretare le relazioni nei sistemi sociali si utilizza il concetto di "Capitale Sociale" come "l'insieme di reti di relazioni interpersonali, norme sociali e fiducia che permettono alle persone di agire collettivamente per il raggiungimento di obiettivi condivisi"; nel nostro contesto esso è il sistema di legami dell'ecosistema territoriale globale della cura che influenza processi e risultati di salute.

Nell'osservazione del capitale sociale distinguiamo:

- capitale sociale coesivo o esclusivo (bonding social capital);
- capitale sociale congiungente o inclusivo (bridging social capital);
- capitale sociale istituzionale (linking social capital).

Il capitale coesivo ed inclusivo è costituito da legami forti come il nucleo familiare o gli amici più stretti, con apporti di solida fiducia e chiusura della rete; esso provvede il supporto emotivo e pratico immediato per la vita quotidiana. Esso assicura il supporto principale ai cittadini

non autosufficienti o cronici e dipende in gran parte da composizione familiare e prossimità spaziale dei familiari.

Il capitale sociale congiungente o inclusivo è costituito da legami formali o informali deboli tra individui appartenenti a cerchie sociali diverse, caratterizzato da fiducia sottile e connessioni che colmano le lacune strutturali tra gruppi.

La dotazione di capitale congiungente è presente in varia misura nelle relazioni tra cittadini e corpi sociali intermedi (circoli, gruppi sportivi, parrocchie, comunità religiose e nazionali, organismi associativi e di volontariato, pro-loco).

Esso, collegando ambienti sociali diversi, potenzia la dotazione delle reti riguardo alla disponibilità di informazioni e facilita la fruizione dei servizi pubblici.

In assenza di forti reti familiari, se il cittadino non ha il supporto quotidiano della famiglia, la presenza di una rete collaborativa extrafamiliare (di paese, di parrocchia, di comunità in genere) permette di mantenere il cittadino nel proprio ambiente evitando ricoveri in strutture residenziali. Per supportare queste persone "isolate" in continuo aumento è necessario coltivare il capitale sociale congiungente nella relazione tra cittadini, servizi pubblici e aggregazioni sociali intermedie.

Assieme al capitale sociale congiungente il capitale istituzionale connette singoli, gruppi e strutture istituzionali (esplicitandosi in rapporti di fiducia tra cittadini e sistema pubblico inclusi Scuole, Aziende Sanitarie o Comuni).

Gli ecosistemi utilizzano il capitale sociale delle comunità per circondare di cure il cittadino, ed allo stesso tempo lo riproducono attivando relazioni di cura e collaborazione tra persone e soggetti sociali ed erogando servizi pubblici.

4. La valutazione multidimensionale del Piano di Salute Personale

Se il Piano di Salute Personale si sviluppa nella comunità la sua valutazione non si limita all'efficacia sanitaria ma deve essere considerata secondo:

a) efficacia sanitaria;
b) autonomia personale;
c) costo dell'intervento;
d) impatto socioeconomico;
e) soddisfazione percepita;
f) impatto ambientale.

La valutazione dell'efficacia sanitaria misura la modifica dello stato clinico-sanitario del cittadino basandosi su indicatori specifici riferiti alle varie patologie.

Il recupero o mantenimento del massimo livello di autonomia personale è importante specie per gli anziani, per cui l'autonomia evita il ricorso a soluzioni di ricovero peggioranti la qualità della vita e più onerose per famiglia e sistema.

Una terza dimensione di valutazione è rappresentata dal costo, raramente considerato per il trattamento complessivo di cura come il PSP.

Una quarta dimensione raramente quantificata è l'impatto socioeconomico sulla vita del cittadino con valutazioni complesse e senza una metodologia univoca.

Possiamo approcciare l'impatto identificando costi ed oneri in termini di tempi di vita e di lavoro indotti su cittadino e famiglia dalle scelte di attuazione del PSP.

La minimizzazione dell'impatto socioeconomico negativo su cittadino e famiglia è la declinazione operativa del principio secondo cui le cure primarie vanno erogate "nelle condizioni di vita" del cittadino, ossia nel suo ecosistema.

La quinta dimensione è la soddisfazione del cittadino e della sua famiglia, valutata attraverso questionari appositi, nonché la rilevazione dei risultati soggettivamente percepiti dell'esperienza del PSP tipicamente rilevati attraverso la rilevazione di PREMs e PROMs. La rilevazione

sistematica di soddisfazione e suggerimenti del cittadino permette di permettere un adattamento continuo.

La sesta dimensione di valutazione del Piano di Salute Personale è quella dell'impronta ambientale, ossia dell'effetto (tipicamente di maggiore inquinamento) determinato dalla realizzazione del piano sull'ambiente circostante

Se consideriamo non tanto il singolo PSP ma un aggregato territoriale di essi possiamo (e in un servizio sanitario pubblico e universalistico dobbiamo) valutare l'equità di accesso dei cittadini ai servizi sanitari, stimando se le diverse "popolazioni" (suddivise per territorio, provenienza, istruzione e reddito) abbiano la stessa possibilità di accesso ai servizi.

Le valutazioni sono applicabili a singoli interventi mentre la dimensione di equità sociale nell'accesso agli interventi dei servizi è applicabile al loro complesso.

5. Prime riflessioni

L'attuazione del nuovo modello di cure primarie per l'assistenza al cittadino "nel suo ambiente di vita e di lavoro" delineato dal DM 77, reso ancor più necessario dall'invecchiamento della popolazione e dalla maggiore incidenza delle cronicità richiede di riprogettare il sistema della cura ponendo al centro il cittadino.

Tale riprogettazione deve prevedere una valutazione multidimensionale degli interventi che accompagni alle valutazioni di efficacia clinica e costo degli interventi il monitoraggio di autonomia personale, impatto socioeconomico, soddisfazione dei cittadini e impronta ambientale.

Per verificare l'utilità del modello concettuale esso deve essere accompagnato dallo sviluppo degli strumenti operativi e da una prima applicazione sperimentale

Parole chiave: Cure Primarie; coproduzione; presa in carico comunitaria; valutazione multidimensionale

Le preferenze di clinici, manager ibridi e amministrativi nelle scelte di adozione dell'innovazione in sanità

Alessandra Da Ros[1], Stefano Landi[2], Claudia Bazzani[3], Chiara Leardini[4]

1. Sviluppo concettuale

L'innovazione rappresenta da tempo un tema centrale nella definizione delle politiche, nella ricerca e nel governo della pubblica amministrazione, in quanto è considerata uno strumento fondamentale per mantenere e migliorare l'erogazione dei servizi pubblici (Chen et al., 2020; Walker, 2006). In tale prospettiva, i risultati delle ricerche che evidenziano un impatto positivo dell'innovazione sulla performance del settore pubblico continuano a suscitare l'interesse dei manager e ad influenzare le direttrici della ricerca (De Vries et al., 2016; Kaul, 1997; Walker et al., 2002). Tuttavia, nell'ambito della sanità pubblica, sebbene le innovazioni tecnologiche svolgano un ruolo cruciale nel miglioramento delle cure, esse comportano un aumento dei costi e delle difficoltà di adozione, compromettendo l'accessibilità e la sostenibilità economica (Cinaroglu & Baser, 2018; Mele et al., 2014; Moreira et al., 2017). Inoltre, i responsabili delle decisioni nella pubblica amministrazione devono affrontare ostacoli specifici per l'adozione e l'implementazione delle innovazioni, tra cui incentivi, sostegno e finanziamenti inadeguati, nonché vincoli di tempo, e resistenza organizzativa (Cinar et al., 2019). La complessità del processo decisionale in ambito sanitario è spesso esacerbata dal fatto che tali decisioni devono essere adottate in scenari incerti, caratterizzati da evidenze scientifiche limitate. In tali circostanze, il ruolo del decisore assume una rilevanza centrale. Ciò è particolarmente rilevante nel contesto sanitario, dove i decisori provengono da contesti multidisciplinari e presentano un'ampia varietà di background professionali, formativi ed esperienziali che possono farli divergere nelle scelte da adottare con implicazioni pratiche nella performance aziendale (Heyden et al., 2018; Smith et al., 2019; Verhoest et al., 2024).

All'interno delle organizzazioni sanitarie pubbliche, generalmente considerate come burocrazie professionali (Mintzberg, 1980), si identificano numerosi attori che, nel contesto della gestione delle strutture, si rivelano reciprocamente indispensabili. Il Capitale Umano presente all'interno delle strutture sanitarie può pertanto essere ascritto a tre principali categorie. All'interno di tali organizzazioni, si delineano due gerarchie direzionali parallele: la prima riguarda i professionisti sanitari con competenze cliniche specialistiche, mentre la seconda riguarda la componente tecnica con funzioni gestionali e di supporto (definite da Mintzberg tecnostruttura e staff di supporto). Analizzando in modo più approfondito, il gruppo di coloro che nelle aziende sanitarie hanno competenze tecniche di supporto, questo include coloro che non svolgono un ruolo diretto nell'erogazione delle cure e non possiedono una formazione sanitaria specifica, come il personale amministrativo. Tuttavia, questi soggetti esercitano un impatto diretto sulle decisioni di adozione dell'innovazione attraverso la gestione delle risorse finanziarie e tecniche. Il secondo gruppo è costituito dai professionisti sanitari, come i medici, che operano

direttamente nell'assistenza e utilizzano personalmente le innovazioni sanitarie, beneficiando delle nuove soluzioni. In tale dicotomia, la letteratura scientifica ha nel tempo offerto crescenti opportunità di approfondimento introducendo la figura dei manager ibridi, ovvero medici deputati alla riconciliazione tra i valori e le priorità delle due funzioni menzionate in precedenza, mediante la gestione delle risorse umane, tecnologiche e finanziarie, nonché del mantenimento di responsabilità sugli aspetti clinici (Sartirana, 2019). I manager ibridi sono professionisti sanitari che, nel corso della loro carriera, acquisiscono anche competenze manageriali, ad esempio medici con incarichi di direzione di struttura o, in generale, incarichi di responsabilità organizzativa (Sarto et al., 2019). Gli ibridi sono stati considerati un modo per ridurre l'attrito tra i tradizionali valori professionali e i nuovi paradigmi organizzativi.

La letteratura suggerisce che, oltre alle proprietà tecniche delle innovazioni, anche le caratteristiche relative al background e alle caratteristiche personali dei decisori influenzano l'adozione delle tecnologie (Cinar et al., 2019; Damanpour & Schneider, 2009; Jones & Fulop, 2021). Infatti, i decisori in sanità svolgono un ruolo strategico nel processo decisionale all'interno delle loro organizzazioni grazie alla posizione autorevole che rivestono e al coinvolgimento diretto nell'allocazione delle risorse che viene a loro demandato (Daellenbach et al., 1999; Helfat & Martin, 2015). Aspetti come il capitale umano dei decisori, il loro livello di sensibilità verso l'innovazione, la singola propensione al rischio, nonché gli interessi verso l'equilibrio tra risultati a breve termine e sviluppi futuri sono tra gli aspetti che sono stati studiati in relazione all'adozione di innovazione tecnologica (Becker, 1962). In relazione a ciò, i ricercatori hanno sviluppato modelli teorici che suggeriscono come l'operato dei decisori si fondi su una gerarchia complessa di competenze. Tali competenze includono conoscenze generali, utili in vari contesti professionali, anche in settori molto distanti tra loro, competenze specifiche, trasferibili all'interno degli stessi settori, e competenze specifiche dell'azienda, radicate nella cultura unica e nella conoscenza operativa di una singola organizzazione (Castanias & Helfat, 2001). Inoltre, un'altra parte della letteratura esistente ha esaminato la distinzione tra un tipo di decisore generalista e uno specialista (Datta & Iskandar-Datta, 2014), intendendo per generalista il decisore a cui sono state trasmesse delle competenze manageriali, ad esempio, attraverso dei Master in Amministrazione Aziendale e per specialista colui che ha definito le sue competenze manageriali all'interno di percorsi di studio verticali in aree funzionali, come, ad esempio, la contabilità aziendale. Questi filoni di ricerca rientrano nell'ambito della teoria del Capitale Umano, che può offrire una lente utile attraverso la quale esplorare come le preferenze individuali derivate dal retaggio personale o professionale influenzino i risultati del processo decisionale relativo all'adozione dell'innovazione (Damanpour & Schneider, 2009; Kor & Sundaramurthy, 2009; Nasirov et al., 2021).

2. Obiettivi

Sulla base dei filoni di ricerca delineati precedentemente, è possibile formulare l'ipotesi che le diverse caratteristiche personali e professionali dei decisori, attribuibili al Capitale Umano, generino profili decisionali distinti, con impatti sulle scelte di adozione delle innovazioni nel settore sanitario. In tale contesto teorico, la ricerca si propone di esaminare l'impatto del capitale umano dei numerosi decisori operanti nel settore sanitario sulle loro preferenze in merito all'interesse verso l'adozione di un'innovazione tecnologica in fase di sviluppo. Più precisamente, lo studio si prefigge di indagare empiricamente se il diverso capitale umano dei decisori conduca a preferenze differenziate riguardo all'adozione dell'innovazione nel settore sanitario.

Al fine di esaminare il processo decisionale degli stakeholder in materia di innovazione nel settore sanitario, è stato implementato un esperimento a scelta discreta (DCE), utilizzando un caso di studio simulato che coinvolge una tecnologia medica robotica integrata di Intelligenza Artificiale in fase di sviluppo e non ancora immessa nel mercato. Il disegno in esame consente di esaminare empiricamente come molteplici categorie di decisori prioritizzano le caratteristiche di

un'innovazione sanitaria, identificandone le diverse preferenze che guidano la scelta. I risultati empirici derivanti da tale ricerca si pongono l'obiettivo di informare sia la pratica manageriale che la ricerca accademica, offrendo contributi aggiornati sulla comprensione del ruolo del Capitale Umano nelle scelte di adozione di un'innovazione sanitaria.

3. Quadro metodologico

Per rispondere alla domanda di ricerca, è stato impiegato un esperimento di scelta discreta (DCE), un metodo di preferenza dichiarata ampiamente utilizzato nel marketing e nell'economia applicata, che sta conoscendo un'espansione sempre maggiore anche nel settore sanitario (De Bekker-Grob et al., 2012; Mühlbacher & Johnson, 2016; Soekhai et al., 2019). Più di recente, l'impiego del DCE si è esteso anche al settore della gestione pubblica, dove tale strumento viene utilizzato per analizzare le preferenze degli amministratori e supportare il processo decisionale in contesti e questioni gestionali complesse (Østergaard-Nielsen, 2025; van der Voet & Lerusse, 2024; Van Puyvelde et al., 2016). Nei DCE, ai partecipanti vengono presentate una serie di scenari decisionali ipotetici che includono alternative di acquisto caratterizzate da attributi e livelli di attributi diversi, tra cui il prezzo. In ogni scenario di scelta, agli individui viene quindi richiesto di trovare un compromesso tra le opzioni di risposta a disposizione e un'alternativa di rinuncia. Questo strumento di ricerca simula il processo decisionale degli individui in contesti di acquisto reali.

3.1. Contesto di ricerca

Lo studio si inserisce in un caso di studio relativo a un'innovazione nel settore dell'urologia (Robiopsy - EIC 101112739), che mira ad integrare su un dispositivo robotico un software di intelligenza artificiale progettato per migliorare l'accuratezza della diagnosi del carcinoma prostatico. Tale problema riveste un'importanza significativa per la popolazione generale, in quanto rappresenta il secondo tumore più comune negli uomini, con un tasso di mortalità che supera le 350.000 unità annue (Culp et al., 2020). La gestione della tecnologia nel settore sanitario è soggetta ad una regolamentazione attraverso strumenti riconosciuti come l'Health Technology Assessment (HTA) (Ijzerman et al., 2017). A tale processo, nell'ambito della pratica quotidiana, contribuiscono i clinici promuovendo i benefici delle tecnologie per i pazienti che assistono nella quotidianità. Le procedure di adozione sono successivamente sponsorizzate dai manager ibridi che contribuiscono attivamente all'inoltro di tali domande agli apparati amministrativi delle aziende sanitarie.

Tali richieste vengono poi vagliate da personale non sanitario che le amministra in armonia con i vincoli gestionali dell'azienda.

Lo studio si concentra sul processo decisionale di tre categorie di capitale umano. Quello dei clinici (urologi in formazione specialistica e strutturati), dei direttori dei reparti clinici (manager ibridi), e del personale tecnico-amministrativo (ad esempio, ingegneri clinici, personale dell'amministrazione, direttori amministrativi). Come descritto nella sezione precedente, ciascuno di questi decisori rappresenta un diverso incrocio di competenze cliniche e amministrative. Sebbene all'interno delle aziende sanitarie i ruoli manageriali siano formalmente responsabili del processo decisionale, il personale clinico in prima linea li supporta e li influenza nelle loro scelte quotidiane, promuovendo le decisioni in base alle esigenze dei pazienti e alle caratteristiche tecniche. Le variabili di capitale umano sono state operazionalizzate attraverso le caratteristiche auto-dichiarate raccolte tramite un sondaggio online in un disegno cross-sectional avvenuto nel corso del 2025 e distribuito tramite associazioni scientifiche, dati disponibili online e contatti personali alle figure di interesse sopra descritte.

3.2. Il disegno di ricerca

Le preferenze dei tre gruppi di decisori dai diversi profili di capitale umano sono state valutate attraverso un DCE preregistrato sul sito web AsPredicted (De Bekker-Grob et al., 2012). Il DCE si è servito di uno scenario ipotetico, ma realistico all'interno del quale analizzare le microfondamenta delle scelte dei decisori operanti nella pubblica amministrazione. Ai partecipanti, dopo essere stati esposti a un cheap talk come approccio ex ante per mitigare possibili bias ipotetici che potrebbero influenzare gli studi sulle preferenze dichiarate, è stato richiesto di prendere una decisione riguardo a una scelta di acquisto di una tecnologia medica (Asioli et al., 2022).

Il DCE è stato preceduto da una revisione della letteratura che ha rivelato le caratteristiche principali da attenzionare per introdurre un'innovazione sanitaria (Smith et al., 2019). Queste sono state operazionalizzate in dimensioni concrete e rilevanti per il processo decisionale nel caso adottato: accuratezza tecnologica e supporto alla terapia (nell'ambito della valutazione della conformità); curva di apprendimento e compatibilità utente-sistema (nell'ambito della risoluzione dei problemi basata sulle esigenze); riduzione dei prezzi e della durata delle procedure (nell'ambito della valutazione economica) (Tabella 1). La selezione di tali attributi è stata perfezionata mediante consultazioni ed interviste semi-strutturate con esperti del settore, al fine di garantirne la rilevanza pratica e l'allineamento con il processo decisionale relativo all'acquisto di innovazioni nel settore sanitario. Infine, nel 2025, il sondaggio che includeva il DCE è stato distribuito tramite e-mail ad un campione di convenienza, utilizzando la piattaforma Qualtrics.

Nel disegno di ricerca sono state incluse 24 coppie di scelta, suddivise in tre blocchi. A ciascun rispondente veniva assegnato in modo casuale uno dei blocchi, composto da otto scenari decisionali. Ogni scenario presentava due alternative di dispositivi tecnologici da acquistare (alternativa A e alternativa B), ciascuna delle quali differiva per sei attributi (di cui quattro con due livelli e due con quattro livelli), oltre a una terza opzione di "opt-out" (Ryan et al., 2012).

Attributi	**Livelli**
Accuratezza tecnologica	Il robot compensa i movimenti del paziente
	Il robot non compensa i movimenti del paziente
Informazioni sulla curva di apprendimento	Entro 30 casi
	Assenza di informazioni
Durata della procedura	Status quo
	5' in meno dell'attuale durata media
	10' in meno dell'attuale durata media
	15' in meno dell'attuale durata media
Compatibilità con altri sistemi	Compatibile con altri sistemi di ultrasuoni già disponibili presso l'azienda sanitaria
	Incompatibile con altri sistemi di ultrasuoni già disponibili presso l'azienda sanitaria

Supporto per la terapia	Compatibile con la terapia focale
	Incompatibile con la terapia focale
Prezzo	80.000 €
	120.000 €
	160.000 €
	200.000 €

Tabella 1. Attributi e livelli delle caratteristiche dell'innovazione inseriti nel DCE

Incorporando un attributo relativo al prezzo del dispositivo sanitario nel DCE, l'impostazione sperimentale consente di stimare la disponibilità a pagare (WTP) dei decisori per ogni specifico attributo dell'innovazione studiato. Il DCE finale è stato modellato mediante un approccio bayesiano basato su un precedente disegno sperimentale fattoriale frazionario ortogonale eseguito in uno studio pilota su un campione di 44 intervistati. I risultati dello studio pilota sono stati analizzati mediante un modello logit multinomiale (MNL), le cui stime sono state impiegate per generare un disegno bayesiano finale (Bliemer & Collins, 2016). Entrambi i disegni hanno condotto alla generazione di 24 set di scelta mediante l'impiego del software Ngene 1.2.

3.3. Analisi dei dati

Le risposte raccolte al DCE, che è ancora in corso, sono state pre-analizzate utilizzando modelli di scelta discreta coerenti con la teoria dell'utilità casuale (McFadden, 1974) e con la teoria economica del comportamento dei consumatori di Lancaster (Lancaster, 1966). Secondo la teoria dell'utilità casuale, gli individui prendono decisioni per massimizzare la loro utilità in base a vincoli reali (come i limiti di budget) e le scelte possono essere modellate confrontando una componente casuale nella funzione di utilità e analizzando la probabilità di scelta tra le alternative. La teoria di Lancaster, d'altra parte, postula che l'utilità totale di un bene possa essere suddivisa in utilità parziali derivanti dai diversi attributi del bene stesso. Per quanto detto, il modello secondo la teoria dell'utilità casuale prevede che l'individuo n scelga l'alternativa j ottenendo che l'utilità sia:

$$U_{njt} = \beta_n' x_{njt} + \varepsilon_{njt} \quad (1)$$

dove x_{njt} è un vettore delle variabili osservate relative all'alternativa j e all'individuo n, β_n' è un vettore dei parametri strutturali di preferenza che caratterizzano le scelte, e ε_{njt} è il termine di errore non osservato, che si presume indipendente da β e x. In base alla teoria di Lancaster, la presente analisi si basa sull'ipotesi che l'utilità (U) che l'individuo n ricava scegliendo l'alternativa j della tecnologia robotica nel compito di scelta t possa essere specificata come segue:

$$U_{njt} = NOBUY + \beta_1 PRICE_{njt} + \beta_2 ACCURACY_{njt} + \beta_3 DURATION_{njt} + \beta_4 COMPATIBILITY_{njt} + \beta_5 LC_{njt} + \beta_6 THERAPY_{njt} + \varepsilon_{njt} \quad (2)$$

In tale contesto, i coefficienti $\beta_1 - \beta_6$ rappresentano l'utilità marginale associata a ciascun attributo, catturando la direzione e la forza delle preferenze dei rispondenti al modello del DCE. Nell'equazione (2), $NOBUY$ rappresenta la costante specifica dell'alternativa (ASC), assumendo

il valore 1 per l'alternativa "nessun acquisto" e 0 altrimenti. $PRICE$ rappresenta una variabile continua costituita da quattro livelli di prezzo (80.000 €, 120.000 €, 160.000 € e 200.000 €), mentre $DURATION$, ovvero la riduzione della durata della procedura, è una variabile discreta che incorpora quattro livelli sperimentali (lo status quo, 5', 10' e 15' in meno rispetto alla durata media attuale). Variabili non legate al prezzo, quali l'accuratezza della tecnologia ($ACCURACY$), la compatibilità con più dispositivi a ultrasuoni ($COMPARABILITY$) e il supporto alla terapia ($THERAPY$), sono variabili codificate mediante variabili dicotomiche. Tali variabili assumono il valore 1 in caso di compatibilità con la caratteristica, mentre assumono il valore 0 in caso di incompatibilità. Similmente, le informazioni relative alla curva di apprendimento (LC) sono codificate mediante variabili binarie, assumendo il valore 1 in presenza di informazioni disponibili (entro 30 casi) e 0 in assenza di informazioni sull'attributo. Il termine εnjt rappresenta il valore casuale non osservato, la cui distribuzione segue una curva di tipo I, con i valori estremi distribuiti sulle alternative. Infine, le differenze nel processo decisionale e nelle soglie di disponibilità a pagare relative alla scelta di acquisto globale per l'innovazione tra diversi profili di capitale umano sono stimate utilizzando un modello di regressione lineare basato sulle variabili del capitale umano.

4. Risultati preliminari

Il DCE completo è attualmente in corso; tuttavia, i risultati preliminari dello studio pilota evidenziano differenze nelle preferenze relative all'adozione dell'innovazione in base al capitale umano degli intervistati. I rispondenti al sondaggio sono principalmente uomini con un'età media di 45 anni. La maggioranza dei soggetti esaminati, cioè il 39%, appartiene alla categoria dei clinici, mentre il 38% è composto da amministrativi e il 23% da manager ibridi. La Tabella 2 illustra le caratteristiche del capitale umano selezionato nel campione di rispondenti esaminati.

Sample characteristics (N=87)			**Missing values (n)**
Age (years), mean (SD)		44.74 (13.07)	3
Gender, n (%)	*Female*	24 (28.24)	2
	Male	61 (71.76)	
Subgroups, n (%)	*Specialist*	34 (39.08)	
	Hybrid	20 (22.99)	
	Generalist	33 (37.93)	
Tenure in the current sector (years), mean (SD)		16.14 (12.10)	
Tenure in the current organization (years), mean (SD)		9.85 (9.93)	
Tenure in the current role (years), mean (SD)		6.57 (6.66)	

Organization size, n (%)	*No beds*	8 (9.20)
	Small	7 (8.05)
	Medium	30 (34.48)
	Large	42 (48.28)
Managerial education, n (%)	*Yes*	23 (26.44)
	No	63 (73.56)
Academic publication in the last three years, n (%)	*Yes*	51 (58.62)
	No	36 (41.38)
PhD	*Yes*	10 (11.49)
	No	77 (88.51)

Tabella 2. Caratteristiche demografiche e di background dei rispondenti alla survey

La Tabella 3 illustra i risultati preliminari del modello mixed logit. Tutti gli attributi inclusi nel disegno di studio sono risultati statisticamente significativi. Si nota che l'effetto più forte è quello legato all'accuratezza diagnostica (1.395, p< 0.01), seguito dalla compatibilità con altri dispositivi (1.336, p< 0.01) e dalla riduzione del tempo della procedura di 10' (1.037, p< 0.01). La riduzione del prezzo ha un effetto negativo (-0.0126, p< 0.01). Questo indica che, all'aumentare del prezzo del dispositivo, la disponibilità all'acquisto diminuisce. La significatività statistica della deviazione standard in molti degli attributi indica la presenza di variabilità interna agli attributi stessi rispetto alle preferenze dei rispondenti.

	Mean	**Choice**	**SD**

*Tabella 3. Risultati del modello mixed logit. Standard errors tra parentesi. * p< 0.10, ** p< 0.05, *** p< 0.01*

La Tabella 4 riporta i tre modelli utilizzati nell'analisi preliminare sulla disponibilità ad acquistare globale (valori espressi per 100 €). Il modello 3 con le interazioni evidenzia che gli amministrativi tendono ad avere valori di disponibilità a comparare più alti rispetto ai clinici, ma che all'aumentare dell'esperienza nel ruolo ricoperto, tale disponibilità all'acquisto diminuisce in modo significativo.

5. Conclusioni potenziali

Nonostante i risultati finali non siano ancora disponibili, in quanto la raccolta dati è ancora in corso, le prime indicazioni contribuiscono alla letteratura in ambito aziendale, evidenziando come i diversi profili di capitale umano dei decisori presenti nel settore sanitario influenzino il processo decisionale che conduce alle scelte di adozione dell'innovazione (Huang & Villadsen, 2023). L'assistenza sanitaria, infatti, è costituita da aggregazioni professionali che storicamente hanno sempre goduto di un processo decisionale autonomo (Denis et al., 2022), e che sono arricchite da un capitale umano diversificato e altamente specializzato, derivante da molteplici conoscenze, ruoli e una vasta esperienza professionale. Tuttavia, l'emergere rapido di tecnologie in continua evoluzione sta erodendo questa centralità (Susskind & Susskind, 2022), rendendo necessario un confronto tra i decisori con diversi capitali umani presenti nelle aziende sanitarie per affrontare ciò che alcuni percepiscono come una crescente "minaccia tecnologica" (Kirkpatrick et al., 2023; Muzio et al., 2019).

Nel contesto sanitario, questo DCE rappresenta uno dei primi tentativi empirici di esplorare le preferenze verso l'adozione di innovazione esaminando il ruolo del capitale umano dei decisori all'interno della pubblica amministrazione. I risultati consolidati forniranno informazioni utili sia per le politiche che per la pratica manageriale all'interno delle aziende sanitarie, in particolare nel settore della governance dell'innovazione tecnologica.

Beyond Adoption: Artificial Intelligence and Organizational Transformation. An Empirical Study

Alba Miranda[1], Annunziata Tarulli[2], Raffaele Silvestri[3], Domenico Morrone[4]

1. Contextual background

Healthcare systems worldwide are currently strained by complex phenomena such as population growth, the spread of serious diseases like cancer or chronic illnesses, and a significant shortage of healthcare personnel (Ho et al., 2023).

These issues emerged with greater disruptiveness during the Covid-19 pandemic, making the healthcare landscape more fragile and vulnerable. In fact, during this period, medical staff, who were already previously burdened by excessive workloads, showed difficulty in managing the unexpected demand for assistance required by the emergency (Dicuonzo et al., 2023).
In a scenario like this, the implementation of Artificial Intelligence (AI) represents the strategic choice to focus on, as it offers the possibility of enhancing the value creation process for the healthcare system.

This perspective is evidenced by the countless advances being achieved in the medical and clinical fields following its use, which have been suitably mapped by scientific literature.

Consider the field of medical imaging, where the evolution and refinement of deep neural networks have made new instrumentation capable of detecting lesions that human observation alone would not be able to identify with the same precision (Davenport & Kalakota, 2019). Furthermore, consider the revolutionary possibility of performing remote surgery and providing specialist consultation and continuous clinical monitoring of patients through the innovative services offered by telemedicine (Cannavacciuolo et al., 2023).
Finally, a further example of success is given by Watson, the tool implemented by IBM, which succeeded in identifying the exact number of RNA-binding proteins involved in amyotrophic lateral sclerosis (Bakkar et al., 2017).

All these technological advancements translate, in most cases, into a clear and tangible improvement in diagnostic processes (Bhagat & Kanyal, 2024; Ali et al., 2023) and a superior therapeutic quality provided to patients (Mohammed et al., 2022).

From all this, it is unequivocally clear how the integration of Artificial Intelligence in healthcare is realizing what Leroy Hood (2013) defined as "4P Medicine": Predictive, Preventive, Personalized, and Participatory. Therefore, a change in perspective is urgent and can no longer be postponed: Artificial Intelligence should no longer be considered an optional technology; rather, it must be seen as an indispensable technology (Chung, 2025) for the progress and well-being of the entire community and for the sustainability of healthcare systems.

2. Problem and research gap

[1] Ph.D. Candidate, ECON-07/A, University of Foggia; alba.miranda@unifg.it – corresponding author

[2] Research Fellow, ECON-07/A, LUM University; tarulli@lum.it

[3]Assistant Professor, ECON-07/A, University of Foggia; raffaele.silvestri@unifg.it

[4] Full Professor, ECON-07/A, LUM University; morrone@lum.it

However, it is essential and crucial to recognize that the disruptive digital innovation brings with it an inevitable series of new responsibilities and the urgent need to reflect on the resulting obligations. In fact, the need arises for all modern healthcare systems to establish and develop organizational structures capable of best administering and managing the new technology (Sun & Medaglia, 2019). In parallel, an update of the skill set required for healthcare professionals who are interacting daily with Artificial Intelligence becomes necessary. This update is considered of vital importance in order to promote collaborative intelligence, based on the synergistic interaction between humans and AI systems (Bhatt & Bae, 2023).

This complex transformation should have the ultimate goal of creating a new and efficient healthcare business model (Kraus et al., 2021), where two main elements are fundamental: collaboration among the various actors in the healthcare system and the absolute centrality of the patient in every care process (Schiavone et al., 2022). Through the rigorous implementation of this new model, operational efficiency can truly be achieved, which presupposes an extremely effective management of time, available personnel, and economic and material resources (Sharabati et al., 2024).

Furthermore, in a context characterized by uncertainty and rapid changes, dynamic capabilities are of vital importance, meaning all the intrinsic competencies of any enterprise to combine, develop, and adapt every skill useful for successfully facing challenges imposed by rapidly changing environments (Teece et al., 1997). The final goal is for these capabilities to support and guide a genuine cultural and operational evolution of the entire healthcare sector (Bohr & Memarzadeh, 2020). The World Health Organization (2021) has acknowledged and affirmed that if the global healthcare system is adequately supported by all these elements, it has the revolutionary potential to change medical outcomes.

However, it must be recognized that a complete implementation and effective integration of Artificial Intelligence within the complex healthcare landscape is by no means a simple process: there is an urgent need to know how to manage it proactively (Kim et al., 2025). Ultimately, in order to maximize operational and clinical benefits while minimizing potential risks, a profound modification of the existing organizational culture is required.

This includes the acquisition of new and specific professional competencies by healthcare personnel and the readjustment and reconfiguration of internal operational processes (Petersson et al., 2022; Topol, 2019).

Studies conducted by Sendak et al. (2020) and Morales et al. (2021) highlight how professionals involved in digital innovation widely lament the lack of clear and standardized guidelines that could accompany and facilitate the difficult process of integrating Artificial Intelligence into their clinical routines.

This lack exposes the new AI technology to a dual and significant risk: on the one hand, the absence of key directives could seriously compromise the effectiveness and safety of operational processes; on the other hand, in the worst-case scenario, its incorrect implementation could invalidate patients' clinical outcomes.

Although studies on this topic in the literature are numerous and continuously growing, notable gaps and areas of uncertainty persist. There is a recognized urgent and strategic need to deeply investigate how healthcare organizations are managing the structural changes introduced into their operational processes by the new technology (Kulkov et al., 2024). At the same time, it is not yet entirely clear whether Artificial Intelligence truly succeeds, specifically, in improving diagnostic quality and reducing staff workload. More generally, it is not entirely certain whether AI can bring real benefits in terms of efficiency (Wenderott et al., 2024). Furthermore, many studies conducted to date tend to examine the phenomenon of new technology adoption almost exclusively in its initial stages. However, these studies often end up neglecting the phases after its implementation (Roppelt et al., 2024).

This omission creates a critical gap that must be absolutely filled to understand the lifecycle of Artificial Intelligence once it is integrated into operational processes.

3. Aim and research question

Given all these contextual premises and the identified scientific gaps, the primary objective of the following empirical study is to deeply investigate how healthcare organizations are managing the complex changes induced by the implementation and integration of Artificial Intelligence into their operational processes. In this regard, particular attention will be paid to analyzing the phases following its adoption.
From these premises, the following research question arises:

RQ: How are healthcare facilities concretely tackling the organizational changes imposed by the implementation of Artificial Intelligence?

4. Methodology

The exploratory nature of the research question requires the adoption of a qualitative approach, based on the Multiple Case Study methodology (Eisenhardt, 1989), which is considered fundamental for effectively and systematically comparing multiple organizational structures that differ from each other. The choice of this approach is further supported by the recognized need to investigate and understand the complexity of all those contexts that are characterized by countless and rapid changes, which, in turn, generate further challenges (Halineen & Tornroos, 2005). Healthcare organizations currently implementing and integrating Artificial Intelligence into their operational processes fall perfectly into this category of high-dynamism contexts.
For the identification of the facilities, purposive sampling (Patton, 2002) was used. This technique allowed for the selection of healthcare facilities that could offer useful and significant information for the purposes of the proposed research question. In this way, the intrinsic nature of the phenomenon under investigation could be best explored, maximizing the relevance of the data collected.

The Purposive Sampling followed a precise methodological protocol. Initially, a detailed and complete analysis of the entire national territory was conducted, leading to the identification of all healthcare organizations that had already implemented, integrated, and made AI technology operational in their routines. Subsequently, the sampling strategy aimed to explore hospital realities belonging to different medical fields and, consequently, clinical specialties. This diversification was essential as it allowed for the acquisition of information and insights related to diverse experiences. Through this sampling process, a total of ten hospital organizations distributed across the national territory were selected. The primary data necessary for the study were collected through the administration of in-depth interviews. This methodological choice was dictated by the need to better understand the relational and operational dynamics, often implicit, present in real clinical settings. The in-depth interviews also had the merit of capturing the expectations, concerns, and subjective perceptions of the interviewees regarding Artificial Intelligence. The set of questions presented to the participants, previously validated in the literature, was specially created to be adapted to a flexible protocol. In this way, flexibility allowed the same set of questions to be administered to all interviewees, even though they belonged to different medical fields. The interviews were primarily conducted remotely, utilizing the Google Meet platform. Only one interview was conducted in person. In both cases, however, the temporal duration of each interview was consistently estimated to be between 40 and 60 minutes.

To establish a solid and coherent relationship between the research subject, the chosen methods, and the reference theory, an abductive methodology was applied, based on the systematic combination of empirical data (Dubois & Gadde, 2002).
All data collected from the in-depth interviews were subsequently codified and made analyzable through their manual and faithful transcription. Finally, the systematic analysis of the data

followed two main phases. The first focused on the internal and in-depth analysis of the case and allowed for detailed coding.
The second phase focused on the cross-case analysis and is what allowed for the detection of analogies and differences among the diverse experiences (Lindgreen et al., 2021) of Artificial Intelligence implementation.

5. Expected Results

The proposed empirical study aims to fill the critical gap identified in the literature, which recognizes a lack of analysis regarding the post-implementation phase of Artificial Intelligence within healthcare contexts. It is hoped that the results obtained will offer the possibility to concretely examine how healthcare organizations, involved in the disruptive digital innovation, are effectively changing and evolving. For this reason, the results aim to analyze how they are reconfiguring their internal processes so that the new technology can be adopted in an effective, safe, responsible, and sustainable way in healthcare. Furthermore, significant contributions to literature are expected, particularly concerning the human-machine relationship and collaboration. By investigating how healthcare professionals interact daily with AI systems and machines in real clinical contexts, the Multiple Case Study will allow for a deeper understanding of how different types of intelligence, human and artificial, can actively collaborate, creating a unique and innovative synergy with the potential to give rise to new and efficient organizational models.

In this way, it will be possible to explore how human professional intelligence is evolving alongside technological innovations, contributing to an evolution of human capital in the healthcare sector.
It is also hoped to identify a set of best practices that have proven effective in maximizing operational efficiency when Artificial Intelligence has been integrated into clinical routines.

Finally, the study seeks to offer valuable insights to policymakers that can help them draft useful guidelines to be provided to clinicians, accompanying and guiding the integration of the new technology into the healthcare landscape, thereby closing the gap identified by Sendak et al. (2020) and Morales et al. (2021).

6. Limitations and Future Research

Although this study represents an empirical analysis conducted in real clinical contexts, it recognizes important limitations that open new research perspectives.
Firstly, the results are recognized to have poor generalizability as they are limited to the Italian territory. In this regard, further comparative studies could be conducted in other contexts to compare the results obtained.

A further limitation concerns the profession of the interviewees: the in-depth interviews were administered only to physicians. Other professional figures involved in the transformative process induced by Artificial Intelligence, such as nurses, managers, and various stakeholders, were not examined. Future research could integrate the perceptions and perspectives of these figures, thereby contributing to an even more detailed exploration of the multidimensional complexity of the phenomenon under examination. To gain a more complete understanding of the phenomenon, integrating the patients' opinion could be considered. Finally, the proposed analysis represents the foundation for proposing longitudinal studies that track the evolution of organizational changes proving effective in managing the shifts introduced by Artificial Intelligence.

Benessere e Accountability: Determinanti della Disclosure sull'SDG 3 nei PIAO Ospedalieri

Vincenzo Pontrelli[1], Lara Oliva[2], Angelo Rosa[3], Arcangelo Marrone[4]

1. Background

Negli ultimi anni, il concetto di sviluppo sostenibile ha assunto un ruolo centrale nel dibattito scientifico, economico e istituzionale, affermandosi come paradigma imprescindibile per la trasformazione dei modelli di governance e dei sistemi produttivi a livello globale (Marrone *et al.*, 2024b). In tale prospettiva, la crescente pressione esercitata dalle sfide ambientali, dall'ampliamento delle disuguaglianze sociali, dalle ricorrenti crisi sanitarie e dai segnali di insostenibilità economica ha rafforzato la domanda di istituti capaci di generare valore pubblico, promuovere resilienza sistemica e favorire modelli inclusivi ed equi (Zampone *et al.*, 2024). Tali istituzioni, attraverso la propria capacità regolativa, allocativa e di coordinamento, risultano determinanti nel contribuire al beneficio comune dell'intero sistema Paese, orientando le politiche e gli interventi verso traiettorie di sviluppo coerenti con gli obiettivi della sostenibilità (Esposito et al., 2024; Marrone et al., 2024b).

In risposta a tali istanze, l'Agenda 2030 delle Nazioni Unite, adottata nel 2015, ha delineato 17 Obiettivi di Sviluppo Sostenibile (Sustainable Development Goals, SDGs) e 169 target, configurandosi come un framework condiviso volto a orientare le politiche pubbliche e private verso uno sviluppo sostenibile ed equilibrato e rappresentando, al contempo, un rilevante punto di svolta nell'ecosistema globale (Ricciardelli *et al.*, 2018; Mukhi & Quental, 2019; Pizzi *et al.*, 2020; Zampone *et al.*, 2024).

Tuttavia, il conseguimento degli SDGs richiede il coinvolgimento sinergico di una pluralità di attori, tra cui imprese, enti pubblici e organizzazioni non governative, il cui contributo risulta imprescindibile per l'attuazione dell'Agenda (Bebbington & Unerman, 2018). Sebbene le imprese private, in particolare, siano state riconosciute per la loro capacità di generare innovazione, mobilitare risorse e produrre impatti su larga scala (Zampone et al., 2024; Pontrelli et al., 2025), si sta progressivamente affermando il paradigma secondo cui il settore pubblico riveste un ruolo altrettanto strategico, soprattutto in ambiti ad elevata rilevanza sociale quali la sanità, l'istruzione e la sicurezza pubblica (Erin et al., 2024). In tali contesti, la capacità delle amministrazioni pubbliche di rendicontare in modo trasparente e sistemico i propri impatti sociali, ambientali ed economici risulta determinante per l'efficacia dell'azione pubblica (Monfardini et al., 2013; Fusco & Ricci, 2019).

Nel contesto italiano, il Servizio Sanitario Nazionale (SSN) rappresenta l'infrastruttura centrale per l'attuazione dell'SDG3"Assicurare la salute e il benessere per tutti e per tutte le età", assicurando servizi universalistici, gratuiti e orientati all'equità (Pizzi et al., 2020). Con un finanziamento annuo di circa 140 miliardi di euro, pari al 75 % della spesa pubblica destinata ai servizi essenziali (Commissione Europea, 2016; ISTAT, 2017), il SSN si configura come un

[1] Assegnista di ricerca, ECON-06/A, Università Gabriele d'Annunzio, Chieti-Pescara; vincenzo.pontrelli@unich.it – corresponding author

[4] Professore ordinario, ECON-06/A, Università LUM Giuseppe Degennaro; marrone@lum.it

pilastro imprescindibile del sistema di welfare nazionale; i suoi risultati, tra cui la riduzione della mortalità, degli incidenti e dei parti cesarei, hanno contribuito al parziale raggiungimento dei target dell'SDG3 (ASviS, 2018).

Nonostante ciò, permangono criticità strutturali di rilievo: disuguaglianze geografiche e sociali nell'accesso alle prestazioni, lunghe liste d'attesa, disparità nella spesa pro capite e livelli di trasparenza ancora inadeguati (Berta et al., 2016). Tale contesto solleva, inoltre, la questione del ruolo delle aziende sanitarie pubbliche, chiamate a operare in scenari istituzionali complessi e a perseguire una missione orientata alla creazione di valore pubblico, promuovendo salute collettiva e inclusione sociale in un'ottica di beneficio comune (Habersam & Piber, 2003; Carlucci & Schiuma, 2012; Mazzotta, 2018; Nicolò et al., 2023). In questo quadro, l'integrazione tra performance sanitaria e misurazione dell'impatto emerge come un fattore abilitante per rafforzare il contributo del settore allo sviluppo sostenibile e, dunque, alla promozione del bene comune, generando fiducia e legittimità attraverso pratiche di disclosure evidence-based (Gravili et al., 2021; Raimo et al., 2023). Tuttavia, il livello di accountability di tali istituti, resta insufficiente: molte aziende adottano modelli di rendicontazione formali, disomogenei e sostanzialmente superficiali (Pizzi et al., 2020; Garzoni et al., 2023; Marrone et al., 2024a), limitando l'interazione ai soli stakeholder interni e determinando un marcato deficit di trasparenza verso la cittadinanza (Farneti & Guthrie, 2009).

In risposta a tali criticità, la Legge n. 113/2021 ha introdotto il Piano Integrato di Attività e Organizzazione (PIAO), concepito come strumento di pianificazione e controllo volto a razionalizzare e integrare gli assetti gestionali delle pubbliche amministrazioni. In tale ottica, il PIAO si propone esplicitamente di favorire una governance trasparente, partecipativa e orientata agli stakeholder, richiamando in modo chiaro i riferimenti strategici dell'Agenda 2030 (De Nicola & Fratini, 2024). Oltre a costituire un meccanismo di razionalizzazione amministrativa, il PIAO può essere interpretato come una vera e propria innovazione di governance, nella misura in cui accorpa in un unico documento funzioni di pianificazione strategica, misurazione della performance e rendicontazione, superando la frammentazione che ha tradizionalmente caratterizzato gli strumenti di programmazione del settore pubblico. In confronto a dispositivi quali i piani della performance o i report sociali, esso si distingue infatti per la capacità di incorporare obiettivi di sostenibilità e accountability all'interno di una logica sistemica e trasversale, rafforzando il coordinamento tra strategia, organizzazione e disclosure. Nel contesto sanitario, tale impostazione assume una rilevanza particolarmente significativa, poiché il PIAO offre l'opportunità di formalizzare in modo sistematico gli impatti organizzativi e sociali delle aziende sanitarie pubbliche, contribuendo a migliorare la rendicontazione del loro apporto al conseguimento dell'SDG 3. In questo senso, l'adozione di indicatori dedicati(e.g. la qualità dei servizi erogati, i livelli di innovazione digitale, il grado di soddisfazione dell'utenza e la sostenibilità economico-finanziaria degli interventi) non solo rafforza l'allineamento con gli Obiettivi di Sviluppo Sostenibile, ma consente anche di colmare le lacune di trasparenza e accountability finora riscontrate, promuovendo un dialogo più strutturato e significativo con l'insieme degli stakeholder. In tale prospettiva, il PIAO non si limita a soddisfare obblighi formali di pianificazione, ma assume il ruolo di vera e propria infrastruttura informativa a supporto dei processi di accountability pubblica, contribuendo alla costruzione di legittimità istituzionale e al consolidamento di relazioni di fiducia con gli stakeholder.

Nonostante la crescente centralità attribuita alla sostenibilità e al ruolo strategico, in particolare nel contesto italiano, degli ospedali nel conseguimento degli SDG dell'Agenda 2030, la riflessione accademica sulle aziende sanitarie pubbliche resta parzialmente esplorata (Bebbington & Unerman, 2018; Buhmann *et al.*, 2019; Pineda Escobar, 2019), con scarsa attenzione alla disclosure di sostenibilità in ambito ospedaliero e un'assenza quasi totale di indagini dedicate al PIAO.

Tra i contributi esistenti, Monfardini *et al.* (2013) evidenziano in un caso di studio italiano l'uso simbolico del bilancio sociale, finalizzato più alla legittimazione che all'informazione sui

risultati; Marasca *et al.* (2020) sottolineano, nello studio sul bilancio integrato di alcune strutture, l'attenzione al valore per il paziente ma anche l'insufficiente capacità di soddisfare i bisogni informativi della cittadinanza. Bonollo (2015) rileva che i bilanci sociali ospedalieri tendono a enfatizzare quantità e tipologia dei servizi erogati, trascurando l'engagement degli stakeholder e la coerenza tra obiettivi e performance, mentre Pizzi *et al.* (2020) ne denunciano la scarsa diffusione e l'assenza di standardizzazione.

Estendendo lo sguardo all'estero, Andrades Peña *et al.* (2020) attribuiscono la variabilità nella quantità di informazioni di sostenibilità a fattori interni (dimensione organizzativa) ed esterni (accesso a Internet, ideologia politica locale, posizionamento nei ranking di trasparenza); Andrades *et al.* (2021) identificano nella ricerca di legittimazione la motivazione principale per la comunicazione online delle iniziative sostenibili. Infine, Garzoni *et al.* (2023) mettono in luce, in un campione di ospedali mondiali, come dimensione, natura pubblica e status universitario favoriscano livelli più elevati di disclosure, nonostante la carenza di pressioni regolatorie.

Nel complesso, la letteratura restituisce un quadro eterogeneo e ancora poco maturo: la disclosure di sostenibilità nel settore ospedaliero è caratterizzata da una debole cultura manageriale, dall'assenza di standard condivisi e da un approccio volontario e simbolico. Nonostante il potenziale contributo degli ospedali al raggiungimento dell'SDG3, nessuno studio ha finora esaminato in modo sistematico i contenuti dei PIAO nel contesto sanitario italiano né indagato le determinanti della disclosure riferita all'SDG3. Tale vuoto rappresenta un'importante lacuna di conoscenza, soprattutto in un'epoca in cui la sanità pubblica è chiamata a misurare e rendicontare in modo continuo il proprio impatto.

Alla luce di questo gap, il presente studio si propone di analizzare la disclosure di sostenibilità relativa all'SDG3 all'interno dei PIAO nel contesto ospedaliero, con due obiettivi principali: valutare se e in che misura gli ospedali rendicontano il loro contributo alla promozione della salute e del benessere collettivo, e identificare le determinanti che ne influenzano la comunicazione.

A supporto dell'analisi si adotta la stakeholder theory (Freeman, 1984), un approccio teorico ampiamente consolidato che interpreta l'organizzazione come un sistema aperto e relazionale, in cui il successo e la sopravvivenza dipendono dalla capacità di rispondere alle esigenze e alle aspettative di molteplici portatori di interesse. Secondo Donaldson e Preston (1995), tale prospettiva possiede una triplice valenza descrittiva in quanto riflette la complessità delle relazioni organizzative, normativa poiché riconosce il valore intrinseco di tutti gli stakeholder, e strumentale in quanto legittima l'adozione di pratiche di gestione e comunicazione orientate all'inclusione e alla fiducia. Nel contesto ospedaliero, tale impostazione risulta particolarmente adeguata per almeno tre motivi. In primo luogo, gli ospedali operano in ambienti ad alta intensità relazionale, in cui si intrecciano aspettative e pressioni provenienti da pazienti, famiglie, comunità locali, enti regolatori, professionisti e cittadini. In secondo luogo, la disclosure di sostenibilità, specialmente quando volontaria e priva di standard vincolanti, assume la forma di un meccanismo di legittimazione sociale, attraverso il quale l'organizzazione comunica la propria adesione a valori pubblici condivisi come l'equità, la trasparenza e il benessere collettivo. In terzo luogo, le pressioni istituzionali, reputazionali e relazionali possono condizionare in modo significativo la quantità e la qualità delle informazioni divulgate, richiedendo un quadro interpretativo capace di integrare dinamiche ambientali e scelte gestionali.

In questo scenario, la stakeholder theory consente di leggere la disclosure di sostenibilità non solo come strumento informativo, ma come pratica sociale e simbolica, in cui gli ospedali si posizionano rispetto agli stakeholder, costruendo relazioni di fiducia e rafforzando la propria identità istituzionale. L'integrazione dell'SDG3 all'interno dei PIAO si configura dunque come un atto di accountability orientato al valore pubblico, che supera la logica dell'adempimento formale per abbracciare un approccio partecipativo, relazionale e orientato al lungo termine.

L'adozione della stakeholder theory permette infine di interpretare le pratiche di disclosure nei PIAO alla luce di una pluralità di determinanti, offrendo un framework coerente per

comprendere le ragioni che spingono gli ospedali a comunicare, in modo più o meno esteso, il proprio contributo alla sostenibilità e al benessere collettivo.

Sulla base di tale impostazione teorica, vengono formulate quattro ipotesi di ricerca che riflettono variabili organizzative ritenute influenti nella letteratura sulla disclosure volontaria. In particolare, si assume che dimensioni quali la dimensione, la collocazione geografica, la complessità organizzativa e la seniority dell'organizzazione possano condizionare l'estensione e la qualità della disclosure, anche nel settore sanitario. Nel dettaglio:

H1: La grandezza dell'ospedale impatta positivamente sulla disclosure relativa all'SDG3 all'interno dei PIAO ospedalieri.

H2: La collocazione territoriale dell'ospedale influisce positivamente sulla disclosure relativa all'SDG3 all'interno dei PIAO ospedalieri.

H3: La complessità organizzativa dell'ospedale ha un impatto positivo sulla disclosure relativa all'SDG3 all'interno dei PIAO ospedalieri.

H4: La seniority dell'ospedale ha un impatto negativo sulla disclosure relativa all'SDG3 all'interno dei PIAO ospedalieri.

2. Metodologia

Per testare le quattro ipotesi appena delineate, lo studio adotta un modello di regressione lineare di tipo cross-sectional, finalizzato a esplorare le determinanti della disclosure di sostenibilità relativa all'SDG3 nei PIAO nel contesto ospedaliero italiano. Tutti i dati utilizzati riferiscono all'anno 2024.

Il campione oggetto di analisi è costituito da 115 ospedali italiani, individuati sulla base della classifica dei migliori ospedali d'Italia pubblicata da Newsweek nel 2024. La graduatoria include sia strutture ospedaliere generali sia specialistiche, selezionate in funzione di criteri quali le raccomandazioni dei professionisti sanitari, l'esperienza dei pazienti e specifici indicatori clinici. Tale scelta consente di selezionare organizzazioni caratterizzate da un'elevata visibilità istituzionale e da un adeguato livello di comparabilità informativa, in quanto fondata su criteri standardizzati e replicabili. Dal dataset originario, composto da 131 ospedali generali e 9 specializzati, sono stati esclusi tutti gli ospedali privati in quanto non soggetti all'obbligo normativo di redazione e pubblicazione del PIAO, documento oggetto dell'indagine. Il campione finale comprende, pertanto, unicamente ospedali pubblici, per un totale di 115 unità di analisi.

Il modello impiega otto variabili in totale: una dipendente, quattro indipendenti e tre di controllo. La variabile dipendente *SDG3_DISC* misura il livello di disclosure relativa all'SDG3 nei documenti PIAO analizzati ed è costruita come media aritmetica di due indicatori complementari. Il primo, *SDG3_QNT*, cattura la copertura quantitativa dei 13 target dell'SDG3 attribuendo un punteggio di 1 per ogni target menzionato e 0 in caso contrario, e calcolando il rapporto tra i target trattati e il totale previsto. Il secondo, *SDG3_QL*, si basa su un sistema di scoring da 0 a 4 per ciascun target: 0 indica l'assenza di contenuti, 1 una menzione vaga, 2 un riferimento generico, 3 una trattazione qualitativa dettagliata e 4 un'informazione supportata da dati quantitativi. L'indice composito *SDG3_DISC, sviluppato a partire dal contributo di Pizzi et al. (2020), consente di cogliere in modo integrato sia l'ampiezza sia la profondità della rendicontazione relativa ai temi della salute pubblica.*

Per quanto riguarda le variabili esplicative, sono considerate quattro variabili indipendenti che riflettono caratteristiche strutturali e organizzative rilevanti. La prima è la grandezza dell'ospedale (SIZE), misurata attraverso il logaritmo naturale del numero di posti letto (Peña et al., 2020; Nicolò et al., 2023; Garzoni et al., 2023). La seconda è la collocazione geografica (GEO), operazionalizzata come variabile dicotomica che assume valore 1 per le strutture situate nel Nord Italia e 0 per quelle nel Centro e Sud (Pizzi et al., 2020). La terza è la complessità organizzativa (COMP), misurata in base al numero di prestazioni effettivamente erogate, calcolate sulla base di 58 indicatori clinici selezionati all'interno del Programma Nazionale Esiti

2024. Sono state escluse le prestazioni con volumi annui inferiori a dieci, considerate non rappresentative, e rimosse eventuali ridondanze tra indicatori. Infine, la seniority dell'ospedale (AGE) viene definita come la differenza tra il 2024, anno di analisi, e l'anno di istituzione della struttura (Garzoni *et al*., 2023).

Al fine di controllare possibili effetti distorsivi, sono state incluse tre variabili di controllo. La trasparenza (TRASP) è definita come la disponibilità del PIAO sul sito istituzionale dell'ente, rilevata tramite una variabile dicotomica che assume valore 1 se il documento è pubblicato e 0 in caso contrario. La visibilità online (ONLV) è misurata mediante il logaritmo naturale del numero di risultati restituiti dal motore di ricerca Google alla digitazione del nome dell'ospedale, utilizzata come proxy dell'esposizione informativa (Garzoni et al., 2023; Raimo et al., 2023). La terza variabile di controllo è la natura universitaria della struttura (UNIV), che assume valore 1 qualora l'ospedale risulti integrato con un ateneo, e 0 in caso contrario.

Il modello econometrico adottato è specificato come segue:

$$SDG3_DISC = \beta0 + \beta1\ SIZE + \beta2\ GEO + \beta3\ COMP + \beta4\ AGE + \beta5\ TRASP + \beta6\ ONLV + \beta7\ UNIV + \varepsilon$$

3. Risultati preliminari

I risultati preliminari sono riassunti nella tabella 1.

Variabile	Coefficiente	Errore Standard	p-value	Sign.
Cons	0.744	6.263	0.906	
SIZE	1.831	0.989	0.067	*
GEO	3.28	0.967	0.001	***
COMP	-0.07	0.054	0.199	-
AGE	0.04	0.024	0.106	-
TRASP	2.472	1.22	0.045	**
ONLV	-0.182	0.258	0.483	-
UNIV	1.972	1.104	0.077	*
Note: n = 115 R^2 adj = 0.2100 *** Significatività a livello 1%; ** Significatività a livello 5%; * Significatività a livello 10%				

Tabella 1. Risultati preliminari

I risultati preliminari dell'analisi empirica mostrano un valore di R^2 aggiustato pari a 0.2100, indicando che il modello spiega circa il 21% della varianza nella variabile dipendente (SDG3_DISC). Sebbene il valore non sia particolarmente elevato, esso risulta coerente con quanto osservato in altri studi sulla disclosure di sostenibilità nel settore sanitario, dove la varietà dei comportamenti informativi è spesso legata a fattori non osservabili o istituzionali.

I risultati preliminari supportano l'ipotesi H1. La dimensione dell'ospedale (SIZE) è positivamente e significativamente associata al livello di disclosure riferito all'SDG3 (p = 0.067). Le strutture più grandi sembrano più attrezzate, sia in termini di risorse umane che organizzative, nel predisporre documenti più articolati e completi. Ciò è coerente con precedenti evidenze empiriche che collegano le dimensioni organizzative a una maggiore propensione alla rendicontazione (Peña et al., 2020; Garzoni et al., 2023; Nicolò et al., 2023), anche in ragione dell'esposizione reputazionale a cui sono soggette le grandi strutture ospedaliere.

I risultati preliminari supportano l'ipotesi H2. La collocazione territoriale dell'ospedale (GEO) mostra una relazione positiva e statisticamente significativa con la disclosure (p = 0.001), evidenziando come gli ospedali situati nel Nord Italia tendono a fornire livelli informativi

superiori rispetto a quelli localizzati nel Centro e Sud del Paese. Tale risultato è coerente con la letteratura sulle disuguaglianze territoriali in ambito sanitario (Pizzi et al., 2020) e conferma che il divario Nord-Sud si riflette anche nella qualità e nella quantità della rendicontazione non finanziaria nei PIAO.

I risultati preliminari non supportano l'ipotesi H3. La complessità organizzativa (COMP), misurata sulla base del numero di prestazioni cliniche erogate, presenta un coefficiente negativo e non significativo ($p = 0.199$). Contrariamente alle attese, livelli più elevati di complessità non risultano associati a una maggiore propensione alla disclosure. È plausibile che le organizzazioni caratterizzate da assetti più articolati tendano a concentrare le proprie risorse sugli aspetti operativi e assistenziali, riservando un'attenzione limitata alla rendicontazione strategica o incontrando difficoltà nel ricondurla in modo sistematico all'interno dei documenti ufficiali. In tale prospettiva, l'aumento della complessità gestionale può determinare forme di sovraccarico amministrativo, inducendo il management a privilegiare l'erogazione dei servizi rispetto alle attività di reporting strategico. Inoltre, in contesti fortemente regolati, come quello della sanità pubblica, le pratiche di disclosure possono essere prevalentemente guidate da logiche di isomorfismo istituzionale, riducendo l'incidenza delle differenze organizzative interne.

I risultati preliminari non supportano l'ipotesi H4. La seniority dell'ospedale (AGE) mostra un'associazione positiva ma non significativa con la disclosure ($p = 0.106$). Questo suggerisce che la storicità della struttura, intesa come seniority organizzativa, non rappresenta un fattore discriminante per la qualità o quantità delle informazioni rendicontate nei PIAO. È plausibile che la presenza di un quadro normativo fortemente uniformante, unitamente alle recenti riforme del sistema sanitario, abbia attenuato l'incidenza del fattore storico. In una prospettiva riconducibile alla stakeholder theory, la seniority organizzativa può infatti generare effetti ambivalenti: da un lato, la sedimentazione di routine operative e lo sviluppo di competenze amministrative; dall'altro, fenomeni di inerzia organizzativa e una ridotta propensione all'innovazione informativa. L'assenza di evidenze statisticamente significative suggerisce, pertanto, che l'introduzione del PIAO possa aver limitato, almeno nel breve periodo, la capacità dell'età dell'organizzazione di discriminare i comportamenti di disclosure.

4. Conclusioni preliminari e future fasi di ricerca

Questo studio preliminare intende offrire importanti spunti per il rafforzamento del dibattito accademico e istituzionale sul ruolo degli ospedali nel promuovere accountability e sostenibilità attraverso strumenti di pianificazione integrata come il PIAO.

In particolare, i risultati contribuiscono a consolidare il valore esplicativo della stakeholder theory nell'interpretare le dinamiche di disclosure volontaria nel settore sanitario, evidenziando come la trasparenza nei confronti degli stakeholder non sia solo il risultato di obblighi normativi, ma anche di condizioni organizzative e relazionali specifiche. Inoltre, il presente studio apporta un contributo teorico originale introducendo i PIAO come nuovo contesto di analisi per la disclosure di sostenibilità e individuando le determinanti organizzative e istituzionali che ne influenzano la qualità informativa, ampliando così il modello esplicativo della stakeholder theory nel settore sanitario pubblico.

Dal punto di vista operativo e manageriale, le evidenze empiriche emerse indicano la necessità di potenziare la capacità delle strutture ospedaliere di comunicare in modo sistemico e coerente il proprio contributo alla salute collettiva. La marcata eterogeneità riscontrata nei livelli di disclosure segnala l'esistenza di ampi margini di miglioramento, sia in termini di contenuto informativo sia con riferimento alla qualità del reporting e alla standardizzazione dei formati adottati. In tale prospettiva, i risultati offrono indicazioni rilevanti per le amministrazioni centrali e regionali, chiamate a sostenere le aziende sanitarie nel rafforzamento dei meccanismi di accountability, anche attraverso la definizione di linee guida operative e l'implementazione di sistemi di monitoraggio condivisi.

Sul piano delle politiche pubbliche, le evidenze suggeriscono che il PIAO possa essere ulteriormente valorizzato quale strumento di armonizzazione e coordinamento delle pratiche di disclosure nel settore sanitario. In particolare, le autorità nazionali e regionali potrebbero individuare un set minimo di indicatori di disclosure, coerenti con il PIAO e riferiti all'SDG 3, al fine di promuovere comparabilità informativa e livelli minimi di rendicontazione. Tali indicatori potrebbero, inoltre, supportare esercizi di benchmarking inter-aziendale, favorendo processi di apprendimento istituzionale e la diffusione di buone pratiche in materia di accountability.

Lo studio presenta tuttavia alcune limitazioni che suggeriscono una lettura prudente dei risultati. In particolare, la selezione del campione, limitata agli ospedali pubblici inclusi nella classifica Newsweek 2024, potrebbe aver determinato una sovrarappresentazione di strutture caratterizzate da maggiore visibilità e performance, con possibili implicazioni in termini di generalizzabilità dei risultati. Al contempo, alcuni criteri alla base del ranking, quali la reputazione professionale e l'esperienza del paziente, potrebbero risultare indirettamente associati a una maggiore attenzione verso la trasparenza e la qualità della disclosure. Tale circostanza potrebbe aver contribuito a includere nel campione ospedali maggiormente esposti a pressioni reputazionali e orientate agli stakeholder, influenzando i livelli di disclosure osservati.

Inoltre, l'adozione di un disegno cross-sectional limita la possibilità di cogliere evoluzioni dinamiche nella disclosure e nelle pratiche gestionali. Anche la scelta delle variabili indipendenti, per quanto fondata su letteratura consolidata, non esaurisce la complessità dei fattori potenzialmente rilevanti, trascurando dimensioni quali la cultura organizzativa, la pressione istituzionale o la leadership.

Sviluppi futuri potrebbero considerare l'estensione del campione a strutture di diversa natura e collocazione istituzionale, l'adozione di approcci longitudinali in grado di cogliere le variazioni nel tempo, nonché l'integrazione di metodi qualitativi finalizzati a esplorare in profondità le logiche decisionali sottostanti alle pratiche di disclosure. Tali prospettive consentirebbero di affinare ulteriormente la comprensione dei meccanismi che regolano la trasparenza e la responsabilità nel contesto ospedaliero, contribuendo allo sviluppo di modelli di governance pubblica più sostenibili, inclusivi e orientati alla creazione di valore. Inoltre, ricerche future potrebbero esaminare ulteriori e/o differenti strumenti di disclosure, quali, ad esempio, i bilanci di sostenibilità, nonché valutare la stabilità dei risultati attraverso test di robustezza e specificazioni alternative del modello. In tale ambito, l'introduzione di proxy alternative della complessità organizzativa e della localizzazione territoriale potrebbe offrire evidenze aggiuntive sulla solidità delle relazioni osservate.

Progettazione di un modello di riferimento per l'implementazione di soluzioni digitali innovative e sostenibili nell'attuale sistema della Salute

Claudia Salvatore[1], Lorenzo Mercurio[2], Alessandra Ricciardelli,[3] Alessio Piras[4], Maddalena Illario[5]

1. Introduzione, obiettivi e sviluppo concettuale del lavoro

Il presente extended abstract descrive l'attività in progress di un gruppo di studio e di ricerca multidisciplinare impegnato su uno specifico Work Package (WP) di un progetto di ricerca nazionale dal titolo "Digital Health Solutions in Community Medicine" (DHEAL-com), Ministero della Salute - Piano Nazionale Complementare (PNC - "Ecosistema Innovativo della Salute"), nel quadro del Piano Nazionale di Ripresa e Resilienza (PNRR).

DHEAL-com è un progetto multidisciplinare che coinvolge diverse Istituzioni tra le quali l'IRCCS INRCA di Ancona, l'Università degli Studi di Napoli Federico II, l'Università di Pavia, e l'Università di Genova, quali Spoke di I livello; l'Università degli Studi di Salerno, la Fondazione Bruno Kessler di Trento e l'Azienda Ospedaliera Universitaria Meyer di Firenze, quali Spoke di II livello.

Obiettivo generale del progetto DHEAL-COM è la costituzione di un Life Science Hub a livello nazionale (DHEAL-COM HUB), quale modello di riferimento per lo sviluppo e il rafforzamento di tecnologie digitali per la medicina di comunità. Obiettivo specifico è il miglioramento della gestione dei servizi sociosanitari e dell'assistenza e monitoraggio degli utenti/pazienti lungo il loro ciclo di vita (life course), sviluppando attività di prevenzione e cura attraverso l'uso di soluzioni digitali innovative e sostenibili in un sistema Salute integrato.

Pertanto, notevole rilevanza è data alla centralità degli utenti/pazienti, dei loro bisogni, dei loro caregiver e dei nuovi professionisti ed attori del settore, con attenzione ai territori e alle comunità, da valorizzare secondo le specificità e le problematiche locali.

Il progetto DHEAL-COM, dunque, attraverso otto Work Packages (WPs), (Figura1), mira a generare innovazione per l'introduzione e l'uso di nuove tecnologie digitali nell'ambito del sistema sociosanitario.

Figura 1. Dheal-com Work Packages

Il gruppo di ricerca è impegnato nel Work Package 8 ed è focalizzato su un task specifico (Task 8.3).

Il WP8 "Citizen engagement, sustainability and exploitation" è un WP trasversale, coordinato dall'Università di Napoli Federico II, i cui obiettivi principali sono la creazione di un Open Platform DHEAL-COM, volta alla condivisione di dati, informazioni, conoscenze, e di un Living Lab (LL) di progetto nella digital health per garantire continuità delle cure.

Inoltre, il WP mira a implementare modelli gestionali e di governance, adatti a specifiche innovazioni di servizio, tenendo conto degli elementi socio-culturali della popolazione target, per personalizzare l'adattamento e l'adozione delle soluzioni digitali per l'assistenza e i servizi alla comunità. La disponibilità della piattaforma aperta e del Living Lab sosterrà l'uso delle tecnologie digitali e la digitalizzazione dei servizi sanitari di comunità.

Il WP8 mira a creare una rete di servizi di assistenza di prossimità che collaborino con l'Hub nazionale per testare soluzioni digitali innovative sviluppate nei servizi integrati di comunità. La Task 8.3 del WP8: "Economic viability, reimbursement models and sustainability" si occupa di progettare un modello di riferimento (organizzativo-gestionale) che tenga conto della ricerca epidemiologica sulla domanda e dei bisogni specifici della popolazione, per facilitare i processi di innovazione e digitalizzazione nei servizi socio- sanitari.

Inoltre, tra gli obiettivi progettuali rientra lo studio e l'individuazione di modelli di rimborso, applicabili e sostenibili, che garantiscano il mantenimento dei risultati della ricerca e promuovano politiche nazionali di innovazione, strategie di exploitation basate sulle buone pratiche emergenti. In tal modo, è garantita anche la continuità dei risultati del progetto e viene consentito alle politiche nazionali di promuovere e sostenere un ulteriore ampliamento.

La sostenibilità a lungo termine passerà da una strategia di ampliamento basata su buone pratiche emergenti che saranno testate attraverso casi di uso specifici, in contesti specifici. L'obiettivo della Task 8.3. è, infatti, sviluppare e validare modelli economico-gestionali di sostenibilità e di creazione di valore basati su evidenze empiriche, garantendo la fattibilità e la replicabilità delle soluzioni digitali in diversi contesti sanitari, regionali e nazionali.

Obiettivo è la creazione di un modello di implementazione dell'innovazione nei servizi sociosanitari utilizzando tecnologie digitali volte a progettare e riorganizzare i servizi creando

anche un'integrazione territorio-ospedale e coinvolgendo diversi professionisti e attori per migliorare la salute del cittadino e non solo del paziente.

Inoltre, il progetto con l'introduzione di tecnologie digitali innovative vuole migliorare la catena del valore, non solo l'outcome di salute, ma anche l'esperienza del paziente tenendo conto dei costi che la struttura deve sostenere per erogare la prestazione. Pertanto, il lavoro risponde alle seguenti domande di ricerca:

- RQ1: Qual è il valore creato dall'implementazione delle innovazioni e tecnologie digitali?
- RQ2: Quale modello integrato è necessario per implementare queste tecnologie?

Innovazione integrata significa creare valore in un servizio erogato, oppure in un processo, in ambito sanitario e sociosanitario per migliorare la salute dei cittadini in un'epoca di cambiamento demografico, di necessità di risolvere i temi della cronicità e fragilità e dell'invecchiamento della popolazione attraverso la trasformazione digitale.

2. Metodologia

Per rispondere alle domande di ricerca, il progetto, e in particolare il WP8, mira a sviluppare casi d'uso (use case) per il trattamento e la prevenzione di alcune patologie, in particolare quelle croniche, in un'ottica di creazione di valore, al fine di creare modelli che possano portare innovazione nei servizi. Obiettivo è individuare la migliore strategia per implementare un modello integrato che crei valore per tutti gli stakeholder coinvolti nel sistema (paziente, cittadino, caregiver, volontari, imprese, centri di ricerca e istituzioni, professionisti della salute).

Questo approccio, basato sugli use case, utilizza metodi misti radicati nella ricerca di management sanitario e di accounting. Viene utilizzata la metodologia Time-Driven Activity-Based Costing (TDABC) per analizzare e confrontare i percorsi di cura prima e dopo l'introduzione delle soluzioni digitali, lungo l'intero ciclo di cura.

Il framework analitico integra: - la mappatura dei processi assistenziali e dei patient journey; - l'identificazione degli attori coinvolti nell'erogazione dei servizi; - la misurazione del consumo di risorse e dei cost driver attraverso i confini organizzativi; - la valutazione dei costi evitati, degli effetti di coordinamento e delle riconfigurazioni organizzative abilitate dalle tecnologie digitali; - l'analisi comparativa dei modelli di rimborso per i servizi di sanità digitale, inclusi confronti internazionali con Paesi europei selezionati.

Questo approccio consente una comprensione articolata di come l'innovazione digitale interagisca con le strutture organizzative, i ruoli professionali e i meccanismi di governance, andando oltre le valutazioni puramente tecnologiche o cliniche.

L'analisi dei costi effettuata evidenzia quali sono i costi attuali di un processo di use case e quelli che si sviluppano con l'introduzione delle nuove soluzioni digitali. Il tutto ovviamente dopo aver mappato i processi e il patient journey, come indicato sopra. Di grande impatto è individuare i costi evitati, con l'uso delle soluzioni digitali innovative. Inoltre, verranno esplorati i modelli di rimborso delle prestazioni sanitarie digitali anche confrontandoli con strategie di rimborso adottate in altri Paesi Europei, per superare il sistema di rimborso dei DRG (ospedale centrico) e finanziare percorsi di cura digitali che coinvolgano i MMG, gli infermieri di famiglia e comunità e i sistemi di telemonitoraggio.

3. I Casi d'Uso

3.1. USE CASE 1: "Fabry disease"

Il primo caso d'uso si focalizza sulla malattia di Fabry (Fabry Disease - FD) che è una malattia genetica rara, cronica e multisistemica che fa parte del gruppo delle malattie da accumulo lisosomiale. La terapia utilizza un approccio combinato di trattamenti specifici per la malattia e cure di supporto.

La natura complessa della FD richiede un approccio basato sul lavoro di squadra che integri le competenze di nefrologi, cardiologi, neurologi, gastroenterologi, oftalmologi, dermatologi, psicologi e infermier,i per tutta la vita.

La FD è un esempio lampante delle sfide economiche ed organizzative nella gestione delle malattie rare, che rappresenta una piccola coorte complessiva di pazienti che necessita di cure intensive ed economicamente onerose, e per i quali i trattamenti farmacologici costituiscono il principale fattore di costo. I dati raccolti nell'ambito di questo studio (170 pazienti) mostrano che il costo medio annuo della sola terapia farmacologica è superiore a 177.000 euro per paziente, pari a oltre il 99% della spesa totale. Al contrario, l'intero percorso assistenziale organizzativo rappresenta solo lo 0,09%.

Il Servizio Sanitario Nazionale copre i costi elevati per conto dei pazienti tramite il Codice di Esenzione per le Malattie Rare; tuttavia, ciò non allevia la sfida poiché il numero di aziende che detengono brevetti su questi farmaci salvavita è relativamente limitato, e ciò è inversamente correlato al potere negoziale dei sistemi pubblici. Al di là della dimensione economica, l'organizzazione frammentata e inefficiente dell'assistenza sanitaria rappresenta un problema rilevante. I pazienti sono spesso costretti a gestire diversi appuntamenti con vari specialisti e anche le pratiche amministrative sono ancora prevalentemente cartacee; la mancanza di una cartella clinica elettronica unificata ostacola una comunicazione efficace e aumenta le possibilità di errori amministrativi o clinici. Inoltre, le disparità regionali sono evidenti: alcune aree forniscono terapie domiciliari supportate da servizi infermieristici privati, mentre in altre aree i pazienti sono costretti a recarsi regolarmente in ospedale per le infusioni.

Questo use case ha applicato la metodologia TDABC per mappare e quantificare il consumo di risorse e i costi associati al percorso di cura dei pazienti affetti da FD presso un'azienda ospedaliera universitaria. L'analisi ha riguardato l'intera coorte di 170 pazienti, con una distribuzione equa tra i sessi e una combinazione di tipi di terapia e complessità cliniche. I risultati sono presentati in quattro aree chiave: la distribuzione dei costi delle attività del percorso di cura, l'impatto della complessità dei pazienti, gli elevati costi farmaceutici e l'allocazione di risorse specifiche.

Si evidenzia che per le malattie rare e croniche che richiedono trattamenti costosi come la Fabry Disease, lo studio sposta il dibattito di policy da un'attenzione irrisolvibile sui prezzi dei farmaci a un programma attuabile di ottimizzazione del sistema di erogazione delle cure stesso (costi nascosti legati al processo amministrativo cartaceo e alla frammentazione del coordinamento) che migliori la continuità assistenziale.

3.2. USE CASE 2: Paziente anziano multimorbido

Per il secondo caso d'uso, che è in fase di analisi, verranno utilizzate le stesse metodologie del caso precedente.

Risulta però necessaria una fase di clusterizzazione dei pazienti, in quanto la multimorbidità è una condizione generica che si specifica poi nelle caratteristiche delle diverse patologie con le quali il paziente convive (Steell et al., 2025; Marengoni, A., Triolo, F., & Zucchelli, A., 2025.).

In questo contesto, quindi, i processi assistenziali attivati per la presa in carico sono necessariamente diversi. Da quello che emerge in questa prima fase, la generazione dei costi sposta il focus sugli effetti della necessaria multidisciplinarietà e sul coordinamento tra diversi attori (MMG, specialisti, assistenti sociali).

4. Risultati attesi

I risultati attesi rientrano nell'obiettivo più generale del progetto Dheal-com di utilizzare l'innovazione digitale per creare percorsi più connessi, efficienti ed efficaci, incentrati sul paziente.

Lo studio offre un contributo teorico e metodologico al management e all'organizzazione sanitaria integrando prospettive di innovazione multidisciplinare e integrata e metodi avanzati di costing e di rimborso all'interno di un quadro analitico strutturato.

Da un punto di vista pratico, fornisce ai decisori strumenti per valutare gli investimenti in sanità digitale non solo in termini di risparmi immediati, ma rispetto a dimensioni più ampie di valore, tra cui l'esperienza del paziente, il coordinamento professionale, la sostenibilità ambientale e la resilienza di lungo periodo del sistema.

In particolare, i risultati suggeriscono che il successo della trasformazione digitale in sanità dipende dalla capacità di ripensare i meccanismi di governance, rimborso e valutazione, riconoscendo i ruoli interconnessi degli attori nella creazione di valore.

La scelta metodologica dell'uso dell'analisi degli use case è orientata ad individuare una valida giustificazione economica per la trasformazione digitale nel sistema salute e a definire un modello per la riprogettazione organizzativo-gestionale necessaria nei processi di innovazione (Figura 2).

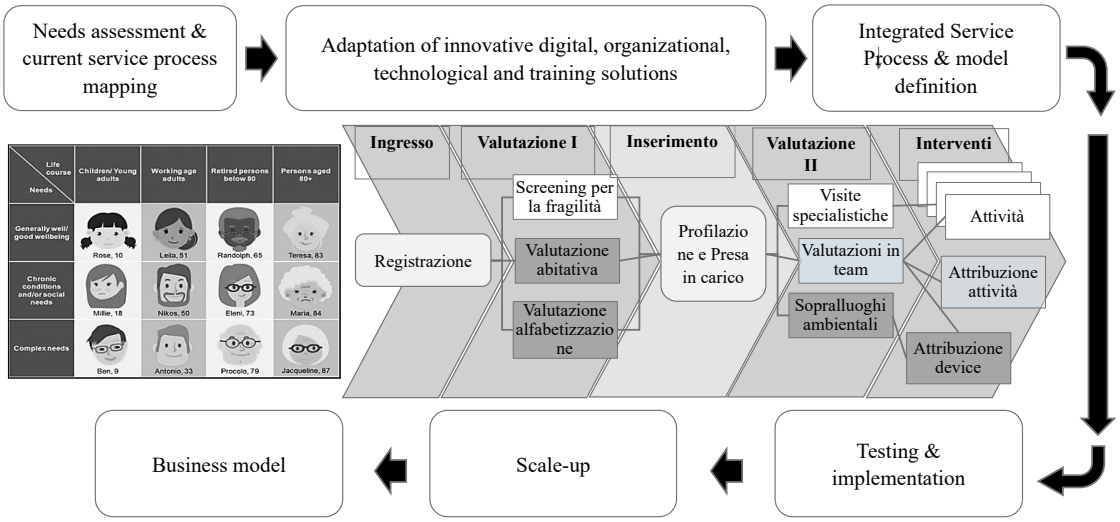

Figura 2. Il processo di innovazione che parte dai casi d'uso

Investire in piattaforme digitali integrate, modelli di riferimento standardizzati e percorsi di cura sviluppati in collaborazione con tutte le parti interessate è, quindi, una necessità.

L'efficienza non dovrebbe essere misurata in base ai risparmi diretti sui costi derivanti dal percorso di cura, ma in base al valore aggiunto ottenuto grazie a un migliore coordinamento, a un minor carico amministrativo, ad una migliore gestione e, soprattutto, ad una migliore qualità della vita (QoL) dei pazienti. Questo studio ipotizza, quindi, che il valore si realizzi attraverso l'ottimizzazione del percorso organizzativo, la componente variabile e ottimizzabile dell'assistenza, con il passaggio dell'endpoint primario dalla riduzione dei costi al miglioramento della qualità della vita dei pazienti.

5. Conclusioni

Riformulare l'assistenza sanitaria attraverso una prospettiva multidisciplinare ed integrata richiede di andare oltre le tradizionali strutture di potere e le logiche contabili. Questo studio dimostra che metodologie come il TDABC possono svolgere un ruolo fondamentale nel rendere visibili le dinamiche organizzative, gestionali ed economiche dell'innovazione digitale, sostenendo così sistemi sanitari più inclusivi, sostenibili e orientati al valore.

Ancorando i cambiamenti paradigmatici astratti all'analisi empirica, il contributo di questa fase del progetto risponde direttamente alle richieste contemporanee di ripensare il management e l'organizzazione della sanità in un'epoca di trasformazione digitale, urgenza ecologica e crescente complessità sociale.

In conclusione, emerge dalla prima fase di analisi, che un modello di implementazione delle innovazioni e delle tecnologie digitali debba prevedere l'uso fondamentale di metodologie di determinazione dei costi, come ad esempio il TDABC, per aumentare la precisione e l'adattamento delle soluzioni digitali disponibili nei contesti reali.

Si intende verificare in quale modo il modello debba essere adattabile al fine di creare uno schema di riferimento che possa fornire un set di soluzioni utilizzabili negli specifici setting d'innovazione.

Performance, Governance e Capitale Umano: Una Analisi Integrata della Sanità Calabrese

Alba Maria Gallo[1], Ubaldo Comite[2], Lavinia Pastore,[3] Francesco Bianchi[4]

1. Introduzione

Il Negli ultimi anni il Servizio Sanitario Nazionale (SSN) sta vivendo una fase di crescente tensione sistemica, nella quale la sostenibilità operativa dipende dalla capacità del sistema di trasformare risorse limitate in prestazioni accessibili, appropriate e tempestive. La dinamica del finanziamento pubblico incide direttamente sull'organizzazione dei servizi: la contrazione delle risorse disponibili si riflette sui tempi di attesa, sulla saturazione delle strutture ospedaliere, sulla riduzione dell'offerta e sulla continuità assistenziale, con effetti rilevanti sull'equità di accesso e sulla fiducia dei cittadini nelle istituzioni sanitarie.

L'interconnessione tra finanziamento, organizzazione e capacità produttiva del sistema è ampiamente documentata nella letteratura (Borgonovi,2002). Si evidenzia, infatti, come i sistemi sanitari pubblici richiedano un costante allineamento tra risorse, assetti organizzativi e bisogni collettivi, poiché la sanità rappresenta un settore ad alta rigidità strutturale, nel quale le variazioni di spesa producono effetti immediati sulla capacità di erogazione dei servizi. La performance delle aziende sanitarie dipende quindi dalla coerenza tra programmazione, dotazioni professionali, infrastrutture e modelli organizzativi (Lega, 2023). I dati di sistema forniscono una cornice empirica di forte evidenza, l'8° Rapporto sul Servizio Sanitario Nazionale, curato dalla Fondazione GIMBE e presentato l'8 ottobre 2025, riporta che negli ultimi tre anni (2022–2025) la sanità pubblica italiana ha subito una riduzione di risorse pari a circa 13,1 miliardi di euro. Nel medesimo periodo, il rapporto segnala che la rinuncia alle cure ha coinvolto circa una persona su dieci, e che circa 41,3 miliardi di spesa sanitaria sono stati sostenuti direttamente dalle famiglie, con un peso crescente delle uscite fuori dai percorsi di finanziamento pubblico.

Queste evidenze quantitativamente documentate collocano l'Italia in una posizione di disallineamento rispetto ai principali paesi OCSE: la spesa sanitaria pubblica, in rapporto al PIL, risulta inferiore alla media europea e ai livelli richiesti per mantenere la piena erogazione dei Livelli Essenziali di Assistenza (LEA).

Sul piano organizzativo, questo disomogeneità tra fabbisogni assistenziali e risorse disponibili produce una tensione crescente alla capacità produttiva del sistema. Le strutture sanitarie sono chiamate a garantire volumi di prestazioni elevati in presenza di dotazioni di personale e di tecnologie insufficienti, determinando un'intensificazione strutturale dei carichi di lavoro e una gestione ordinaria in condizioni di costante emergenza operativa.

Nella presente ricerca, l'interesse teorico riguarda le conseguenze professionali e organizzative che emergono quando il sistema sanitario opera in condizioni di disallineamento tra risorse disponibili, assetti organizzativi e bisogni collettivi (Borgonovi, 2002). In tali condizioni, la carenza di personale, la limitata disponibilità di tecnologie (Comite,2025), materiali e la

difficoltà di garantire supporti organizzativi adeguati comprimono l'appropriatezza e la sicurezza dell'attività clinica, rendendo più fragile la capacità operativa delle strutture.

Questo nodo diventa particolarmente rilevante rispetto alla riforma delineata dal DM 77/2022, che presuppone integrazione multiprofessionale, prossimità e presa in carico continuativa: obiettivi che richiedono capitale umano sufficiente, coordinamento tra professioni e condizioni organizzative coerenti con il modello territoriale (Lega, 2023).

All'interno di tale scenario, la carenza di condizioni materiali e organizzative produce una frattura professionale: la competenza resta formalmente presente, mentre il suo pieno esercizio viene vincolato dalla mancanza di risorse, strumenti e supporti operativi, con effetti sull'identità professionale e sulla qualità del lavoro (Freidson, 1994/2001). A questa frattura si affianca una frattura economica, legata al disequilibrio tra intensità lavorativa e remunerazione, che accentua la percezione di insostenibilità del lavoro nel settore pubblico.

L'interazione tra frattura professionale e frattura economica alimenta un driver strutturale di mobilità dal pubblico al privato, riconducibile alle dinamiche di public-to-private shift osservate in letteratura, specialmente nei sistemi in cui il settore privato risulta più attrattivo in termini di condizioni organizzative e ritorni economici (Socha & Bech, 2011). La perdita di capitale professionale incide così sulle dimensioni tecniche, relazionali e organizzative che permettono al sistema di generare valore pubblico, compromettendo la capacità di realizzare riforme complesse e di sostenere performance coerenti con i bisogni collettivi (Cepiku & Mastrodascio, 2018). Su questo terreno, le implicazioni di governance si orientano verso politiche di retention e rafforzamento della sostenibilità organizzativa del lavoro sanitario (Pfeffer, 1994).

Il capitale umano rappresenta l'infrastruttura cognitiva e relazionale attraverso cui il sistema sanitario genera qualità delle cure, sicurezza clinica e continuità assistenziale. Quando le condizioni di esercizio della professionalità risultano compromesse da vincoli organizzativi e materiali, la permanenza nel settore pubblico perde progressivamente attrattività, alimentando dinamiche strutturali di public-to-private shift che incidono direttamente sulla sostenibilità del Servizio Sanitario Nazionale e sulla capacità di attuare riforme di sistema.

È in questo quadro che si colloca la principale traiettoria istituzionale di riforma del sistema sanitario italiano, rappresentata dallo sviluppo dell'assistenza territoriale formalizzato dal DM 77/2022 del Ministero della Salute, che definisce modelli e standard organizzativi per strutture e funzioni quali Case della Comunità, Ospedali di Comunità e Centrali Operative Territoriali, orientate all'integrazione multiprofessionale e alla continuità della presa in carico.

In chiave teorico-manageriale, il DM 77/2022 rappresenta un disegno di governance orientato a riconfigurare il sistema operativo del Servizio Sanitario Nazionale, spostando il baricentro dell'assistenza da un paradigma prevalentemente ospedalocentrico a un modello di prossimità territoriale, nel quale la performance dipende dalla cooperazione tra professionalità, dalla qualità dei processi di coordinamento e dalla capacità di integrazione tra livelli di cura.

L'impianto della riforma presuppone condizioni abilitanti di natura organizzativa, tecnologica e professionale. L'integrazione territoriale si configura come un processo complesso che richiede disponibilità di capitale professionale adeguato, dotazioni infrastrutturali coerenti, chiarezza dei ruoli e capacità di gestione del cambiamento. In assenza di tali presupposti, si determina una distanza strutturale tra l'architettura formale del modello e la capacità reale di attuazione, con il rischio che gli standard normativi restino privi di un corrispondente supporto operativo in termini di risorse, competenze e assetti organizzativi.

Alla luce di quanto scritto, la regione Calabria rappresenta un contesto di osservazione particolarmente informativo per analizzare le condizioni di implementazione del modello territoriale delineato dal DM 77/2022 e le sue implicazioni in termini di performance, governance e capitale umano. Alla complessità ordinaria dei sistemi sanitari regionali si affianca, infatti, una condizione di governo straordinario che incide strutturalmente sull'assetto del Servizio Sanitario Regionale: la gestione commissariale per l'attuazione del Piano di rientro dai disavanzi sanitari.

La sanità calabrese è sottoposta a commissariamento a partire dal 2009, a seguito delle criticità economico-finanziarie e organizzative che hanno condotto il Governo centrale ad attivare la procedura prevista per le regioni in disavanzo sanitario. La gestione straordinaria è stata successivamente confermata e rinnovata nel tempo, fino alla nomina del Commissario ad acta con DPCM 4 novembre 2021, pubblicato anche sui canali istituzionali della Regione Calabria, che attribuisce al Commissario i poteri necessari per l'attuazione del Piano di rientro e per la riorganizzazione della rete sanitaria regionale (Regione Calabria, Dipartimento Tutela della Salute).

Il commissariamento rappresenta un dispositivo di governance che modifica in modo profondo gli assetti decisionali, le priorità di intervento e le traiettorie di investimento del sistema sanitario regionale. La gestione straordinaria orienta l'azione amministrativa verso obiettivi di riequilibrio economico-finanziario, riorganizzazione della rete assistenziale e controllo della spesa, incidendo direttamente sull'organizzazione dei servizi, sulla programmazione delle risorse professionali e sulle condizioni di esercizio della professionalità sanitaria. Infatti, le politiche di sviluppo del capitale umano, il rafforzamento delle dotazioni tecnologiche e l'innovazione organizzativa si collocano entro vincoli stringenti che condizionano la capacità operativa del sistema e la sostenibilità dei carichi di lavoro.

Il contesto calabrese consente dunque di osservare con particolare chiarezza la distanza che può generarsi tra l'architettura formale delle riforme nazionali e la capacità reale di attuazione a livello territoriale. Il modello di assistenza di prossimità previsto dal DM 77/2022 presuppone condizioni abilitanti che includono disponibilità di personale adeguatamente formato, infrastrutture coerenti con i nuovi modelli organizzativi, sistemi informativi integrati, chiarezza dei ruoli professionali e capacità di coordinamento interistituzionale. In una regione caratterizzata da persistenti criticità strutturali e da una governance straordinaria di lungo periodo, tali presupposti diventano variabili decisive per comprendere la tenuta del sistema e le dinamiche di permanenza o fuoriuscita dei professionisti dal settore pubblico.

All'interno di questo quadro regionale, la scelta empirica di concentrare la fase iniziale della ricerca sulla provincia di Cosenza risponde a criteri di rappresentatività demografica e professionale. La provincia di Cosenza costituisce il bacino territoriale più ampio della regione in termini di popolazione residente, come attestato dalle statistiche ufficiali ISTAT sulla popolazione provinciale, e concentra una quota rilevante delle principali professioni sanitarie, come documentato dalle rilevazioni ordinistiche.

La dimensione del bacino e la consistenza della base professionale rendono Cosenza un punto di osservazione privilegiato per cogliere dinamiche organizzative e professionali che attraversano l'intero sistema sanitario regionale. In questa prospettiva, il caso calabrese e il bacino provinciale cosentino consentono di analizzare in modo integrato il rapporto tra vincoli di governance, capacità organizzativa e sostenibilità del lavoro sanitario, offrendo un contesto empirico idoneo a studiare le condizioni che favoriscono o ostacolano l'attuazione del modello territoriale e che orientano le scelte professionali tra settore pubblico e settore privato. L'assetto istituzionale e organizzativo che caratterizza il sistema sanitario calabrese consente di osservare con particolare evidenza una tensione strutturale che attraversa oggi la professione sanitaria. Tale tensione si manifesta nella forma di una duplice frattura: una frattura professionale, legata alla difficoltà di esercitare pienamente le competenze secondo standard clinici, tecnici ed etici adeguati, e una frattura economica, connessa allo squilibrio tra intensità lavorativa, responsabilità assunte e livelli di riconoscimento retributivo e organizzativo.

Questa condizione rinvia ad un problema strutturale di regolazione del lavoro professionale nei sistemi sanitari complessi e richiede una lettura teorica capace di cogliere il nesso tra competenza, condizioni di esercizio e assetti istituzionali. La teoria del professionalismo elaborata da Eliot Freidson (2001) fornisce una chiave interpretativa particolarmente adeguata per analizzare le trasformazioni in atto nel lavoro sanitario pubblico e per comprendere le dinamiche di progressivo indebolimento delle condizioni di esercizio della professionalità. Il suo contributo

risulta centrale nell'impianto analitico del presente lavoro poiché consente di leggere le criticità organizzative del sistema sanitario come fattori che incidono direttamente sulla struttura stessa della professionalità sanitaria. Freidson interpreta il professionalismo come una modalità specifica di organizzazione del lavoro che si applica in modo diretto alle professioni sanitarie, caratterizzate da elevata complessità tecnica, responsabilità clinica e necessità di prendere decisioni in condizioni di incertezza. In questo tipo di lavoro, la prestazione non può essere regolata esclusivamente attraverso meccanismi di mercato, basati su logiche di scambio e prezzo, né attraverso modelli burocratico-manageriali fondati su procedure standard e controllo gerarchico.

Nelle professioni sanitarie, la qualità della prestazione dipende in larga misura dalla capacità del professionista di esercitare il proprio giudizio tecnico in modo autonomo e responsabile, all'interno di un sistema di standard condivisi e di regole professionali. Per questo motivo, la professionalità non coincide con solo nel possesso di competenze specialistiche, ma richiede condizioni organizzative che consentano di utilizzare tali competenze in modo appropriato: disponibilità di strumenti e tecnologie, adeguate dotazioni di personale, assetti organizzativi funzionali, processi logistici affidabili e tempi di lavoro compatibili con la complessità dell'attività svolta.

Nel contesto sanitario pubblico, questa impostazione consente di leggere le carenze strutturali di personale, le insufficienze infrastrutturali e le rigidità organizzative come fattori che incidono direttamente sulla qualità del lavoro professionale e sulla possibilità di operare secondo standard clinici e tecnici adeguati. In tale configurazione, la crisi del lavoro sanitario si traduce in una difficoltà concreta di esercitare la professionalità nelle condizioni richieste dalla natura stessa dell'attività clinica e assistenziale.

Applicata al campo sanitario, questa teoria consente di interpretare le carenze di personale, le insufficienze infrastrutturali, le criticità tecnologiche e le rigidità organizzative come fattori che non incidono soltanto sull'efficienza del sistema, ma compromettono la possibilità concreta di esercitare la professionalità secondo i principi che ne legittimano socialmente il ruolo. In tale configurazione, la frattura professionale che attraversa oggi il lavoro sanitario può essere letta come una crisi delle condizioni istituzionali che rendono possibile il professionalismo, più che come una crisi delle competenze in senso stretto.

In questa cornice, le condizioni materiali e organizzative assumono una funzione strutturale. Dotazioni tecnologiche adeguate, personale di supporto sufficiente, infrastrutture funzionali, processi logistici affidabili e assetti organizzativi stabili rappresentano presupposti indispensabili per garantire sicurezza delle cure, appropriatezza clinica e responsabilità etica. Quando tali presupposti vengono meno, la competenza professionale resta formalmente intatta, ma risulta progressivamente compressa nella sua possibilità di espressione concreta. Si produce così una forma di deprofessionalizzazione pratica, nella quale il sapere specialistico non trova un ambiente organizzativo capace di sostenerne l'esercizio secondo standard professionali.

Sul piano manageriale, questa frattura si traduce in una criticità strutturale di performance. L'impossibilità di operare in condizioni organizzative adeguate accresce l'esposizione al rischio clinico, alimenta inefficienze operative, intensifica il carico cognitivo ed emotivo, accresce lo stress organizzativo e riduce la qualità percepita del lavoro. La dimensione economica della frattura investe, inoltre, l'equità percepita, il riconoscimento istituzionale, la sostenibilità dei carichi di lavoro e la coerenza tra responsabilità esercitate e strumenti disponibili, configurandosi come una leva centrale nella gestione delle risorse umane nei sistemi ad alta intensità di conoscenza.

La frattura professionale ed economica assume i tratti di una tensione sistemica tra competenza, responsabilità e condizioni di esercizio, che incide direttamente sull'identità professionale e sulla capacità del sistema sanitario di trattenere capitale umano qualificato. In tale prospettiva, il lavoro sanitario emerge come uno spazio di regolazione complesso, nel quale le logiche istituzionali, organizzative ed economiche concorrono a definire la sostenibilità della

professionalità nel lungo periodo. All'interno della frattura professionale ed economica che attraversa il lavoro sanitario, l'attrattività del settore privato e delle strutture accreditate emerge come esito coerente degli assetti incentivanti che regolano il mercato del lavoro sanitario. In presenza di differenziali retributivi significativi, di condizioni organizzative più sostenibili e di una maggiore disponibilità di risorse tecnologiche e infrastrutturali, il passaggio dal settore pubblico al settore privato si configura come una scelta razionale di riallocazione del capitale professionale.

La letteratura sulla dual practice e sulle transizioni pubblico-privato interpreta tali dinamiche come fenomeni strutturali dei sistemi sanitari caratterizzati da segmentazione istituzionale e da regimi di regolazione differenziati. In questo filone di ricerca, la compresenza di opportunità professionali nel settore pubblico e in quello privato genera un sistema di incentivi asimmetrici che orienta le scelte individuali dei professionisti verso contesti percepiti come più sostenibili dal punto di vista economico e organizzativo (Socha & Bech, 2011). La mobilità verso il privato assume i tratti di una strategia individuale prevedibile all'interno di un assetto istituzionale che produce disallineamenti persistenti tra responsabilità esercitate, condizioni di lavoro e livelli di riconoscimento. Il passaggio al settore privato si colloca, dunque, come risposta razionale a un sistema che fatica a garantire condizioni di esercizio coerenti con la natura e la complessità del lavoro sanitario.

Nel quadro analitico del presente studio, questa dinamica assume un rilievo centrale poiché consente di collegare il livello micro delle condizioni operative quotidiane con il livello macro delle traiettorie di sostenibilità del sistema sanitario. Le carenze organizzative e infrastrutturali, insieme alla pressione sui carichi di lavoro, si traducono in perdita di capitale professionale, che a sua volta indebolisce la capacità del sistema di garantire continuità assistenziale, qualità delle prestazioni e attuazione delle riforme organizzative.

La perdita di capitale professionale che deriva dal public-to-private shift investe direttamente la capacità istituzionale del sistema sanitario di generare valore pubblico. In questa prospettiva, la tenuta del Servizio Sanitario Nazionale dipende dalla capacità di preservare e sviluppare quell'insieme di risorse cognitive, relazionali e organizzative che rendono possibile l'erogazione di servizi sanitari equi, appropriati e accessibili.

Il concetto di valore pubblico consente di inquadrare tali dinamiche all'interno di una visione sistemica della performance istituzionale. La generazione di valore pubblico richiede competenze tecniche, capacità di coordinamento interprofessionale, continuità organizzativa, fiducia tra attori, legittimazione istituzionale e stabilità delle routine operative. In questa prospettiva, la perdita di professionisti impoverisce l'intelligenza organizzativa del sistema, intesa come patrimonio collettivo di saperi taciti, pratiche efficaci e capacità di cooperazione che sostiene il funzionamento quotidiano dei servizi (Cepiku & Mastrodascio, 2018). Sul piano della governance, la tenuta del capitale professionale si colloca come una leva strategica per la sostenibilità del sistema sanitario. In tale direzione, la letteratura sottolinea il ruolo delle politiche di retention come strumenti fondamentali per la stabilità organizzativa nei sistemi ad alta intensità di conoscenza. La capacità competitiva delle organizzazioni dipende dall'investimento sulle persone e dalla costruzione di contesti di lavoro capaci di rendere sostenibile l'impegno professionale nel lungo periodo (Pfeffer, 1994). Applicata al settore sanitario pubblico, questa impostazione implica che le politiche di retention includano il ridisegno dei processi organizzativi, il rafforzamento delle dotazioni tecnologiche, il potenziamento delle strutture di supporto, la governance dei carichi di lavoro e il ripristino di condizioni di esercizio professionale coerenti con la natura dell'attività sanitaria.

La gestione del capitale umano diventa una componente strutturale delle politiche di governance del Servizio Sanitario Nazionale. La capacità di trattenere competenze qualificate, di preservare l'intelligenza organizzativa e di garantire condizioni di lavoro sostenibili costituisce un presupposto essenziale per la realizzazione delle riforme in corso e per la salvaguardia della funzione pubblica del sistema sanitario nel lungo periodo.

Alla luce del quadro teorico sin qui sviluppato, la ricerca empirica si propone di analizzare tali dinamiche attraverso un'indagine qualitativa basata su interviste semi-strutturate ai Presidenti degli Ordini delle professioni sanitarie, al fine di ricostruire, dal punto di vista degli attori istituzionali e professionali, le condizioni organizzative, economiche e operative che orientano le scelte di permanenza o di uscita dal settore pubblico.

2. Raccolta dati

Per garantire La ricerca ha adottato una metodologia qualitativa basata su interviste semi-strutturate (Qu & Dumay, 2011) rivolte ai Presidenti degli Ordini delle professioni sanitarie operanti nella Regione Calabria, selezionati in qualità di key informants istituzionali e osservatori privilegiati delle dinamiche organizzative, professionali ed economiche del sistema sanitario regionale, nonché delle traiettorie occupazionali e delle condizioni di esercizio della professionalità sanitaria.

È stata predisposta una guida per interviste semi-strutturate articolata in sezioni tematiche coerenti con il quadro teorico della ricerca e con gli obiettivi dello studio, finalizzate ad esplorare in modo sistemico:

- l'esistenza e la natura del fenomeno di fuoriuscita dei professionisti dal settore pubblico;
- le condizioni di esercizio della professionalità sanitaria;
- i fattori organizzativi, tecnologici ed economici che influenzano la performance clinico-assistenziale;
- le determinanti della mobilità verso il settore privato;
- le implicazioni sistemiche per la governance del sistema sanitario regionale e per l'attuazione del modello territoriale previsto dal DM 77/2022.

Le domande sono state formulate in forma aperta al fine di favorire una narrazione libera e approfondita delle esperienze, delle percezioni e delle valutazioni istituzionali degli intervistati. Le domande principali sono state integrate, ove necessario, da richieste di chiarimento e approfondimento, con l'obiettivo di cogliere esempi concreti, dinamiche operative e traiettorie professionali.

La guida per le interviste è stata strutturata attorno alle seguenti dieci domande:

Esistenza e natura del fenomeno

1) Dal suo punto di osservazione istituzionale, ha rilevato negli ultimi anni una tendenza alla fuoriuscita dei professionisti della sua categoria dal settore pubblico? In che modo questo fenomeno si manifesta concretamente?

2) Secondo la sua esperienza, tale fenomeno riguarda specifici profili professionali, fasce di età o livelli di esperienza, oppure appare diffuso e trasversale all'interno della categoria?

Condizioni di esercizio della professionalità (frattura professionale)

3) Ritiene che, nel contesto attuale del sistema sanitario pubblico regionale, i professionisti riescano a esercitare pienamente la propria competenza clinica e tecnico-assistenziale? Quali sono, a suo avviso, i principali fattori organizzativi o strutturali che ostacolano il pieno esercizio della professionalità nel settore pubblico?

4) In che misura la disponibilità di attrezzature, tecnologie, farmaci, materiali sanitari e personale di supporto incide sulla qualità e sull'appropriatezza dell'attività professionale quotidiana?

5) Secondo lei, queste condizioni influenzano il senso di identità professionale, di riconoscimento del ruolo e di appartenenza al sistema pubblico? In che modo?

Carico di lavoro, responsabilità e riconoscimento economico (frattura economica)

6) Come descriverebbe il rapporto tra carico di lavoro, livello di responsabilità professionale e riconoscimento economico nel settore pubblico regionale?

Meccanismo di uscita e public-to-private shift

7) Secondo lei, quali differenze principali riscontrano i professionisti che decidono di passare dal settore pubblico a quello privato o alle strutture accreditate, in termini di condizioni di lavoro e possibilità di esercizio della professione? A suo avviso, il passaggio al settore privato rappresenta prevalentemente una scelta temporanea o una vera e propria alternativa strutturale al lavoro nel settore pubblico? Perché?

Effetti sistemici della perdita di capitale professionale

8) Quali conseguenze produce, secondo lei, la perdita di professionisti esperti sulla capacità del sistema sanitario pubblico di garantire continuità assistenziale, integrazione multiprofessionale e qualità delle cure? In che modo questa fuoriuscita incide sull'organizzazione dei servizi e sulla tenuta complessiva del sistema sanitario regionale?

Governance, DM 77 e prospettive di intervento

9) Secondo lei, quanto le attuali condizioni organizzative del sistema sanitario regionale consentono di realizzare concretamente il modello territoriale e integrato previsto dal DM 77? Quali criticità legate alla disponibilità e alla gestione del capitale umano rischiano di compromettere l'attuazione di tale modello?

10) Quali condizioni dovrebbero essere garantite affinché il settore pubblico torni a essere percepito come uno spazio attrattivo e sostenibile per l'esercizio della professione sanitaria?

Le interviste sono state condotte tra dicembre 2025 e gennaio 2026 in modalità telefonica. Tutti i colloqui sono stati audioregistrati previo consenso informato degli intervistati.

Nella fase attuale della ricerca sono stati intervistati due Presidenti di Ordini professionali della provincia di Cosenza:

- il Presidente dell'Ordine delle Professioni Infermieristiche (OPI);
- il Presidente dell'Ordine TSRM-PSTRP.
- Le interviste hanno avuto una durata media di circa 30 minuti ciascuna.
- Le registrazioni audio sono state successivamente trascritte integralmente mediante uno strumento di intelligenza artificiale per la trascrizione automatica del parlato, che ha restituito una trascrizione parola per parola. Le trascrizioni sono state successivamente revisionate dall'autrice per garantire accuratezza, coerenza semantica e fedeltà al contenuto originale.

Al momento della stesura del presente contributo, la ricerca è in corso. Oltre agli Ordini già intervistati, sono programmate ulteriori interviste con i Presidenti degli Ordini dei medici, dei fisioterapisti e delle ostetriche, al fine di ampliare il perimetro empirico dell'analisi e rafforzare la validità sistemica dei risultati.

Pertanto, i risultati presentati devono essere interpretati come evidenze preliminari di una ricerca in divenire, orientata alla costruzione di una lettura integrata delle dinamiche di performance, governance e capitale umano nel sistema sanitario calabrese.

3. Analisi empirica e risultati

La presente analisi qualitativa si concentra sulla provincia di Cosenza, individuata quale contesto territoriale di riferimento in virtù della sua rilevanza demografica e organizzativa all'interno del sistema sanitario calabrese. La provincia di Cosenza rappresenta il bacino territoriale più esteso della regione per popolazione residente, numero di comuni e articolazione delle strutture sanitarie, configurandosi come snodo centrale dell'erogazione assistenziale regionale.

In tale contesto operano i principali presìdi ospedalieri hub della regione (Annunziata di Cosenza, spoke di Castrovillari, Corigliano-Rossano, Paola-Cetraro), nonché la più ampia rete territoriale di servizi distrettuali. Ne deriva che le dinamiche professionali, organizzative ed economiche che attraversano la sanità cosentina risultano altamente rappresentative delle criticità strutturali dell'intero Servizio Sanitario Regionale.

L'analisi si fonda su due interviste semi-strutturate realizzate con:

- il Presidente dell'Ordine delle Professioni Infermieristiche (OPI) della provincia di Cosenza;
- il Presidente dell'Ordine TSRM-PSTRP della provincia di Cosenza, che rappresenta circa 1.400 professionisti appartenenti a 18 profili sanitari.

Entrambi rivestono il ruolo di key informants istituzionali e osservatori privilegiati dell'ecosistema sanitario territoriale.

Entrambi gli intervistati convergono nel descrivere un fenomeno strutturale di progressiva fuoriuscita dei professionisti sanitari dal settore pubblico verso il settore privato e le strutture accreditate.

Il Presidente dell'Ordine TSRM-PSTRP evidenzia come tale orientamento riguardi in modo particolare i professionisti più giovani:

«Oggi c'è la predisposizione dei colleghi più giovani ad orientarsi più nel privato, perché è più appetibile e perché oggi c'è una condizione economica migliore.»

Il fenomeno non viene interpretato come una scelta transitoria, ma come una vera e propria strategia professionale di medio-lungo periodo.

Analogamente, il Presidente dell'Ordine delle Professioni Infermieristiche sottolinea come sempre più infermieri scelgano di lasciare il servizio pubblico per approdare stabilmente nel privato, nelle cliniche accreditate o nel lavoro autonomo:

«Sempre più colleghi valutano di andare via dal pubblico perché le condizioni non sono più sostenibili, né sul piano organizzativo né su quello personale.»

Il passaggio al privato viene descritto come una scelta razionale, fondata su una valutazione comparativa delle condizioni di lavoro, dei carichi assistenziali e della qualità della vita professionale.

Dalle interviste emerge una profonda frattura professionale che incide direttamente sulla possibilità dei professionisti di esercitare pienamente la propria competenza clinica e tecnico-assistenziale.

In particolar modo, il Presidente dell'Ordine delle Professioni Infermieristiche descrive una condizione di sofferenza strutturale dei reparti ospedalieri, caratterizzata da:

- cronica carenza di personale;
- sovraccarico assistenziale;
- impossibilità di garantire standard adeguati di presa in carico.

Secondo l'intervistato, la carenza di organico non consente più di lavorare secondo i modelli organizzativi previsti dalle linee guida nazionali e internazionali:

«Oggi in molti reparti lavoriamo sotto organico, con turni massacranti e carichi assistenziali che non permettono più di garantire un'assistenza realmente personalizzata.»

Il problema non è solo quantitativo, ma qualitativo: la mancanza di personale compromette la possibilità di esercitare pienamente la professione infermieristica secondo il suo profilo avanzato, fondato sulla presa in carico globale del paziente, sulla continuità assistenziale e sulla relazione di cura.

«L'infermiere oggi è costretto spesso a rincorrere l'urgenza, a lavorare in emergenza continua. Questo non è il modello professionale che la riforma vorrebbe realizzare.»

Ne deriva una progressiva perdita di senso del lavoro, con effetti diretti sulla motivazione, sull'identità professionale e sulla fidelizzazione al sistema pubblico.

Il Presidente dell'Ordine TSRM-PSTRP richiama invece il ruolo del commissariamento regionale e della carenza di personale medico e tecnico come fattori che limitano fortemente l'operatività dei servizi:

«La Regione Calabria è una regione ancora commissariata e c'è una carenza organica, anche per quanto riguarda la radiologia. I medici radiologi sono pochi e di conseguenza si ha poca possibilità di avere una crescita.»

In alcune strutture, la carenza di specialisti determina una riduzione delle attività diagnostiche:

«In alcune strutture, non essendoci la presenza del medico radiologo, si ha una riduzione delle attività e il personale è poco motivato.»

Questa condizione genera un appiattimento delle traiettorie professionali e una percezione di stagnazione organizzativa:

«Non avendo opportunità di crescita si ha una tendenza a un appiattimento dei profili professionali.»

Accanto alla frattura professionale, emerge con forza una frattura economica legata al disequilibrio strutturale tra intensità lavorativa, responsabilità e riconoscimento economico.

Il Presidente dell'Ordine TSRM-PSTRP sottolinea l'elevato livello di responsabilità giuridica e professionale, in particolare nei pronto soccorso:

«I carichi di lavoro aumentano tanto all'interno del prontosoccorso, c'è un rischio elevato e ogni operatore ogni giorno rischia anche di essere denunciato.»

A fronte di tali responsabilità, la remunerazione viene percepita come inadeguata:

«Nel privato il professionista sceglie addirittura quanto deve essere pagato.»

Il Presidente dell'Ordine delle Professioni Infermieristiche conferma la stessa dinamica, sottolineando come l'incremento dei carichi assistenziali non sia stato accompagnato da un adeguato riconoscimento economico:

«Gli stipendi degli infermieri non sono più proporzionati alle responsabilità che ci vengono attribuite, soprattutto nei reparti ad alta intensità di cura.»

Ne deriva una crescente percezione di ingiustizia organizzativa che alimenta la scelta di uscita dal settore pubblico.

Dall'analisi congiunta delle due interviste emerge una traiettoria causale ricorrente:

carenze strutturali → impossibilità di lavorare secondo standard professionali → demotivazione → scelta di uscita verso il privato

Il Presidente TSRM-PSTRP sintetizza chiaramente questo meccanismo:

«Oggi si va nel privato esclusivamente per un fattore economico.»

Il Presidente OPI aggiunge che il privato offre condizioni organizzative più sostenibili:

«Nel privato spesso trovi turni più regolari, meno pressione, più possibilità di gestire il tempo di lavoro.»

Il passaggio al settore privato viene quindi interpretato come risposta razionale a una crisi di sostenibilità del lavoro pubblico.

Entrambi gli intervistati sottolineano come la carenza di personale comprometta:

- la continuità assistenziale,
- l'integrazione multiprofessionale
- la qualità complessiva delle cure.

Il Presidente OPI evidenzia come la carenza infermieristica renda impossibile realizzare il modello territoriale previsto dal DM 77/2022:

«Se non c'è personale, le Case della Comunità restano scatole vuote. Senza infermieri non esiste assistenza territoriale.»

Il Presidente TSRM-PSTRP richiama invece il tema della sostenibilità tecnologica:

«Le tecnologie ci sono, ma senza personale formato e senza specialisti restano inutilizzate.»

La perdita progressiva di capitale professionale erode le dimensioni tecniche, relazionali e organizzative dell'intelligenza aziendale necessaria per generare valore pubblico.

Nel loro insieme, le due interviste restituiscono una rappresentazione coerente della crisi del sistema sanitario pubblico calabrese, letta attraverso le categorie di performance, governance e capitale umano. La provincia di Cosenza, in quanto principale bacino demografico e professionale della regione, si configura come osservatorio privilegiato delle dinamiche di erosione del capitale professionale e del progressivo spostamento verso il settore privato.

L'analisi empirica conferma pienamente il modello teorico del paper:

la compresenza di una frattura professionale e di una frattura economica costituisce il driver strutturale del public-to-private shift, compromettendo la capacità del sistema di generare valore pubblico e di realizzare il modello territoriale previsto dal DM 77/2022.

4. Discussione

Lo scopo di questo studio è analizzare, attraverso un approccio qualitativo, le condizioni organizzative e professionali che caratterizzano il lavoro sanitario nel contesto calabrese e che orientano le scelte di permanenza o di fuoriuscita dal settore pubblico. In questa fase preliminare, l'analisi si fonda su due interviste condotte con i Presidenti dell'Ordine delle Professioni Infermieristiche e dell'Ordine TSRM-PSTRP della provincia di Cosenza, in qualità di osservatori istituzionali privilegiati dell'ecosistema sanitario territoriale.

I risultati mettono in evidenza una rappresentazione convergente delle criticità strutturali che attraversano il sistema sanitario pubblico regionale. Entrambi gli intervistati descrivono un contesto caratterizzato da carenze di personale, sovraccarico assistenziale, difficoltà operative e limitata capacità di garantire continuità e appropriatezza delle cure. In particolare, emerge una condizione di pressione organizzativa permanente che incide sulla qualità del lavoro quotidiano e sulla possibilità di esercitare pienamente le competenze professionali.

Nel settore infermieristico, pur in presenza di una diffusione del fenomeno ancora contenuta, viene segnalata una crescente insostenibilità delle condizioni di lavoro, legata all'intensificazione dei carichi assistenziali, alla carenza di organico e alla difficoltà di operare secondo modelli assistenziali coerenti con le linee guida nazionali. Nel settore TSRM-PSTRP, il fenomeno della mobilità verso il privato appare invece più strutturato, soprattutto tra i professionisti più giovani, che orientano le proprie scelte sulla base di una valutazione comparativa delle condizioni economiche e organizzative.

Le interviste mostrano come il passaggio verso il settore privato venga percepito come una strategia professionale razionale, fondata su tre dimensioni principali: sostenibilità dei carichi di lavoro, qualità dell'organizzazione e riconoscimento economico. In entrambi i casi, il privato viene descritto come un contesto nel quale è possibile esercitare la professione in condizioni operative più stabili, con una maggiore possibilità di gestione del tempo di lavoro e con un ritorno economico ritenuto più coerente con le responsabilità assunte.

Un elemento particolarmente rilevante riguarda il ruolo del commissariamento regionale, richiamato esplicitamente dal Presidente dell'Ordine TSRM-PSTRP come fattore che incide sulla capacità di sviluppo dei servizi e sulle opportunità di crescita professionale. La gestione straordinaria viene percepita come un vincolo strutturale che limita la programmazione del personale, rallenta i processi di riorganizzazione e contribuisce a una percezione di stagnazione organizzativa, con effetti diretti sulla motivazione e sulle prospettive professionali.

Nel loro insieme, le interviste restituiscono una rappresentazione coerente della crisi di sostenibilità del lavoro sanitario pubblico in Calabria, letta attraverso le categorie di carico assistenziale, condizioni organizzative, riconoscimento economico e prospettive di sviluppo. La provincia di Cosenza, in quanto principale bacino demografico e professionale della regione, emerge come un osservatorio privilegiato delle dinamiche di erosione del capitale professionale e del progressivo spostamento verso il settore privato.

Questi risultati preliminari risultano coerenti con quanto documentato a livello nazionale dal Rapporto GIMBE (2025) in relazione alla compressione delle risorse pubbliche, all'aumento della pressione sui servizi e alla crescita dell'area di bisogno non soddisfatto. Allo stesso tempo, essi si inseriscono nel solco della letteratura sulla dual practice e sulle transizioni pubblico-privato, che interpreta tali dinamiche come esito strutturale di regimi di regolazione differenziati e di incentivi asimmetrici (Socha & Bech, 2011).

Il contributo empirico di questo studio risiede nella capacità di restituire una lettura istituzionale e professionale delle trasformazioni in atto, fondata sulle testimonianze di attori che

operano quotidianamente all'intersezione tra governance regionale, organizzazione dei servizi e rappresentanza professionale. L'analisi consente di mettere in luce come le criticità organizzative e finanziarie del sistema sanitario calabrese si traducano operativamente in scelte professionali orientate alla ricerca di contesti lavorativi più sostenibili.

Alla luce della natura preliminare della ricerca, i risultati devono essere interpretati come prime evidenze esplorative. Il proseguimento dell'indagine, attraverso il coinvolgimento degli Ordini dei medici, dei fisioterapisti e delle ostetriche, consentirà di ampliare il perimetro empirico dell'analisi e di rafforzare la validità sistemica delle conclusioni.

5. Conclusioni e limiti

Il presente contributo presenta risultati preliminari di una ricerca qualitativa in corso sulle condizioni organizzative e professionali del lavoro sanitario nel contesto calabrese. L'analisi si basa, nella fase attuale, sulle interviste ai Presidenti dell'Ordine delle Professioni Infermieristiche e dell'Ordine TSRM-PSTRP della provincia di Cosenza.

Le evidenze emerse consentono di delineare una prima rappresentazione istituzionale delle criticità che attraversano il sistema sanitario regionale, mettendo in luce il ruolo delle condizioni organizzative, dei carichi di lavoro e delle prospettive professionali nelle scelte di permanenza o di mobilità verso il settore privato. Tali risultati vanno interpretati come indicazioni esplorative utili a orientare l'analisi, ma non come conclusioni definitive.

Il principale limite dello studio risiede nel carattere ancora parziale del disegno empirico. La ricerca prevede l'estensione dell'indagine ai Presidenti degli Ordini dei medici, dei fisioterapisti e delle ostetriche, al fine di ampliare il campo di osservazione e costruire una lettura sistemica delle dinamiche di performance, governance e capitale umano nel Servizio Sanitario Regionale.

Il contributo si configura pertanto come una prima tappa di un percorso di ricerca volto a comprendere le trasformazioni in atto nel lavoro sanitario calabrese e le loro implicazioni per la sostenibilità del sistema pubblico.

Tecnostress nella medicina generale: impatti delle tecnologie cliniche e amministrative sulla performance dei MMG

Alessandra Pernice[1], Francesca De Domenico[2]

1. Introduzione

La trasformazione digitale nel settore sanitario ha migliorato l'efficienza operativa e la qualità dell'assistenza, ma ha anche introdotto nuove forme di pressione legate all'uso intensivo delle tecnologie informatiche, spesso ricondotte al tecnostress (Luo et al., 2024). In questo scenario, i medici di medicina generale (MMG) occupano una posizione particolarmente esposta, poiché devono bilanciare responsabilità cliniche e incombenze amministrative in un contesto in cui strumenti digitali come i sistemi di supporto alle decisioni cliniche per la prescrizione e il Fascicolo Sanitario Elettronico (FSE) sono diventati imprescindibili per l'erogazione delle cure e per il rispetto dei protocolli normativi. In quanto professionisti ibridi, i MMG agiscono come "finestre bidirezionali" tra bisogni clinici e requisiti informativi (Llewellyn, 2001), chiamati a gestire un duplice ruolo che richiede l'integrazione armonica di dimensioni cliniche, documentali e gestionali.

La pressione derivante dall'introduzione massiva delle tecnologie non riguarda soltanto l'adozione di nuovi strumenti, ma la ridefinizione dei processi di lavoro, delle aspettative organizzative e della relazione medico-paziente. In molti casi, i MMG percepiscono la digitalizzazione come un cambiamento non negoziabile che si sovrappone a carichi già elevati, con il rischio di ridurre il tempo dedicato al paziente a favore di attività di documentazione. Questo fenomeno, spesso definito come "spostamento del baricentro professionale", genera tensioni identitarie che si sommano agli stressor tecnologici.

Il presente studio adotta il modello di risposta affettiva (Affective Response Model, ARM) di Agogo e Hess (2018) per analizzare i fattori che contribuiscono al tecnostress nei MMG e comprendere come esso influenzi la performance prescrittiva e l'aderenza alla documentazione digitale. Sebbene l'ARM offra una cornice teorica articolata per interpretare le risposte emotive innescate dalla tecnologia, la letteratura presenta ancora una limitata evidenza empirica sulla relazione tra tali risposte e gli esiti concreti del lavoro clinico. Il lavoro si propone quindi di contribuire al dibattito attraverso un'analisi qualitativa basata su interviste semi-strutturate a MMG di diverse regioni italiane, esplorando come essi affrontino le sfide generate dalle tecnologie cliniche e amministrative e con quali ricadute sulla pratica quotidiana.

2. Contesto teorico

La crescente digitalizzazione dei sistemi sanitari sta ridefinendo modalità di lavoro, modelli organizzativi e pratiche di cura. La digital innovation è stata concettualizzata come l'introduzione di prodotti, processi e modelli di business percepiti come nuovi e tali da richiedere cambiamenti significativi (Fichman et al., 2014). La distinzione tra digitization e digitalization (Brennen e Kreiss, 2016) aiuta a comprendere come la trasformazione non riguardi solo la conversione tecnica di dati, ma anche la riorganizzazione delle attività e delle relazioni tra gli attori coinvolti.

In sanità, la digital health e l'approccio Health 4.0 integrano sistemi informativi, telemedicina, Internet of Things, big data e intelligenza artificiale per migliorare la prevenzione, la diagnosi e la gestione delle patologie (Yeung et al., 2023; Monteiro et al., 2018). La pandemia da Covid-19 ha accelerato questo processo, rendendo ancora più evidente la centralità delle tecnologie digitali.

Nell'ambito della medicina generale, è utile distinguere tra tecnologie cliniche e tecnologie amministrative. Le prime supportano direttamente la diagnosi e il trattamento e sono generalmente percepite come coerenti con l'identità professionale del medico. Le seconde includono sistemi informativi sanitari, fascicoli elettronici, piattaforme di rendicontazione e prescrizione, e richiedono attività documentali aggiuntive non sempre percepite come strettamente cliniche. Gli studi mostrano come tali strumenti possano migliorare la trasparenza e la tracciabilità, ma anche generare un aumento del carico burocratico e modificare in modo significativo il flusso di lavoro (Porterfield et al., 2014; Qureshi et al., 2015).

La letteratura recente sulla professione medica sta ponendo crescente attenzione al concetto di "professionalismo ibrido" (Noordegraaf, 2007; Giacomelli, 2020), che descrive l'integrazione di logiche cliniche e manageriali nelle pratiche quotidiane. I MMG, più di altre figure professionali, devono conciliare obiettivi di appropriatezza, efficienza, accountability e adempimenti normativi, con effetti diretti sulla loro identità professionale. Questa ibridazione, se non adeguatamente sostenuta, può amplificare le risposte affettive negative verso le tecnologie percepite come estranee al nucleo clinico.

Proprio l'impatto soggettivo delle tecnologie ha alimentato un crescente filone di studi sul tecnostress, definito come lo stress sperimentato nell'uso intensivo delle tecnologie digitali (Tarafdar et al., 2007). La letteratura ha individuato stressor quali sovraccarico informativo, complessità percepita, invasività e insicurezza, con effetti negativi sul benessere e sulla performance. Nel settore sanitario tali dinamiche appaiono amplificate, poiché i professionisti della salute devono impiegare quotidianamente sistemi che condizionano non solo la produttività, ma anche la qualità dell'assistenza.

All'interno di questo quadro teorico si colloca il modello ARM, che propone una lettura triadica delle reazioni alla tecnologia: gli stressor tecnologici generano risposte affettive negative – tra cui frustrazione, irritazione e ansia indotta dalla tecnologia (TISA) – che a loro volta influenzano i comportamenti d'uso e la performance dell'utente (Agogo e Hess, 2018). Tale modello offre quindi una lente particolarmente adatta per comprendere come i MMG si relazionino a tecnologie che possono risultare più o meno allineate al proprio ruolo professionale.

3. Obiettivi della ricerca

La ricerca intende esplorare come i MMG interpretino e gestiscano i diversi tipi di tecnologia, distinguendo tra strumenti clinici e amministrativi, e con quali ricadute sulle loro risposte affettive, sul tecnostress percepito e sulla performance. L'attenzione è rivolta in particolare al ruolo delle competenze digitali e dell'identità professionale nell'influenzare tali dinamiche, con l'obiettivo di contribuire allo sviluppo di strategie in grado di ridurre il carico tecnologico e favorire un uso più consapevole ed efficiente dei sistemi digitali nelle cure primarie.

Un ulteriore obiettivo è comprendere come le differenti configurazioni regionali dei sistemi informativi sanitari influenzino il modo in cui i MMG percepiscono il carico digitale. Le regioni italiane presentano livelli molto eterogenei di maturità digitale, sia in termini di integrazione dei sistemi sia di qualità degli strumenti software messi a disposizione dei medici: analizzare queste differenze consente di valutare come vari contesti istituzionali plasmino le emozioni e i comportamenti dei professionisti.

4. Metodologia

Lo studio adotta un approccio qualitativo esplorativo fondato su interviste semi-strutturate realizzate con MMG di diverse regioni italiane. Il campione è composto da tredici professionisti operanti in Lombardia, Veneto, Lazio, Toscana e Sicilia, selezionati sulla base della variabilità dei contesti tecnologici regionali, della differente esperienza nell'uso dei sistemi digitali e della diversificazione delle competenze digitali possedute.

La scelta di una metodologia qualitativa risponde all'esigenza di approfondire la dimensione vissuta del tecnostress, difficilmente catturabile attraverso strumenti quantitativi. Le interviste hanno consentito di ricostruire il vissuto emotivo dei professionisti, dando voce alle strategie individuali di adattamento e alle modalità con cui essi negoziano l'uso della tecnologia nei propri flussi di lavoro.

Le interviste, della durata compresa tra 45 e 75 minuti, hanno approfondito le percezioni dei MMG circa le tecnologie cliniche e amministrative, le esperienze di sovraccarico digitale e complessità, la gestione della messaggistica e delle richieste asincrone, le manifestazioni di ansia tecnologica, l'impatto sulla performance prescrittiva e documentale e le strategie di adattamento adottate. Le trascrizioni sono state analizzate mediante NVivo seguendo una procedura di codifica tematica articolata in tre fasi: codifica aperta, identificazione di categorie assiali e integrazione dei risultati attraverso confronto costante tra casi e contesti regionali. Lo studio si configura come work in progress, in linea con le indicazioni della Call AIDEA.

5. Risultati preliminari

L'analisi evidenzia come il tecnostress dei MMG sia influenzato da una molteplicità di fattori riconducibili sia alle caratteristiche delle tecnologie sia alle dinamiche organizzative regionali. Le differenze nella maturità digitale dei sistemi sanitari regionali rappresentano uno dei principali elementi di variabilità. In contesti come la Toscana e la Lombardia, dove sono disponibili piattaforme più integrate e sistemi di filtraggio digitale delle comunicazioni, i MMG riportano un uso più fluido dei sistemi informativi e una minore percezione di sovraccarico. Al contrario, nelle regioni con infrastrutture digitali frammentate, come la Sicilia, l'assenza o l'inefficacia dell'FSE, la duplicazione delle informazioni e i frequenti malfunzionamenti dei portali generano frustrazione, perdita di tempo e un acuto senso di inefficienza.

Diversi MMG intervistati riportano episodi concreti che mettono in evidenza tali differenze: in Lombardia, ad esempio, i sistemi di prenotazione, prescrizione e consultazione sono percepiti come relativamente coordinati, mentre in Sicilia la molteplicità di portali richiede continui passaggi tra piattaforme, aumentando la complessità percepita. In una delle interviste, un medico racconta di dover ripetere la stessa operazione su due portali diversi per poter generare una singola prescrizione, evidenziando l'impatto diretto del disallineamento tecnologico sulla performance quotidiana.

Un secondo risultato riguarda la netta distinzione tra l'impatto delle tecnologie cliniche e quello delle tecnologie amministrative. Le prime vengono descritte come strumenti che potenziano la capacità clinica, migliorano la qualità delle decisioni e favoriscono una gestione più tempestiva dei pazienti. Le seconde, al contrario, sono percepite come una fonte primaria di stress, poiché introducono procedure aggiuntive, frammentano il flusso di lavoro e appaiono spesso disallineate rispetto al ruolo clinico. In molti casi, i MMG tendono a utilizzare tali strumenti solo per adempiere a obblighi regolatori, limitandosi al minimo indispensabile.

Questa distinzione emerge chiaramente anche in relazione al sistema di supporto alle decisioni cliniche, considerato utile e a volte persino rassicurante, mentre il FSE è spesso descritto come un "contenitore obbligatorio" con scarsa utilità operativa. Alcuni MMG sottolineano che la compilazione del FSE richiede tempo che preferirebbero dedicare all'attività clinica, contribuendo a sentimenti di frustrazione e inefficienza.

Un ulteriore elemento critico è rappresentato dalla crescente pressione comunicativa derivante dall'uso della messaggistica istantanea, che si configura come un tecnostressor

emergente non ancora adeguatamente considerato dalla letteratura. La ricezione continua di messaggi tramite WhatsApp, anche in orari non lavorativi, genera ansia di reperibilità, ipervigilanza e intrusioni nella dimensione privata, con importanti ricadute sull'equilibrio emotivo dei professionisti. Alcuni MMG riportano di aver introdotto sistemi di triage digitale o centralini automatici per contenere tale pressione, mentre altri riconoscono che la mancanza di regolamentazione delle comunicazioni rappresenta una delle principali criticità del loro lavoro quotidiano.

Una MMG intervistata racconta di aver ricevuto messaggi vocali alle tre di notte per richieste non urgenti, sviluppando una forma di ansia anticipatoria che la porta a controllare costantemente il telefono. Un altro medico, al contrario, descrive l'introduzione di un sistema automatico di gestione delle richieste come una "svolta psicologica" che ha ridotto l'invadenza digitale e migliorato la qualità della vita lavorativa.

Le competenze digitali si configurano come un fattore cruciale di moderazione del tecnostress. I MMG con maggiore familiarità con le tecnologie riescono a sfruttare software di automazione, strumenti di supporto basati su intelligenza artificiale e sistemi di gestione delle comunicazioni, ottenendo un significativo alleggerimento del carico di lavoro. Al contrario, coloro che possiedono competenze digitali limitate sperimentano con maggiore frequenza stress emotivo, senso di inadeguatezza e comportamenti di evitamento delle tecnologie. In alcuni casi estremi, l'accumulo di stress tecnologico è percepito come uno dei fattori che contribuiscono alla decisione di lasciare la professione.

L'analisi delle interviste mostra come la digital literacy non influisca solo sulla capacità di utilizzare le tecnologie, ma anche sul vissuto emotivo associato ad esse: i medici più esperti riferiscono di "dialogare" con i sistemi informativi, mentre i colleghi meno esperti parlano di "dover lottare" con essi. Questa differenza interpretativa sembra incidere sulla resilienza emotiva e sulla capacità di adattamento.

Infine, la performance prescrittiva appare influenzata sia dalla qualità dei sistemi digitali sia dal livello di tecnostress percepito. Nei contesti tecnologicamente avanzati, i flussi prescrittivi risultano più snelli e la gestione dei pazienti cronici è semplificata; nelle regioni meno digitalizzate, invece, il doppio inserimento dei dati e i frequenti disservizi determinano rallentamenti significativi e una riduzione della precisione documentale.

6. Discussione

I risultati preliminari confermano le previsioni dell'Affective Response Model, mostrando come gli stressor tecnologici attivino risposte affettive negative che, a loro volta, incidono in modo sostanziale sulla performance dei MMG. In particolare, l'overload documentale, la frammentazione dei sistemi, l'imprevedibilità tecnologica e l'invasività della messaggistica contribuiscono alla generazione di stati di ansia tecnologica (TISA), frustrazione e irritazione.

Particolarmente rilevante è il ruolo della percezione di controllo: il modello ARM suggerisce che la perdita di controllo percepita sulle tecnologie aumenta la probabilità di risposte affettive negative. Questa dinamica è confermata dalle testimonianze dei MMG, che riportano maggiore stress quando i sistemi non rispondono ai comandi, presentano down-time, oppure richiedono operazioni ridondanti non spiegate. La mancanza di trasparenza e prevedibilità dei sistemi digitali sembra quindi rappresentare un fattore centrale nel generare TISA.

Le tecnologie cliniche, percepite come coerenti con il ruolo professionale, tendono a generare emozioni neutre o positive, mentre quelle amministrative sono più frequentemente associate a vissuti negativi e comportamenti di evitamento. La digital literacy emerge come un elemento chiave nella capacità dei MMG di modulare tali risposte affettive e di integrare efficacemente la tecnologia nel proprio lavoro.

Un altro elemento che emerge è la tensione tra logiche professionali e logiche manageriali: quando le tecnologie sono percepite come strumenti per migliorare la cura, il loro uso è

accompagnato da un senso di efficacia; quando, al contrario, sono viste come mezzi di controllo o adempimento, attivano risposte affettive negative. Questa dinamica è ampiamente discussa nella letteratura sui professionisti ibridi e trova riscontro diretto nei dati raccolti.

7. Contributi attesi

Lo studio contribuisce alla comprensione del tecnostress in medicina generale e si inserisce nel dibattito della Track 11 evidenziando come l'introduzione di tecnologie sanitarie debba essere accompagnata non solo da investimenti tecnici, ma anche da una riflessione sulle dimensioni affettive, identitarie e organizzative che condizionano il modo in cui i professionisti vivono l'innovazione.

Il lavoro mette inoltre in luce l'importanza delle politiche regionali nella determinazione del carico tecnologico percepito dai MMG: sistemi informativi integrati, formazione adeguata e strumenti di supporto all'adozione possono ridurre significativamente il tecnostress e migliorare la qualità del lavoro. Inoltre, i risultati suggeriscono che il design dei sistemi digitali dovrebbe essere maggiormente user-centered, includendo i MMG nei processi decisionali e valutando l'impatto delle tecnologie non solo sulla produttività, ma anche sulle emozioni dei professionisti.

Una migliore governance digitale, una maggiore attenzione alle competenze digitali e una progettazione più user-centered dei sistemi possono favorire una riduzione del carico tecnologico e creare condizioni di lavoro più sostenibili per i MMG.

Innovazioni tecnologiche e Medicina di Genere: verso modelli personalizzati di assistenza sanitaria

Grazia Dicuonzo[1], Antonio Fusco[2], Virginia Milone[3], Nadia Cipullo[4]

1. Introduzione

Le innovazioni tecnologiche come l'intelligenza artificiale (IA) e la telemedicina sono in rapida e costante evoluzione e stanno trasformando profondamente diversi ambiti, tra cui quello medico. In particolare, i sistemi di IA comprendono tutte le tecnologie studiate per imitare l'intelligenza umana, replicando il comportamento dell'uomo: sistemi di machine learning, deep learning, robotica, ecc. (Haenlein e Kaplan, 2019; Bobini et al., 2022).

In campo sanitario, l'IA supporta decisioni fondamentali per la pratica clinica che incidono profondamente sulle varie attività e sugli esiti di salute, generando un vero e proprio cambiamento nella definizione della diagnosi, terapia, prognosi e gestione del paziente. L'incremento dei casi di malattie oncologiche e cronico-degenerative ha acuito la necessità di diagnosi sempre più precise e tempestive, accelerando il processo di adozione di strumenti di IA. La possibilità di intercettare il manifestarsi delle patologie in fase iniziale riduce disabilità e mortalità, incidendo anche su una riduzione dei costi di gestione del singolo paziente, ma, al contempo, rende indispensabile l'analisi di un numero molto elevato di dati clinici e immagini medicali. Al trend di crescita delle malattie citate si accompagna la necessità, sempre più avvertita, di personalizzazione delle cure al fine di ottimizzare la diagnosi, la prevenzione e il trattamento dei singoli pazienti (Shai et al., 2021).

L'utilizzo dell'IA in medicina è oramai pervasivo in ogni ambito della pratica clinica e sta favorendo l'applicazione dei principi della medicina di genere attraverso l'identificazione di differenze cliniche, biologiche e di risposta ai trattamenti tra uomini e donne. La medicina di genere (MdG) analizza come le differenze biologiche e socio-culturali tra uomini e donne influiscano sulla salute, sulle malattie e sulla risposta terapeutica ai trattamenti (Giovagnoni et al., 2021; Goetz et al., 2022). La rilevanza della tematica ha portato il legislatore ad emanare la Legge 3/2018 nella quale, per la prima volta in Europa, viene considerato il genere nella definizione dei percorsi diagnostici e terapeutici, nella ricerca scientifica, nella comunicazione ai cittadini, nella formazione degli studenti e nell'aggiornamento dei professionisti della salute.

Partendo da tali premesse, il lavoro mira a comprendere le modalità con le quali il management gestisce i processi di implementazione delle innovazioni tecnologiche (tra le quali l'IA) introdotte all'interno delle aziende sanitarie pubbliche, quali sono i principali fattori che favoriscono o rallentano i processi di adozione delle tecnologie e come tali dinamiche si intersecano con le esigenze e le prospettive della medicina di genere. Per raggiungere tali obiettivi, è stata adottata la metodologia del case study ed è stato utilizzato il framework di Implementation Science denominato Consolidated Framework for Implementation Research.

2. Analisi della letteratura

L'IA si occupa dello studio dei processi cognitivi mediante modelli computazionali e algoritmi in grado di simulare capacità umane come percepire, ragionare e agire (Charniak e McDermott, 1985; Winston, 1992). I sistemi di IA comprendono diverse tecnologie, tra cui machine learning, deep learning, reti neurali e robotica, che mirano a replicare il comportamento umano e a supportare decisioni complesse, sia in ambito clinico che manageriale (Haenlein e Kaplan, 2019; Bobini et al., 2022).

L'IA riveste un ruolo fondamentale poiché produce vantaggi per pazienti, operatori sanitari, organizzazioni ma anche per l'intero settore sanitario (Ali et al., 2023). Gli strumenti algoritmici sofisticati di cui si avvale sono in grado di accelerare la scoperta di informazioni di importanza clinica all'interno di grandi volumi di dati, agevolando i processi di decision-making e problem solving degli operatori, con benefici concreti per la salute dei pazienti (Secinaro et al., 2021). I processi decisionali relativi alla diagnosi necessitano di tempo e risorse che i sistemi di IA consentono di ridurre, con una conseguente ottimizzazione dei flussi di lavoro e una riduzione dei costi, migliorando la qualità dell'assistenza.

Le applicazioni di IA permettono di passare da un approccio sanitario reattivo a uno proattivo: identificando tempestivamente rischi clinici e patologie, queste tecnologie consentono interventi precoci e ottimizzano la programmazione delle risorse sanitarie (Fyhr et al., 2017; Bag et al., 2023). Inoltre, grazie alla capacità di analizzare grandi quantità di dati clinici stratificati in base a caratteristiche individuali, l'IA favorisce l'adozione di pratiche di medicina di genere, permettendo trattamenti maggiormente personalizzati e attenti alle differenze biologiche e sociali tra pazienti (Fanizzi et al., 2025).

Dal punto di vista organizzativo, l'implementazione di IA richiede team multidisciplinari, integrando competenze cliniche, ingegneristiche, informatiche e manageriali, per favorire la collaborazione, il knowledge sharing e il coordinamento interno ed esterno (Bobini et al., 2022). La formazione di nuove competenze tecnologiche, il coinvolgimento attivo del personale clinico e la cultura organizzativa favorevole al cambiamento risultano determinanti per il successo dei progetti. L'inclusione di esperti in medicina di genere all'interno dei team multidisciplinari può garantire che lo sviluppo e l'implementazione delle applicazioni di IA rispondano in modo efficace alle esigenze specifiche di diversi gruppi di pazienti (Alami et al., 2021; Golden, 2006).

Partendo da tali premesse, il presente studio si pone la seguente domanda di ricerca: "In che modo le aziende sanitarie gestiscono l'implementazione di innovazioni tecnologiche, tra cui l'intelligenza artificiale, integrando le esigenze della medicina di genere e quali fattori facilitano o ostacolano questi processi?"

3. Metodologia di ricerca

Per rispondere alla domanda di ricerca, è stata adottata la metodologia del case study, che costituisce un approccio qualitativo idoneo all'analisi di un fenomeno contemporaneo entro il suo contesto di vita reale, in particolare quando i confini tra fenomeno e contesto non risultano chiaramente definiti (Yin, 2014). Tale impostazione metodologica permette al ricercatore di cogliere la complessità del fenomeno, osservandone le molteplici dimensioni e avvalendosi di più fonti – quali documentazione interna, evidenze empiriche, interviste e osservazioni dirette.

Il caso oggetto di studio è stato selezionato secondo il principio del campionamento teorico (Eisenhardt, 1989), individuando un'azienda che presentasse caratteristiche coerenti con il fenomeno investigato e un processo di innovazione tecnologica sufficientemente chiaro, trasparente e osservabile (Pettigrew, 1988).

Nella fase di raccolta dei dati sono state definite due modalità di reperimento: 1) interviste semi-strutturate con il Direttore generale, il Dirigente Servizio Ingegneria Clinica e Sistemi Informativi e il responsabile del progetto di IA della durata di circa 60 minuti ciascuna; 2) consultazione di documenti aziendali (dati secondari), tra cui il Piano Integrato di Attività e

Organizzazione 2024-2026 e 2025-2027, atti deliberativi relativi alla formazione dei team di lavoro e delle loro funzioni, programmi di ricerca dei team multidisciplinari.

Le tracce delle interviste semi-strutturate sono state elaborate a partire dalla letteratura di riferimento e dal framework di Implementation Science noto come Consolidated Framework for Implementation Research (CFIR) (Damschroder et al., 2009; Kirk et al., 2016), che si articola in 33 costrutti raggruppati in cinque domini: caratteristiche dell'innovazione; ambiente esterno; ambiente interno; persone coinvolte nell'implementazione; processo di implementazione (Damschroder et al., 2009).

Il caso esaminato è un ente pubblico dotato di autonomia organizzativa e gestionale, specializzato nella cura delle malattie oncologiche, che ha conseguito la certificazione di Clinical Cancer Center in conformità alle disposizioni dell'Organizzazione degli Istituti del Cancer Europe. La ricerca si focalizza sull'implementazione, all'interno dell'unità operativa di ematologia, di sistemi di supporto alle decisioni (CDSS) basati su algoritmi di machine learning che indirizzano il personale medico nella formulazione di diagnosi tumorali, tenendo conto delle differenze di genere per personalizzare i percorsi diagnostico-terapeutici.

4. Risultati della ricerca

Si presentano di seguito i preliminari risultati dell'analisi del caso studio suddivisi per dominio e costrutto del Consolidated Framework for Implementation Research (adjusted).

i) Caratteristiche dell'innovazione

L'innovazione analizzata riguarda un sistema di supporto alle decisioni basato su algoritmi di machine learning in ambito ematologico, progettato per supportare il personale medico nella formulazione di diagnosi di alcune tipologie di linfomi. L'obiettivo strategico del sistema è quello di ridurre i tempi relativi alle attività diagnostiche, attraverso l'identificazione probabilistica del tipo di patologia tumorale. La base scientifica comprende studi internazionali e ricerche dell'ente che evidenziano come la risposta ai trattamenti e i profili di diagnosi possano differire in base alle caratteristiche di genere. L'adattabilità tecnologica consente di integrare nel tempo nuove variabili cliniche, incluse quelle correlate al genere, rendendo il sistema idoneo a costruire modelli più accurati e sensibili alle peculiarità del singolo individuo.

ii) Ambiente esterno

Le variabili politiche e normative hanno influito positivamente sul processo di implementazione dei sistemi di IA. Le attuali aree strategiche di intervento sia a livello europeo che nazionale incoraggiano lo sviluppo di tecnologie che favoriscano percorsi di cura personalizzati, anche nella prospettiva della medicina di genere. Un importante contributo è stato offerto dal PNRR e dalla ricerca finalizzata che hanno sostenuto finanziariamente gli studi orientati alla costruzione di sistemi di IA per la personalizzazione terapeutica avanzata.

iii) Ambiente interno

La struttura multidisciplinare del team (clinici, matematici, fisici, bioinformatici) favorisce un approccio integrato che consente di arricchire i modelli predittivi con variabili cliniche specifiche, incluse quelle legate al genere. La cultura aziendale orientata alla ricerca ha facilitato l'inserimento della dimensione di genere nei percorsi innovativi e ha promosso l'adozione di pratiche finalizzate alla personalizzazione delle cure. Nella unità operativa di ematologia, l'algoritmo è stato integrato rapidamente nelle routine cliniche, incrementando la capacità di proporre scelte diagnostiche e terapeutiche personalizzate e gender-sensitive.

iv) Le persone coinvolte

La multidisciplinarietà dei team consente di identificare e mitigare bias algoritmici, inclusi quelli di genere, e di costruire sistemi che favoriscano la personalizzazione clinica. La formazione mirata rafforza la capacità dei professionisti di interpretare gli output e di integrare decisioni sensibili alle differenze individuali e di genere.

v) Processo di implementazione

L'approccio bottom-up ha garantito che la pianificazione fosse aderente alle esigenze cliniche reali, incluse quelle relative alla personalizzazione del trattamento e alla sensibilità di genere. Le sperimentazioni avviate nelle linee di ricerca sull'IA costituiscono un contesto ideale per sviluppare modelli predittivi capaci di proporre percorsi individualizzati e gender-sensitive.

5. Conclusioni preliminari

Le analisi del caso studio sono ancora in corso. L'implementazione dell'innovazione nell'azienda esaminata documenta il percorso di introduzione di un sistema di machine learning a supporto delle diagnosi tumorali in ambito ematologico. Ciò che emerge con chiarezza è la centralità dell'integrazione nei processi, della trasparenza, della formazione e della governance dei dati come condizioni abilitanti. I principali benefici che emergono dall'implementazione dell'innovazione tecnologica sono: maggiore accuratezza diagnostica, riduzione di errori diagnostici, supporto al decision making clinico, possibilità di modelli predittivi anche basati su differenze di genere.

Il processo di implementazione delle innovazioni è stato caratterizzato da un approccio di tipo bottom-up: l'iniziativa è stata originata da un gruppo di professionisti composto da personale medico e ricercatori operanti all'interno dell'unità operativa di ematologia. La letteratura sottolinea come strategie bottom-up risultino efficaci nel limitare la comparsa di resistenze al cambiamento, riducendo potenziali conflitti sia verticali (tra manager e clinici) sia orizzontali all'interno dei team operativi (Alami et al., 2021; Golden, 2006).

Il ruolo dei team multidisciplinari si conferma centrale, evidenziando come la collaborazione tra professionisti con competenze diversificate costituisca un fattore chiave per lo sviluppo di soluzioni innovative che non solo potenziano i servizi e migliorano la qualità dei processi clinico-assistenziali, ma favoriscono anche una gestione più efficiente delle risorse impiegate (Bobini et al., 2022). L'integrazione della medicina di genere nei sistemi di IA ha permesso di considerare differenze biologiche e cliniche tra pazienti, contribuendo a decisioni più precise, appropriate ed eque, in grado di adattarsi alle caratteristiche individuali dei singoli pazienti.

Growth and innovation strategies in family businesses: emerging models between governance, continuity, and digital transformation

Michele Modina[1], Anna Vittoria Formisano[2], Ilaria Nunzia Nigro[3], Marilena Bredice[4]

1. Introduction

Family businesses represent one of the most important players in European economic systems, accounting for over 70% of businesses and contributing substantially to job creation, innovation, and social value (Basco, 2015; Rovelli et al., 2022). Their resilience and ability to adapt to changing contexts are often attributed to specific structural characteristics: a long-term orientation, a strong value identity, attention to reputation, and intergenerational cohesion (De Massis et al., 2018). However, these same traits can translate into strategic rigidity, limiting the propensity to pursue non-traditional growth paths or undertake radical innovation processes (Chrisman et al., 2015; Hernández-Perlines et al., 2023).

In recent years, three trends have redefined the competitive trajectory of family businesses. Firstly, the growing turbulence in global markets, characterized by volatility in demand and geopolitical instability, requires more dynamic diversification and internationalization strategies (Benito et al, 2022). Secondly, post-pandemic digital transformation has accelerated the adoption of advanced technologies, such as artificial intelligence (AI), blockchain, and big data analytics, opening new opportunities for development but requiring a profound cultural change (Worek, 2025). Finally, the push towards economic, social, and environmental sustainability has introduced new approaches to governance and performance management (De Souza Barbosa et al., 2023). In particular, the COVID-19 pandemic represented a turning point: the crisis forced family businesses to adopt new technologies and organizational methods to ensure business continuity, accelerating adaptation processes that had previously developed more gradually (De Massis et al., 2022).

International literature has recognized that family businesses possess distinctive resources, such as relational capital, tacit knowledge, long-term identity, and intergenerational cohesion, which can be important enablers of innovation and growth (Genc, 2024; López-Nicolás et al., 2024). However, the fragmentation of studies has hindered an integrated understanding of these dynamics.

This paper aims to fill this gap by proposing a unified perspective that analyzes the relationship between growth strategies, family governance, and digital innovation in family businesses. The overall objective is to construct an integrated theoretical model capable of explaining how the combination of family values, governance structures, and digital skills can foster sustainable growth paths consistent with the intergenerational mission of the business.

2. Theoretical framework

2.1. Growth strategies in family businesses

The analysis of growth strategies for family businesses has long been a diverse strand of management and family business literature. Already in the contributions of Habbershon and Williams (1999), growth is understood as a process that serves to perpetuate the business and the family, rather than as an end in itself. The resource-based approach (RBV) and the "familiness" approach have emphasized the unique combination of tangible and intangible resources specific to family businesses, highlighting how these resources, if properly developed, can constitute a sustainable competitive advantage (Gorovaia & Pfahnl, 2024).

In the most recent developments in research, the theme of growth has been reinterpreted in a strategic-dynamic key. Family firms, in fact, no longer limit themselves to preserving family capital, but seek to enhance it through processes of innovation, diversification, and internationalization (De Massis et al., 2018). Literature distinguishes between different trajectories: organic expansion, mergers and acquisitions, sector diversification, and internationalization.

Palm (2024) shows that M&A transactions have increasingly become a proactive tool for acquiring technological expertise and innovative capabilities, especially in second- or third-generation family businesses. From this perspective, growth is no longer just a goal of expansion in size but a strategy of competitive adaptation. Similarly, diversification is interpreted as a mechanism for mitigating risk and exploring new market opportunities consistent with family values and the relational capital structure of the business.

The most recent literature proposes a distinction between incrementalist and transformative growth strategies. The former, more traditional, aim to consolidate competitive position through gradual and controlled investments, consistent with the long-term orientation typical of family businesses (Schweiger et al., 2024). The latter, on the other hand, involve a greater propensity for risk and openness to new business areas or external partnerships (López-Nicolás et al., 2024). This distinction reflects the dualism between the desire to maintain control and the need to adapt to rapidly changing markets (Akram et al., 2022; López-Nicolás et al., 2024; Schweiger et al., 2024).

Internationalization represents a form of "learning growth," in which family businesses develop new skills and expand their networks through exposure to external contexts. Collaboration with institutional actors, industrial partners, and support organizations allows for increased innovative capacity (Stam, 2015; Cavallo et al., 2018).

In summary, the literature shows that growth strategies in family businesses derive from a dynamic balance between continuity and change. The goal is not simply to increase the size of the business, but to build sustainable development models capable of integrating family aspirations with the competitive demands of the global market (López-Nicolás et al., 2024).

2.2. Family governance and socioemotional wealth (SEW)

In this context, corporate governance determines the ability of a family business to implement growth and innovation strategies (D'Allura & Faraci, 2018). Structural characteristics such as ownership concentration, the presence of family members on the board of directors and in management, and intergenerational succession mechanisms profoundly influence risk appetite, decision-making speed, and willingness to collaborate with external actors (Chrisman & Patel, 2012; Kotlar et al., 2023).

One of the most established theoretical paradigms for understanding these dynamics is that of socioemotional wealth (SEW) (Berrone et al., 2012). SEW represents the set of non-economic benefits that the family derives from owning and controlling the business: the perpetuation of

values, the prestige of the name, the identification of members with the company, and the ability to pass on the family heritage to future generations.

Traditionally, SEW has been associated with conservative behaviors, such as risk aversion or reluctance to dilute family ownership (Gómez-Mejia & Herreo, 2022). However, more recent studies have introduced an evolutionary and dynamic view of the concept. According to Flen Rossi and Rojas-Vallejos (2024), SEW can become a lever for innovation and adaptation when the family interprets growth and technological transformation as tools for preserving and strengthening its identity over time.

The dynamic approach to SEW explains why some family businesses manage to reconcile traditional values with processes of radical renewal (Flen Rossi & Rojas-Vallejos, 2024; Chirico et al, 2025). In these cases, growth becomes a form of "continuity through change" and the family acts as an agent of transformation rather than inertia (Genc, 2024).

At the same time, the composition of boards plays a decisive role. The presence of external directors, the entry of new generations, and the diversification of managerial skills increase the propensity for radical innovation, while reducing the risk of family conflicts. Family governance, therefore, should not be interpreted as a static structure, but as a dynamic mechanism that constantly mediates between identity and adaptation (Gonzales-Bustos et al., 2020; Turrent et al., 2023; Fiorillo et al., 2025).

2.3. Innovation and digital transformation

Innovation has long been a controversial topic for family businesses. While several studies have highlighted their tendency toward conservatism (Nieto et al., 2015), others have emphasized their resilience and ability to innovate in a sustainable manner (Duran et al., 2016). The COVID-19 pandemic represented a significant turning point, forcing many family businesses to accelerate digitalization to ensure business continuity.

De Massis et al. (2022) showed how the pandemic crisis has fostered a process of "forced innovation," pushing even the most traditional businesses to adopt digital technologies, e-commerce platforms, smart working solutions, and data analysis systems. However, only some of these businesses have managed to turn technology adoption into a real competitive advantage, due to a lack of managerial skills and flexible organizational structures.

The integration of artificial intelligence and blockchain-based tools requires a profound rethinking of governance, decision-making processes, and intergenerational relationships (Atienza-Barba et al., 2025; Kumar, 2025). Effective technology adoption depends, in fact, on the ability to combine tacit and relational knowledge accumulated over time with new digital skills (Belkhodja, 2022; Nieto et al., 2023).

In this context, digital transformation is not just a technological phenomenon, but a process that redefines family interactions, decision-making mechanisms, and the intergenerational transfer of skills (Porfirio et al., 2024). Recent studies show that digital transformation can only have a positive effect on performance when accompanied by cultural renewal and openness to collaboration with external actors, such as universities, startups, and technology providers (López-Nicolás et al., 2024).

The integration of family values and technological skills is now the new frontier for family businesses: companies that have been able to transform digitalization into a factor of identity strengthening in the post-pandemic phase are those that have shown the greatest success and resilience (Nieto et al., 2023; Zapata-Cantu et al., 2023). According to Genc (2024), the coexistence of a long-term perspective and an innovation-oriented culture encourages family businesses to adopt an 'ambidextrous' approach, aimed at balancing the exploitation of existing skills with the exploration of new growth opportunities.

Zhou (2025) shows how digital internationalization allows family businesses to overcome traditional geographical limitations while maintaining the centrality of the family in governance.

From this perspective, technology becomes a bridge between the local and the global, between tradition and modernity.

López-Nicolás et al. (2024) suggest that sustainable innovation in family businesses emerges from the alignment of digital strategies with principles of social and environmental responsibility. This approach reflects the growing trend among family businesses to consider social impact as an integral part of their long-term mission.

Finally, the bibliometric results of the analyses confirm that research is converging towards an integrated paradigm, in which growth, innovation, and sustainability are interpreted as interdependent dimensions. Thanks to their value structure and adaptability, family businesses can become laboratories of responsible transformation, capable of combining economic performance and social cohesion.

3. Methodology

To achieve the research objectives, a bibliometric methodology was adopted, which is currently considered one of the most effective tools for analyzing, systematizing, and mapping a large body of scientific knowledge in a given field of study (Verbeek et al., 2002; Khan et al., 2022). The appeal of bibliometric analysis lies in its ability to process large amounts of scientific data, facilitating an accurate and visual representation of the connections between authors, institutions, keywords, and research areas. The use of dedicated software, such as VOSviewer (Van Eck & Waltman, 2010), and complementary tools such as Bibliometrix (Aria & Cuccurullo, 2017), allows the generation of thematic maps and co-occurrence networks that can graphically represent the conceptual structures underlying academic production.

However, the validity of a bibliometric analysis depends on the quality and reliability of the sources used. For this reason, this research was based exclusively on Scopus, one of the most internationally accredited multidisciplinary databases, capable of guaranteeing the coverage and relevance of the contributions analyzed (Zupic & Čater, 2015; Donthu et al., 2021). The analysis focused exclusively on articles in English, without imposing any time limits, in order to include all relevant scientific publications.

The selection was limited to the categories “Business, Management, and Accounting” and “Economics, Econometrics and Finance” with the aim of outlining a picture consistent with the managerial and strategic perspectives of the topic. However, to obtain a more complete view, gray literature sources such as conference proceedings, books, chapters, and review articles were also considered, in line with the recommendations of Adams et al. (2017), Hiebl (2023), and Linnenluecke et al. (2020).

The keywords used in the Scopus search were as follows: (“family firm*” OR “family business*” OR “family company*” OR “family enterprise*”) AND (“growth strategy” OR “innovation” OR “digital transformation” OR “artificial intelligence” OR “AI”) AND (“socioemotional wealth” OR “socio-emotional wealth” OR ‘SEW’ OR “governance”).

The queries returned a total of 305 results. After an initial relevance analysis and the removal of duplicates, the contributions underwent a systematic selection process based on the PRISMA 2020 (Preferred Reporting Items for Systematic Reviews and Meta-Analyses) model, which represents the most advanced methodological benchmark for the selection and validation of content in systematic reviews and meta-analyses (Moher et al., 2021; Page et al., 2021).

This approach ensured high transparency, replicability, and reliability of the analysis process, in line with the suggestions of Gutiérrez-Salcedo et al. (2018) and Fusco et al. (2020). The final sample, consisting of 275 contributions in the “Management” and “Finance” areas, was subjected to bibliometric analysis using two complementary techniques: performance analysis and scientific mapping (Cobo et al., 2011; Baker et al., 2020). Performance analysis was used to assess the productivity and scientific impact of authors, institutions, countries, and journals, providing insights into the distribution and evolution of academic production over time. This phase made it

possible to identify centers of excellence in research on growth and innovation in family businesses and to analyze their influence on the development of the main theoretical lines.

At the same time, scientific mapping has made it possible to explore the conceptual structure of the field of study, identifying the interrelationships between the different thematic dimensions through the analysis of keyword co-occurrences, co-citations, and co-authorship. The use of VOSviewer software has made it possible to graphically represent these relationships, constructing co-authorship maps (Acedo et al., 2006), co-occurrence networks, and co-citation networks (White & Griffith, 1981).

The co-authorship analysis highlighted the density of collaborations between authors and institutions, allowing us to identify the most active research clusters and emerging scientific networks. Co-occurrence analysis, on the other hand, has made it possible to identify the semantic structure of the field, determining the frequency and strength of association between key concepts related to "family firms," "innovation," "growth strategies," and "digital transformation." Finally, co-citation, based on the assumption that two articles frequently cited together deal with related topics, made it possible to outline the cognitive configuration of the discipline (Van Eck & Waltman, 2010).

The methodological process adopted therefore follows a sequential logic of identification, screening, and selection, ensuring a consistent and integrated reading of scientific production. This approach has made it possible to define a comprehensive picture of the state of the art and to identify the main trajectories of development of research on growth strategies and innovation in family businesses.

4. Expected results

Performance analysis provides an overview of scientific developments in the field of growth strategies and innovation in family businesses, highlighting the main trends over time, authors, countries, and sources of publication.

The trend over time in publications (Figure 1) shows growing and constant interest, with an initial phase of exploration in the 2000s and a significant acceleration since 2015. The most recent peak, in the two-year period 2023–2024, confirms that the topic is booming and has not yet reached maturity. This dynamic reflects the growing attention to digital transformation and sustainability as new strategic levers for family firms.

Analysis of the main authors shows the formation of a consolidated scientific core, including De Massis, Kraus, Kotlar, Lazzarotti, and Martínez-Romero, which constitutes the theoretical reference for studies on growth, innovation, and governance in family businesses. The relative homogeneity in the distribution of publications suggests a consolidating field, characterized by a high degree of collaboration and interdisciplinary openness.

From a geographical perspective, production is dominated by China, Italy, and Spain, followed by the United States and the United Kingdom. The strong presence of European countries reflects the importance of family businesses in the continent's productive fabric, while China's rise indicates growing international attention to family models of growth and innovation in emerging markets.

Finally, publication sources confirm the relevance of the topic within leading management and innovation journals, such as the Journal of Family Business Strategy, the Journal of Family Business Management, and the Journal of Business Research. The balanced distribution between specialist and generalist journals signals the cross-cutting nature of the topic and its progressive integration into broader debates on strategy and sustainability.

Overall, the results of the performance analysis show a rapidly growing thematic domain, supported by a cohesive and geographically diverse scientific community, confirming the centrality of family businesses as a privileged laboratory for studying the interaction between innovation, governance, and sustainable growth.

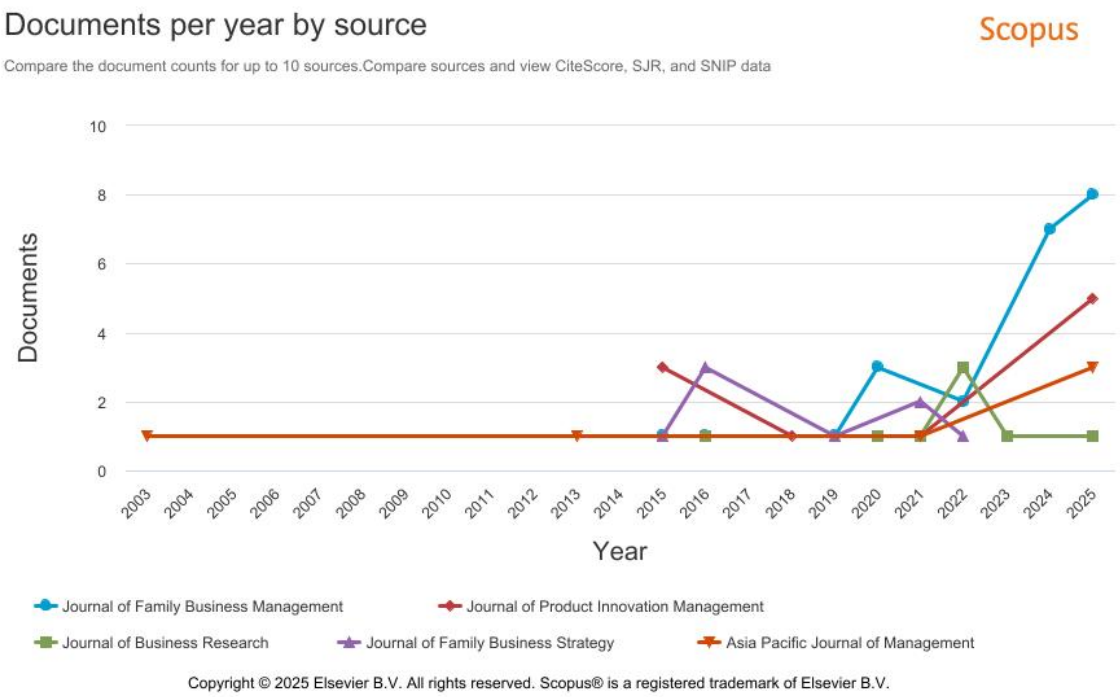

Figure 1. Documents by year by source

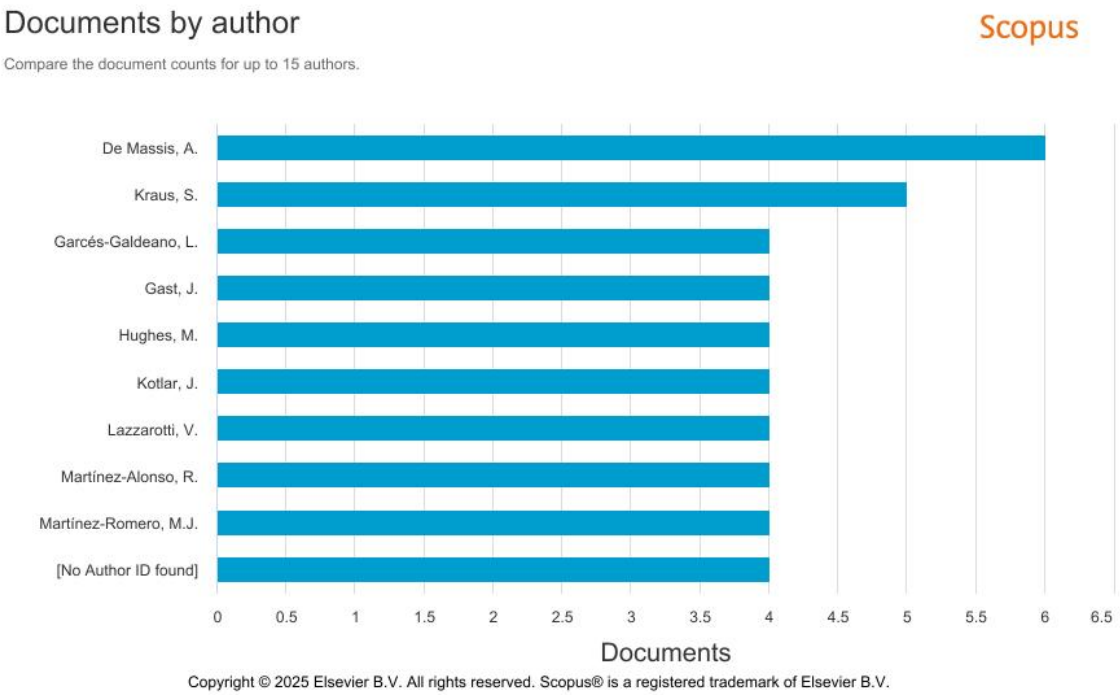

Figure 2. Documents by author

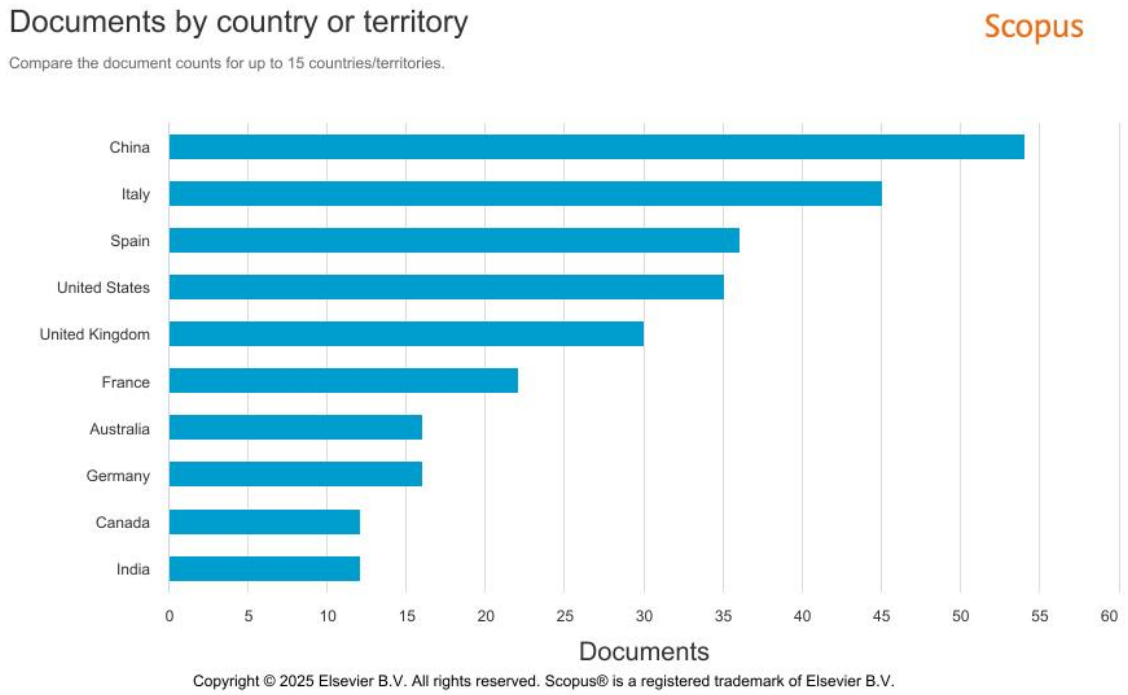

Figure 3. Documents by country or territory

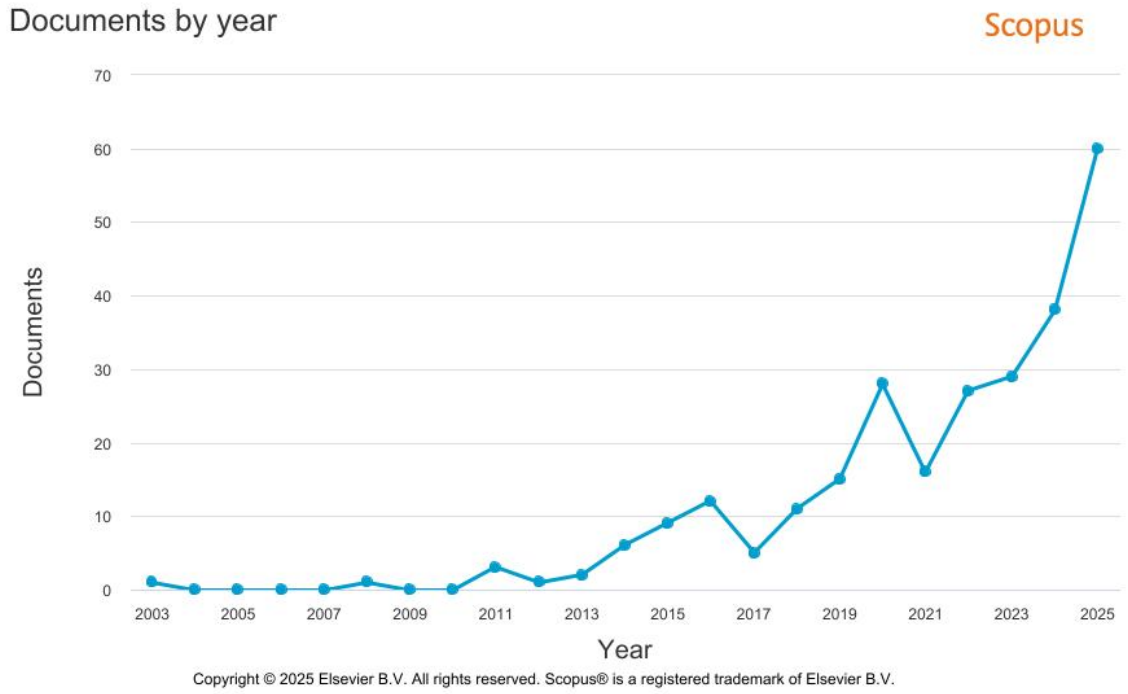

Figure 4. Documents by year

The research, which is still ongoing, is expected to achieve significant results in terms of theory and application. Firstly, it is expected to outline an integrated mapping of the literature on growth strategies and innovation in family businesses. A conceptual evolution is expected to

emerge from the traditional view of growth, based on continuity and control, towards a "hybrid" perspective, in which digitalization and innovation represent tools for protecting the SEW and not factors of threat.

Secondly, bibliometric analysis should confirm the centrality of governance as a mechanism connecting family values and innovation capacity. Family businesses with more diversified and professionalized boards are expected to show a greater propensity to combine external growth strategies with internal innovation processes, in line with the latest research.

A third expected result concerns the construction of an integrated conceptual model linking family governance, dynamic SEW, and digital transformation as joint determinants of growth. This model, which will form the basis for future empirical investigations, aims to explain how entrepreneurial families can transform their identity values into a sustainable competitive advantage through the selective adoption of digital technologies and openness strategies.

Finally, we expect to identify the most relevant research gaps, particularly those relating to the impact of artificial intelligence on family decision-making practices, the role of new generations in the diffusion of innovation, and the interactions between territorial ecosystems and the performance of family businesses.

5. Conclusions and implications

This study contributes to advancing knowledge about family businesses by providing a unified view of the relationships between growth, innovation, and governance. Its main contribution lies in proposing a theory of adaptive growth, in which the capacity for innovation derives from the dynamic interaction between family values and digital skills. Far from being a constraint, SEW is a strategic resource capable of guiding innovation in a responsible manner consistent with family identity.

The managerial implications suggest the need to promote more open and inclusive governance models that encourage the participation of new generations and the entry of digital skills into boards. Digital transformation must be interpreted as a process of evolutionary continuity, capable of strengthening the reputation and sustainability of family businesses in the long term. Finally, the policy implications concern the need for public programs to accompany digitization and incentives for management training, in order to support the competitiveness of the European family business fabric.

Leader nell'era degli algoritmi: leadership e percezioni dell'intelligenza artificiale nella PA

Davide Giacomini[1], Lisa Grandi[2], Giacomo Carli[3]

1. Introduzione

L'intelligenza artificiale (IA) sta progressivamente occupando un ruolo sempre più rilevante nelle scelte gestionali e nelle pratiche organizzative, trasformando sia il settore privato (Davenport & Ronanki, 2018) sia quello pubblico (Mergel et al., 2023; Tangi et al., 2024).

Nonostante la crescente attenzione verso l'IA nelle amministrazioni pubbliche, la letteratura presenta un gap significativo: mentre numerosi studi hanno analizzato il ruolo della leadership nell'accettazione tecnologica nel settore privato (Aziz et al., 2020; Hasija & Esper, 2022; Molino et al., 2021; Schepers et al., 2005; Smothers et al., 2024; Yuniawan et al., 2025; Zhang et al., 2025), nel settore pubblico le ricerche si sono concentrate soprattutto sulle percezioni dei cittadini (Aoki, 2020; Araujo et al., 2020; Gesk & Leyer, 2022; Schiff et al., 2025), o sugli atteggiamenti generali dei dipendenti verso l'IA (Ahn & Chen, 2022; Giraldi et al., 2024; Haesevoets et al., 2025), trascurando il contributo della leadership nel modellare la propensione verso queste evoluzioni tecnologiche.

Il presente lavoro mira a colmare tale lacuna, esplorando in quale modo la leadership possa efficacemente sostenere l'adozione di tecnologie legate all'IA nel settore pubblico. In particolare, l'analisi indaga come la leadership trasformazionale (Bass & Avolio, 1994) e lo scambio leader-membro (LMX) (Bauer & Green, 1996) possano influenzare le attitudini legate all'accettazione dell'IA da parte dei dipendenti pubblici. Tale scelta mira ad approfondire l'evidenza che la leadership possa plasmare non solo il contesto organizzativo, ma anche i significati attribuiti all'innovazione, incidendo sull'accettazione dell'innovazione tecnologica e, in ultimo, sull'utilizzo ottimale della stessa (Ajzen & Fishbein, 2000; Schepers et al., 2005; Zare & Flinchbaugh, 2025).

Muovendo dalla centralità delle percezioni individuali nei modelli di accettazione tecnologica (Ajzen, 1985; Davis, 1989) e dalle evidenze che collegano atteggiamenti favorevoli a una maggiore propensione all'uso dell'IA (Choung et al., 2023; Grassini, 2023; Lichtenthaler, 2019), il presente studio risponde a due domande di ricerca: (1) in che modo differenti forme di leadership influenzano la propensione dei dipendenti pubblici ad adottare l'IA? e (2) tale relazione è mediata dal valore organizzativo percepito?

Trattandosi di un lavoro in corso, le analisi presentate costituiscono risultati preliminari suscettibili di ulteriori approfondimenti e verifiche nelle fasi successive della ricerca. Ciononostante, utilizzando un modello di equazioni strutturali (SEM) su un campione di 809 dipendenti di enti locali italiani, emergono spunti interessanti. La presenza di leadership trasformazionale incide indirettamente sulla propensione ad adottare l'IA attraverso il valore organizzativo percepito. Al contrario, lo scambio leader-membro non presenta alcuna influenza

[3] Professore associato, Open University (UK); giacomo.carli@open.ac.uk

significativa. Coerentemente con la letteratura esistente, caratteristiche individuali e organizzative contribuiscono ulteriormente a modellare tali percezioni.

2. Quadro teorico e ipotesi

Nei processi di cambiamento organizzativo, è ampiamente riconosciuto che le persone abbiano un ruolo centrale (Choi, 2011). Le percezioni e le attitudini individuali rappresentano, infatti, determinanti cruciali dei comportamenti, inclusi quelli legati all'adozione delle innovazioni tecnologiche (Ajzen & Fishbein, 2000; Choung et al., 2023; Venkatesh et al., 2003). Nel settore pubblico, l'adozione dell'intelligenza artificiale costituisce una trasformazione particolarmente rilevante, poiché introduce modalità decisionali e operative nuove, potenzialmente in grado di modificare ruoli, competenze e confini professionali (Giacomini & Grandi, 2025). Analizzare le attitudini dei dipendenti verso tali tecnologie risulta dunque fondamentale per comprendere i meccanismi di accettazione e resistenza, nonché per prevedere l'utilizzo ottimale dell'IA nel lavoro amministrativo (Araujo et al., 2020; Grimmelikhuijsen & Tangi, 2024; Lichtenthaler, 2019). Il celebre modello di accettazione della tecnologia (Technology Acceptance Model, TAM), fornisce un quadro teorico solido per interpretare tali dinamiche, evidenziando le percezioni individuali come i principali antecedenti dell'adozione e utilizzo di una tecnologia (Davis, 1989; Venkatesh, 2022). Un ulteriore riferimento teorico rilevante è rappresentato dalla teoria della Diffusione dell'Innovazione (Diffusion of Innovation, DOI), secondo la quale uno dei principali determinanti dell'adozione e della successiva diffusione di un'innovazione tecnologica risiede nel vantaggio relativo percepito dagli utilizzatori. Evidenze più recenti confermano inoltre che il successo nell'adozione delle tecnologie basate sull'intelligenza artificiale non dipende esclusivamente dalle caratteristiche intrinseche della tecnologia, dalle risorse organizzative disponibili o dalle pressioni normative esterne, ma è significativamente influenzato anche dalle predisposizioni individuali e dal livello di accettazione da parte dei dipendenti pubblici (Haesevoets et al., 2025). Tali valutazioni a livello micro plasmano le risposte comportamentali all'innovazione e, se aggregate, influenzano i percorsi di adozione organizzativa e il successo dell'implementazione (Puranam, 2018).

Recenti evidenze empiriche nell'ambito della pubblica amministrazione corroborano tale prospettiva, mostrando come il valore organizzativo percepito costituisca un significativo predittore della predisposizione individuale all'adozione dell'intelligenza artificiale (Grimmelikhuijsen & Tangi, 2024). Ad esempio, Ahn e Chen (2022) evidenziano come le percezioni individuali svolgano un ruolo determinante nel plasmare la disponibilità a sostenere l'adozione dell'intelligenza artificiale nelle organizzazioni pubbliche. In particolare, tale disponibilità risulta fortemente influenzata dai benefici organizzativi attribuiti all'impiego della tecnologia, quali il miglioramento della qualità dei servizi erogati e il rafforzamento dei processi decisionali. Gli autori mostrano come la percezione del contributo dell'IA alle prestazioni organizzative, in termini di efficienza, efficacia e creazione di valore pubblico, assuma un peso maggiore rispetto a fattori quali l'incremento della produttività individuale o gli atteggiamenti personali nei confronti della tecnologia, configurandosi come un elemento chiave nel sostegno alla sua implementazione e al suo utilizzo. In tale prospettiva, e alla luce dei principali contributi delle teorie tradizionali, il presente lavoro ipotizza che il valore organizzativo derivante dall'adozione della nuova tecnologia, così come percepito dal dipendente pubblico, rappresenti un fattore determinante nel modellare le percezioni individuali nei confronti della tecnologia e, conseguentemente, la propensione o la resistenza al suo utilizzo.

La centralità delle attitudini individuali richiama l'attenzione sul ruolo della leadership, la quale può modellare tali rappresentazioni, influenzando il modo in cui i dipendenti comprendono e valutano il cambiamento tecnologico (Rodriguez Müller et al., 2025). Comune a molte definizioni di leadership è, infatti, l'enfasi sul processo di influenza sociale che essa implica, attraverso il quale vengono facilitati gli sforzi per raggiungere obiettivi condivisi (Oreg & Berson,

2019), e che influenza le attitudini e i comportamenti dei follower (Backhaus & Vogel, 2022). La relazione con i follower consiste, infatti, in uno scambio reciproco, in cui l'impegno, la fiducia e il sostegno emotivo del leader vengono ripagati attraverso impegno, lealtà e apertura al cambiamento (Cropanzano & Mitchell, 2005; Oreg & Berson, 2011; Zhang et al., 2025).

Nel contesto dell'adozione dell'IA, quindi, l'influenza sociale della leadership risulta particolarmente rilevante. L'introduzione di tecnologie avanzate può generare tra i follower incertezza, resistenza o timori legati alla sostituzione di competenze e ruoli, che possono essere superate grazie al supporto del leader (Oreg & Berson, 2019; Schepers et al., 2005). Inoltre, la leadership può influire direttamente sulle percezioni individuali, favorendo una valutazione più positiva dei benefici dell'IA e aumentando quindi la probabilità di utilizzo, in linea con i meccanismi proposti dal TAM (Aziz et al., 2020; Lichtenthaler, 2019).

L'ipotesi di fondo del lavoro è che i leader nella pubblica amministrazione, alla luce della progressiva adozione dell'IA (Grimmelikhuijsen & Tangi, 2024), mostrino una maggiore propensione verso l'adozione di tale innovazione (Haesevoets et al., 2025) e, di conseguenza, abbiano interesse a promuoverne l'accettazione anche tra i dipendenti dell'organizzazione (Attard-Frost et al., 2024; Kelly, 2025; Osborne & Nasi, 2024; Tangi et al., 2022). Al contempo, come illustrato, le percezioni individuali relative ai benefici organizzativi derivanti dall'utilizzo delle innovazioni tecnologiche sono fattori chiave per l'accettazione, il supporto e l'utilizzo ottimale delle medesime. L'adozione efficace dell'IA nelle organizzazioni dipende, infatti, dalla propensione individuale all'utilizzo, la quale è a sua volta condizionata dalla percezione, da parte degli individui, del valore che tale tecnologia può apportare al conseguimento degli obiettivi organizzativi.

In tale prospettiva, diverse forme di leadership possono essere comprese come configurazioni differenti di risorse simboliche, motivazionali e relazionali offerte ai follower, che incidono sulle percezioni individuali e sulla conseguente disponibilità all'adozione e all'utilizzo dell'IA. Per il loro potenziale, il lavoro analizza l'influenza di leadership trasformazionale e LMX (Jeong & Jeong, 2025; Martin et al., 2016). È necessario notare che, che, sebbene la letteratura talvolta li sovrapponga, i due costrutti sono concettualmente distinti e implicano meccanismi di influenza differenti (Zare & Flinchbaugh, 2025). Muovendo da tali premesse teoriche, è possibile articolare in modo più specifico come differenti stili di leadership si traducano in meccanismi capaci di influenzare le percezioni e i comportamenti dei dipendenti rispetto all'IA.

La leadership trasformazionale si caratterizza per i quattro elementi di influenza idealizzata, motivazione ispiratrice, stimolazione intellettuale e considerazione individualizzata (Avolio et al., 1991; Avolio & Yammarino, 2013; Bass & Avolio, 1994). I leader trasformazionali ispirano e guidano i follower mediante una visione motivante, promuovono l'apertura al cambiamento e favoriscono l'apprendimento organizzativo (Wright et al., 2012). In tal modo, possono migliorare la percezione del valore derivante dalle nuove tecnologie, come evidenziato da studi condotti in organizzazioni private (Jeong & Jeong, 2025; Quaquebeke & Gerpott, 2023; Schepers et al., 2005). Seguendo la logica del quadro teorico proposto, è plausibile che tale influenza operi proprio attraverso il beneficio organizzativo dell'IA per la pubblica amministrazione. Quindi, si può ipotizzare quanto segue:

- HP1.1. La leadership trasformazionale ha un effetto positivo sulla propensione ad adottare l'AI.
- HP1.2. Il valore organizzativo percepito media la relazione tra leadership trasformazionale e propensione ad adottare l'IA.

Il costrutto del LMX si concentra, invece, sulla qualità della relazione diadica tra leader e follower, nel quale il leader costruisce un rapporto personalizzato a seconda del follower con il quale si interfaccia (Wright et al., 2012). Lo scambio leader-membro è concettualmente radicato nella teoria dello scambio sociale, poiché descrive come le relazioni basate su fiducia, rispetto e reciprocità producano benefici reciproci (Cropanzano & Mitchell, 2005; Tummers & Knies, 2013). Un LMX di alta qualità genera maggiore coinvolgimento, lealtà e disponibilità dei

dipendenti, con effetti positivi su diversi esiti individuali e organizzativi (Martin et al., 2016). In contesti di innovazione tecnologica, relazioni di questo genere hanno solitamente un'influenza positiva e possono favorire atteggiamenti più aperti e cooperativi verso l'adozione di strumenti innovativi (Smothers et al., 2024). Anche per il LMX, coerentemente con la prospettiva teorica proposta, è plausibile che l'effetto si manifesti attraverso il beneficio organizzativo percepito.

- HP2.1. La presenza di LMX ha un effetto positivo sulla propensione ad adottare l'AI.
- HP2.2. Il valore organizzativo percepito media la relazione tra LMX e propensione ad adottare l'IA.

Nel complesso, entrambe le prospettive teoriche convergono nel riconoscere alla leadership un ruolo centrale nel promuovere fiducia, reciprocità e allineamento dei follower rispetto agli obiettivi organizzativi. Attraverso tali meccanismi, la leadership è in grado di influenzare in modo significativo i processi interpretativi e valutativi mediante i quali gli individui attribuiscono valore all'introduzione di tecnologie emergenti, orientandone la percezione del contributo alla creazione di valore organizzativo. In questa prospettiva, il comportamento e lo stile relazionale dei leader non si limitano a plasmare la cultura e il clima organizzativo, ma incidono anche sulle percezioni individuali relative al valore, all'affidabilità e alle potenzialità delle tecnologie emergenti. Il valore organizzativo percepito si configura pertanto come una leva strategica attivabile dalla leadership per favorire una maggiore disponibilità all'adozione dell'intelligenza artificiale e, più in generale, per sostenere la propensione, prima individuale e poi organizzativa, all'innovazione.

3. Misure e metodologie

Il modello proposto utilizza scale validate per la misurazione dei costrutti di interesse. I due tipi di leadership sono operazionalizzati mediante scale derivate rispettivamente da Wright et al. (2012) e Bauer & Green (1996). Il valore organizzativo dell'IA per la pubblica amministrazione consiste in una scala sviluppata e validata dagli autori[4]. La propensione all'adozione di IA è misurata tramite la scala di Grassini (2023), la quale valuta le attitudini generali verso l'IA. La scala viene qui utilizzata come proxy della propensione all'adozione, in quanto sviluppata nell'alveo concettuale del TAM. Tutte le variabili sono state misurate tramite item a risposta su scala Likert a 5 punti (da 1 = "fortemente in disaccordo" a 5 = "fortemente d'accordo").

Le variabili di controllo incluse nel modello sono: età, genere, ruolo, anni di esperienza lavorativa dell'individuo e dimensione (numero di abitanti serviti) e sede (area geografica) dell'amministrazione, caratteristiche rivelatesi influenti in modelli analoghi (Ahn & Chen, 2022; Araujo et al., 2020; Giraldi et al., 2024).

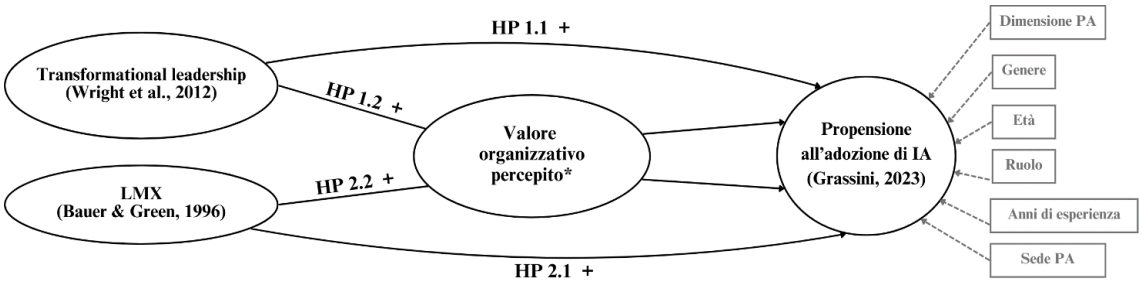

Figura 1. Illustrazione del modello proposto

[4] L'articolo di validazione del costrutto è in fase di review.

I dati sono stati raccolti mediante un questionario somministrato a un campione di dipendenti degli enti locali italiani, utilizzando una strategia di snowball sampling. Dopo le procedure di data cleaning, il campione finale risulta composto da 809 rispondenti. La raccolta si è concentrata sulle amministrazioni locali, poiché rappresentano il livello amministrativo più vicino ai cittadini e sono responsabili dell'erogazione di un'ampia gamma di servizi pubblici. Il campione è costituito prevalentemente da donne (n= 501), seguite da uomini (n= 306) e da persone non binarie (n= 2). In linea con i dati forniti dall'Osservatorio INPS, che sottolinea come il 76,6% dei lavoratori pubblici abbia almeno 40 anni (INPS, 2025), la maggioranza relativa dei rispondenti ha più di 49 anni (n= 399), seguita dalla fascia 30-49 anni (n= 372) e infine da quella sotto i 30 anni (n= 38). In termini territoriali, il 37.5% proviene da amministrazioni del Nord Italia (n= 304), il 59% dal Sud (n= 477) e il 3.5% dal Centro (n= 28). Quanto ai ruoli, la maggioranza è composta da funzionari o impiegati (n= 725), seguiti da dirigenti o segretari comunali (n= 54) e da personale con mansioni operative (n= 30).

L'analisi dei dati si è articolata in più fasi, dalla verifica preliminare della validità delle misure fino alla stima del modello strutturale. Poiché tutti i costrutti utilizzati derivano da scale validate, è stata condotta un'analisi fattoriale confermativa (CFA). I caricamenti dei fattori, tranne uno pari a .444, variano tra .613 e .970. Gli indici di adattamento risultanti (CFI = .947; TLI = .939; RMSEA = .078; SRMR = .033) indicano un livello di fit accettabile (Hair et al., 2019). L'affidabilità dei costrutti è risultata soddisfacente: tutti i valori di Cronbach's α e Composite Reliability (CR) superano la soglia di .80, mentre l'Average Variance Extracted (AVE) è superiore a .60, confermando l'adeguatezza della validità convergente e discriminante (Hair et al., 2019) (Appendice – tabella 1).

La Common Method Variance è stata controllata garantendo l'anonimato delle risposte e tramite l'Harman's single-factor test, che ha riportato un valore di varianza spiegata pari a .352, inferiore alla soglia restrittiva di .40.

Successivamente è stato stimato un modello di equazioni strutturali (SEM) utilizzando il pacchetto lavaan per R (Rosseel, 2012), al fine di testare le ipotesi e le relazioni di mediazione secondo l'approccio proposto da Hair et al. (2019). Dopo aver verificato la significatività della relazione tra la variabile mediatrice e la variabile dipendente, sono stati confrontati i modelli mediato e non mediato. Gli indici di adattamento del modello finale risultano soddisfacenti (χ^2 = 1479.708; df = 323; $p < .001$; CFI = .939; TLI = .931; RMSEA = .067; SRMR = .036).

4. Risultati preliminari

Le ipotesi Hp.1.1 e 2.1 non trovano conferma, poiché nessuna delle due tipologie di leadership mostra effetti diretti sulla variabile indipendente, la propensione all'adozione dell'IA. In altre parole, la presenza di leadership, indipendentemente dalla tipologia, non influisce direttamente sulle percezioni individuali e la propensione ad adottare l'intelligenza artificiale.

Nel modello mediato, tuttavia, la leadership trasformazionale (Hp. 1.2) mostra un effetto positivo e significativo sul valore organizzativo percepito (β= 0.271; p<.001) la quale, a sua volta, influenza in modo marcato la propensione ad adottare l'IA (β= 0.799; p<.001). L'analisi dell'effetto indiretto conferma che la leadership trasformazionale incide significativamente sulla propensione all'adozione dell'IA attraverso il valore organizzativo percepito (β= 0.217, p< .001), configurandosi pertanto come un mediatore pieno. Tali risultati confermano evidenze precedenti legate a organizzazioni private, spiegando che ciò avviene grazie alla stimolazione intellettuale generata da tale stile di leadership (Schepers et al., 2005). Contrariamente, la LMX non manifesta alcuna influenza significativa nel modello proposto.

Le variabili di controllo offrono spunti interpretativi aggiuntivi. L'età incide negativamente sul valore organizzativo percepito: i dipendenti pubblici più anziani tendono a percepire meno il valore dell'IA per la pubblica amministrazione. Il genere mostra effetti significativi, con gli

uomini che esprimono percezioni più positive rispetto alle donne, coerentemente con precedenti evidenze empiriche (Araujo et al., 2020; Giraldi et al., 2024; Grassini, 2023).

La dimensione dell'organizzazione pubblica, misurata in base al numero di abitanti serviti, risulta positivamente associata alla percezione del valore: nelle amministrazioni di maggiori dimensioni l'IA tende a essere considerata in modo maggiormente favorevole (Ahn & Chen, 2022). Tale relazione potrebbe derivare dalla maggiore complessità organizzativa e dal più elevato fabbisogno di efficienza dei processi, ambiti nei quali l'IA può offrire un contributo significativo. In alternativa, essa potrebbe riflettere il fatto che i dipendenti delle organizzazioni di più ampia scala dispongono generalmente di opportunità formative più strutturate (Hansson, 2007) e risultano, di conseguenza, maggiormente consapevoli delle potenzialità offerte da queste tecnologie. Infine, il ruolo ricoperto è rilevante, in quanto i dirigenti e i segretari comunali mostrano una percezione più favorevole dell'IA rispetto ai funzionari e agli operai, confermando l'ipotesi secondo cui chi occupa posizioni di leadership tende a riconoscere maggiormente il potenziale dell'IA e a promuoverne l'adozione (Haesevoets et al., 2025).

Figura 2. Illustrazione schematica dei risultati significativi delle analisi.

5. Conclusioni

Complessivamente, il modello proposto spiega una quota significativa della varianza nei costrutti endogeni e mostra che la leadership trasformazionale è in grado di orientare positivamente i dipendenti verso l'IA, agendo attraverso la trasmissione del vantaggio organizzativo derivato dall'utilizzo di tale tecnologia per il settore pubblico. I risultati preliminari indicano, quindi, che tale forma di leadership può rappresentare un fattore abilitante del cambiamento digitale orientato all'adozione delle tecnologie legate all'IA (Valle-Cruz et al., 2024).

Attraverso la capacità di valorizzare i benefici organizzativi associati all'IA, la leadership trasformazionale favorisce percezioni più positive e, di conseguenza, una maggiore propensione all'utilizzo. Il vantaggio organizzativo emerge dunque come un mediatore centrale tra la visione strategica del leader e il comportamento individuale, in linea con il quadro teorico presentato Diversamente, la qualità dello scambio leader–membro non risulta associata alla propensione all'adozione dell'IA, indicando che la qualità della relazione interpersonale con il leader non produce necessariamente un orientamento favorevole verso l'innovazione.

Infine, le variabili di controllo evidenziano differenze sistematiche tra gruppi demografici: età, genere, ruolo gerarchico e dimensione dell'ente influiscono significativamente nel modello, confermando che fattori individuali e organizzativi contribuiscono a modulare le percezioni nei confronti dell'IA.

Entrepreneurial Ecosystems and Organized Crime: Evidence from Italian Regions

Riccardo Campagnolo[1], Francesca Capo[2], Mara Bergamaschi[3]

1. Introduction

The impact of organized crime on the economy is a highly relevant issue for the competitiveness of territories and the development of businesses. In particular, the ability of criminality to infiltrate the economic fabric and influence business dynamics represents a significant challenge for institutions and economic actors. In Italy, the presence of criminal organizations is historically rooted in certain regions, but in recent decades the phenomenon has taken on a national scope, extending even into the more economically developed areas of the country.

This working paper aims to analyze the influence of organized crime on regional business ecosystems, with a particular focus on venture capital and private equity investments, two crucial elements for business growth and innovation. These financing instruments represent an essential lever for strengthening the local business fabric, as they facilitate the development of startups and high-potential companies, accelerating processes of digitization, research and development, and the adoption of new technologies. In particular, complex economies are increasingly relying on innovation ecosystems, meaning networks of interconnected economic and institutional actors (including companies, universities, research centers and policy makers) that foster the development of technological solutions and new business models.

However, the environment in which businesses operate is strongly influenced by institutional stability, the quality of governance and, indeed, the degree of infiltration of organized crime (Operti, 2018). In contexts where the economic system is permeable to crime, market dynamics are distorted, making it difficult for new players to enter and discouraging private investment (Mocetti and Rizzica, 2021).

This ongoing research aims to examine the relationship between organized crime and entrepreneurial development in Italian regions. Specifically, we collected data on the amount of capital invested by private equity and venture capital firms in a region and the number of new businesses emerged, and regress them with the quantity of organized crime activities over a five-years period (2017-2021). Our results show, in line with some research on the topic (Dutta and Sobel, 2016; Mohammad et al., 2024), that the presence of organized crime is a variable influencing local economic dynamics through various channels, both direct and indirect.

This working paper aims to offer useful insights for entrepreneurs, managers, and policymakers, providing inputs for the development of strategies to strengthen the business environment and promote a more investment-attracting environment.

2. Theoretical Background

Entrepreneurial ecosystems, organized crime, and corruption

Literature has investigated the conditions that foster or constrain entrepreneurial development and allow to create an environment that is favorable to economic competitiveness (Buciuni and Corò, 2023; Florida and Mellander, 2016). In particular, scholars have shown that the synergy between skilled human capital, strong interpersonal relationships and an advanced financial system is the foundation for the development of a successful innovation ecosystem (Stam and Van de Ven, 2021). Only through the integration of these elements is it possible to create a business environment that can compete globally and, at the same time, strengthen local economies through knowledge transfer and shared value creation.

In investigating the factors that allow entrepreneurial ecosystems to emerge and thrive, scholars have also been studying the relationship between corruption and innovation, fueling a debate over two opposing perspectives: the "sanding" perspective and the "greasing" perspective. The "sanding" perspective argues that corruption hinders innovation by increasing costs and creating uncertainty. Firms face unexpected payments for key resources such as licenses, permits, and intellectual property rights, thus discouraging investment in innovative activities (Mohammad et al., 2024). In contrast, the "greasing" perspective suggests that, in contexts with weak institutions and excessive regulations, corruption can act as a "lubricant" to accelerate bureaucratic processes and facilitate entrepreneurial activity. Mohammad et al. (2024) analyze these two perspectives through a systematic review of the literature, showing that the "grease the wheels" effect occurs predominantly in the short run. In bureaucratic environments, paying bribes allows firms to obtain licenses and permits more quickly, overcoming barriers that would otherwise have hindered their operations. However, the authors emphasize that this benefit is contingent on the presence of an inefficient institutional environment and that the positive effects tend to be limited over time. Dutta and Sobel (2016) further elaborate on the concept of "grease the wheels," showing that, in particularly rigid regulatory environments, corruption can temporarily increase entrepreneurial activity by allowing entrepreneurs to "circumvent" administrative obstacles. However, the authors point out that these benefits are only short-lived and do not represent a sustainable solution as the direct positive effects of corruption are quickly outweighed by the indirect negative ones, such as the loss of social trust and an inefficient allocation of resources.

Adding to this discussion, Mirenda, Mocetti, and Rizzica (2019) offer an important perspective on the economic impact of 'ndrangheta infiltration into legal businesses. The authors reveal that, in the short term, mafia infiltrations can produce seemingly positive outcomes for affected businesses. This result is attributed to several factors, including access to low-cost illicit capital, which enables firms to overcome financial difficulties and compete more aggressively in the market. In addition, the oppressive power of the 'ndrangheta ensures favorable business conditions for infiltrated firms, often to the detriment of competitors. These short-term effects, however, should not be read as a real improvement in economic performance. In many cases, the revenues of infiltrated firms are artificially inflated for money laundering activities, and the absence of investment in fixed capital suggests a short-term oriented strategy. Infiltrated firms tend to favor immediate gains rather than building a solid foundation for future growth. In the long run, the negative effects of infiltration far outweigh the transitory benefits.

These findings are closely aligned with the broader debate on the economic effects of organized crime and corruption more generally. In some contexts, as also highlighted by the "grease the wheels" theory, crime can temporarily alleviate bureaucratic inefficiencies or institutional constraints, stimulating apparent economic growth. However, this dynamic is inherently unsustainable: mafia activities distort competition, fuels illegal practices, and undermines long-term economic development potential.

Our research aims at contributing to this stream of research, and investigate what is the impact of organized crime on the entrepreneurial development of specific territories, examining the relationship between the former and both the amount of capital invested by private equity and venture capital firms and the number of new businesses created in Italian regions.

3. Methodology: data collection and analysis

This working paper aims to analyze the impact of organized crime on the entrepreneurial development of Italian regions, based on the analysis of a dataset including 100 observations over a 5-year time period, i.e., between 2017 and 2021. The study considers the entire national territory of Italy, thus its 20 regions. The data structure is panel type, allowing analysis of both temporal variations and spatial differences between Italian regions. The variables considered were selected to represent relevant economic, social and institutional aspects, with particular attention to the role of organized crime and business dynamics. Table 1 below provides a description of variables used, their significance and respective sources.

Type of Variable	Variable Name	Description	Source
Dependent variable	VC PE Investments	The total amount of capital invested by private equity and venture capital firms in a region.	AIFI
Dependent variable	New Businesses	The number of newly registered businesses in a specific year.	Unioncamere
Independent variable	Organized Crime	Sum of organized crime s.o.s and SPIA crimes.	Direzione investigativa antimafia
Control variable	Average Income	The average income per capita within the region.	Istat
Control variable	Total Businesses	The total number of active businesses in the region.	Istat
Control variable	R&D Expenses	Total expenditures on research and development activities within the region.	Istat
Control variable	People Graduates	The total number of individuals with a university degree.	Istat
Control variable	Reg. Crime rate	The number of criminal offenses reported in the region.	Istat
Control variable	S.O.S	Suspicious financial transaction reports (s.o.s.) related to organized crime.	Direzione investigativa antimafia
Control variable	SPIA Crimes	Suspicious reports of crimes deemed most indicative of organized crime.	Direzione investigativa antimafia
Control variable	Unemployment rate	The percentage of the labor force that is unemployed and actively seeking employment.	Istat
Control variable	Employment rate	The percentage of the working-age population currently employed.	Istat
Control variable	Interregional Migration	The number of people moving from one region to another within the country.	Istat
Control variable	Interdiction Measures	The total number of government measures prohibiting businesses linked to criminal activities.	Direzione investigativa antimafia
Control variable	Incidence of Interdiction Measures	The percentage of businesses subject to interdiction measures relative to the total number of businesses.	Direzione investigativa antimafia

Table 1. List of variables used and sources

4. Results

Table 2 presents the results of the correlations among the variables included in the model. In the course of the analysis, it was necessary to exclude some variables from the model due to the presence of multicollinearity, as multiple independent variables are found to be highly correlated with each other. This methodological choice is essential to ensure that the model is robust, interpretable and statistically reliable.

For example, the variable Total Businesses was excluded because it was found to be strongly correlated with New Businesses. Total Businesses, in fact, inherently includes the contribution of New Businesses, making the inclusion of both in the model redundant. Keeping only New Businesses made it possible to focus on the specific phenomenon of new business start-ups, without overlapping with other information. Another significant case concerns the variables S.O.S and SPIA Crimes, which were closely related to Organized Crime, the main independent variable. These variables represent sub-indicators of Organized Crime and did not add additional information to the overall variable. Their inclusion would have introduced collinearity without adding value to the analysis. For this reason, we only kept Organized Crime in the model. Further simplification was applied to the labor market variables, namely Unemployment rate and Employment rate. Since they are inversely correlated by definition (an increase in the employment rate implies a decrease in the unemployment rate), their joint inclusion would have introduced redundancy. Consequently, only one of these variables was retained, ensuring an adequate representation of labor market conditions without compromising the robustness of the model. The exclusion of these variables was guided by statistical analyses, such as the correlation matrix and Variance Inflation Factor (mean VIF equal to 4.76), which highlighted variables with high correlation values or VIFs above the critical threshold.

Variables	(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)
(1) VC PE Investments	1.000								
(2) Reg. Crime rate	0.230	1.000							
(3) Average Income	0.102	0.161	1.000						
(4) New Businesses	0.720	0.585	-0.062	1.000					
(5) Year	0.150	-0.272	0.078	-0.052	1.000				
(6) R&D Expenses	0.784	0.516	0.111	0.870	0.021	1.000			
(7) Unemployment rate	-0.290	0.044	-0.576	0.065	-0.146	-0.327	1.000		
(8) Organized Crime	0.638	0.331	-0.045	0.661	0.431	0.609	0.070	1.000	
(9) Incidence of Interdiction Measures	-0.144	-0.184	-0.263	-0.100	0.079	-0.231	0.583	0.002	1.000

Table 2. Correlation matrix

5. Regression models

The results (presented in Table 3) show a significant relationship between VC PE Investments and Organized Crime, with a positive coefficient of 0.001, statistically significant at the 5 percent level (p=0.012). Although the coefficient value is small, its statistical significance indicates that organized crime is a relevant factor to consider in understanding private investment flows. This result suggests the existence of a link between criminal phenomena and economic

dynamics, which may reflect both direct and indirect influences on the ability to attract venture capital.

The time variables provide additional details on investments in different years compared to 2017, which was used as a reference. The years 2018 and 2019 have negative coefficients (-1.258 and -1.575, respectively), but they are not statistically significant. This could indicate a marginal reduction in investment compared to 2017, without clear statistical evidence. The year 2020 shows a more pronounced decrease (-7.544, p=0.146), highlighting a possible impact related to extraordinary factors, such as the COVID-19 pandemic, although the result does not reach the significance threshold. In 2021, the coefficient is positive (0.294), suggesting a slight recovery from 2017, but also not significant, indicating substantial stability over the period analyzed.

From an overall perspective, the model offers a significant explanation for the variability in investment levels, with an R-squared of 0.528, indicating that 52.8 percent of the observed variation in VC PE Investments is explained by the included variables. This result suggests that the model is able to capture a good portion of the economic dynamics analyzed, while leaving room for additional factors not included. The F-test confirms the overall significance of the model (p=0.013), indicating that at least one of the explanatory variables has a significant effect on investments.

VC PE Investments	**Coef.**	**St.Err.**	**t-value**	**p-value**	**[95% Conf**	**Interval]**	**Sig**
Organized Crime	.001	0	2.76	.012	0	.002	**

*** *p<.01, ** p<.05, * p<.1*

Table 3. Regression Model: Dependent and Independent Variable

Table 4 presents the results of a regression model aimed at examining the relationship between VC PE Investments and the independent variable Organized Crime, plus a range of economic, social and crime-related variables, as well as temporal control variables. The results show, first, a positive and significant effect of the Organized Crime variable. The estimated coefficient is 0.002, with a significance level of 0.1 percent (p=0.004). This result indicates that an increase in the presence of organized crime is associated with an increase in venture capital and private equity investment. Although the value of the coefficient is small, its statistical significance confirms that the phenomenon of organized crime affects investment dynamics.

As for the regional crime rate (Reg. Crime Rate), the coefficient is negative (-0.152) but not statistically significant (p=0.641). This result suggests that, unlike organized crime, the generic crime rate does not exert a significant influence on levels of venture capital investment. The average income (Average Income) is also not significant (p=0.486), with a coefficient of practically zero. This indicates that, at least in the context analyzed, income level is not a direct driver for attracting VC PE investments.

A particularly interesting variable is New Businesses, which has a highly significant positive coefficient (0.006) ($p<0.001$). This result underscores the importance of new business start-ups as a central element in attracting venture capital. The positive and statistically robust relationship highlights how a dynamic business environment is crucial to the functioning of investment ecosystems.

The variable R&D Expenses, despite its theoretical relevance, is not significant in the model, with a coefficient of zero and a p-value of 0.252. This could be due to the multicollinearity with other variables, such as New Businesses, which capture similar innovation-related dynamics. Unemployment rate and Incidence of Interdiction Measures also do not show a statistically significant effect, with p-values of 0.672 and 0.337, respectively, suggesting that these factors do not exert a direct influence on the levels of investment analyzed.

The time variables (dummies for the years 2018-2021) are not significant compared to 2017, except for a slight positive sign for 2020 (5.57, $p=0.106$), which, however, does not reach the significance threshold. This might suggest that there are no substantial changes in investment related to the time factor.

From an overall perspective, the model explains a significant share of the variability in investments, with an R-squared of 0.715, indicating that about 71.5 percent of the variation in VC PE Investments is explained by the included variables. In addition, the overall significance test (F-test, $p<0.001$) confirms that the model is statistically significant.

VC PE Investments	**Coef.**	**St.Err.**	**t-value**	**p-value**	**[95%Conf**	**Interval]**	**Sig**

Table 4. Regression Model: Dependent, Independent Variable, and Controls

Table 5 presents a regression model in which the dependent variable is the number of New Businesses. This model differs from previous models in that it focuses on the effect of organized crime and time variables not on VC PE investments, but on a direct measure of entrepreneurial dynamism. The objective is to investigate the determinants of new business creation in Italian regions by exploring how structural and temporal factors influence entrepreneurial activity.

The coefficient of the Organized Crime variable is negative and equal to -0.095, being highly significant (p<0.001). This result shows an inverse relationship between the presence of organized crime and the number of new businesses. Statistical significance confirms that organized crime exerts a major impact on entrepreneurial dynamism, influencing the economic environment in which new businesses are started.

Time variables indicate the effect of years compared to 2017, used as the base year. For the year 2018, the coefficient is -144.266 (p=0.322) and is not statistically significant, suggesting that there is no significant difference from 2017. The year 2019 shows a positive coefficient (189.289, p=0.394), also lacking statistical significance. The year 2020, on the other hand, shows a substantial and significant decline in the number of new businesses (-2012,165, p<0.001), reflecting the impact of extraordinary events such as the COVID-19 pandemic. In 2021, the coefficient is positive (68,861) but not significant (p=0.804), indicating a recovery with no significant change from 2017. From the perspective of model performance, the R-squared is 0.672, indicating that about 67.2 percent of the variability in the number of new firms is explained by the included variables. The overall significance test (F-test, p<0.001) confirms that the model is significant overall.

New Businesses	**Coef.**	**St.Err.**	**t-value**	**p-value**	**[95% Conf**	**Interval]**	**Sig**

Table 5. Regression Model: New Businesses as Dependent Variable

6. Discussion

The results from the regression models analyzed show a significant relationship between the presence of organized crime and investments in venture capital and private equity. This result, although counterintuitive, can be interpreted considering some complex dynamics that characterize territories with a high mafia presence.

First, the time factor emerges: in the short term, organized crime has a positive effect on entrepreneurial development. The dataset used in the methodology, in fact, takes into consideration a time interval of five years; therefore, the result obtained from the regression confirms what has been observed. This effect is explained through two main dynamics (Mirenda, Mocetti and Rizzica, 2019): access to cheap illicit capital and the control exerted by the mafia,

which can guarantee more favorable conditions for local business activities by eliminating competition or providing 'protection'. Although these conditions may create a temporarily favorable environment for certain forms of private investment, such as venture capital, they are ultimately distorting and unsustainable in the long run, as criminal influence does not rely on genuine market dynamics but rather on monopolistic control, corruption, and distortion of competition. Over time, this weakens economic resilience, discourages legitimate businesses from entering the market, and increases dependence on illicit financial flows, leading to a stagnation or decline once these distortions become unsustainable.

The findings ultimately challenge the idea that corruption can serve as a permanent catalyst for economic growth or entrepreneurship. Although it may provide short-term relief in environments burdened by heavy institutional constraints, reducing corruption remains essential to promoting lasting economic and entrepreneurial development.

Emphasizing again the positive correlation obtained from the regression model, with VC PE Investments as dependent variable, a further interpretation emerges. In the literature, we have analyzed how the formation of innovative ecosystems and entrepreneurial initiative can have positive leverage in combating organized crime. As the study by McDaniel et al. (2021) points out, well-structured entrepreneurial ecosystems are able to generate positive effects in communities affected by high crime rates, reducing economic marginalization and offering legitimate pathways to success. In this sense, entrepreneurship is not only a victim of organized crime, but also a possible tool to counter it by promoting legitimate economic opportunities that reduce dependence on the criminal system.

The positive correlation between organized crime and venture capital investments can thus also be interpreted as a reflection of the need to finance entrepreneurial and innovative projects in problematic regions, contributing to the construction of an innovative ecosystem capable of transforming local economic dynamics. As explained by Bucioni and Corò (2023), an entrepreneurial and financial approach that encourages risk-taking and supports innovative projects is essential for economic growth, especially in peripheral contexts. The authors point out that economic success in these areas requires advanced financial instruments that go beyond traditional bank credit, such as venture capital, public innovation funds and public-private partnerships. In this context, venture capital and private equity investments can be seen as part of a broader attempt to revive economic and social growth in regions scarred by organized crime. By supporting innovative and technology-intensive initiatives, these investments not only generate economic value, but also help reduce dependency on criminal networks. Indeed, they offer concrete and legitimate opportunities for both local businesses and communities, helping to counter economic marginalization and build a more stable and prosperous future.

The results of the regression model with New Businesses as the dependent variable show a significant negative relationship between the presence of organized crime and the creation of new businesses. The results of the analysis are fully consistent with most empirical studies in the literature. The presence of organized crime and its influence in different economic sectors creates a condition of unsustainability in the long run, as these organizations act by pursuing short-term goals, often through corruption and illegal activities. This creates an unfavorable business environment for entrepreneurs wishing to start new businesses, who find themselves competing with illegal enterprises that benefit from distorted competitive advantages not available to legitimate businesses.

Starting a business requires a perspective of long-term sustainability to ensure its survival and success. However, operating in an environment in which a significant factor such as organized crime negatively affects the economic development of the territory poses a significant challenge to entrepreneurs, making the context unfavorable for starting new businesses.

Also, a crucial element in starting a business is the ability to access credit, which is key to cover the initial investments required by a new business. However, in regions characterized by a

high presence of organized crime, entrepreneurs often face significant barriers in the financial system that hinder them from obtaining the necessary funds.

This dynamic occurs because banks and credit institutions perceive a higher risk in granting loans in territories with high crime. The economic uncertainty generated by the presence of organized crime, including extortion, bribery and other forms of illicit pressure, increases the risk of insolvency for local businesses. Consequently, credit institutions react by tightening the conditions for granting loans, thus reducing the accessibility of financing for small entrepreneurs and further discouraging the establishment of new businesses.

This situation creates a vicious circle: the absence of new entrepreneurial initiatives limits local economic development opportunities, while the domination of organized crime continues to exert a negative influence on the economic and social fabric. Moreover, the lack of access to credit forces many aspiring entrepreneurs to give up or turn to informal sources of finance, which may be linked to illegal circuits, further exacerbating the problem.

7. Implications for entrepreneurs and policy-makers

Organized crime represents a huge barrier to the creation of new businesses, with profound repercussions on the economic development of the affected areas. Entrepreneurs, who should be the engine of change and economic growth, find themselves operating under extremely difficult conditions. They face an environment of constant uncertainty, higher operating costs and unfair competition from companies that, often through illicit connections or corruption, enjoy unfair competitive advantages. The direct consequence is a general slowdown in entrepreneurial dynamism: not only do individual companies suffer, but the entire territory loses its ability to grow and innovate. To meet these challenges and operate in complex environments, entrepreneurs can investing in sectors less vulnerable to organized crime (e.g., technology-intensive industries, digital services, research and development activities), seek strategic partnerships to mitigate risks (collaborating with established companies, trade associations, universities and local institutions), and identify and target regions with sound institutional policies, transparent administration and specific incentives.

For policy makers, this working paper suggests that they may need to play a key role in creating favorable conditions for those who want to do business and invest, especially in those areas where organized crime is an obstacle to economic development. To make the fight against organized crime effective and foster a more dynamic business environment, policy makers can work to develop more effective policies to combat organized crime and can perhaps promote incentives to attract private capital to the most disadvantaged areas (e.g., supporting the creation of technological hubs to foster development and fight organized crime).

8. Limitations and future research

Similarly to any empirical analysis, this working paper has some limitations that have to be taken into account when interpreting the results. One of the main limitations relates to the difficulty of establishing a clear causal relationship between organized crime and venture capital investments or start-ups. Although the analysis shows a positive correlation between these phenomena, it is not possible to exclude the presence of endogeneity, that is, the possibility that unobserved variables are influencing both dynamics.

Another limitation concerns the measurement of organized crime, a phenomenon that is by nature occult and difficult to quantify accurately. By the same measure, venture capital investments may not fully reflect the real allocation of private capital. Investments in start-ups and innovative firms often involve transactions that are not always reported in official datasets, and capital flows may be recorded in regions other than those in which the firms actually operate. Moreover, venture capital develops at different stages, and available data may not capture all

financing dynamics of start-ups. To improve this aspect, future studies could adopt a more detailed approach, including data disaggregated by sector and stage of financing, as well as integrating information from interviews and internal investor reports.

The impact of insularity on entrepreneurship: evidence from Italian regions

Carlo Amenta[1], Martina Aronica[2], Arabella Mocciaro Li Destri[3], Carlo Stagnaro[4]

1. Introduction

Entrepreneurship plays a central role in shaping regional economic performance, innovation capacity, and long-term development trajectories. In advanced economies, new firms contribute to productivity growth, stimulate competition, and renew the industrial structure by introducing novel business models and technological approaches. However, entrepreneurship is not uniformly distributed across space, and substantial differences persist across regions in terms of start-up creation, survival, and growth. These differences reflect both observable regional characteristics and deeper structural factors embedded in geography and territorial configurations. One of the most distinctive, and understudied, spatial characteristics affecting regional development is insularity. As an extreme form of peripheral location, insularity combines geographical isolation, limited accessibility, smaller markets, and the absence of land-based connectivity to the national core. The resulting structural constraints affect not only transport costs but also patterns of human capital mobility, knowledge diffusion, institutional quality, and social capital formation. While extensive research exists on small island economies and their vulnerabilities, much less attention has been paid to the broader question of how insularity itself, irrespective of island size, shapes entrepreneurial ecosystems; even more so when islands are not organized as independent states but belong to larger states. This ongoing research project addresses this gap by examining the impact of insularity on entrepreneurial dynamics in the Italian context. Italy provides an attractive empirical setting: its two main islands, Sicily and Sardinia, are large territories, structurally different from small island states, yet they remain economically peripheral, demographically challenged, and historically disadvantaged in terms of connectivity and institutional performance. The availability of regional data from ISTAT and the Bank of Italy allowed us to build a specific database already tested to measure the impact of insularity on GDP to conduct an in-depth quantitative analysis over nearly two decades.

The central question guiding this research is whether insularity represents a structural disadvantage for entrepreneurship, and if so, in what specific dimensions. In particular, we assess whether insular regions differ from mainland regions in terms of new firm creation, net entrepreneurial growth, and firm turnover. This distinction is critical because the vitality of an entrepreneurial ecosystem depends not only on the quantity of new firms but also on their capacity to survive and consolidate. A high birth rate combined with weak survival would indicate a fragile entrepreneurial environment one unable to accumulate entrepreneurial capital over time.

Using an original panel dataset for the period 2000–2018, this paper analyzes the relationship between insularity and three key business demography indicators: birth rate, net enrolment rate, and turnover rate. Econometric evidence from random-effects models and instrumental-variable

specifications shows that while insular regions display significantly higher birth rates, they experience lower turnover rates and weaker net entrepreneurial growth. These results demonstrate that insularity fosters start-up creation but undermines survival, leading to high churn and limited long-term accumulation of entrepreneurial capacity.

By identifying insularity as a structural constraint on entrepreneurial sustainability, this research project contributes to the literature on the external condition for the development of entrepreneurship, on regional and territorial economy, and island studies. It also provides policy-relevant insights, highlighting the need for targeted strategies that address the specific challenges of insular entrepreneurship rather than relying solely on incentives for start-up creation. It can also strengthen and support the literature on the differences between quantity and quality of entrepreneurship measurement and on the different sets of entrepreneurships and their role in value creation.

2. Theoretical background

Determinants of entrepreneurship

Entrepreneurship research identifies a wide range of determinants influencing regional entrepreneurial performance. Classical studies emphasize supply-side factors such as human capital endowments, demographic composition, and skill levels, alongside demand-side elements related to market size, income growth, and industrial structure. More recent contributions highlight institutional quality, social norms, cultural attitudes toward risk-taking, and historical entrepreneurial legacies as critical factors shaping regional differences. Importantly, the literature increasingly distinguishes between quantity and quality of entrepreneurship. High start-up rates are not necessarily indicative of high-growth entrepreneurship or meaningful structural change. Regions with high entry but high exit rates may suffer from a form of "entrepreneurial churn," where numerous micro-firms are created but few scale up, innovate, or survive beyond the initial years. Such dynamics can reflect necessity- based entrepreneurship, structural labor-market rigidities, or weak competitive environments that do not reward innovation.

This distinction becomes crucial when analyzing insular regions. Higher start-up rates may appear to indicate a vibrant entrepreneurial environment, but low survival rates suggest that firms face significant structural constraints that impede long-term consolidation. The results from this study align with this dual interpretation: insular regions show high entry but low survival, pointing to a fragile entrepreneurial ecosystem rather than a robust one.

The spatial dimension of entrepreneurship

Geography is a fundamental determinant of regional entrepreneurship. Spatial proximity facilitates knowledge spillovers, collaboration, and network formation. Regions embedded within dense and well-connected economic systems benefit from agglomeration economies: access to skilled labor, supplier networks, capital markets, and innovation ecosystems. Such factors promote both firm entry and firm success. Peripheral regions, by contrast, face several disadvantages: 1) Limited accessibility hinders the movement of goods, people, and information. 2) Smaller markets reduce the potential returns from innovation and specialization. 3) Weak institutional capacity undermines support for entrepreneurship. 4) Lower human capital attraction restricts the availability of skilled labor. 5) Fewer interregional exchanges limit exposure to new ideas and entrepreneurial role models. 6) Reduced competitive pressure diminishes incentives for innovation and efficiency.

Insularity can be interpreted as an extreme case of peripheral location where these disadvantages are amplified. The absence of land connectivity may reinforce cognitive isolation, impede the diffusion of entrepreneurial norms, and reduce openness to external investors or

partners. These effects compound over time, potentially generating persistent structural barriers to entrepreneurial growth.

Islands as economically vulnerable territories

Research on island economies highlights several structural vulnerabilities associated with insularity:

- Small domestic markets, which prevent firms from achieving economies of scale.
- Geographic remoteness, raising transportation costs for goods and inputs.
- Tourism dependence, leading to seasonality, volatility, and exposure to external shocks.
- Limited labor mobility, which constrains the talent pool and raises hiring costs.
- Concentrated social capital, which reinforces bonding ties but weakens bridging ties essential for innovation.
- Institutional weaknesses, often linked to clientelism, limited administrative capacity, or fragmented policy coordination.

For many islands, the entrepreneurial ecosystem reflects these structural conditions. Studies suggest that entrepreneurs in remote islands perceive their environment as riskier and more uncertain, often relying on government subsidies or fiscal incentives for survival rather than on market-driven innovation. This dependence can reduce autonomy, discourage experimentation, and hinder the emergence of high-growth firms.

The Italian case is particularly interesting: Sicily and Sardinia are not small islands, yet they face many of the vulnerabilities described above. Their geographic isolation, institutional weaknesses, demographic decline, and economic stagnation make them an ideal test case for understanding how insularity affects entrepreneurial performance in a developed-country context.

3. Data and methods

The empirical analysis relies on a strongly balanced self-created panel dataset including all Italian regions (N=21) over the period 2000–2018. The dataset comprises 399 observations, drawing on high-quality sources: ISTAT business demography statistics and Bank of Italy regional financial indicators.

Dependent variables

The study examines three core indicators of entrepreneurial activity: 1. Birth Rate: the number of new enterprises registered each year relative to the existing stock of active firms. 2. Net Enrolment Rate: the net change in firm population (entries minus exits) as a percentage of the stock of registered firms. 3. Turnover Rate: the difference between birth and death rates, reflecting the overall dynamism of the entrepreneurial ecosystem. These indicators allow us to distinguish between entry, survival, and net growth, capturing both the quantity and the structural quality of entrepreneurship.

Independent variables

The key variable of interest is the Island, a dummy variable, equal to 1 for Sicily and Sardinia and 0 otherwise. This captures the structural effect of insularity on entrepreneurial performance. Other control variables include: the log of GDP growth (with two lags to address potential endogeneity); interest rates applied by regional banks a proxy to measure the cost and the risk of doing business; illiteracy rate and tertiary education share to measure the competences and the pool of talent in each region that can result in more enterpreneurs; the median age of population to capture the potential for innovation and entrepreneurship; the R&D expenditure as share of

GDP to measure the level of existing innovation developed by existing firms that can create an ecosystem; Net export normalized by regional GDP to capture the level of openness of the regional economies.

These variables account for economic conditions, financial constraints, human capital endowments, innovation capacity, demographic structures, and trade openness, factors widely recognized as determinants of entrepreneurship.

Econometric Strategy

The empirical approach consists of two main components: 1. Random-effects panel regressions for each dependent variable. 2. Instrumental-variable (IV) random-effects regressions, using two lags of GDP growth as instruments to correct for potential reverse causality between economic performance and entrepreneurial dynamics. The models are estimated with robust standard errors. The IV approach is particularly relevant because regional economic conditions may simultaneously influence entrepreneurship while being affected by entrepreneurial activity.

4. Results

Insularity and the Birth Rate: Higher Entry

The first notable finding is that insularity is associated with a higher firm birth rate. Across specifications, the Island dummy is positive and statistically significant. This suggests that individuals in insular regions start new firms at higher rates than those in mainland regions. Several mechanisms may underlie this pattern: 1) Necessity entrepreneurship, driven by weak wage employment opportunities. 2) Cultural norms favoring self-employment, particularly in regions with limited industrial development; 3) Seasonal opportunities, especially in tourism-related activities. 4) Public incentives for start-ups, which are more common in lagging regions.

However, while higher entry rates can be interpreted as a sign of entrepreneurial vitality, this interpretation changes when we consider firm survival and turnover.

Insularity and Survival: Lower Turnover Rates

The turnover rate represents the difference between firm births and firm deaths. A negative and statistically significant coefficient for the Island dummy indicates that insular regions have structurally lower turnover rates, meaning that firm deaths outweigh the benefits of higher birth rates. This pattern reflects structural fragility: firms are created more often but fail disproportionately. Several explanations are consistent with both the literature and the empirical setting: 1) High operating costs due to remoteness and supply-chain constraints; 2) Small and fragmented markets, which limit firm scalability; 3) Weak institutional quality that foster firm consolidation. 4) Lower innovation capacity, stemming from limited R&D and human-capital inflows. 5) Seasonal business cycles, which make revenue streams volatile. The results reveal that insularity does not prevent firm creation but makes firm survival considerably harder.

Net Enrolment Rate: Weak Net Growth

Although the coefficient on the Island dummy is negative and not always significant, the direction is consistent with the turnover results: insular regions show weaker net firm growth. The combination of high entry and fragile survival means that the entrepreneurial stock does not grow sustainably over time.

Control Variables and Robustness

Several control variables behave as expected with GDP growth which strongly predicts entrepreneurial dynamism in the baseline model. Median age has a consistently negative impact, reflecting the demographic constraints of ageing regions. Interest rates positively correlate with birth rates, possibly because credit expansion coincides with periods of entrepreneurial optimism or because financial institutions in dynamic regions operate with wider margins. Human capital and R&D variables display mixed effects, possibly due to limited regional variation or structural factors overshadowing their influence. The IV models confirm the core results: the negative effect of insularity on turnover remains robust even after correcting for potential endogeneity in economic growth.

5. Discussion

A Dual Pattern: High Entry, Low Survival

The coexistence of high entry rates and low survival rates is central to understanding insular entrepreneurship. This dual pattern suggests that individuals are motivated, or compelled as subsistence entrepreneurs, to start businesses, but structural constraints prevent these ventures from consolidating. From a policy perspective, this indicates that focusing solely on start-up creation is insufficient and the real challenge lies in enhancing firm quality, resilience, and growth potential. This can be obtained by fostering the condition for the creation of an entrepreneurial ecosystem in which more relevant and competent firm can act as an anchor for the creation of firms' clusters.

Insularity as a Structural Constraint

The results affirm that insularity represents a structural barrier to entrepreneurial sustainability. Importantly, this effect persists even though Sicily and Sardinia are not small islands. Insularity, therefore, should not be interpreted only in terms of physical size but in terms of permanent geographical separation and reduced connectivity which affects the cultural and social environment on which firms operate reducing the probability of the creation of a favorable environment for value creation through entrepreneurship. Some of the disadvantages that can be associated to Italian islands are persistent logistical disadvantages, structural dependence on low-value-added sectors such as tourism, a persistent difficulty in attracting external investors or skilled workers. The low institutional quality and administrative barriers are other important structural factors that can limit competitive pressure and producing an insufficient integration into national innovation networks.

These factors collectively undermine firm survival and reduce the long-term accumulation of entrepreneurial capital.

Implications for Policy

Given the evidence, regional policy for insular territories must prioritize: 1) Connectivity: improving transport infrastructure, digital networks, and logistics. 2. Entrepreneurial ecosystem support by fostering the networks between new firms and established one not by economic incentives but creating a favorable regulatory environment based on less regulations and constraints; 3. Innovation networks: linking insular universities with mainland research centers. 4. Human capital attraction and retention: scholarships, mobility programs, remote-work incentives. 5. Financial access: targeted credit lines and venture capital instruments adapted to insular constraints. 6. Managerial training: programs to strengthen entrepreneurial capabilities and firm governance also by mentoring strategies with the participation of more established firms. Policies limited to subsidies or tax incentives may boost entry but not survival. Effective strategies must address deeper structural disadvantages.

6. Conclusion

This research project investigates the relationship between insularity and entrepreneurial activity using a self-built panel of Italian regions from 2000 to 2018. The evidence points to a clear and robust pattern: insular regions display higher birth rates but significantly lower survival rates and lower entrepreneurial turnover. This combination reveals that insular entrepreneurial ecosystems are characterized by high entry but fragile consolidation, leading to weaker long-term growth potential. Insularity emerges not merely as a geographical feature but as a structural constraint that affects entrepreneurial sustainability. The ongoing research project calls for more nuanced policy interventions that focus on improving firm survival, innovation, and growth rather than simply promoting start-up creation.

Future research should explore sectoral differences, integrate social capital indicators, and compare the Italian case with other European islands. Understanding the complex interplay between geography and entrepreneurship remains central for designing effective regional policies in peripheral and insular territories.

Costruire imprese resilienti: il ruolo dell'imprenditore e della gestione degli stakeholder

Sonia Caterina Giaccone[1], Pasquale Massimo Picone[2]

1. Il contesto di riferimento della ricerca

Le performance delle imprese sono sempre più condizionate da eventi esterni imprevedibili, come crisi economiche, terremoti o pandemie (Iftikhar et al., 2021; Linnenluecke, 2017). Per resistere a tali shock esogeni, le imprese devono essere in grado non solo di limitare i possibili danni, ma anche di cogliere - ove possibile - le opportunità generate dalle mutate condizioni di contesto (Conz e Magnani, 2020; Conz et al., 2023). La letteratura di management definisce questa capacità come resilienza. Numerosi studiosi hanno analizzato il tema della resilienza d'impresa, con particolare attenzione al contesto delle piccole e medie imprese (PMI) e delle imprese familiari (Calabrò et al., 2021; Mihotić et al., 2023; Santoro et al., 2021). Queste realtà, infatti, si caratterizzano per una limitata disponibilità di risorse, che ne riduce la capacità di resistere e/o rispondere in modo efficace agli shock esogeni (Iborra et al., 2020; Pal et al., 2014).

Non sorprende che, data l'importanza della resilienza per la stessa sopravvivenza e le performance di lungo periodo delle imprese, risulti cruciale comprendere quali fattori ne alimentano lo sviluppo. In particolare, il ruolo degli imprenditori e della loro resilienza personale (Hedner et al., 2011) è stato ampiamente riconosciuto in letteratura come elemento centrale nel plasmare la resilienza d'impresa (Korber e McNaughton, 2018; Pathak et al., 2024; Su e Junge, 2023). Diversi studi hanno messo in luce come gli imprenditori, grazie alle esperienze pregresse nell'affrontare circostanze imprevedibili e difficili, tendano a sviluppare un'elevata capacità di adattamento che contribuisce a mantenere le piccole imprese resilienti (Branicki et al., 2017; Wall e Bellamy, 2019). Tuttavia, è stato anche sottolineato che la resilienza individuale dell'imprenditore può – ma non necessariamente deve – tradursi in resilienza organizzativa (Su e Junge, 2023).

2. Obiettivo della ricerca

Una questione ancora non sufficientemente esplorata in letteratura riguarda il modo in cui la resilienza individuale degli imprenditori si trasformi in resilienza d'impresa. Pertanto, questo studio intende rispondere alle seguenti domande di ricerca: in che modo la resilienza dell'imprenditore può plasmare la resilienza dell'impresa? Possono fattori contestuali influire in questo processo, e come? In altre parole, l'obiettivo di questo studio, tuttora in fieri, è indagare i processi che sottendono tale dinamica.

Lo studio mette in luce il ruolo dell'imprenditore nella costruzione della resilienza d'impresa, sottolineando anche l'importanza della gestione degli stakeholder nell'intensificare l'impatto della resilienza imprenditoriale sulla resilienza d'impresa. Per indagare i processi attraverso i quali la resilienza dell'imprenditore si traduce in resilienza dell'impresa, è stato analizzato il caso di un'impresa operante nel settore turistico, nello specifico il Four Points by Sheraton Catania Hotel & Conference Center. Data la natura esplorativa della nostra domanda di ricerca, abbiamo

[2] Professore ordinario, ECON-07/A, Università degli Studi di Palermo; pasqualemassimo.picone@unipa.it

adottato un approccio qualitativo, che consente un'indagine aperta e favorisce la generazione di teorie (Bluhm et al., 2011; Graebner et al., 2012; Sutton, 1997; Gibbert et al., 2008). La ricerca si basa su un'analisi di caso (Flyvbjerg, 2011; Yin, 2014), di particolare interesse per la decisione coraggiosa e non convenzionale dell'imprenditrice di mantenere aperto l'hotel durante la pandemia di COVID-19, nonostante le restrizioni imposte dal governo italiano alla mobilità delle persone.

3. Background teorico della ricerca

3.1. Profili definitori del concetto di resilienza

Il concetto di resilienza trae origine dalle discipline dell'ingegneria, della fisica e dell'ecologia, ed è stato adottato anche nell'ambito della ricerca economico-aziendale (Gunderson, 2000; Woods, 2015; Aversa et al., 2024). A tal proposito, Conz e Magnani (2020) hanno osservato come il crescente interesse verso il tema della resilienza nel contesto delle imprese abbia portato a una parziale sostituzione del tradizionale mantra della "ricerca del profitto" con quello della "ricerca della resilienza".

Oggi, in letteratura, il concetto di resilienza appare sfaccettato e intrecciato con altri affini, tra cui quelli di robustezza e antifragilità (Muñoz et al., 2022). In questo lavoro, adottiamo la definizione di resilienza come una capacità articolata su tre momenti (Conz e Magnani, 2020). Nella fase proattiva, la resilienza si manifesta nella capacità di anticipare e prepararsi a eventi inattesi, attraverso vigilanza, prontezza e preparazione alla discontinuità. La seconda fase può assumere la forma adattiva, tesa ad apportare tempestivamente cambiamenti interni per mantenere le funzioni operative dopo lo shock (Bhamra et al., 2011), oppure assorbitiva, ovvero maggiormente indirizzata a mantenere la stabilità e il controllo. Infine, nella fase denominata reattiva, le imprese mirano a ristabilire un equilibrio a un livello uguale o superiore rispetto a quello precedente allo shock.

Gli studi sulla resilienza delle imprese si sono sviluppati lungo due principali direttrici. La prima direttrice di ricerca si è focalizzata sulla natura, sulla velocità di comparsa, sulla misurazione e sulla gravità degli eventi avversi (Su e Junge, 2023) che l'impresa deve affrontare, nonché sull'impatto che tali eventi esercitano sulla sopravvivenza organizzativa. La seconda direttrice di ricerca, invece, si concentra sugli antecedenti della resilienza d'impresa. In particolare, la letteratura ha analizzato i fattori determinanti della resilienza a diversi livelli di analisi (Aversa et al., 2024), includendo sia le caratteristiche degli imprenditori sia quelle delle imprese.

3.2. Le caratteristiche degli imprenditori come antecedenti della resilienza d'impresa

Gli studi precedenti hanno messo in luce che le risorse psicologiche – quali adattabilità, fiducia, supporto sociale e determinazione – risultano determinanti per la continuità d'impresa (Chhatwani et al., 2022; Wall e Bellamy, 2019; Branicki et al., 2017). È stato altresì evidenziato come attributi personali quali ingegnosità, tenacia e ottimismo rafforzino la capacità di affrontare le avversità, mentre la formazione imprenditoriale favorisca creatività e coraggio (Ayala e Manzano, 2014; Chadwick e Raver, 2020).

Ulteriori ricerche hanno esaminato come specifici attributi psicologici, quali narcisismo, empatia o hubris, possano influenzare la resilienza organizzativa (Su e Junge, 2023; Picone et al., 2025). In generale, questa letteratura considera la resilienza dell'imprenditore come una forza motivazionale collettiva che guida l'azione di fronte a shock esogeni (Williams e Shepherd, 2016). L'idea sottesa è che le propensioni individuali dell'imprenditore – come la capacità di esplorazione, la perseveranza, la gestione della complessità e il problem solving – si traducano in capacità collettive dell'impresa (Hadjielias et al., 2022). Tale impostazione sottolinea il ruolo delle risposte cognitive e comportamentali degli imprenditori (Lengnick-Hall et al., 2011).

4. Aspetti metodologici della ricerca

Le performance delle imprese sono sempre più condizionate da eventi esterni imprevedibili, come crisi Lo studio si concentra sui processi alla base della resilienza d'impresa, particolarmente rilevanti per imprese familiari e di piccole dimensioni (Hadjielias et al., 2022). È stato scelto di analizzare il caso del Four Points by Sheraton Catania Hotel & Conference Center, situato ad Aci Castello (in provincia di Catania) e gestito dalla famiglia Laneri da oltre quarant'anni. Questo caso, selezionato secondo i principi del campionamento teorico (theoretical sampling), fornisce un contesto significativo per analizzare la transizione dalla resilienza dell'imprenditore a quella d'impresa. La scelta si fonda su diverse motivazioni. Anzitutto, l'impresa opera nel settore turistico, tra i più colpiti dalla pandemia di COVID-19 (Collins-Kreiner e Ram, 2021; Dolnicar e Zare, 2020; Gössling et al., 2020). L'impatto improvviso e senza precedenti della crisi ha lasciato alle imprese scarso margine per fare affidamento su esperienze pregresse e mettere in atto comportamenti adeguati per fronteggiarla. Le restrizioni governative — lockdown, distanziamento sociale e divieti di viaggio — hanno causato un arresto quasi totale delle attività turistiche (Agovino e Musella, 2022). Come evidenziano Chaudhary et al. (2024), la pandemia ha generato tensioni tra obiettivi a breve e lungo termine, efficienza e adattabilità, sicurezza e redditività, imponendo sfide particolarmente severe alle PMI del comparto turistico.

Inoltre, la scelta del caso si è basata sulla possibilità di ottenere una comprensione approfondita e pertinente al fine di rispondere alla nostra domanda di ricerca, piuttosto che sulla rappresentatività statistica del settore turistico. Il Four Points by Sheraton Catania rappresenta, infatti, un caso estremo e particolarmente significativo, essendo uno dei pochissimi hotel del settore a essere rimasto aperto per l'intera durata della pandemia.

Un ulteriore elemento di rilievo è stata la disponibilità dell'imprenditrice a fornire accesso ai documenti interni e a facilitare il contatto con gli attori chiave (dipendenti, fornitori e clienti) consentendo la convergenza di molteplici linee di indagine da diverse prospettive. Tale apertura ha reso possibile una triangolazione solida delle evidenze (Jick, 1979), rafforzando la validità e la robustezza dei risultati. Per analizzare il caso studio, sono stati raccolti dati da fonti primarie, ovvero tramite la conduzione di interviste semi-strutturate, e da fonti secondarie, attraverso la consultazione di social media, siti web e articoli di stampa. Le interviste semi-strutturate sono state condotte con l'imprenditrice e con i diversi tipi di stakeholder dell'impresa. In particolare, tra gli stakeholder interni, sono stati intervistati alcuni manager (ad esempio, direttore generale, business developer manager) e alcuni collaboratori dell'impresa (ad esempio, receptionist, barman, chef); tra gli stakeholder esterni, sono invece stati intervistati un cliente ed alcuni fornitori. L'identificazione dei partecipanti è avvenuta tramite una tecnica di snowball. Le interviste, che sono state condotte nel biennio 2024-2025, hanno avuto una durata media di circa 40 minuti ciascuna.

5. Risultati preliminari

Le interviste con l'imprenditrice hanno mostrato come numerosi eventi avversi e scelte difficili abbiano plasmato la sua resilienza personale e professionale. L'imprenditrice ha affrontato diverse criticità lavorando nell'impresa di famiglia, tra cui problemi relazionali con il padre dal quale faticosamente ha ottenuto fiducia in ambito lavorativo. Le sfide familiari e lavorative affrontate nel tempo hanno formato e temprato l'atteggiamento resiliente dell'imprenditrice, rendendola più forte e pronta a reagire e a gestire eventuali nuove situazioni difficili, alimentando così la sua resilienza proattiva.

Di fronte all'imprevedibilità della crisi pandemica, una decisione particolarmente rischiosa, ma decisiva è stata mantenere operativo l'hotel, manifestando così una resilienza adattiva. Sebbene i fratelli soci dell'imprenditrice considerassero questa scelta azzardata, le hanno dato

piena fiducia. La scelta di mantenere l'hotel aperto è stata spinta dalla percezione di una pressione sociale nei confronti degli stakeholder interni ed esterni, ovvero i dipendenti dell'impresa e i clienti che avevano bisogno di pernottare in albergo per esigenze lavorative, nonostante i rischi per la salute. Ciò ha portato l'imprenditrice a voler prendersi cura del personale dell'albergo, garantendo sicurezza, serenità e stabilità economica. Inoltre, nonostante il numero limitato di ospiti durante il periodo COVID-19, l'imprenditrice mirava a garantire loro un ambiente sicuro in cui si potesse generare un senso di accoglienza e comunità tra il personale e gli ospiti.

La sensibilità e la percezione della pressione sociale verso le persone, alimentata dalle vicende critiche della vita personale e lavorativa dell'imprenditrice, hanno determinato implicazioni anche a livello d'impresa. In generale, riconosciamo la pressione sociale come un costrutto chiave che emerge nel nostro caso, ed è anche ben consolidato nella letteratura di management. Concepiamo la pressione sociale come l'influenza esercitata dagli altri—individui nel caso delle scelte personali di un imprenditore, e stakeholder nel caso delle decisioni d'impresa. Tali pressioni possono essere espresse in modo esplicito, ma sovente sono disomogenee, poiché i decisori possono dare priorità agli interessi di alcuni individui o gruppi di stakeholder rispetto ad altri. A livello d'impresa, la letteratura tende a enfatizzare potere, legittimità e urgenza come dimensioni chiave che modellano la pressione degli stakeholder (Mitchell et al., 1997); tuttavia, queste pressioni possono anche essere emotive, cognitive o professionali, riflettendo preoccupazioni morali, aspettative culturali e standard settoriali.

L'attenzione prioritaria verso la costruzione e la cura delle relazioni con gli stakeholder ha spinto l'imprenditrice a fare in modo di creare un ambiente accogliente e armonioso all'interno dell'hotel, una sorta di bolla di serenità che potesse favorire un senso di comunità tra le persone. Inoltre, nella gestione degli stakeholder, l'imprenditrice ha potuto beneficiare delle relazioni di fiducia costruite nel tempo con gli stakeholder, che hanno permesso di contare sull'impegno dei dipendenti e sulla collaborazione dei partner esterni. Questo risultato è coerente con la letteratura manageriale che sottolinea l'importanza di costruire relazioni come condizione necessaria per accedere alle risorse, non solo prima di uno shock esogeno, ma più in generale per garantire un supporto continuo da parte degli stakeholder dell'impresa (Pfeffer e Salancik, 1978). Tale supporto appare fondamentale per la possibilità dell'impresa di rimanere aperta e sopravvivere. In sintesi, la gestione degli stakeholder si è fondata sull'interazione tra relazioni di fiducia consolidate nel tempo e pressioni sociali, che l'imprenditrice ha saputo mediare e tradurre in decisioni efficaci. Tale approccio ha garantito non solo la sopravvivenza, ma anche il rafforzamento della resilienza organizzativa del Four Points by Sheraton Catania.

Il Four Points by Sheraton Catania ha saputo reagire alla crisi improvvisa, non solo in termini di resilienza proattiva e resilienza adattiva. Infatti, sono state osservate anche forme di resilienza reattiva, legate alla creatività nell'adattare i servizi per garantire la continuità dell'offerta al cliente.

6. Contributi attesi

Il primo contributo di questo studio riguarda la resilienza d'impresa. Studi precedenti hanno evidenziato l'importanza delle risorse potenzialmente utilizzabili, che possono essere riadattate per il raggiungimento degli obiettivi organizzativi (George, 2005). Tali risorse offrono flessibilità, consentendo risposte rapide e creative per fronteggiare circostanze avverse e discontinuità contestuali. Tuttavia, shock esterni possono renderle rapidamente obsolete, riducendone l'efficacia nel sostenere la resilienza. Inoltre, queste risorse producono un servizio potenziale che dipende dal modo in cui vengono gestite, e dunque dalle interazioni e decisioni dei manager (Foss et al., 2008). Di conseguenza, si può dedurre che le caratteristiche individuali degli imprenditori possano rafforzare la resilienza dell'impresa (Kovoor-Misra, 2020; Sommer et al., 2016).

In secondo luogo, evidenziamo il ruolo centrale della gestione degli stakeholder nel rafforzare la resilienza, non soltanto attraverso l'accesso alle risorse, ma anche mediante

l'interazione continuativa con gli stakeholder e la gestione delle pressioni sociali. Una gestione efficace di tali dinamiche combina una dimensione relazionale, fondata su fiducia, collaborazione e capitale sociale, con una dimensione dinamica, nella quale l'imprenditore deve bilanciare richieste eterogenee e rispondere con flessibilità, soprattutto nei periodi di crisi.

Rispetto alla letteratura esistente che evidenzia come l'affrontare eventi avversi alimenti la resilienza imprenditoriale (Bernard e Barbosa, 2016; Prah e Sibiri, 2021), noi riconosciamo non soltanto che tali esperienze favoriscono una resilienza proattiva, intesa come preparazione alle possibili perturbazioni (Conz e Magnani, 2020), ma aggiungiamo che la gestione delle relazioni con gli stakeholder risulta determinante per preservare e amplificare la capacità di resilienza (Bhamra et al., 2011).

Nel complesso, i nostri risultati suggeriscono che la resilienza imprenditoriale può essere interpretata come una capacità latente, che necessita di essere attivata attraverso specifiche condizioni contestuali: da un lato, l'esperienza delle avversità, e dall'altro, una gestione efficace degli stakeholder. Mostriamo infatti come l'impatto della resilienza individuale dell'imprenditore venga amplificato dalla gestione delle relazioni con gli stakeholder, contribuendo così ad approfondire la comprensione dei processi che trasformano la resilienza personale in resilienza organizzativa.

The Human Side of Data-Driven New Ventures: How Design Thinking Mindset Enables a Strong Data Culture

Simona Leonelli [1], Bernardo Balboni [2], Linda Gabbianelli [3], Ludovica Leone [4], Giulia Tagliazzucchi[5], Marina Vignola[6]

1. Introduction

This paper is part of ongoing research that explores the potential synergy between a human-centered approach—grounded in design thinking—and the development of a data-driven culture in new ventures. While design thinking emphasizes empathy and user engagement to generate meaningful innovations (Liedtka, 2015), a data-driven culture supports decision-making and strategic alignment (Chatterjee et al., 2024). Recently, researchers examined how the implementation of design thinking might relate to organizational-level constructs, such as organizational culture (Elsbach and Stigliani, 2018), to show that design thinking is not just a set of tools but an organizational capability that influences cognitive flexibility, experimentation, and adaptation—key qualities for startups operating under conditions of uncertainty. Additional research shows the value created when human intuition combines with algorithmic reasoning and machine intelligence (Kolbjørnsrud, 2024). The merging of a human-centered approach and data-driven decision-making can unlock innovation processes, enabling new ventures to iterate quickly, respond flexibly to market signals, and promote organizational learning across various contexts (Visvizi et al., 2022; Grimaldi; 2025). This integration indicates a broader shift in innovation management toward combining human-centered strategies with the analytical rigor needed for modern digital environments. New ventures are indeed increasingly challenged to balance creativity with analytical and data-driven rigor (Visvizi et al., 2022) to improve agility and scalability. To further explore this topic, the present work uses a survey of Italian innovative new ventures. The results show that human insight and data analytics are not opposing logics; rather, when entrepreneurs are empathetic and eager to learn, they may be especially inclined to use data to make user insights more accurate, test different solutions, and support a more informed, user-centered innovation process.

Recent research highlights that integrating Design Thinking (DT), an approach based on empathy, iterative exploration, and user engagement, with Data-Driven Culture (DDC) is emerging as crucial (Sreenivasan and Suresh, 2024). Scholars have also explored DT not only as an innovation methodology but also as a cognitive frame and decision-making approach, influencing how organizations identify and interpret problems and develop potential solutions (Elsbach & Stigliani, 2018; Glen et al., 2015). DDC refers to shared norms and practices that enable organizations to systematically use data for decision-making. It features high data literacy, broad access to relevant data, analytical maturity, and the integration of data into both strategic and operational processes (Provost & Fawcett, 2013; McAfee et al., 2012).

DT has become a central paradigm for innovation because it prioritizes a deep understanding of user needs and contexts (Brown, 2009; Liedtka, 2014; Liedtka, 2015). According to Brown (2009), DT can be understood as an approach that applies designers' ways of thinking and working to align human needs with technological possibilities and business strategies capable of transforming those possibilities into market opportunities. Overall, DT integrates empathic research and iterative prototyping, ultimately enhancing the capacity to learn from users and to generate solutions that are both feasible and desirable (Magistretti et al., 2022). DT promotes experiential learning (Kolb, 2014) by guiding teams through cycles of hypothesis formation, testing, and sense-making. Uncertainty is embraced as a natural aspect of innovation, and mistakes are seen as essential learning moments within a double-loop learning framework (Argyris & Schön, 1978), where new ventures not only modify their actions based on feedback but also revisit problem framing. Practices frequently used to go beyond personal assumptions and uncover hidden user needs include ethnographic observation, journey mapping, and rapid feedback cycles (Kelley, 2011). Overall, these practices help to reframe problem definition by encouraging practitioners to "look through the eyes of the user," emphasizing empathy and contextual inquiry. This user-focused approach fundamentally influences decision-making by shifting the focus from internal preferences or expert judgments to evidence gathered through interactions with real users. In this way, user-centeredness is not only an approach to problem-solving and innovation but could also become a cultural trait that shapes how new ventures see problems, evaluate opportunities, and allocate resources. In entrepreneurship research, DT is shown to support opportunity creation and iterative learning, as its principles promote reframing, experimentation, and continuous exploration (Carlgren et al., 2016). The literature also indicates that DT not only boosts creativity but also helps develop cultural norms that encourage collaboration, shared problem-solving, and adaptive learning (Elsbach & Stigliani, 2018). Consistent with this perspective, DT might assist entrepreneurs in navigating uncertainty by gaining a deep understanding of user needs and generating innovative solutions through iterative learning (Liedtka, 2015).

DDC is inherently an organizational and cultural phenomenon that facilitates the use of data-based evidence, not solely a technological construct. In literature, DDC is often conceptualized as a key intangible resource and a central component of big data analytics capability (Gupta & George, 2016; Garmaki et al, 2023). Moreover, DDC enhances both exploratory and exploitative innovation, supporting organizational ambidexterity (Mikalef et al., 2019; Ciampi et al., 2021). Empirical studies show that ventures having a DDC outperform their competitors through greater efficiency and more effective innovation processes. However, achieving a DDC requires overcoming barriers such as siloed data, lack of analytical skills, resistance to transparency, and misalignment between data practices and organizational identity.

3. Hypothesis development

Although DT and DDC emerge from different traditions—one human-centered and qualitative, the other analytical and quantitative—they are increasingly recognized as complementary approaches to innovation (Visvizi et al., 2022). DDT is focused on empathy and

emphasizes deep qualitative insights derived from user engagement, while DDC relies on quantitative evidence from digital traces, analytics, and behavioral patterns (Vignoli et al. 2023). Integrating these perspectives offers a more holistic understanding of user behavior and supports more robust innovation and decision-making (Mortati et al., 2023). For example, recent conceptual and empirical studies show that embedding DT into data-intensive projects allows organizations to connect analytics to real user needs, identify more meaningful questions for analysis, and translate complex results into actionable improvements in products and services (Pham et al., 2021)

In new ventures, this orientation closely aligns with the empirical evidence that innovation results not only from technology use but also from how people interact with information and turn data into meaningful insights (Grimaldi et al., 2025). A strong focus on understanding users—empathizing with them—drives the systematic search for accurate, multidimensional information about their behaviors, preferences, and pain points. In innovative new ventures, such insight increasingly comes from structured data sources like behavioral analytics, digital traces, and user feedback (Visvizi et al., 2022). Successful, data-driven ventures combine user-centered discovery practices with systematic data management, helping them reduce bias, improve decision quality, and find behavioral patterns that support product and business model development. Building on this, a strong user-centered mindset is likely to bolster a venture's DDC, as founders and teams rely more on user-related data to deepen their empathetic understanding and guide strategic decisions (An et al., 2024). Therefore, higher levels of user-centeredness and empathy are expected to foster a stronger organizational DDC by embedding the belief that understanding and serving users depends on systematic, data-supported insights rather than subjective judgment. We then propose the following hypothesis.

H1: Empathy (EMP) is positively associated with Data-Driven Culture (DDC)

Learning orientation is a key dimension of the DT mindset, reflecting individuals' eagerness to challenge assumptions, experiment, iterate, and continually deepen their understanding through feedback and reflection (Vignoli et al., 2023). In innovative startups, learning is explicitly connected to how founders and teams work with data: empirical results from startup interviews indicate that organizational learning occurs when teams treat data as a strategic asset, employ iterative testing (e.g., A/B tests), and depend on data to detect failures, improve processes, and refine hypotheses. Data can thus act as a catalyst for this iterative learning process (Vizvivi et al., 2022). In new ventures, individuals with a strong learning orientation are more likely to activate and maintain data-driven behaviors—such as experimentation, evidence-based iteration, and reflective data analysis—thereby fostering a culture that systematically uses data to manage uncertainty and promote innovation. Similarly, research on digital organizational culture confirms that a data-driven mindset grows stronger when organizations encourage ongoing development, knowledge sharing, and routines based on evidence-based improvements (An et al., 2024). In this context, data functions as a catalyst for learning processes that speed up the creation of DDC. We then propose the following hypothesis.

H2: Learning Orientation (LO) is positively associated with Data-Driven Culture (DDC)

4. Methodology

4.1. Data collection and sample

To test the hypotheses of our theoretical model, we conducted a survey on Italian innovative startups. To gather data, we used a questionnaire administered through phone interviews between September and October 2025. The questionnaire is divided into two sections: the first, with items based on a seven-point Likert scale, includes questions about the entrepreneur's design thinking mindset and the firm's data-driven culture; the second section pertains to respondent characteristics, such as gender, age, and educational level, as well as firm characteristics like size, age, industry, and geographical area of operation. On average, the interviews lasted about 30

minutes. The key informant is the startup's founder, typically serving as CEO or a member of the board of directors. The reference population consists of 6,820 Italian startups registered in the official Italian registry of innovative startups founded between 2018 and 2021. Of these, 2,142 companies with contact information (phone number and email) were considered (31.4%). Finally, 305 Italian startups agreed to participate in the study (return rate of 14.2%). The sample provides good representativeness by industry, geographic area, and year of foundation (firm age), as shown in Table 1.

Firm characteristics	**n**	**%**	**Respondent characteristics**	**n**	**%**
Firm size			**Gender**		
0 - 4 employees	242	79.34	Man	237	77.70
5 – 9 employees	36	11.80	Woman	68	22.30
10 – 19 employees	27	8.86			
Firm age			**Age**		
4 years old	98	32.13	≤ 39 years old	80	26.23
5 years old	94	30.82	40 - 49 years old	83	27.21
6 years old	73	23.93	50 – 59 years old	95	31.15
≥ 7 years old	40	13.11	≥ 60 years old	47	15.41
Geographical area			**Educational level**		
Nord-West	100	32.79	High school diploma	87	28.52
Nord-East	47	15.41	Bachelor's & master's degree	156	51.15
Centre	59	19.34	Master's or Ph.D.	62	20.33
South and Islands	99	32.46			
Industry					
Commerce	9	2.95			
Manufacturing	57	18.69			
Services	237	77.70			
Tourism	2	0.66			

Table 1. Sample demographic characteristics

The majority of companies are microenterprises, with almost 80% (79.34%) reporting fewer than 5 employees, consistent with the nature of startups. Geographically, firms are distributed evenly across the North-West (32.79%) and South and Islands (32.46%), with only modest representation from the Centre (19.34%) and North-East (15.41%). This data is consistent with the sampling procedure, which reflects the broader presence of startups in the North-West. Finally, our start-ups are predominantly in the service industry (77.70%), followed by manufacturing (18.69%), while commerce (2.95%) and tourism (0.66%) are minimally represented.

As for the respondent characteristics, the gender distribution (male 77.7%, female 22.3%) reflects a common pattern in the Italian entrepreneurial field. Age-wise, the dataset reveals a diverse range. Individuals aged 50-59 years make up the largest segment (31.15%), followed by those aged 40–49 years (27.21%) and those aged 39 years or younger (26.23%). The proportion of respondents aged 60 or above is comparatively lower (15.41%), consistent with the innovative start-up environment. Most of the respondents have at least a bachelor's or a master's qualification (51.15%), and an additional fifth holds a post-experience master's or a Ph.D. (20.33%).

4.2. Measures

The model constructs that we used were developed on the basis of the existing literature on the data-driven culture and design-thinking mindset and adapted to the current study. As dependent variable, we measure the data-driven culture by using the 5-item Likert scale developed by Gupta and George (2016). Exemplar items are: We consider data a tangible asset; We base our decisions on data rather than on instinct; We continuously coach our employees to make decisions based on data. As independent variable, we measure the design thinking mindset of the entrepreneur, using the scale developed by Vignoli, Dosi and Balboni (2023). Based on our hypotheses, we considered two factors of the multifactor scale: empathy and learning. Empathy is 'the ability to see and experience through another person's eyes, to recognize why people do what they do'. Items for the empathy scale are: During the design activity, I dedicate a considerable amount of time to understand what users need; I can tune into how users feel rapidly and intuitively; I am comfortable seeing problems from the users' point of view; I easily empathize with the concern(s) of other people. Learning is the measure of the 'appetite for learning, the desire to learn, including learning about others, challenging existing frameworks, and seeking new contexts in which to learn something'. The original factor has a 5-item scale, some exemplar items are: I am comfortable seeing a problem as an opportunity to learn; I am comfortable receiving feedback and learn from it.

As control variables, we used the startups' geographical area, the industry, the age of the startups, the entrepreneur's education level, age, and gender.

5. Results

The statistical software used in the analysis was Stata 16. Table 2 illustrates the Spearman's correlations of variables. Considering only the main variables of interest of the model, results show that data driven culture is positively correlated with empathy ($r= 0.242$, $p < 0.001$), learning ($r= 0.320$, $p < 0.001$), and geographical area ($r= 0.133$, $p < 0.05$). While empathy and learning are positively correlated each other ($r= 0.647$, $p < 0.001$).

	1	2	3	4	5	6	7	8	9
1. Data driven culture	1								
2. DT_empathy	0.242***	1							
3. DT_learning	0.320***	0.647***	1						
4. Geographical area	0.133*	0.022	0.054	1					
5. Industry	0.092	0.047	0.002	-0.029	1				
6. SME age	0.018	0.080	0.091	0.215***	0.053	1			

	1	2	3	4	5	6	7	8	9
7. Entr. education	0.047	0.028	-0.005	0.101	0.152**	0.037	1		
8. Entr. age	0.022	0.092	0.095	-0.115*	-0.008	0.075	-0.131*	1	
9. Entr. gender	-0.043	0.092	0.012	-0.006	-0.070	0.069	0.044	-0.146*	1

* $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$

Table 2. Spearman correlation matrix

As these variables describe DT capabilities and they are strongly correlated, they may capture overlapping aspects of the same underlying construct. To avoid this and better assess the distinct influence of each capability, we ran two separate models – one focus on empathy and one on learning – as recommended when theoretically related predictors exhibit high intercorrelations (Hair et al., 2019). Table 3 presents the results of the hierarchical regression analyses. Models 1 reports only the control variables, model 2 adds the empathy variable, and models 3 considers the learning variable.

Our preliminary results show a positive and significant relationship between DDC and empathy ($\beta = 0.161$, $p < 0.001$ – Model 2) and learning ($\beta = 0.124$, $p < 0.001$ – Model 3). Specifically, the higher the empathy and learning, the greater the data driven culture.

6. Discussion and conclusion

This study explores how a human-centered DT approach at the entrepreneurial level relates to the emergence of a data-driven culture in startups. By focusing on empathy and learning, two essential dimensions of the DT, we provide empirical evidence that this human-centered approach significantly shapes the development of data-oriented cultural norms. The findings suggest that empathy facilitates the emergence of a data-driven culture, confirming H1. The results support the hypothesis that a strong focus on understanding users and "being in users' shoes" with empathy encourages a more systematic approach to data collection and analysis. In innovative new ventures, this user-centered sensitivity translates into an increasing reliance on structured data sources. Learning orientation also demonstrates a positive association with DDC, confirming H2. Learning orientation move beyond mere accumulation of data and allows for those data to be actively interpreted, reshaped, and used to support iterative experimentation and ongoing improvement. The results confirm the hypothesis that organizational learning emerges when data are considered as a strategic asset and new ventures engage in iterative processes to refine assumptions, improve decision-making, and enhance their solutions. This aligns with the Lean Startup approach (Ries, 2011), where the "build–measure–learn" loop rests on systematic, evidence-driven iteration. Likewise, the literature on organizational ambidexterity (March, 1991; Mikalef et al., 2019) suggests that learning routines enhance both exploratory and exploitative behaviors—reinforcing cultural norms that position data as a fundamental basis for decision-making. Therefore, rather than acting as a bridge between human-centered and data-centered reasoning, these capabilities may help organizations integrate human insight into data-based decision-making processes, thus making data use more context-sensitive and meaningful, especially for new ventures that are increasingly challenged to balance creativity with analytical rigor (Visvizi et al., 2022). Finally, we show that empathy and learning orientation operate through distinct mechanisms: while empathy drives entrepreneurs to seek richer, more accurate information about users, learning orientation shapes how this information is iteratively interpreted, tested, and incorporated into decision-making.

The present study contributes to this debate at the intersection of entrepreneurial and organizational literature. First, we contribute to the DT literature by linking it to a data-oriented organizational outcome. Previous work has mainly discussed how DT shapes creativity,

collaboration, or general organizational culture. Our results show that entrepreneurs who adopt DT – and specifically empathy and learning – are associated with the development of a data-driven culture in their startups. This suggests that DT is not only about generating novel ideas but also about structuring how evidence is gathered, interpreted, and embedded in organizations.

Second, the study advances the debate on integrating human-centered and data-centered approaches to innovation. Our findings empirically support this integrative view: empathy and learning are positively related to a culture that encourages the systematic use of data. Rather than seeing human insight and data analytics as opposing logics, our results suggest that when entrepreneurs are empathic and eager to learn, they may be especially inclined to use data to test alternative solutions and scale successful innovations. When human insight is woven directly into data-based decision-making, data becomes more context-sensitive and actionable, supporting a richer, more informed innovation process.

From a managerial point of view, the findings highlight several implications for startup founders and innovation leaders. First, developing empathy for users can greatly enhance how entrepreneurs interpret data. Empathic founders who regularly engage with users through interviews, shadowing, and co-creation are better at identifying meaningful problems, but they also tend to value structured data (e.g., usage logs, behavioral metrics) to supplement their qualitative insights. This interpretive skill makes data more actionable and relevant to the context. Second, fostering a learning-oriented mindset encourages teams of new ventures to approach innovation through ongoing experimentation rather than relying solely on intuition. When learning is a core part of the process, data naturally becomes integrated into cycles of testing, feedback, and improvement. In the end, this iterative approach helps startups make better decisions and manage uncertainty more effectively. Furthermore, when qualitative exploration—such as user interviews or prototyping—is systematically linked to quantitative analysis, startups can achieve both deeper users understanding and more scalable decision-making. This integration could help startups to build innovation processes that are both analytically rigorous and genuinely human-centered. In uncertain environments, such dual capability may become a key source of adaptability, enabling entrepreneurs not only to innovate but to keep their innovations aligned with the evolving expectations of users and stakeholders.

Like any study, our work has limitations that open doors for future research. First, the paper is a work in progress, offering an initial analysis of an ongoing project that is not yet finished, leaving room for further exploration of the results. Second, while this study focused on empathy and learning, two key aspects of the scale by Vignoli et al. (2023), future research may investigate additional DT dimensions and how they relate to DDC and other performance outcomes, such as product-market fit or the innovation process. Third, comparative studies across countries or innovation ecosystems could help uncover the influence of institutional and cultural contexts. Different cultural attitudes toward uncertainty, learning, or data use may affect how entrepreneurs apply and combine design thinking with data-driven practices. Fourth, qualitative research could provide detailed insights into the microprocesses through which empathy and learning influence data interpretation and decision-making. These approaches would complement quantitative data and deepen understanding of how founders interpret data in real-world settings. Fifth, this study examines Italian innovative startups. Although this setting is relevant, cultural and institutional factors might shape both DT and data practices. Cross-country and cross-ecosystem comparisons could assess whether the relationships observed are consistent across different regulatory, technological, and cultural environments.

Keywords: Design thinking; data-driven culture; innovation; new ventures; organizational learning

The Governance of Intelligent Technologies: How Board Composition Shapes Ethical AI Adoption. Evidence from Board Structures A cross 2025 Global Firms

Fabrizio Maria Bertusi[1], Giuseppe Maria Bifulco[2], Riccardo Tiscini[3]

1. Introduzione

L'evoluzione della corporate governance nell'era dell'Intelligenza Artificiale (AI) solleva interrogativi inediti sulla capacità delle imprese di coniugare innovazione tecnologica e responsabilità etica. L'adozione di pratiche formali di AI governance, tra cui le Ethical AI Policies, non rappresenta più un'iniziativa meramente reputazionale, ma si configura come un elemento strutturale della strategia aziendale, segnalando la maturità dell'organizzazione nel governare una tecnologia che modifica processi, rischi e relazioni con gli stakeholder.

In tale prospettiva, l'introduzione di politiche etiche sull'AI può essere interpretata, alla luce della Resource-Based View (Barney, 1991; García et al., 2018), come una manifestazione tangibile di una capability organizzativa avanzata. Governare l'AI non implica soltanto possederne le competenze tecniche, ma richiede capacità più profonde: integrare criteri etici nei processi decisionali, anticipare rischi regolatori e reputazionali, interpretare l'impatto sociale della tecnologia. Queste capacità sono particolarmente coerenti con il paradigma dell'absorptive capacity (Cohen & Levinthal, 1990; Vlačić et al., 2019), secondo cui le imprese dotate di maggiori competenze cognitive e organizzative sono più pronte a riconoscere il valore delle conoscenze emergenti e a trasformarlo in vantaggio competitivo sostenibile.

Parallelamente, la letteratura ESG ha ampiamente documentato come le performance ambientali, sociali e di governance costituiscano leve interne di creazione del valore, correlate a maggiore resilienza, migliori risultati economici e minore rischio (Morea et al., 2025; Deng, 2024; Shin et al., 2023; Bahadir & Akarsu, 2024; Xu & Wan, 2024; Binesh et al., 2024; Farooq & Noor, 2021; Antunes et al., 2023). In tale quadro, la governance etica dell'AI può essere vista come una naturale estensione contemporanea della dimensione "G" dell'ESG: un nuovo dominio attraverso cui il board esercita supervisione strategica, allineando innovazione tecnologica, responsabilità etica e interesse degli stakeholder (Floridi & Cowls, 2019).

2. Review della letteratura e sviluppo delle ipotesi

Il presente studio prende le mosse da un'analisi sistematica della letteratura sull' AI ethics e corporate governance. A tal fine è stato adottato un approccio bibliometrico su dati Web of Science, utilizzando una query mirata che combina le keyword "AI ethics", "responsible AI" e "corporate governance" all'interno dell'area Business & Economics. Il dataset così ottenuto è stato elaborato tramite VOSviewer, mappando le co-occorrenze in titoli e abstract e consentendo di identificare i principali cluster tematici e le aree di maggiore intensità del dibattito.

Figura 1. Mappa bibliometrica delle co-occorrenze delle parole chiave nella letteratura su AI Ethics e Corporate Governance

L'analisi delle co-occorrenze evidenzia tre filoni principali: un cluster valoriale, centrato su etica, responsabilità, accountability e trasparenza; un cluster tecnico-organizzativo, focalizzato su impresa, algoritmo, rischio e modelli di business; e un cluster decisionale, legato a processi decisionali, integrazione tecnologica e creazione di valore sostenibile. Nel complesso, la letteratura risulta in rapida espansione ma ancora frammentata e prevalentemente concettuale: sebbene siano ormai ben delineate le intersezioni tra AI, governance ed etica, sono scarse le evidenze empiriche sistematiche sull'adozione effettiva di politiche etiche per l'AI e, soprattutto, sul ruolo che la composizione del board svolge nel favorirne l'introduzione.

È precisamente in questo spazio che si colloca il presente contributo, che mira a colmare tale gap offrendo prime evidenze empiriche su base cross-section circa l'associazione tra struttura del board e l' adozione di AI Ethical Policies.

La letteratura recente evidenzia come l'AI stia ridefinendo ruoli, capacità e processi decisionali del board, introducendo nuove esigenze di supervisione etica e strategica. L'AI potenzia le funzioni informative e di monitoraggio del board, ma richiede al contempo competenze specifiche, meccanismi di controllo dedicati e una governance capace di gestire rischi algoritmici e opacità decisionale (Agnese et al. 2025). La letteratura evidenzia altresì come l'AI stia trasformando capacità e processi decisionali del board, ampliandone le funzioni informative ma introducendo anche vulnerabilità legate alla mancanza di apprendimento senziente e consapevolezza socioculturale (Forsythe, 1993; Kaplan & Haenlein, 2019; Lebovitz et al., 2021). Sebbene particolarmente efficace in contesti stabili, l'AI risulta più esposta a fallimenti estremi rispetto agli agenti umani, il cui ragionamento rimane superiore nella formulazione dei problemi e nella prevenzione degli errori critici (Balasubramanian et al., 2022; Krakowski et al., 2022). A ciò si aggiungono i rischi sociali associati ai sistemi di frontiera, che richiedono architetture dedicate di risk governance, tra cui la progettazione di ethics board con responsabilità, composizione e processi chiaramente definiti (Schuett et al., 2024). In questo scenario, l'adozione dell'AI modifica le fonti della competizione e rende il ruolo del board ancora più centrale nel garantire un'integrazione responsabile e strategicamente orientata delle tecnologie intelligenti.

La composizione del board rappresenta un determinante essenziale della qualità della governance, in particolare attraverso i profili di indipendenza e diversità, che influenzano in modo

significativo la performance organizzativa e la capacità dell'impresa di governare la trasformazione digitale e le tecnologie emergenti. La presenza di amministratori indipendenti è positivamente associata all'efficacia dei meccanismi di controllo e di disclosure del rischio (Mazumder & Hossain, 2022; Adamu & Ivashkovskaya, 2021) e, più in generale, a migliori esiti di responsabilità sociale d'impresa, soprattutto nei contesti caratterizzati da elevata asimmetria informativa (Álvarez & Pucheta-Martínez, 2019; Cucari et al., 2017). Questi contributi evidenziano come board più autonomi siano meglio attrezzati per presidiare rischi complessi, una capacità particolarmente cruciale nelle fasi di adozione e integrazione delle tecnologie digitali (Hasan et al., 2022).

In tale prospettiva, la letteratura mostra che livelli elevati di indipendenza del board favoriscono risultati superiori sia sul piano ambientale e di governance sia nella gestione dei profondi cambiamenti tecnologici legati alla digitalizzazione (Napoli, 2023). L'interazione tra struttura di governance e adozione di tecnologie innovative risulta quindi decisiva: imprese caratterizzate da composizioni consiliari solide ottengono performance migliori in ambito ESG e presentano una maggiore propensione a implementare con successo soluzioni digitali (Grishunin et al., 2022). Parallelamente, la diversità del board – e in particolare quella di genere – contribuisce a ridurre fenomeni di groupthink, promuovendo una cultura di innovazione e capacità adattiva (Esposito et al., 2023). Board eterogenei, grazie alla pluralità di prospettive e competenze, risultano più efficaci nel supervisionare l'adozione di tecnologie emergenti, mitigando i rischi connessi agli investimenti digitali e orientando l'impresa verso strategie di crescita resilienti (Kamalnath, 2018).

Adottando tale prospettiva, appare ragionevole ritenere che l'adozione di una AI Ethical Policy si configura dunque quale una proxy aggiornata della qualità della governance tecnologica dell'impresa, un indicatore sintetico della capacità di integrare innovazione e responsabilità in un assetto decisionale maturo. Essa riflette, contemporaneamente, l'assorbimento organizzativo delle implicazioni dell'AI e la volontà del board di orientare la trasformazione digitale entro confini etici chiari, coerenti e sostenibili.

Alla luce del crescente ruolo delle tecnologie di intelligenza artificiale nei processi decisionali aziendali e delle implicazioni etiche che ne derivano, la presente ricerca si propone di indagare il legame tra governance societaria e adozione di pratiche etiche in ambito AI. In particolare, lo studio affronta la seguente domanda di ricerca:

"In che misura la struttura del board contribuisce a spiegare l'adozione di pratiche etiche relative all'AI?"

A partire da tale interrogativo, vengono formulate due ipotesi di ricerca.

In primo luogo, si ipotizza che la qualità complessiva del consiglio di amministrazione, intesa come configurazione strutturale capace di favorire un'efficace supervisione e un orientamento responsabile delle scelte strategiche, sia associata all'adozione di politiche etiche in ambito AI (H1):

"La qualità complessiva del board è positivamente associata alla probabilità che l'impresa adotti una AI Ethical Policy, a parità di dimensione, performance economica, profilo ESG e struttura dei comitati di governance dell'impresa."

In secondo luogo, lo studio assume che la qualità del board non sia un costrutto monolitico, ma il risultato di specifiche componenti strutturali che possono incidere in modo differenziato sulla capacità dell'impresa di integrare l'AI all'interno di un quadro di governance responsabile. In particolare, l'attenzione viene posta su tre dimensioni chiave del board: indipendenza, diversity e seniority (H2):

"Le componenti strutturali del board – indipendenza, diversity e seniority – presentano effetti differenziati sulla probabilità di adozione di una AI Ethical Policy."

Coerentemente con tali ipotesi, l'analisi empirica è articolata in due modelli distinti: il primo focalizzato sulla qualità complessiva del board, il secondo volto a isolare il contributo specifico delle singole dimensioni strutturali del consiglio di amministrazione.

3. Dati e metodologia

Le analisi empiriche si basano su un dataset originale tratto da Bloomberg, che rappresenta, allo stato attuale, la più ampia popolazione disponibile sulla piattaforma in materia di governance etica dell'intelligenza artificiale. Il campione è costituito da un dataset cross-section riferito all'anno 2025 e comprende 2.048 imprese quotate operanti negli Stati Uniti, in Europa e in Asia. L'analisi si fonda sulla variabile AI_ETH_PLCY_Dumm[4] , una variabile dummy che assume valore pari a 1 qualora l'impresa dichiari l'adozione di linee guida o policy esplicitamente orientate all'impegno etico nell'utilizzo dell'intelligenza artificiale, e 0 altrimenti. Considerata la natura emergente (c.d. early stage) del fenomeno e la conseguente limitata diffusione delle pratiche di disclosure in ambito AI ethics, il processo di campionamento ha seguito un criterio pienamente inclusivo, ricomprendendo tutte le osservazioni censite da Bloomberg per le quali l'informazione risulta disponibile, senza l'applicazione di ulteriori filtri selettivi ex ante. Tale approccio consente di ridurre potenziali bias di selezione e di cogliere in modo più rappresentativo lo stato dell'arte delle pratiche di governance etica dell'AI a livello globale.

Il database è stato successivamente arricchito con un insieme articolato di variabili coerenti con le ipotesi di ricerca e con l'impianto empirico adottato. In primo luogo, con riferimento alla struttura del consiglio di amministrazione, è stato incluso il Board Composition Score[5], un indicatore sintetico che misura la qualità complessiva della composizione del board, integrando dimensioni quali indipendenza, diversity, seniority e configurazione dei ruoli dei consiglieri. Al fine di analizzare in modo più granulare il contributo delle singole componenti strutturali del board, l'analisi considera inoltre il Board Independence Score[6] , il Board Gender Diversity Score[7] e l'età media dei membri del consiglio[8], utilizzata come proxy della seniority demografica del board. Per controllare la presenza di meccanismi formali di supervisione e di presidio delle tematiche etiche e di sostenibilità, il database include una variabile dummy relativa alla presenza di un comitato CSR o di sostenibilità che riporti al consiglio di amministrazione, nonché il numero di membri del comitato di audit, quale indicatore della struttura del sistema di controllo interno[9]. L'analisi tiene inoltre conto di un insieme di caratteristiche economico-finanziarie e di sostenibilità dell'impresa, includendo la dimensione aziendale, misurata come logaritmo del

[4] Bloomberg AI_ETH_PLCY_ indica se la società ha adottato linee guida etiche e/o attività di adeguamento per l'intelligenza artificiale (AI) progettata e sviluppata. 'Y' indica che la società è impegnata in un AI che minimizza i divari e promuove la rappresentazione inclusiva.

[5] Bloomberg Board Composition Score è un indicatore sintetico (0–10) che misura la qualità complessiva della composizione del Consiglio di amministrazione. Il punteggio deriva da una media ponderata dei principali fattori di governance, diversità, indipendenza, ruoli dei direttori e età del board, con pesi determinati sulla base di criteri societari e di mercato.

[6] Bloomberg BOD_INDEPENDENCE_SCORE rappresenta il punteggio (0–10) che misura la rappresentanza femminile nel board e nei ruoli dirigenziali.

[7]Bloomberg BOARD_GENDER_DIVERSITY_SCORE espresso su una scala da 0 a 10, misura la diversità di genere all'interno del Consiglio di amministrazione e nei ruoli dirigenziali.

[8]Bloomberg BOD_AVERAGE_AGE rappresenta l'età media dei membri del consiglio, indicatore sintetico della seniority demografica del board.

[9] Bloomberg Audit Committe misura il numero di membri del consiglio che siedono nel comitato di audit (o equivalente) della società. Include esclusivamente i membri effettivi a tempo pieno, escludendo membri supplenti o alternativi. CSR Committee dummy: variabile dummy che indica se la società dispone di un comitato CSR/sostenibilità (o equivalente) che riporta al Consiglio di amministrazione. Assume valore 1 quando tra le responsabilità del comitato rientrano esplicitamente attività di controllo in materia di responsabilità sociale, sostenibilità, salute e sicurezza e/o efficienza energetica, e 0 altrimenti.

totale dell'attivo[10], la performance operativa, misurata attraverso il logaritmo dell'EBIT[11], e il punteggio ESG complessivo[12], che sintetizza la performance ambientale, sociale e di governance dell'impresa. Infine, al fine di tenere conto dell'eterogeneità strutturale tra imprese operanti in contesti differenti, l'analisi incorpora variabili di controllo relative al settore industriale e all'area geografica di appartenenza dell'impresa.

A completamento della descrizione del campione, la Tabella 1 riporta le statistiche descrittive delle principali variabili considerate nell'analisi. I dati evidenziano come l'adozione di una AI Ethical Policy risulti ancora relativamente contenuta nel campione (circa 8,7% delle imprese), coerentemente con la natura emergente delle pratiche di governance etica dell'AI. Con riferimento alle caratteristiche del board, il Board Composition Score presenta un valore medio pari a 5,53 su una scala 0–10, indicando una qualità complessiva moderata della composizione dei consigli di amministrazione, a fronte di una marcata eterogeneità nelle singole dimensioni strutturali, in particolare in termini di indipendenza e diversity. L'età media dei membri del consiglio si attesta intorno ai 58 anni, mentre la presenza di meccanismi formali di governance, quali il comitato CSR, riguarda circa un terzo delle imprese del campione. Le variabili economico-finanziarie e di sostenibilità mostrano infine un'elevata dispersione, riflettendo la significativa eterogeneità dimensionale, reddituale ed ESG delle imprese analizzate.

Tabella 1. Statistiche descrittive delle variabili utilizzate nell'analisi empirica

A integrazione delle statistiche descrittive, la Figura 1 rappresenta la distribuzione del Board Composition Score distinguendo tra imprese che adottano e imprese che non adottano una AI Ethical Policy. La figura 2 evidenzia uno spostamento verso valori più elevati dell'indicatore di qualità del board per le imprese che dichiarano l'adozione di politiche etiche sull'AI, suggerendo una maggiore qualità media della composizione del consiglio. Tale evidenza grafica fornisce un primo riscontro descrittivo della relazione analizzata, senza implicare alcuna interpretazione di natura causale.

[10] Bloomberg totale dell'attivo da stato patrimoniale, espresso in scala logaritmica.
[11] Bloomberg LTM EBIT è il risultato operativo LTM espresso in scala logaritmica.
[12] Bloomberg ESG è il punteggio che misura la performance ESG complessiva (0-10).

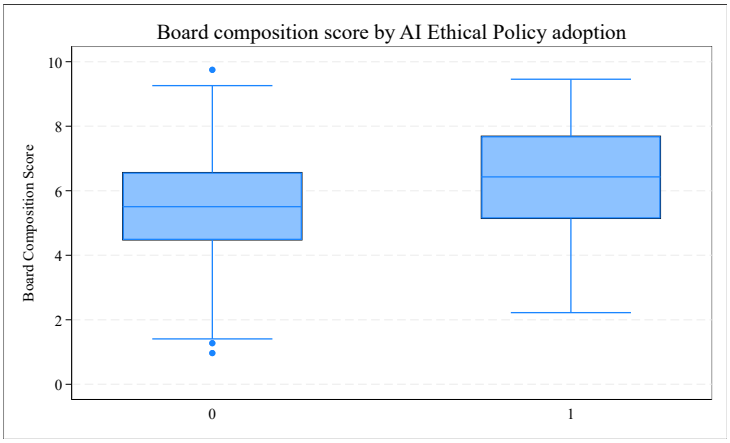

Figura 2. Distribuzione del Board Composition Score in funzione dell'adozione di una AI Ethical Policy

Le analisi empiriche sono condotte su dati cross-section riferiti all'anno 2025. La scelta di un'impostazione trasversale riflette la natura e la disponibilità delle informazioni oggetto di analisi, in particolare con riferimento alla variabile dipendente AI_ETH_PLCY_Dumm, per la quale non risultano attualmente disponibili serie storiche coerenti e comparabili nel tempo. Di conseguenza, l'assenza di una dimensione longitudinale impedisce l'impiego di modelli panel e orienta l'analisi verso un approccio associativo, volto a esplorare le relazioni tra struttura del board e adozione di pratiche etiche relative all'AI. Considerata la natura dicotomica della variabile dipendente, le stime principali sono realizzate mediante modelli di regressione logistica (Logit), che consentono di modellare in modo appropriato la probabilità che un'impresa adotti una AI Ethical Policy in funzione delle caratteristiche del board e di un insieme coerente di variabili di controllo. L'utilizzo del modello Logit permette inoltre di interpretare i coefficienti stimati in termini di odds ratio, facilitando la lettura dei risultati in un contesto di governance e policy disclosure. I risultati sono presentati sia in termini di odds ratio sia, ove rilevante, attraverso average marginal effects, al fine di fornire una misura intuitiva della rilevanza sostantiva delle associazioni stimate.

L'impianto econometrico adottato è incrementale.

Per testare l'ipotesi H1, viene stimato un primo insieme di modelli ("Modello 1") in cui la probabilità di adozione di una AI Ethical Policy è spiegata mediante un indicatore sintetico della qualità complessiva del board, misurato dal Board Composition Score di Bloomberg, includendo un set di controlli relativi alla dimensione aziendale, alla performance operativa, alla performance ESG e alla presenza di presìdi formali di governance (comitato CSR e comitato di audit). L'inclusione di tali variabili consente di isolare l'associazione tra qualità del board e adozione di pratiche etiche sull'AI, a parità delle principali caratteristiche economico-finanziarie e di governance dell'impresa.

Le specificazioni del Modello 1 sono articolate come segue:

"Baseline": $PR\ (AI_{ETH_{PLCY}{dum}_i} = 1)\ = \Lambda\ (\alpha + \beta_i * BOD_{COMP_{Score}{}_i} + X^i\beta)$

"With sector control": $PR\ (AI_{ETH_{PLCY}{dum}_i} = 1)\ = \Lambda\ (\alpha + \beta_i * BOD_{COMP_{Score}{}_i} + X^i\beta + \ + \delta_{s(i)})$

"With continent control": $PR\ (AI_{ETH_{PLCY}{dum}_i} = 1)\ = \Lambda\ (\alpha + \beta_i * BOD_{COMP_{Score}{}_i} + X^i\beta + \ \theta_{c(i)})$

dove $\Lambda(\cdot)$ indica la funzione di distribuzione logistica cumulata, BOD_COMP_Score_i rappresenta l'indicatore sintetico di qualità della governance del board, $X^i\beta$ è il vettore delle

variabili di controllo, $\delta_{s(i)}$ e $\theta_{c(i)}$ catturano rispettivamente effetti settoriali e geografici, ed ε_i rappresenta il termine di errore.

Per testare l'ipotesi H2, l'analisi sostituisce l'indicatore sintetico di board quality con le singole componenti strutturali del consiglio di amministrazione, includendo misure di indipendenza, diversity di genere e seniority demografica, mantenendo invariato il set di controlli e la struttura incrementale delle specificazioni.

Per fini di robustezza, le stesse specificazioni sono state replicate anche mediante modelli di probabilità lineare (OLS) applicati al medesimo set di dati, mantenendo invariate le specificazioni. Tali stime, pur non costituendo il riferimento principale dell'analisi a causa dei limiti noti dell'OLS in presenza di variabili dipendenti dicotomiche, consentono di verificare la stabilità del segno e della significatività delle associazioni osservate nei modelli logit. I risultati OLS sono pertanto interpretati esclusivamente come controllo di robustezza.

4. Risultati

La Tabella 2 riporta i risultati relativi al Modello 1, volto a testare l'ipotesi H1, secondo cui la qualità complessiva del consiglio di amministrazione è positivamente associata all'adozione di pratiche etiche relative all'intelligenza artificiale.

H1 - Modello 1 **AI_ETH_PLCY_Dumm**	**Baseline** Logit (OR)	**Sector controls** Logit (OR)	**Continent controls** Logit (OR)

Tabella 2. Exponentiated coefficients, Standard errors in parentheses

I risultati forniscono un supporto chiaro e coerente all'ipotesi formulata. In tutte le specificazioni considerate, il Board Composition Score risulta positivamente e significativamente associato alla probabilità che l'impresa adotti una AI Ethical Policy, suggerendo che una maggiore qualità complessiva della struttura del board si accompagna a una più elevata propensione a formalizzare principi e linee guida etiche nell'utilizzo delle tecnologie di intelligenza artificiale. L'associazione emerge già nel modello baseline e si mantiene stabile anche includendo controlli per l'eterogeneità settoriale e geografica, indicando che il legame osservato non è riconducibile a specificità industriali o continentali, ma riflette una relazione più generale tra qualità del consiglio di amministrazione e orientamento verso pratiche di governance responsabile. In termini interpretativi, tali evidenze suggeriscono che board caratterizzati da una composizione più solida, in termini di indipendenza, equilibrio dei ruoli, diversity e seniority, appaiono maggiormente in grado di presidiare i rischi etici e reputazionali associati all'adozione dell'AI, traducendo tale attenzione in strumenti formali di indirizzo e supervisione.

Per quanto riguarda le variabili di controllo, i risultati mostrano un quadro nel complesso coerente con la letteratura sulla corporate governance e sulla disclosure volontaria analizzata. La dimensione aziendale, misurata come logaritmo del totale dell'attivo (BS_TA_LN), presenta un'associazione positiva con l'adozione di una AI Ethical Policy, che diventa più marcata e statisticamente significativa una volta controllato per l'eterogeneità settoriale e geografica. Tale andamento suggerisce che l'effetto della dimensione emerge in modo più netto quando si isolano le differenze strutturali tra contesti industriali e territoriali, coerentemente con l'idea che le imprese di maggiori dimensioni siano più esposte a pressioni reputazionali, regolamentari e di accountability. Analogamente, L'effetto positivo e persistente dell'ESG Score indica inoltre che la AI Ethical Policy si inserisce nel solco di una cultura aziendale orientata alla sostenibilità, configurandosi, potenzialmente come una naturale evoluzione della dimensione "G" dell'ESG. Al contrario, la presenza di un comitato CSR e la dimensione del comitato di audit non mostrano associazioni statisticamente significative, suggerendo che l'adozione di policy etiche sull'AI sembra dipendere più dalla qualità complessiva del consiglio di amministrazione che dalla mera esistenza di specifici presìdi organizzativi. La performance operativa, misurata attraverso l'EBIT, presenta infine un'associazione meno robusta, risultando significativa solo nel modello baseline e perdendo rilevanza una volta introdotti i controlli settoriali e geografici; ciò indica che la decisione di adottare una AI Ethical Policy non appare guidata primariamente da considerazioni di breve periodo legate alla redditività, ma piuttosto da fattori strutturali di governance.

Nel complesso, i risultati del Modello 1 indicano che la qualità del board, intesa come capacità del consiglio di amministrazione di esercitare un ruolo efficace di indirizzo e supervisione strategica, rappresenta un fattore rilevante nell'orientare le imprese verso l'adozione di pratiche etiche relative all'intelligenza artificiale. Con riferimento alla variabile di interesse principale, l'entità dell'effetto stimato risulta rilevante anche dal punto di vista sostantivo: in termini di odds ratio, un incremento di un punto nel Board Composition Score è associato a un aumento delle probabilità relative di adozione di una AI Ethical Policy compreso tra circa il 22% e il 36%, a seconda della specificazione considerata. L'analisi degli average marginal effects indica inoltre che un incremento unitario dell'indicatore di qualità del board si traduce, in media, in un aumento di circa 2 punti percentuali nella probabilità di adozione di una AI Ethical Policy, a parità delle altre condizioni. Questo effetto, pur in un contesto caratterizzato da una diffusione ancora limitata delle policy etiche sull'AI, risulta economicamente significativo e rafforza l'interpretazione secondo cui la qualità del consiglio di amministrazione rappresenta un elemento chiave nella capacità dell'impresa di integrare l'intelligenza artificiale all'interno di un quadro di governance responsabile. Come indicato, graficamente in figura 3, la probabilità predetta di adozione di una AI Ethical Policy aumenta in modo progressivo al crescere della qualità complessiva del board.

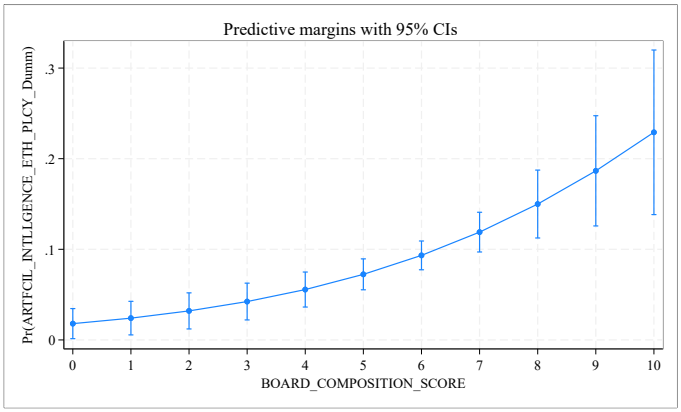

Figura 3. Margini predetti dell'adozione di una AI Ethical Policy al variare del Board Composition Score

Una volta accertata la rilevanza della qualità complessiva del *board*, si è proceduto a scomporre tale indicatore nelle sue principali componenti strutturali, al fine di testare l'ipotesi H2 relativa ai contributi differenziati di indipendenza, *diversity* e *seniority.*

I risultati del "Modello 2" sono di seguito sintetizzati (tabella 3).

H2 - Modello 2 **AI_ETH_PLCY_Dumm**	**Baseline** Logit (OR)	**Sector controls** Logit (OR)	**Continent controls** Logit (OR)

Tabella 3. Exponentiated coefficients, Standard errors in parentheses

Coerentemente con l'ipotesi, le evidenze empiriche mostrano una chiara eterogeneità negli effetti associati alle diverse dimensioni del board.

In particolare, il Board Independence Score risulta positivamente e significativamente associato alla probabilità di adozione di una AI Ethical Policy in tutte le specificazioni considerate. L'effetto si mantiene stabile anche includendo controlli settoriali e geografici, suggerendo che l'indipendenza del consiglio rappresenta una componente strutturale particolarmente rilevante nella governance etica dell'AI. Tale risultato è coerente con il ruolo attribuito agli amministratori indipendenti nel rafforzare la funzione di monitoraggio e nel promuovere decisioni orientate alla gestione dei rischi emergenti e alla tutela degli stakeholder nel lungo periodo.

Le evidenze relative alla diversità di genere risultano invece meno robuste. Il Board Gender Diversity Score mostra un'associazione positiva nel modello baseline, che tuttavia perde significatività una volta introdotti i controlli settoriali e geografici, suggerendo un effetto maggiormente condizionato dal contesto istituzionale e industriale. Analogamente, la seniority demografica del board, misurata attraverso l'età media dei consiglieri, non mostra associazioni statisticamente significative, indicando che l'anzianità anagrafica del consiglio, di per sé, non rappresenta un driver sistematico dell'adozione di policy etiche sull'AI.

Per quanto riguarda le variabili di controllo, la dimensione aziendale e il punteggio ESG complessivo risultano positivamente e stabilmente associati all'adozione di una AI Ethical Policy in tutte le specificazioni, mentre la presenza di un comitato CSR, la dimensione del comitato di audit e la performance operativa non mostrano effetti sistematici.

In termini di odds ratio, un incremento di un punto nel Board Independence Score è associato a un aumento delle odds di adozione di una AI Ethical Policy compreso tra circa il 17% e il 21%, a seconda della specificazione considerata. Coerentemente, l'analisi degli average marginal

effects indica che un aumento dell'indipendenza del consiglio si traduce, in media, in un incremento dell'ordine di 1–2 punti percentuali nella probabilità di adozione di una policy etica sull'AI, a parità delle altre condizioni. In figura 4, sono rappresentati i risultati dell'analisi.

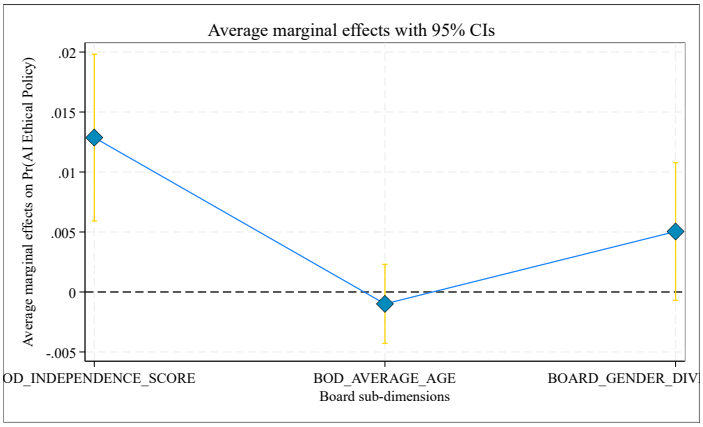

Figura 4. Effetti marginali medi delle dimensioni del consiglio di amministrazione sulla probabilità di adozione di una AI Ethical Policy

A fini di verifica della stabilità dei segni e della coerenza dei risultati, le analisi sono state replicate mediante modelli OLS/LPM su dati cross-section, includendo le medesime specificazioni baseline, con controlli settoriali e geografici. Le evidenze empiriche risultano coerenti tra le diverse specificazioni e metodologie adottate, rafforzando la solidità e l'affidabilità dei risultati presentati.

Tabella 5. Standard errors in parentheses

Nel complesso, i risultati forniscono evidenza associativa robusta a supporto dell'idea che la struttura e la qualità del consiglio di amministrazione rappresentino elementi rilevanti nella governance etica dell'intelligenza artificiale. Da un lato, la qualità complessiva del board emerge come un fattore sistematicamente associato all'adozione di una AI Ethical Policy; dall'altro, l'analisi delle singole componenti strutturali mostra che tale relazione è trainata in particolare dal grado di indipendenza del consiglio, mentre diversity e seniority svolgono un ruolo più contingente o dipendente dal contesto. Nel loro insieme, queste evidenze suggeriscono che la capacità dell'impresa di integrare l'AI all'interno di un quadro di governance responsabile dipende in misura significativa dalla funzione strategica esercitata dal board.

5. Conclusioni e discussioni dei risultati

Nel complesso, l'evidenza empirica mostra che l'adozione di una AI Ethical Policy rappresenta un tratto distintivo delle forme più avanzate di corporate governance. Lungi dal configurarsi come un mero adempimento di compliance o come uno strumento reputazionale "nice to have", la presenza di una policy etica sull'AI emerge come un indicatore della capacità del consiglio di amministrazione di esercitare una supervisione strategica consapevole sulle tecnologie intelligenti. Tale risultato appare particolarmente rilevante in un contesto in cui l'intelligenza artificiale sta ridefinendo ruoli, processi decisionali e funzioni del board, ampliandone le capacità informative ma introducendo, al contempo, nuove vulnerabilità legate a rischi algoritmici, opacità decisionale e mancanza di consapevolezza socioculturale (Forsythe, 1993; Kaplan & Haenlein, 2019; Lebovitz et al., 2021; Agnese et al., 2025).

I risultati relativi all'ipotesi H1 confermano che la qualità complessiva del board è positivamente associata alla probabilità di adozione di una AI Ethical Policy, a parità di dimensione, performance economica, profilo ESG e struttura dei comitati di governance. Tale

evidenza è coerente con la Resource-Based View (Barney, 1991), secondo cui le capacità di governo delle tecnologie emergenti costituiscono risorse organizzative difficilmente imitabili, e con il paradigma dell'absorptive capacity (Cohen & Levinthal, 1990), che sottolinea il ruolo delle competenze cognitive e organizzative nel riconoscere, assimilare e governare conoscenze complesse. In questa prospettiva, la governance etica dell'AI può essere interpretata come una manifestazione tangibile di una capability organizzativa avanzata, che consente all'impresa di integrare innovazione tecnologica e responsabilità etica in modo coerente e sostenibile.

L'analisi dell'ipotesi H2 mostra che tale relazione non è monolitica, ma riflette il contributo differenziato delle singole componenti strutturali del consiglio di amministrazione. In particolare, l'indipendenza del board emerge come la dimensione maggiormente associata all'adozione di una AI Ethical Policy, confermando il ruolo centrale degli amministratori indipendenti nel rafforzare la funzione di monitoraggio, nel presidiare rischi complessi e nel promuovere decisioni orientate al lungo periodo (Mazumder & Hossain, 2022; Hasan et al., 2022). Al contrario, le evidenze relative alla diversità di genere e alla seniority demografica risultano meno robuste e più sensibili al contesto, suggerendo che tali dimensioni, pur rilevanti per altri esiti di governance e performance, non si traducono automaticamente in una maggiore propensione all'adozione di policy etiche sull'AI. Questo risultato contribuisce a chiarire il dibattito teorico, indicando che non tutte le caratteristiche del board incidono allo stesso modo sulla governance delle tecnologie intelligenti.

Nel loro insieme, i risultati rafforzano l'interpretazione secondo cui la governance etica dell'AI rappresenta una estensione contemporanea della dimensione "G" dell'ESG attraverso la quale il board esercita una funzione di indirizzo strategico su una tecnologia ad alto impatto sistemico (Floridi & Cowls, 2019),. L'adozione di una AI Ethical Policy può dunque essere letta come una proxy aggiornata della qualità della governance tecnologica dell'impresa e della sua readiness ad affrontare le sfide etiche, operative e reputazionali poste dall'intelligenza artificiale.

Dal punto di vista manageriale, i risultati suggeriscono che l'adozione di un impegno etico nella governance dell'AI non è un esito casuale né puramente simbolico, ma riflette la qualità strutturale del consiglio di amministrazione. Ne discende che le imprese intenzionate a governare responsabilmente le tecnologie intelligenti dovrebbero rafforzare l'indipendenza del board, investire nello sviluppo di competenze specifiche in materia di AI e promuovere una autentica AI literacy consiliare. Inoltre, appare cruciale integrare la governance dell'AI all'interno dei comitati esistenti o istituire presìdi dedicati, collegando formalmente le policy etiche ai processi di gestione del rischio, alle strategie ESG e ai meccanismi di tutela reputazionale. Dal punto di vista delle policy pubbliche, i risultati suggeriscono l'opportunità di introdurre standard minimi di disclosure in materia di AI governance, requisiti di competenza tecnica per i board e architetture di governance in grado di prevenire rischi etici e sociali connessi all'adozione di sistemi intelligenti. Tali interventi potrebbero contribuire a rafforzare un ecosistema di innovazione più trasparente, responsabile e orientato alla sostenibilità tecnologica.

Pur offrendo un contributo originale, lo studio presenta alcune limitazioni che ne circoscrivono la portata interpretativa. In primo luogo, la variabile dipendente è dicotomica e cattura esclusivamente la presenza o assenza di una AI Ethical Policy, senza misurarne contenuto, qualità, grado di enforcement o maturità. Ciò impedisce di distinguere tra approcci meramente dichiarativi e framework effettivamente operativi. In secondo luogo, la natura cross-section dell'analisi, riferita al solo 2025, limita ogni inferenza causale e non consente di analizzare le dinamiche temporali successive all'adozione, lasciando aperti possibili fenomeni di reverse causality. Infine, l'assenza di variabili rilevanti, quali intensità di R&D, capitale umano digitale, AI literacy del board, struttura proprietaria o presenza di competenze tecnologiche dedicate, introduce potenziali bias da variabili omesse.

Tali limiti non attenuano tuttavia il valore esplorativo del contributo, ma indicano direzioni di ricerca future scientificamente promettenti. Studi futuri potrebbero analizzare qualitativamente il contenuto delle AI Ethical Policies, distinguendo tra approcci simbolici e sistemi di governance

effettivi, nonché esaminare il ruolo delle competenze consiliari e delle architetture di governance dedicate nel favorire accountability algoritmica e migliori scelte di design dei sistemi. La disponibilità di dati longitudinali consentirà inoltre di osservare dinamiche di apprendimento, effetti ritardati e percorsi di maturazione della AI governance oggi non identificabili, ma particolarmente rilevanti in un fenomeno che, allo stato attuale, può essere considerato ancora in una fase early-stage.

Verso una comprensione multimodale dell'Autenticità d'impresa: prime intuizioni da un caso esplorativo

Alessandra Russo[1], Sonia Quarchioni[2], Pasquale Massimo Picone[3]

1. Contesto di riferimento

Oggi le imprese sono immerse in un mondo sovraccarico di informazioni (Roetzel, 2019) e il ruolo della comunicazione, sia digitale sia fisica, è divenuto estremamente cruciale (Forgues & May, 2017). Proprio per tale ragione, in un recente articolo pubblicato su Forbes (2025, trad. nostra), Michael Shribman, presidente e fondatore di APS Global Partners Inc. e Medias Health Inc., afferma che "L'autenticità nel business è diventata molto più di una tendenza di marketing; […] Influenza ogni punto di contatto—dallo sviluppo del prodotto alle pratiche di assunzione fino al servizio clienti. Le aziende che si impegnano nell'autenticità non sono solo apprezzate—sono amate."

La riflessione sopra riportata trova riscontro anche in un'area emergente della ricerca accademica, che concorda nel riconoscere l'autenticità come una condizione necessaria affinché le imprese possano risultare credibili (Carroll & Wheaton, 2009) nelle proprie relazioni (Carroll & Kovács, 2021) e, di conseguenza, ottenere quella "licenza ad operare" di cui hanno bisogno (Verhaal et al., 2017). Tale considerazione risulta ancor più rilevante per le imprese operanti in settori in cui tradizione, distintività e artigianalità costituiscono elementi centrali (Rondi et al., 2024); in tali settori, l'autenticità rappresenta non solo il "come" le imprese si esprimono ma anche come esse si differenziano (Carroll & Wheaton, 2009). La centralità del tema è ben evidenziata, ad esempio, dal fatto che la più recente edizione della *Guida Winemag 2026* per i vini ha scelto di focalizzarsi proprio sul concetto di "autenticità" (Bortone, 2025).

Alla luce della sua crescente rilevanza, non sorprende che negli ultimi lustri il tema dell'autenticità abbia attirato una considerevole attenzione accademica (Lehman et al., 2019; Sagiv et al., 2019; Voronov et al., 2023). Studi recenti hanno iniziato ad indagare come l'autenticità sia simbolicamente espressa attraverso molteplici elementi organizzativi e modalità comunicative (Cavanaugh & Shankar, 2014; Voronov et al., 2023).

In questo quadro, Carroll e Wheaton (2009), riprendendo la nozione Weberiana di *idealtipo*, individuano diversi tipi di autenticità: tipologica (*type*), artigianale (*craft*), morale (*moral*) e idiosincratica (*idiosyncratic*). Certamente, l'autenticità non può essere considerata semplicemente come un fenomeno che riguarda la singola impresa, bensì essa rappresenta un fenomeno relazionale. Riprendendo la metafora teatrale di Goffman (1959), l'autenticità riguarda la coerenza tra il "retroscena" (back stage) e la "ribalta" (front stage). Nel quadro concettuale di Goffman (1959), l'autenticità è una performance "costruita", plasmata dalle aspettative sociali e dalle norme organizzative. Questa idea di "costruzione" (Peterson, 1997; 2005) suggerisce che le imprese, proprio come gli attori sul palcoscenico, gestiscono e modellano attivamente la propria autenticità per allinearsi alle aspettative dei loro pubblici. In tale prospettiva, l'autenticità d'impresa "emerge dalle pratiche di persuasione e di valutazione" (Voronov et al., 2023, p. 1440,

[1] Dottoranda di ricerca, ECON-07/A, Università degli Studi di Palermo; alessandra.russo04@unipa.it – corresponding author

[2] Professoressa associata, ECON-06/A, Università degli Studi di Palermo; sonia.quarchioni@unipa.it

[3] Professore ordinario, ECON-07/A, Università degli Studi di Palermo; pasqualemassimo.picone@unipa.it

trad. nostra). Questa consapevolezza sposta così l'attenzione su come le imprese sviluppano opportunità per "costruire" la propria autenticità (Peterson, 2005).

2. La formulazione del problema di ricerca

Una breve ricognizione panoramica della letteratura sull'autenticità mette in luce due aspetti centrali. Primo, i diversi tipi di autenticità (Newman & Smith, 2016; Lehman et al., 2019) offrono chiavi interpretative alternative, ma complementari, per spiegare come le imprese possano essere percepite come "autentiche" secondo criteri differenti (Carroll & Wheaton, 2009). Gli studiosi riconoscono sempre più che i tipi ideali di autenticità non rappresentano "tipi separati e incompatibili da valutare lungo continuum distinti" (Radoynovska & King, 2019, p. 796, trad. nostra), bensì possono coesistere, alternarsi o evolvere all'interno della stessa impresa (Carroll & Wheaton, 2009; Sagiv et al., 2019). Comprendere tali dinamiche consente di avanzare la teoria sull'autenticità d'impresa, superando una visione statica delle sue tipologie e riconoscendone la natura processuale e relazionale.

Secondo, le strutture organizzative e le pratiche d'impresa sono fondamentali per costruire e sostenere l'autenticità (Carroll & Wheaton, 2009). In questa prospettiva, Peterson (2005) introduce la nozione di authenticity work, intesa come l'insieme degli sforzi deliberati e strategici volti a proiettare rivendicazioni di autenticità credibili. Studi successivi mostrano che l'authenticity work è plasmato da risorse narrative (Beverland, 2005; Jones & Smith, 2005) e dalla coesistenza di risorse narrative e materiali (Dickinson, 2002; Cavanaugh & Shankar, 2014; Demetry, 2019; Voronov et al., 2023). Ad esempio, l'autenticità è sovente rafforzata attraverso artefatti fisici, spazi e riferimenti storici che rendono più plausibili le narrazioni e ne amplificano la risonanza simbolica (Hatch & Schultz, 2017; Ravasi et al., 2019; Voronov et al., 2023). Tuttavia, la nostra comprensione di come l'authenticity work evolva nel tempo e, soprattutto, di come renda possibile l'interazione tra diversi tipi di autenticità, rimane ancora limitata (Sagiv et al., 2019).

La presente ricerca, ancora in fieri, propone un'analisi della costruzione dell'autenticità attraverso la lente della multimodalità, intesa come l'orchestrazione di diverse risorse semiotiche – testi, immagini, odori – organizzate in modalità distinte quali verbale, visiva e olfattiva (Höllerer et al., 2018; 2019). La ricerca sulla multimodalità ha dimostrato il suo potenziale nel modellare i processi di costruzione del significato (Boxenbaum et al., 2018; Quattrone et al., 2021), soprattutto attraverso dimensioni sensoriali legate all'esperienza di un luogo (Giovannoni & Napier, 2023; Dacin et al., 2024) o di un prodotto (Islam et al., 2016). Secondo Voronov et al. (2023), l'authenticity work si configura come un processo narrativo intimamente connesso alla materialità e alla spazialità. A partire da questa intuizione, il presente studio utilizza la prospettiva della multimodalità per indagare le modalità concrete attraverso cui l'autenticità viene costruita nella pratica organizzativa. Il presente studio intende cogliere la natura dinamica dell'authenticity work ed esplorare come le imprese mobilitino differenti modalità comunicative per costruire e sostenere vari tipi di autenticità nel tempo.

3. Quadro teorico della ricerca

3.1. L'autenticità d'impresa: profili definitori

Il tema dell'autenticità attraversa la storia del pensiero umano come risposta alla persistente tensione tra apparenza e realtà (Trilling, 1971). Secondo Trilling (1971, p. 62) la centralità dell'autenticità si rafforza nell'epoca della fioritura del teatro, simbolicamente riassunta nella celebre iscrizione sulle mura del teatro Globe di Shakespeare «Totus mundus agit histrionem», ovvero "Tutto il mondo recita una parte". Lungo i secoli, il tema dell'autenticità è stato al centro di un dibattito continuo poiché diverse tradizioni filosofiche e culturali –come la filosofia classica (Grecia antica), la prospettiva dell'esistenzialismo (Heidegger, Kierkegaard, Sartre) e la

psicologia cognitiva sugli *schemata* (Medin & Smith, 1984)– ne hanno proposto interpretazioni divergenti.

In ambito aziendale, a fronte dei frequenti disallineamenti tra ciò che un'impresa è/fa e ciò che dichiara di essere/fare (Cording et al., 2014), coltivare l'autenticità è necessario per preservare la credibilità organizzativa (Carroll & Wheaton, 2009).

Radicata in una tensione costante tra realtà e apparenza, l'autenticità va intesa come un risultato intenzionalmente fabbricato (Peterson, 2005). Tale "fabbricazione" implica che le imprese, come attori su un palcoscenico, costruiscono attivamente la propria autenticità in linea con le aspettative del pubblico (Goffman, 1959). Sulla base di questa prospettiva, Peterson (2005) definisce l'autenticità come una qualità socialmente costruita (Grayson & Martinec, 2004; Jones & Smith, 2005).

Lehman et al. (2019, p. 1) descrivono l'autenticità come un concetto sfaccettato che può assumere tre distinti significati:

- coerenza tra i valori interni di un'entità e le sue espressioni esterne (Lehman et al., 2019, p. 1). Questo significato di autenticità si riferisce alla coerenza tra le espressioni esteriori di un individuo o di un'impresa e i propri valori e convinzioni interiori;
- conformità di un'entità alle norme della categoria sociale a cui appartiene (Lehman et al., 2019, p. 1). In questo caso, l'autenticità è intesa come l'allineamento di un'entità con la categoria di riferimento o di identificazione;
- connessione tra un'entità e una persona, un luogo o un tempo così come rivendicata (Lehman et al., 2019, p. 1). Questo significato di autenticità può riferirsi alle origini dell'entità, ossia alla sua provenienza. In alternativa, può riguardare una connessione spazio-temporale, definita *transference*, oppure legami di natura simbolica (Lehman et al., 2019).

Mentre Lehman et al. (2019) scandagliano i significati distinti sottesi all'autenticità, Carroll e Wheaton (2009) ne propongono una classificazione dei diversi tipi.

Il primo tipo ideale è l'autenticità tipologica (type), che si riferisce alla misura in cui qualcosa –come un prodotto o un'impresa– soddisfi le aspettative associate alla propria categoria (Carroll & Wheaton, 2009). Secondo gli autori, l'autenticità tipologica nel tempo si evolve in autenticità artigianale (craft), in cui l'enfasi si sposta sulla padronanza della tecnica. In questa prospettiva, qualcosa è autentico quando è realizzato con abilità artigianali e metodi appropriati. Il secondo tipo ideale è l'autenticità morale (moral), che deriva dall'intenzione sincera di agire in coerenza con convinzioni e valori profondamente radicati (Carroll & Wheaton, 2009). Carroll e Wheaton (2009) sostengono che dall'autenticità morale evolve l'autenticità idiosincratica (idiosyncratic), che non si fonda su valori ampiamente condivisi, ma su eccentricità, peculiarità o storie uniche che conferiscono a un prodotto o a un'organizzazione un carattere unico. I tipi di autenticità non sono statici né mutuamente esclusivi (Carroll & Wheaton, 2009); al contrario, possono coesistere, alternarsi o persino fondersi nel corso del tempo (Radoynovska & King, 2019).

A supporto di questa visione dinamica, Hatch e Schultz (2017) mostrano come un manufatto storico possa essere reinterpretato in momenti diversi per generare tipi distinti di autenticità: prima come simbolo di craft authenticity, poi come emblema di moral authenticity. Studi longitudinali confermano tale evoluzione. Rondi et al. (2024, p. 812), indagando i concetti di autenticità, tradizione e unicità, evidenziano la transizione dal lavoro artigianale manuale ("pure craft") a quello tecnico, narrativo ed ecosistemico. Sagiv et al. (2019) mostrano che la costruzione dell'autenticità procede attraverso fasi in cui moral e type authenticity si alternano con lo scopo di decostruire rispettivamente forme e valori e poi coesistono, consentendo la ricombinazione tra forme e valori.

Nonostante gli avanzamenti in letteratura sopra riportati, noi riconosciamo che resta poco esplorato il modo in cui i tipi di autenticità interagiscono nel tempo attraverso specifiche pratiche di costruzione del significato.

Un filone promettente affronta il tema attraverso la nozione di authenticity work (Peterson, 2005), inteso come l'insieme di sforzi materiali e simbolici che rendono credibili le rivendicazioni

di autenticità. Tali pratiche si fondano su risorse linguistiche, materiali e spaziali che non solo persuadono i pubblici, ma funzionano anche come artefatti riflessivi, aiutando l'impresa a dare senso alla propria storia (Hatch & Schultz, 2017).

È d'uopo notare che un recente lavoro di Voronov et al. (2023) ha esplorato il ruolo della narrazione e della materialità nella costruzione dell'autenticità. Secondo gli autori, l'*authenticity work* mira a costruire rivendicazioni di autenticità e si manifesta generalmente attraverso lo sviluppo di specifiche narrazioni. Le narrazioni rappresentano una forma di "impiego linguistico che collega persone, luoghi o cose in una disposizione coerente" (Voronov et al., 2023, p. 1439, trad. nostra) concepita per trasmettere un'immagine chiara e diretta di ciò che l'impresa rappresenta. Tuttavia, le rivendicazioni di autenticità possono risultare più persuasive quando sono connesse alla materialità (Voronov et al., 2023), intesa come "modalità fisica dell'essere" (Faulkner & Runde, 2012) dotata di caratteristiche spaziali distintive (ad esempio, nel loro caso, le caratteristiche del prodotto, l' human embodiment o il design architettonico). Sebbene la letteratura esistente abbia iniziato a esplorare il ruolo della narrazione e della materialità nell'*authenticity work* (Voronov et al., 2023), persiste un significativo divario di comprensione su come le diverse modalità interagiscano all'interno di una strategia di autenticità. Indagare come tali modalità contribuiscano alla costruzione dell'autenticità potrebbe rivelare se esse si rafforzino reciprocamente o si contrappongano.

3.2. Una prospettiva multimodale sull'autenticità

La multimodalità rappresenta "la combinazione e orchestrazione di molteplici modalità negli atti comunicativi" (Höllerer et al., 2018, p. 2, trad. nostra). Il significato dell'atto comunicativo non nasce da una singola modalità, ma emerge dall'interazione tra testi, immagini, suoni, spazi e gesti, che insieme compongono un sistema integrato di segni (Kress & Van Leeuwen, 2001; 2006; Höllerer et al., 2019). Le modalità non si limitano a coesistere, ma si modellano reciprocamente amplificando l'espressività complessiva in complesse "orchestrazioni" (Kress, 2010; Höllerer et al., 2019, p. 7).

Studi recenti hanno mostrato come la combinazione di modalità visive, materiali, sensoriali e verbali influenzi in modo decisivo la costruzione del significato organizzativo (Islam et al., 2016; Boxenbaum et al., 2018; Nathues et al., 2025). Noi crediamo che questa prospettiva risulti particolarmente feconda per analizzare l'authenticity work. Questa idea è supportata da alcuni studi. Ad esempio, Dickinson (2002, p. 16, trad. nostra), nel suo studio del caso Starbucks, mostra che l'autenticità viene costruita attraverso spazio, materialità, elementi visivi, suoni e odori, che insieme danno vita a una retorica "complessa e multimodale" capace di evocare la naturalità del prodotto e l'atmosfera del caffè autentico. In modo analogo, Cavanaugh e Shankar (2014), analizzando un caso di produttori alimentari nel Nord Italia e un caso di Dirigenti pubblicitari asiatico-americani nella città di New York, dimostrano come l'interazione tra modalità linguistiche e materiali (ad esempio, degustazioni, brochure, gesti e rituali) crei un'esperienza sensoriale che rafforza le rivendicazioni di autenticità. Hatch e Schultz (2017) evidenziano come gli artefatti materiali possano funzionare non solo come strumenti di persuasione, ma come promemoria tangibili della storia e dei valori di un'impresa. Infine, Voronov et al. (2023), studiando il settore canadese del whisky, mostrano che l'authenticity work si sviluppa attraverso narrazioni radicate nella materialità e nella spazialità. Nel loro insieme, questi studi dimostrano che la multimodalità rappresenta una lente potente per comprendere come l'authenticity work operi nella pratica.

4. Aspetti metodologici

Questo studio adotta un approccio qualitativo e interpretativo basato su un caso singolo. Il ricorso al case study risulta particolarmente adeguato all'indagine di processi articolati nella loro

manifestazione pratica (Denzin & Lincoln, 2017). Sebbene la ricerca sull'autenticità si sia focalizzata sul livello di settore, diversi contributi hanno messo in evidenza il valore del single case study (Dickinson, 2002; Liedtka, 2008; Hatch & Schultz, 2017; Melewar & Skinner, 2020; Rondi et al., 2024) per comprendere in profondità come l'autenticità si sviluppi nella pratica. In particolare, un caso singolo risulta utile quando l'obiettivo è analizzare il ruolo delle risorse multimodali nei processi organizzativi di costruzione del significato (Siebert et al., 2017; Daymond et al., 2024).

4.1. Selezione del caso

La nostra ricerca, ancora in fase di collezione dei dati, si focalizza su un'impresa familiare di medie dimensioni situata in Sicilia e attiva nel settore vinicolo sin dalla fine del XIX secolo. L'impresa è stata rinominata GoldGrape per ragioni di anonimità; essa opera sia nella produzione di vino sia nell'enoturismo ed è stata selezionata intenzionalmente come contesto ideale per diverse ragioni (Patton, 2002). Primo, GoldGrape appartiene a un settore ampiamente riconosciuto in letteratura per la centralità attribuita all'autenticità (Beverland, 2005, 2006; Negro et al., 2010, 2011; Voronov et al., 2013), così come altri settori affini quali alimentare, ristorazione (Dickinson, 2002; Carroll & Wheaton, 2009; Cavanaugh & Shankar, 2014; Demetry, 2019; Schifeling & Demetry, 2021), birrificazione (Hatch & Schultz, 2017; Melewar & Skinner, 2020) e distillazione (Voronov et al., 2023). In questi settori, usualmente l'autenticità è trasmessa attraverso risorse come gusto, etichette e processi produttivi (Beverland, 2008; Forgues & May, 2017; Voronov et al., 2023), ma anche tramite modalità spaziali e sensoriali, incluse percezioni olfattive e sonore (Dickinson, 2002; Cavanaugh & Shankar, 2014). Più in generale, la natura esperienziale del consumo di vino (Cardinale et al., 2016; Massa & Bédé, 2018; Sthapit et al., 2024) spinge le imprese del settore a ricorrere a un'ampia gamma di risorse multimodali, rendendo questo contesto particolarmente adatto a studiare come tali risorse plasmino i processi di costruzione del significato.

Secondo, GoldGrape opera in un contesto territoriale distintivo, quello del settore vinicolo siciliano, in cui le imprese devono apparire autentiche bilanciando conformità e differenziazione (Voronov et al., 2013). Regolamentazioni istituzionali, disciplinari e sistemi di certificazione rafforzano l'autenticità come principio organizzativo, mentre tendenze emergenti come sostenibilità e turismo esperienziale spingono verso nuove iniziative, tra cui l'enoturismo. In questo scenario, la "fabbricazione" dell'autenticità (Peterson, 1997; 2005) è diventata una priorità strategica, rendendo il contesto particolarmente fertile per analizzare l'authenticity work nella costruzione di diversi tipi di autenticità.

Terzo, la recente evoluzione di GoldGrape offre ulteriore motivazione di interesse. L'impresa ha riorganizzato i propri spazi fisici, enfatizzando l'artigianalità produttiva, la propria storia e i propri valori. Ciò permette di osservare come le risorse multimodali vengano mobilitate per sostenere l'autenticità nel tempo.

Infine, la scelta del caso è stata facilitata dall'elevato livello di accesso ai dati concesso dall'impresa, che ha permesso una raccolta dati approfondita e la possibilità di cogliere la ricchezza delle molteplici modalità con cui GoldGrape costruisce ed esprime la propria autenticità.

4.2. Raccolta dei dati

La raccolta dati ancora in fieri copre il periodo 2014–2025, anche se l'impresa ha una storia molto più lunga. Il 2014 è stato scelto come anno di avvio dell'analisi poiché segna l'inizio di una trasformazione significativa: in quell'anno, la famiglia proprietaria avvia un processo di rinnovamento strategico che ridefinisce il modo in cui GoldGrape costruisce ed esprime l'autenticità.

I dati utilizzati nello studio sono stati raccolti a partire dai primi mesi del 2024 e comprendono una pluralità di fonti. Sebbene non coprano pienamente l'intero arco temporale analizzato, la varietà di tipologie di dati disponibili può consentire di ricostruire in modo approfondito l'evoluzione dell'authenticity work e la costruzione di diversi tipi di autenticità nel tempo. La continuità delle principali figure organizzative, come i proprietari familiari, il responsabile marketing e il responsabile dell'enoturismo, ha permesso di raccogliere narrazioni retrospettive ricche e coerenti (Langley, 1999).

La principale fonte di dati è costituita dalle interviste a proprietari familiari, manager e dipendenti, ciascuna della durata di circa un'ora e mezza. Tutte le interviste sono state condotte dai tre autori insieme; inoltre, le interviste sono state registrate, trascritte e accompagnate da note di ricerca. Inizialmente, le interviste si sono concentrate sulla storia dell'impresa, sulla sua strategia e sugli elementi percepiti come distintivi. Le interviste sono state progressivamente orientate a esplorare in modo più dettagliato l'impiego di risorse semiotiche multiple, con notevole attenzione agli aspetti materiali, spaziali, olfattivi e gustativi, che si sono rivelati particolarmente rilevanti nell'authenticity work di GoldGrape.

Le interviste hanno seguito un approccio multimodal-sensitizing (Dille & Plotnikof, 2020), che mira a catturare la molteplicità delle modalità di produzione di significato osservando anche il linguaggio del corpo, i gesti e il contesto spaziale. In linea con Höllerer et al. (2019), molte delle interviste sono state condotte negli ambienti di lavoro (come l'ufficio storico dei proprietari familiari, ricco di artefatti, o durante passeggiate nella cantina) consentendo ai discorsi sull'autenticità di emergere direttamente dai contesti fisici che li incarnano.

È stata, inoltre, adottata la photo-elicitation interview (Clark-Ibáñez, 2004) con la capofamiglia, invitata a selezionare e commentare fotografie rappresentative dell'autenticità d'impresa. Questa modalità ha permesso di accedere a livelli emotivi di significato spesso invisibili nelle interviste tradizionali. Studi precedenti ne confermano l'efficacia nel suscitare emozioni (Harper, 2002) ed elaborazioni di senso (Warren, 2002; Parker & Warren, 2017; Höllerer et al., 2019), soprattutto nel contesto delle imprese familiari (Smith, 2015).

Ulteriori dati sono stati raccolti tramite visite in loco e osservazioni durante i tour enologici guidati dai proprietari familiari o i dipendenti. I tour, della durata di circa tre ore, hanno consentito di osservare come l'impresa si auto-presenta e quali elementi enfatizza per creare la propria autenticità. Questo tipo di osservazione ha consentito ai ricercatori di sperimentare in prima persona la dimensione multisensoriale dell'autenticità (Keller et al., 2025) e di sviluppare una comprensione più profonda del fenomeno, basata anche sull'esperienza corporea e sensoriale diretta dei materiali e degli spazi (Dacin et al., 2024; Keller et al., 2025).

Durante le visite sono stati adottati i principi del narrative tour method (Tracy, 2013), registrando in documenti scritti la nostra interpretazione della scena, con particolare attenzione alle sensazioni visive, uditive, olfattive, tattili, gustative e al clima emotivo. Foto e video sono stati utilizzati per arricchire e fissare percezioni, emozioni e impressioni (Keller et al., 2025).

Infine, abbiamo avuto accesso a un ampio set di materiali interni ed esterni: immagini, poster e campagne pubblicitarie, brochure, sito web, libri pubblicati, archivi fotografici, video e artefatti storici. Queste fonti hanno permesso di ricostruire la traiettoria storica di GoldGrape e l'evoluzione del suo authenticity work, evidenziando come differenti modalità si siano intrecciate (Nathues et al., 2025) nella costruzione dell'autenticità.

5. Contributi attesi

La nostra ricerca, tuttora in corso, mira a evidenziare come la costruzione dell'autenticità emerga non dall'impiego separato di specifiche risorse semiotiche, bensì dal loro intreccio multimodale e dalla capacità di produrre significati coerenti, esperienzialmente immersivi e simbolicamente pregnanti. In particolare, la nostra ricerca intende mostrare che l'intreccio di risorse verbali, materiali, visive, spaziali e olfattive non solo rafforza la costruzione

dell'autenticità, ma favorisce anche la coesistenza, l'interazione e il rafforzamento tra diversi tipi di autenticità. In tale prospettiva, il primo contributo della ricerca consiste nell'ampliare la comprensione dinamica dell'authenticity work, mostrando come esso si articoli attraverso l'intreccio di risorse multimodali.

Il secondo contributo mira a integrare le prospettive sull'autenticità e sulla multimodalità, evidenziando che l'autenticità non costituisce soltanto un costrutto simbolico o narrativo, ma anche esperienziale, sensoriale e materiale. Più nello specifico, la ricerca si propone di sviluppare un modello concettuale della costruzione multimodale dell'autenticità d'impresa, capace di spiegare come le imprese orchestrino nel tempo risorse semiotiche di diversa natura.

Infine, il terzo contributo, di natura empirica, consiste nell'offrire implicazioni pratiche per le imprese del settore vinicolo, suggerendo come la combinazione strategica di risorse semiotiche narrative, materiali e sensoriali possa essere gestita per sostenere nel tempo la credibilità e l'autenticità d'impresa.

Parole chiave: Autenticità d'impresa; multimodale; single case study

IA e imprese familiari: disegno di ricerca sul ruolo del mandato del CEO e dei TMT multigenerazionali

Maria Rosaria Marguglio[1], Pasquale Massimo Picone[2], Salvatore Tomaselli[3]

1. Introduzione

L'utilizzo dell'IA rappresenta un tema sempre più centrale per la competitività e la performance delle imprese contemporanee (Davenport e Ronanki, 2018). Per questa ragione, non sorprende che, nel corso dell'ultimo lustro, gli studiosi abbiano dedicato crescente attenzione ai fattori che influenzano l'adozione dell'IA (Mariani et al., 2023; Rizomyliotis et al., 2022; Schwaeke et al., 2025) e alle implicazioni dell'IA sulla performance d'impresa (Krakowski et al., 2023; Prentice et al., 2020; Mikalef e Gupta, 2021). Parallelamente, la ricerca ha esaminato come l'IA rimodelli i processi decisionali e di giudizio all'interno delle imprese (Agrawal et al., 2019; Leyer e Schneider, 2021; Parry et al., 2016; Raisch e Krakowski, 2021; Shrestha et al., 2019; Murtinu e De Massis, 2025). Complessivamente, questi studi collocano l'IA non soltanto come un'innovazione tecnologica, ma come una forza trasformativa che ridefinisce le logiche manageriali, le strutture organizzative e le capacità (Mikalef e Gupta, 2021; Krakowski et al., 2023).

Nel campo delle imprese familiari, studi recenti (Lannon et al., 2024; Karatayev et al., 2024; Soluk et al., 2026) hanno esplorato come queste imprese affrontino le sfide specifiche poste dall'IA. Questi lavori si interrogano su quanto le imprese familiari siano adeguatamente equipaggiate per affrontare le esigenze della quarta rivoluzione industriale, un'era caratterizzata da una rapida digitalizzazione, da processi decisionali guidati dai dati e da una crescente integrazione dell'IA nei processi strategici e operativi (Davenport e Ronanki, 2018). Per le imprese familiari, le cui pratiche e identità sono tipicamente radicate nella tradizione, nell'eredità e nella continuità relazionale (Diaz-Moriana et al., 2020), tali transizioni tecnologiche possono richiedere un distacco profondo da routine consolidate e da logiche gestionali culturalmente radicate. Nonostante la crescente attenzione scientifica, la nostra comprensione di come le imprese familiari affrontino la selezione, l'integrazione e l'adozione delle tecnologie di IA rimane limitata (Lannon et al., 2024).

Evidenze recenti dall'Osservatorio Permanente sull'Adozione e Integrazione dell'IA (2025) indicano che la quota di imprese italiane impegnate in iniziative concrete di IA è salita dal 37% al 67% negli ultimi anni. Questa tendenza riflette un'integrazione strutturale più ampia dell'IA all'interno dei processi d'impresa, segnalando il passaggio dalla sperimentazione all'adozione strategica. Per le imprese familiari, pilastri tanto del sistema imprenditoriale italiano quanto di quello internazionale (Jaskiewicz et al., 2015), questa evoluzione pone considerazioni rilevanti. Le imprese a controllo familiare sono caratterizzate da attributi distintivi quali la ricerca della continuità intergenerazionale (Diaz-Moriana et al., 2020), la preservazione del benessere socio-emotivo familiare (Gómez-Mejía et al., 2007) e una generale propensione alla minimizzazione del rischio (Naldi et al., 2007). Questi tratti possono favorire un orientamento di lungo termine,

[1] Ph.D. Candidate, ECON-07/A, Università degli studi di Palermo; mariarosaria.marguglio@unipa.it – corresponding author

ma possono anche limitare gli investimenti proattivi in tecnologie emergenti come l'IA, soprattutto quando queste sfidano pratiche consolidate o potrebbero essere viste come una minaccia all'identità e ai valori d'impresa.

Questa dualità tra tradizione e innovazione posiziona le imprese familiari come contesti privilegiati per esaminare come le dinamiche di leadership influenzino gli investimenti legati all'IA. Comprendere come le strutture di governance e le configurazioni di leadership tipiche delle imprese familiari modellino gli investimenti in tecnologia offre spunti preziosi per comprendere il più ampio processo di adozione dell'IA.

Il ruolo del CEO e del Top Management Team

La letteratura precedente sottolinea il ruolo centrale del CEO nel plasmare l'orientamento strategico dell'impresa (Hambrick e Fukutomi, 1991). Secondo la teoria del ciclo di vita del CEO, i CEO nelle fasi iniziali del loro mandato affrontano vincoli di legittimazione che limitano la loro capacità di promuovere il cambiamento; l'innovazione tende a raggiungere il picco nella fase intermedia, quando i leader possiedono sia autorità sia ambizione; mentre il conservatorismo tende a prevalere nelle fasi finali, quando i CEO diventano progressivamente ancorati alle routine esistenti (Hambrick e Fukutomi, 1991).

Se da un lato, studi precedenti hanno evidenziato una relazione a U rovesciata tra la durata del mandato del CEO e la propensione imprenditoriale al rischio (Cirillo et al., 2021), altre ricerche (Boling et al., 2016) suggeriscono che la natura familiare della leadership possa rimodellare tale relazione. Nelle imprese familiari, i CEO nelle fasi più avanzate del loro mandato sono meno esposti a pressioni di sostituzione e operano entro un orizzonte di lungo periodo orientato alla continuità. Inoltre, poiché le transizioni di leadership frequentemente coincidono con la successione, i CEO familiari in fase avanzata di mandato possono paradossalmente manifestare una rinnovata apertura all'innovazione (Boling et al., 2016), al fine di salvaguardare la longevità dell'impresa e rafforzare la continuità intergenerazionale. Per questi leader, investire in tecnologie avanzate può rappresentare un atto orientato alla continuità, volto ad assicurare che la generazione successiva erediti un'impresa competitiva e pronta per il futuro.

Tuttavia, concentrarsi esclusivamente sul ruolo del CEO offre una prospettiva limitata sui processi decisionali che determinano la capacità dell'impresa di adottare l'IA. Le iniziative strategiche raramente emergono da una singola visione individuale; al contrario, esse sono l'esito di dinamiche di leadership collettive che coinvolgono il TMT (Cirillo et al., 2021). I TMT multigenerazionali svolgono un ruolo cruciale nel plasmare gli investimenti tecnologici. Integrando membri appartenenti a differenti coorti generazionali, tali gruppi favoriscono eterogeneità della conoscenza e dell'apprendimento (Sciascia et al., 2013; Cirillo et al., 2021). I membri più giovani contribuiscono con familiarità digitale, curiosità tecnologica e apertura all'innovazione, mentre i membri più senior forniscono stabilità strategica, conoscenza contestuale e capitale relazionale di lungo periodo. Questa interazione generazionale può ampliare le capacità di IA dell'impresa in termini di dati, tecnologia, risorse di base e capacità tecniche dei dipendenti (Mikalef e Gupta, 2021).

Tuttavia, come proposto da Cirillo et al. (2021), l'influenza del coinvolgimento generazionale del TMT varia in base alla durata del mandato del CEO: nelle fasi iniziali e intermedie, un elevato coinvolgimento generazionale rafforza la propensione al rischio; nelle fasi avanzate può intensificare la resistenza al cambiamento, poiché i CEO più longevi possono percepire la diversità di conoscenza come una minaccia ai paradigmi consolidati.

Eppure, nell'era dell'IA, tale schema può evolvere. In contesti in cui le generazioni più giovani, nativi digitali e nativi dell'IA (Lannon et al., 2024), partecipano attivamente al top management, la loro familiarità con gli strumenti di IA e la loro capacità tecnologica possono mitigare il conservatorismo tipico delle fasi finali del mandato, favorendo un'apertura continuativa all'innovazione. Ciò suggerisce che i TMT multigenerazionali possano prolungare

la fase del ciclo di vita del CEO in cui il sostegno agli investimenti in IA è più intenso, mantenendolo anche nelle fasi più avanzate del suo mandato.

Sulla scorta di questi argomenti, questa ricerca, ancora in fieri, intende rispondere alla seguente domanda: in che misura la durata del mandato del CEO influenza la capacità di IA nelle imprese familiari, e come il coinvolgimento multigenerazionale del TMT modera tale relazione? Per rispondere a questa domanda, stiamo somministrando un questionario rivolto alle imprese familiari italiane, finalizzato a rilevare come la durata del mandato del CEO e la composizione del TMT influenzino la capacità di IA dell'impresa. Il questionario è stato sottoposto a un test pilota ed è rivolto ai CEO familiari in qualità di informatori privilegiati.

2. Metodologia

Il questionario è stato somministrato a un campione casuale di imprese familiari italiane, comprendente piccole, medie e grandi imprese. I rispondenti al questionario sono stati i CEO di tali imprese, poiché possiedono la visione più ampia dei processi decisionali strategici e dell'allocazione delle risorse.

All'interno di questo campione, le imprese familiari sono state identificate secondo la definizione fornita dall'Associazione Italiana delle Aziende Familiari (AIDAF), in linea con la definizione proposta dalla Commissione Europea. Secondo tale definizione, un'impresa familiare è un'entità legale operante in qualsiasi settore, in cui, da almeno due generazioni:

(a) una famiglia italiana, indipendentemente dal fatto che l'impresa abbia sede in Italia o all'estero, o una famiglia straniera nel caso di un'impresa situata in Italia, detenga direttamente o indirettamente il potere di nominare gli organi di governo dell'impresa; (b) almeno un membro della famiglia sieda in uno degli organi di governo dell'impresa con una posizione esecutiva apicale. Questa operazionalizzazione assicura che la nostra analisi catturi imprese sia di proprietà familiare sia gestite dalla famiglia, riflettendo il duplice influsso della continuità proprietaria e della continuità gestionale.

2.1. Procedure per ridurre i bias da metodo comune

Per affrontare i potenziali bias da metodo comune, sono state applicate diverse misure procedurali e statistiche seguendo le linee guida di Podsakoff et al. (2003). Sulla scorta dell'esempio di Henssen et al. (2014), prima della distribuzione del questionario, tutti gli item sono stati valutati da un panel di studiosi esperti in imprese familiari per garantirne chiarezza concettuale e rilevanza. Considerata la natura tecnica di alcune domande, in particolare quelle riguardanti la capacità di IA in termini di dati, tecnologia, risorse di base e capacità tecniche dei dipendenti, è stato consultato un esperto di IA con ampia esperienza di consulenza presso imprese italiane. Questo esperto ha raffinato gli item più tecnici e ha contribuito a sviluppare definizioni operative per migliorare la comprensione da parte dei rispondenti. Sono state utilizzate esclusivamente scale e item precedentemente validati tratti dalla letteratura esistente. Per garantire l'accuratezza della traduzione, è stato impiegato un processo rigoroso di doppia traduzione: le scale sono state tradotte dall'inglese all'italiano e poi retro-tradotte all'inglese più volte, per mantenere la massima fedeltà ai significati originari.

La versione italiana del questionario è stata pretestata con un gruppo di tre CEO di imprese familiari italiane. Il loro riscontro è stato utilizzato per migliorare la leggibilità e la rilevanza contestuale. Successivamente, il questionario è stato distribuito ai CEO delle imprese familiari italiane attraverso AIDAF e tramite contatti diretti con singole imprese, a seguito di un'e-mail di invito iniziale. È stato garantito l'anonimato dei rispondenti e la partecipazione ha richiesto la lettura di un consenso informato. Una lettera di accompagnamento ha illustrato finalità, tempo richiesto, garanzie di riservatezza e l'opportunità di ricevere un report dei risultati finali.

2.2. Misure

Variabile dipendente: capacità di IA

Abbiamo misurato la capacità di IA delle imprese sulla base dello studio "Artificial intelligence capability: Conceptualization, measurement calibration, and empirical study on its impact on organizational creativity and firm performance" sviluppato da Mikalef e Gupta (2021). Il modello concettualizza la capacità di IA come l'abilità dell'impresa di "selezionare, orchestrare, e sfruttare le proprie risorse specifiche di IA" (Mikalef e Gupta, 2021, p. 4 trad. nostra). Il modello identifica diverse categorie di risorse che determinano la capacità di IA di un'impresa. In questo lavoro, e in linea con la letteratura sull'IA, ci siamo focalizzati sulle risorse tangibili – dati, tecnologia e risorse di base – e su una parte delle risorse umane, ovvero le capacità tecniche dei dipendenti:

- dati: accesso a dati interni ed esterni necessari all'addestramento dei sistemi di IA e al supporto dei processi decisionali;
- tecnologia: sistemi e strumenti necessari per archiviare, elaborare, trasferire e proteggere dati in tutte le fasi, dall'acquisizione all'utilizzo;
- risorse di base: disponibilità di risorse finanziarie e attenzione manageriale dedicate allo sviluppo dei progetti di IA;
- capacità tecniche: competenze tecniche e analitiche dei dipendenti per progettare e operare con i sistemi di IA.

Le suddette risorse sono necessarie perché la natura multidimensionale della capacità di IA richiede non solo aspetti informatici, ma soprattutto lo sviluppo del capitale umano.

Variabile indipendente e moderatore: durata del mandato del CEO e composizione multigenerazionale del TMT

Per misurare l'impatto della durata del mandato del CEO sulla capacità di IA delle imprese, i rispondenti hanno indicato (a) il numero totale di anni trascorsi nell'impresa in qualunque ruolo e (b) il numero di anni trascorsi nel ruolo attuale di CEO. Inoltre, per tener conto della dimensione collettiva del processo decisionale strategico, i rispondenti hanno riportato (c) il numero di membri familiari e non familiari nel TMT e (d) il numero di generazioni rappresentate al suo interno. Questa operazionalizzazione cattura il coinvolgimento multigenerazionale nel TMT come presenza di coorti generazionali multiple, una variabile di diversità intergenerazionale e di eterogeneità di conoscenza.

3. Risultati attesi e contributi

Il focus centrale della nostra ricerca è misurare il livello di capacità di IA nelle imprese familiari italiane. Il nostro modello teorico si basa sulla teoria del ciclo di vita del CEO (Hambrick e Fukutomi, 1991), che integriamo nel contesto dell'IA. L'argomento chiave dello studio è che la durata del mandato del CEO costituisca un antecedente critico della capacità di IA nelle imprese familiari. Riprendendo gli studi che hanno identificato una relazione concava (a U invertita) tra la durata del mandato del CEO e l'orientamento imprenditoriale (Boling et al., 2016), così come tra la durata del mandato del CEO e la propensione al rischio (Cirillo et al., 2021), estendiamo tali intuizioni al contesto dell'IA. In particolare, esaminiamo come la durata del mandato del CEO correli con il livello di capacità di IA dell'impresa in termini di dati, tecnologia, risorse di base e capacità tecniche dei dipendenti. Inoltre, il nostro modello incorpora una variabile moderatrice che cattura l'eterogeneità del processo decisionale strategico: il numero di generazioni rappresentate all'interno del TMT. Questa variabile riflette l'ampiezza della diversità intergenerazionale nella leadership, che riteniamo essere un fattore contestuale rilevante nella definizione dei processi di adozione dell'IA. Ci aspettiamo che i CEO familiari nelle fasi avanzate del loro mandato continuino a mostrare comportamenti innovativi investendo in risorse abilitanti l'IA. Nelle imprese familiari, tali investimenti possono essere interpretati come azioni strategiche orientate alla continuità, volte a salvaguardare il vantaggio competitivo e a garantire continuità di

lungo periodo tra generazioni. Da questa prospettiva, gli investimenti in IA non sono percepiti come una rottura radicale, ma come un veicolo di continuità e rinnovamento, che permette ai leader senior di trasferire ai successori un'impresa tecnologicamente competitiva. Inoltre, ipotizziamo che la presenza di più generazioni all'interno del TMT rafforzi la relazione positiva tra la durata del mandato del CEO e la capacità di IA dell'impresa. Le generazioni più giovani, grazie alla loro maggiore familiarità con le tecnologie digitali e con le tematiche legate all'IA (Lannon et al., 2024), apportano prospettive nuove e alfabetizzazione tecnologica che facilitano gli investimenti. La loro partecipazione attiva al processo decisionale strategico può controbilanciare il conservatorismo tipico delle fasi avanzate del mandato. Di conseguenza, ci aspettiamo che le imprese familiari con TMT multigenerazionali, dove membri più giovani collaborano con leader senior, mostrino livelli più elevati di capacità di IA rispetto a quelle guidate da gruppi più omogenei.

Nel complesso, questa ricerca mira a offrire tre contributi principali alla letteratura. In primo luogo, estende la teoria del ciclo di vita del CEO (Hambrick e Fukutomi, 1991), suggerendo che, nelle imprese familiari, le fasi più avanzate del mandato possano essere associate a una rinnovata apertura verso tecnologie come l'IA, piuttosto che a una contrazione strategica. Tale dinamica si inserisce in un contesto di continuità, in cui questi investimenti possono contribuire a preservare il vantaggio competitivo di lungo periodo dell'impresa anche attraverso le generazioni.

In secondo luogo, contribuisce alla crescente letteratura sull'IA, individuando antecedenti interni del processo di preparazione e adozione tecnologica, in particolare la durata del mandato del CEO e la struttura multigenerazionale del TMT.

Infine, arricchisce la ricerca sul TMT nelle imprese familiari, mostrando come team multigenerazionali, oltre a facilitare lo scambio di conoscenze e a ridurre la resistenza al cambiamento, creino condizioni favorevoli agli investimenti in IA.

Da un punto di vista pratico, i risultati suggeriscono che le fasi avanzate del mandato del CEO possano rappresentare finestre strategiche per l'innovazione e che i TMT bilanciati e multigenerazionali possano agire come catalizzatori dell'adozione dell'IA, combinando competenze digitali con saggezza manageriale accumulata. Riteniamo che la ricerca abbia il potenziale di informare gli operatori d'impresa sull'importanza di valorizzare la continuità di leadership e la diversità generazionale come risorse complementari nel percorso di adozione dell'IA. I CEO familiari nelle fasi avanzate, supportati da leader più giovani con competenze digitali, possono trasformare una potenziale inerzia in lungimiranza strategica, trasformando l'adozione dell'IA in un ponte tra tradizione e innovazione e tra la generazione presente e le generazioni future.

Parole chiave: Intelligenza artificiale; CEO; TMT

Tra consulenza e tecnologia: indagine delle esigenze delle imprese clienti e del nuovo ruolo del consulente aziendale

Diana Cacciotti[1], Fabio Giulio Grandis[2], Carlo Regoliosi[3]

1. Obiettivo della ricerca

L'obiettivo della ricerca è quello di identificare quali siano i servizi degli studi commerciali che le imprese clienti avvertono come più importanti. In tal modo, è possibile comprendere quali siano le attività e quindi i processi della consulenza da migliorare attraverso l'implementazione delle nuove tecnologie.

Inoltre, la ricerca ha lo scopo di indagare sul possibile ruolo del consulente aziendale come intermediario tra le imprese ed i fornitori di tecnologie.

2. Introduzione

Le tecnologie stanno rapidamente trasformando il mondo delle imprese e di conseguenza sono emersi dubbi in merito al ruolo dei consulenti aziendali, di come i loro servizi dovrebbero evolvere al fine di continuare ad apportare valore alle imprese (Bhimani & Willcocks, 2014).

Secondo la letteratura, esistono numerose tecnologie a disposizione e numerosi modi per poterle utilizzare (Sun, 2019-09) (Nelson, Kogan, Srivastava, Vasarhelyi, & Lu, 2000-05) (Goto, 2023-10). Il vantaggio più importante che le tecnologie possono apportare alla consulenza aziendale è l'aumento dell'efficienza e della qualità del lavoro, soprattutto delle attività più ripetitive (Boritz & Stratopoulos, 2023-01) (Almufadda & Almezeini, 2022-09) (Fedyk, Hodson, Khimich, & Fedyk, 2022-09) (Holmes & Douglass, 2022-01) (Almufadda & Almezeini, 2022-09) (Fedyk, Hodson, Khimich, & Fedyk, 2022-09) (Köktener & Tunçalp, 2021).

D'altro canto, la barriera più significativa e diffusa all'implementazione delle tecnologie risulta essere il loro costo (Yang, Blount, & Amrollahi, 2024) (Jackson & Allen, 2024) (Cardinali, Pagano, Carloni, Giovannetti, & Governatori, 2023) (Pajunen, Saastamoinen, Reijonen, Sjögrén, & Syrjä, 2020) (Faulconbridge, Sarwar, & Spring, 2024). Ne consegue che per gli studi professionali di consulenza aziendale (di seguito SPCA) è importante effettuare investimenti mirati, in modo da ottenere i vantaggi desiderati senza disperdere liquidità priva di utilità.

Dato l'alto costo delle tecnologie, gli studi professionali che vogliono innovarsi per migliorare la propria efficienza devono capire quali tecnologie acquistare. Pertanto, è necessario dare priorità ai vari processi di consulenza e capire le attività che conviene migliorare, così da selezionare la tecnologia più adeguata individuando i servizi che i clienti ritengono più utili (Kubr & Prokopenko, 1991).

La prima domanda di ricerca è la seguente:

RQ1: Quali sono i servizi fornibili da uno studio professionale di consulenza aziendale più importanti per le imprese clienti?

[1] Dottoranda di ricerca, ECON-06/A, Università degli Studi Roma Tre; diana.cacciotti@uniroma3.it – corresponding author.

[2] Professore ordinario, ECON-06/A, Università degli Studi Roma Tre; fabiogiulio.grandis@uniroma3.it

[3] Professore associato, ECON-06/A, Università degli Studi Roma Tre; carlo.regoliosi@uniroma3.it

Volendo incentrare la ricerca in particolare sugli SPCA, è necessario indagare le piccole e medie imprese (PMI), in quanto queste rappresentano la clientela maggioritaria degli stessi (R.J. & Robson P.J.A., 1999) (Beck & Fourie, 2025).

Guardando alle PMI, quindi, non si può fare a meno di notare come le innovazioni tecnologiche stiano permettendo alle stesse di semplificare i processi aziendali, espandersi in nuovi mercati (Alam, Setiawan, Toiba, Maulidah, & Rahman, 2025), accrescere la loro resilienza (Hokmabadi, Rezvani, & De Matos, 2024), la loro produttività e la loro competitività (Parra-Sánchez & Talero-Sarmiento, 2024) (Nasution, 2021). Nonostante l'importanza dell'innovazione tecnologica delle PMI sia innegabile, molte di esse faticano a rendersene propriamente conto e tendono perciò a rimanere indietro. Questo è dovuto soprattutto ai costi delle tecnologie ed alla difficoltà delle PMI nella gestione della conoscenza in ambito ICT che impatta sulla loro capacità di assorbire tali innovazioni (Valencia-Arias, Patino-Toro, Coronado, Bernal, & Marquina, 2025) (Ismail, Ghazali, Hamid, Abdullah, & Palil, 2023).

Di fatti, la capacità di una società di innovarsi dipende anche dalla sua capacità di assorbimento della conoscenza, ossia da quanto essa sia in grado di trarre profitto dalla conoscenza esterna. L'abilità di valutare e utilizzare conoscenze provenienti dall'esterno dipende, in larga parte, dal livello di conoscenze pregresse correlate che permettono a chi lavora in una organizzazione di riconoscere il valore delle nuove informazioni diffuse nel mercato, assimilarle e applicarle a fini commerciali (Cohen, 1990).

Parte della letteratura mostra come nelle PMI la capacità di assorbimento e quindi di innovazione sia correlata positivamente alle collaborazioni con società di servizi (Castrogiovanni, 2012) e che la consulenza esterna contribuisce a rafforzare l'impatto positivo delle pratiche di innovazione delle PMI, aumentandone la resilienza (Adam, 2021). Tuttavia, altri studi ritengono che il ricorso a consulenti esterni potrebbe rallentare lo sviluppo delle imprese stesse (Kessler, 2007). In ambito di tale ricerca, ci si chiede se le PMI ritengono il consulente aziendale un partner valido per supportarle nel processo di innovazione.

Pertanto, la seconda domanda di ricerca è la seguente:

RQ2: Il professionista dovrebbe porsi come intermediario tra le imprese clienti ed i fornitori di tecnologie?

3. Contributi teorici e implicazioni pratiche

Vi sono molteplici studi scientifici sulla propensione dei consulenti aziendali verso le innovazioni tecnologiche (Yang, Blount, & Amrollahi, 2024) (Jackson & Allen, 2024) (Cardinali, Pagano, Carloni, Giovannetti, & Governatori, 2023) (Pajunen, Saastamoinen, Reijonen, Sjögrén, & Syrjä, 2020) (Faulconbridge, Sarwar, & Spring, 2024) (Meredith, Blake, Baxter, & Kerr, 2020-12) (Alles & Gray, 2024-09) e altrettanti sull'impatto che le tecnologie hanno su di loro (Moll & Yigitbasioglu, 2019-11) (Boritz & Stratopoulos, 2023-01) (Almufadda & Almezeini, 2022-09) (Fedyk, Hodson, Khimich, & Fedyk, 2022-09) (Holmes & Douglass, 2022-01) (Köktener & Tunçalp, 2021) (Rinta-Kahila, Penttinen, Salovaara, Soliman, & Ruissalo, 2023-01) (Samiolo, Spence, & Toh, 2023-11) (Panda, Pasumarti, & Hiremath, 2023-03) evidenziando le difficoltà percepite e i rischi reali.

Il valore potenziale di tale ricerca, sul lato teorico, risiede nel fornire spunti in merito al dibattito sulla possibilità del consulente aziendale di porsi come intermediario tra le imprese clienti ed i fornitori di tecnologie. Sul lato pratico, invece, risiede nel fornire informazioni utili agli SPCA per la definizione della loro strategia di innovazione tecnologica.

4. Metodologia

L'indagine empirica è stata condotta applicando la case analysis (Ball & Foster, 1982) (Eisenhardt, 1989) (Fattore, 2005) (Rowley, 2002) (Yin, 2009). I dati ottenuti sono stati analizzati attraverso un'analisi quantitativa e qualitativa (Grandis, 2012).

Di seguito si riportano le fasi dell'indagine:

- elaborazione delle domande dell'intervista;
- definizione del campione analizzato;
- somministrazione dell'intervista al campione;
- elaborazione quantitativa dei dati ottenuti;
- analisi qualitativa dei risultati ottenuti.

4.1. Elaborazione delle domande dell'intervista

L'intervista è stata elaborata semi-strutturata (Kubr & Prokopenko, 1991) ed è stata suddivisa in due diverse sezioni.

Prima sezione

La prima sezione mira ad indagare quali siano i servizi erogabili da uno SPCA considerati più importanti dai clienti. In questo modo, gli SPCA possono individuare quali siano i servizi più cruciali e valutare se effettuare un investimento in nuove tecnologie per migliorarli.

A tal fine, è stato elaborato un elenco di attività sulla guida dei documenti riportanti le tariffe professionali consigliate dall'Associazione Nazionale Commercialisti (ANC) e l'Ordine dei Dottori Commercialisti ed Esperti Contabili (ODCEC) di Roma.

Pertanto, sono state identificate le seguenti attività, alcune di esse obbligatorie per le imprese ed altre facoltative:

- Tenuta della contabilità
- Dichiarazioni fiscali
- Bilancio
- Segreteria societaria
- Sostenibilità
- Diritto commerciale
- Aggiornamento/formazione del personale
- Finanza agevolata
- Controllo di gestione
- Pianificazione strategia

Nell'ambito dell'intervista, queste attività sono state affrontate una alla volta e, per ciascuna di esse, sono state poste domande diverse in funzione del fatto che esse vengano effettuate o non effettuate. Pertanto, in merito alle attività facoltative è stata preventivamente posta tale domanda:

Q1. L'Attività facoltativa viene effettuata?

Qualora l'attività fosse effettuata, sono state poste le seguenti domande:

Q2. L'Attività viene effettuate internamente o è stata esternalizzata?

Solo per le Attività esternalizzate:

Q3. Quale figura professionale svolge l'Attività?

Solo per le Attività svolte internamente, sono state poste altre domande.

Q4. Su una scala da 0 a 10 (Kubr & Prokopenko, 1991), di quanta consulenza professionale esterna necessita la società per fare in modo che l'Attività sia efficace?

Q5. Qualora fosse stata indicata un'utilità superiore allo zero, quale pensa possa essere la figura professionale più adeguata a supportare la Società in tale Attività?

Q6. Dato il livello di bisogno percepito, la Società quanto sarebbe disposta ad investire sulla consulenza per migliorare l'Attività?

Qualora, invece, l'Attività non venisse effettuata sono state poste le seguenti domande.

Q7. Su una scala da 0 a 10 (Kubr & Prokopenko, 1991), quanto pensa possa essere utile per la Società iniziare ad effettuare tale Attività?

Q8. Qualora fosse stata indicata un'utilità superiore allo zero, quale pensa possa essere la figura professionale più adeguata al suo svolgimento?

Q9. Dato il livello di utilità percepito, la Società quanto sarebbe disposta ad investire per effettuarla?

Seconda sezione

La seconda sezione ha, invece, l'obiettivo di comprendere l'attuale maturità tecnologica delle imprese e le loro necessità. In questo modo, il professionista potrebbe aiutare le imprese in questo percorso di innovazione ponendosi come intermediario tra le stesse ed i fornitori di strumenti tecnologici.

Anche in questa sezione, le domande sono state differenziate per indagare le tecnologie attualmente adottate e quelle che invece si vorrebbero implementare.

In merito alle tecnologie che vengono utilizzate, sono state poste le seguenti domande.

Q10. Quali tecnologie utilizzate e per quali attività?

Q11. La tecnologia adottata è stata sviluppata internamente o è stata acquistata?

Q12. La tecnologia adottata è stata sviluppata su misura per la Società o è stata acquistata una soluzione prefabbricata?

Se la tecnologia è stata sviluppata su misura, a prescindere dal fatto che sia stata sviluppata internamente o acquistata, sono state poste le seguenti domande.

Q13. Quale figura professionale ha sviluppato tale tecnologia?

Q14. Avete avuto difficoltà nell'interfacciarvi con gli sviluppatori?

Q15. In questo processo di sviluppo, su una scala da 0 a 10 (Kubr & Prokopenko, 1991), quanto pensa avrebbe potuto essere utile un consulente aziendale che intermediasse tra le sue necessità e gli sviluppatori, in modo da migliorare l'efficacia del flusso informativo?

Per quanto concerne le tecnologie che si vorrebbero implementare, sono state poste le seguenti domande.

Q16. Vi sono delle tecnologie che vorreste implementare?

Q17. Si ha intenzione di sviluppare tale tecnologia internamente o di acquistarla?

Q18. Si è orientati ad una tecnologia su misura oppure ad una soluzione prefabbricata?

Se si ha l'intenzione di sviluppare la tecnologia su misura, a prescindere dal fatto che la si voglia sviluppare internamente o acquistarla, sono state poste le seguenti domande.

Q19. Su una scala da 0 a 10 (Kubr & Prokopenko, 1991), quanto pensa che la tecnologia che si vuole implementare possa essere utile per la Società?

Q20. A quale figura professionale si rivolgerebbe?

Q21. Su una scala da 0 a 10 (Kubr & Prokopenko, 1991), quanto pensa potrebbe essere utile un consulente aziendale che intermedi tra le sue necessità e gli sviluppatori, in modo da rendere efficace il flusso informativo?

4.2. Definizione del campione analizzato

Volendo indagare la clientela tipo di uno SPCA, il campione è stato scelto tra la clientela di uno studio professionale.

Pertanto, è stato selezionato un campione di 41 imprese tra la clientela di uno SPCA di Roma, a cui è stata preventivamente mandata una mail di richiesta di partecipazione.

La mail conteneva la presentazione del progetto di ricerca, gli obiettivi, le modalità di svolgimento e una scheda con le domande che sarebbero state poste durante l'intervista. Tale

scheda aveva finalità meramente informativa e non vincolante per lo svolgimento dell'intervista e l'elaborazione dei dati.

Delle 41 imprese contattate, 18 hanno aderito al progetto formando il campione analizzato. Nella tabella n.1 si riportano i profili degli intervistati e delle relative Società. I seguenti dati anagrafici del campione sono stati acquisiti dalle visure e dai bilanci depositati presso la Camera di Commercio e confermati dagli intervistati durante l'indagine.

Intervista	**Ruolo dell'intervistato**	**Forma giuridica**	**Codice ATECORI 2025**	**N. amministratori**	**Età media amministratori**
1	Amministratore	SRL	47.74.09	1	64

Tabella 1. Il campione

4.3. Somministrazione dell'intervista al campione

L'indagine è stata effettuata nel periodo dal 22 maggio 2025 al 8 agosto 2025.

Ciascuna impresa del campione è stata contattata telefonicamente al fine di fissare un appuntamento per lo svolgimento dell'intervista.

Le interviste si sono svolte preferenzialmente in modalità video-conferenza tramite la piattaforma Microsoft Teams. In alternativa, qualora la connessione internet non risultasse adeguata, per via telefonica. In ogni caso, sono state tutte registrate e trascritte.

Tutti gli intervistati sono stati informati sulle modalità e concordi con le stesse.

Le interviste hanno avuto una durata media di 34 minuti.

4.4. Elaborazione quantitativa dei dati ottenuti

Le interviste sono state trascritte in file word. Essendo interviste semi-strutturate, è stato possibile riportare i dati su un file excel con il quale è stata fatta una prima analisi quantitativa (Grandis, 2012).

4.5. Analisi qualitativa dei risultati ottenuti

Sulle Attività e sulle tecnologie emerse come più significative dall'analisi quantitativa, è stata effettuata un'analisi più approfondita di carattere qualitativo (Grandis, 2012). I risultati di tale analisi non sono esposti in questo elaborato, per gli stessi si rinvia al full paper.

5. Risultati preliminari

Si ricorda che il lavoro è un work in progress e alcuni risultati sono in corso di elaborazione come anche taluni risultati dell'analisi qualitativa.

I risultati della ricerca sono esposti seguendo l'ordine delle attività (Metodologia, paragrafo n.1).

Delle attività oggetto dell'intervista, la Formazione\aggiornamento del personale è stata esclusa dall'analisi dei risultati poiché non ha fatto emergere, da parte degli intervistati, alcuna inerenza con la consulenza aziendale.

a) Tenuta della contabilità

Elaborazione quantitativa:

- Esternalizzata: 72 % (n.13)

Q3. Quale figura professionale svolge l'Attività?

La figura professionale a cui tutte e 13 le società affidano tale attività è quella del Dottore Commercialista.

- Internalizzata: 28 % (n.5)

Q4. Su una scala da 0 a 10, di quanta consulenza professionale esterna necessita la società per fare in modo che l'Attività sia efficace?

La media dell'utilità percepita dalle società che tengono internamente la contabilità è pari a 3. In particolare, il 60% (n.3) delle società che tengono internamente la contabilità non sentono il bisogno di alcuna consulenza esterna. Il restante 40% (n. 2) ha individuato un'utilità media di 7,5.

Q5. Qualora fosse stata indicata un'utilità superiore allo zero, quale pensa possa essere la figura professionale più adeguata a supportare la Società in tale Attività?

Entrambi gli intervistati che hanno ravvisato un'utilità del consulente esterno lo hanno identificato nella figura professionale del dottore commercialista.

Q6. Dato il livello di bisogno percepito, la Società quanto sarebbe disposta ad investire sulla consulenza per migliorare l'Attività?

In corso di elaborazione.

b) Dichiarazioni fiscali

Elaborazione quantitativa:

- Esternalizzata: 100% (n.18)

Q3. Quale figura professionale svolge l'Attività?

Tutte le società esternalizzano tale attività alla figura professionale del Dottore Commercialista.

- Internalizzata: 0%

c) Bilancio

Elaborazione quantitativa:

- Esternalizzata: 94% (n.17)

Q3. Quale figura professionale svolge l'Attività?

Tutte le società che esternalizzano tale attività alla figura professionale del Dottore Commercialista.

- Internalizzata: 6 % (n.1)

Q4. Su una scala da 0 a 10, di quanta consulenza professionale esterna necessita la società per fare in modo che l'Attività sia efficace?

La media dell'utilità percepita dalle società che redigono il bilancio internamente è pari a 2.

Q5. Qualora fosse stata indicata un'utilità superiore allo zero, quale pensa possa essere la figura professionale più adeguata a supportare la Società in tale Attività?

L'intervistato ha individuato come figura professionale più adeguata il dottore commercialista.

Q6. Dato il livello di bisogno percepito, la Società quanto sarebbe disposta ad investire sulla consulenza per migliorare l'Attività?

In corso di elaborazione.

d) Segreteria societaria

Elaborazione quantitativa:

- Esternalizzata: 67% (n.12)

Q3. Quale figura professionale svolge l'Attività?

Tutte le società si rivolgono a dottori commercialisti.

- Internalizzata: 33 % (n.6)

Q4. Su una scala da 0 a 10, di quanta consulenza professionale esterna necessita la società per fare in modo che l'Attività sia efficace?

La media della necessità di un supporto esterno percepita dalle società che effettuano la segreteria societaria in autonomia è pari a 1,7. Di queste, il 67% (n.4) non avverte alcuna necessità, mentre il 33% (n.2) avverte una necessità media di 5.

Q5. Qualora fosse stata indicata un'utilità superiore allo zero, quale pensa possa essere la figura professionale più adeguata a supportare la Società in tale Attività?

Entrambi gli intervistati hanno individuato come figura professionale più adeguata il dottore commercialista.

Q6. Dato il livello di bisogno percepito, la Società quanto sarebbe disposta ad investire sulla consulenza per migliorare l'Attività?

In corso di elaborazione.

e) Bilancio di sostenibilità

Elaborazione quantitativa:

- Esternalizzata: 17% (n.3)

Q3. Quale figura professionale svolge l'Attività?

Il 67% (n.2) delle società, che esternalizzano tale attività, si sono rivolti a società specializzate, mentre il 33% (n.1) rientra nel bilancio di sostenibilità consolidato redatto dalla capogruppo.

- Non effettuata: 83% (n.15)

Q7. Su una scala da 0 a 10, quanto pensa possa essere utile per la Società iniziare ad effettuare tale Attività?

La media dell'utilità percepita del bilancio di sostenibilità dalle società che non lo redigono è pari a 5. In particolare, il 27% (n.4) di queste non ravvede alcuna utilità in questa attività, mentre il restante 73% (n.11) percepisce un'utilità media di 6,5.

Q8. Qualora fosse stata indicata un'utilità superiore allo zero, quale pensa possa essere la figura professionale più adeguata al suo svolgimento?

Degli 11 intervistati che hanno ravvisato un'utilità in questa attività, il 27% (n.3) ha indentificato come figura professionale più adeguata alla redazione del bilancio di sostenibilità il dottore commercialista, un altro 27% (n.3) l'ingegnere ambientale, il 9% (n.1) l'avvocato, un altro 9% (n.1) il revisore, un altro 9% (n.1) l'ingegnere gestionale ed il restante 18% un professionista specializzato. Ad ogni modo, tutti vedono come prerequisito necessario la specializzazione del professionista in materia di sostenibilità.

Q9. Dato il livello di utilità percepito, la Società quanto sarebbe disposta ad investire per effettuarla?

In corso di elaborazione.

f) Diritto commerciale

Nell'affrontare questa attività, per tutti gli intervistati sono stati riscontrati risultati significativamente diversi in base all'ambito della contrattualistica ed a quello delle operazioni straordinarie. Ne consegue la decisione di dividere l'attività Diritto commerciale in due diverse sotto-attività: Contrattualistica e Operazioni straordinarie.

f.1) Contrattualistica

Elaborazione quantitativa:

- Esternalizzata: 67% (n.12)

Q3. Quale figura professionale svolge l'Attività?

Il 33% (n.4) delle società, che esternalizzano tale attività, si rivolgono a studi legali e commerciali, il 25% (n.3) a studi legali, l'8% (n.1) alla capogruppo, un altro 8% (n.1) all'associazione di categoria. Vi è inoltre un 8% (n.1) che non ha saputo identificare una figura professionale in particolare, ritenendo che sono svariate in base alla casistica, mentre il restante 17% (n.2) si interfaccia con grandi imprese fornitrici che presentano loro i contratti già predisposti.

- Internalizzata: 33% (n.6)

Q4. Su una scala da 0 a 10, di quanta consulenza professionale esterna necessita la società per fare in modo che l'Attività sia efficace?

La media dell'utilità percepita dalle società che predispongono la contrattualistica internamente è pari a 2,5. In particolare, l'83% (n.5) non presenta alcuna necessità di una consulenza esterna, mentre il 17% (n.1) ha dichiarato una necessità pari a 10.

Q5. Qualora fosse stata indicata un'utilità superiore allo zero, quale pensa possa essere la figura professionale più adeguata a supportare la Società in tale Attività?

L'intervistato ha individuato come figura professionale più adeguata il legale.

Q6. Dato il livello di bisogno percepito, la Società quanto sarebbe disposta ad investire sulla consulenza per migliorare l'Attività?

In corso di elaborazione

f.2) Operazioni straordinarie

Elaborazione quantitativa:

- Esternalizzata: 61% (n.11)

Q3. Quale figura professionale svolge l'Attività?

Tutte le società che nel corso della loro vita hanno avuto a che fare con operazioni straordinarie, per la loro attuazione si sono rivolti a studi legali e commerciali.

- Non effettuata: 39% (n.7)

In questo caso, non sono state poste ulteriori domande, in quanto l'effettuazione o la non effettuazione dipende dal verificarsi o meno della casistica. È possibile, quindi, affermare che il 39% del campione non si è mai trovato ad affrontare operazioni straordinarie.

g) Finanza agevolata

Elaborazione quantitativa:

- Esternalizzata: 67% (n.12)

Q3. Quale figura professionale svolge l'Attività?

Il 58% (n.7) delle società, che hanno esternalizzano tale attività, si sono rivolti a dottori commercialisti, il 17% (n.2) a società specializzate, l'8% (n.1) a consulenti del lavoro e dottori commercialisti, un altro 8% (n.1) all'azienda fornitrice del bene oggetto di agevolazione e il restante 8% (n.1) ha dichiarato che dipende in base al bando.

- Internalizzata: 11% (n.2)

Q4. Su una scala da 0 a 10, di quanta consulenza professionale esterna necessita la società per fare in modo che l'Attività sia efficace?

Tutte le società che hanno una funzione interna apposita per la gestione della finanza agevolata non avvertono alcuna necessità di un supporto esterno.

- Non effettuata: 22% (n.4)

Q7. Su una scala da 0 a 10, quanto pensa possa essere utile per la Società iniziare ad effettuare tale Attività?

La media dell'utilità percepita della finanza agevolata dalle società che ne usano è pari a 4,25. In particolare, il 50% (n.2) di queste non ravvede alcuna utilità in questa attività, mentre il restante 50% (n.2) percepisce un'utilità media di 8,5.

Q8. Qualora fosse stata indicata un'utilità superiore allo zero, quale pensa possa essere la figura professionale più adeguata al suo svolgimento?

Dei 2 intervistati che hanno ravvisato un'utilità in questa attività, uno ha indentificato come figura professionale più adeguata il dottore commercialista, l'altro il dottore commercialista e gli istituti di credito.

h) Controllo di gestione

Elaborazione quantitativa:

- Esternalizzata: 6% (n.1)

Q3. Quale figura professionale svolge l'Attività?

L'unica società del campione che esternalizza il controllo di gestione lo affida al dottore commercialista.

- Internalizzata: 89% (n.16)

La media dell'utilità percepita dalle società che effettuano il controllo di gestione internamente è pari a 2,56. In particolare, il 69% (n.11) non presenta alcuna necessità di una consulenza esterna, mentre il 31% (n.5) ha presentato una necessità media pari a 8,2.

Q5. Qualora fosse stata indicata un'utilità superiore allo zero, quale pensa possa essere la figura professionale più adeguata a supportare la Società in tale Attività?

Delle 5 società che hanno ravvisato una necessità della consulenza esterna, il 20% (n.1) ha individuato come figura professionale più adeguata il dottore commercialista, il 40% (n.2) un consulente aziendale ed il restante 40% (n.2) non ha saputo identificare una professionalità specifica.

Q6. Dato il livello di bisogno percepito, la Società quanto sarebbe disposta ad investire sulla consulenza per migliorare l'Attività?

In corso di elaborazione.

- Non effettuata: 6% (n.1)

Q7. Su una scala da 0 a 10, quanto pensa possa essere utile per la Società iniziare ad effettuare tale Attività?

L'unica società del campione che non effettua il controllo di gestione ne percepisce un'utilità pari a 7.

Q8. Qualora fosse stata indicata un'utilità superiore allo zero, quale pensa possa essere la figura professionale più adeguata al suo svolgimento?

L'intervistato ha indentificato come figura professionale più adeguata il dottore commercialista.

i) Pianificazione strategica

Elaborazione quantitativa:

- Internalizzata: 78% (n.14)

Q4. Su una scala da 0 a 10, di quanta consulenza professionale esterna necessita la società per fare in modo che l'Attività sia efficace?

La media dell'utilità percepita dalle società che effettuano la pianificazione strategica internamente è pari a 1,30. In particolare, il 75% (n.12) non presenta alcuna necessità di una consulenza esterna, mentre il 25% (n.2) ha presentato una necessità media pari a 9.

Q5. Qualora fosse stata indicata un'utilità superiore allo zero, quale pensa possa essere la figura professionale più adeguata a supportare la Società in tale Attività?

Entrambe le società hanno ravvisato una necessità della pianificazione strategica hanno individuato come figura professionale più adeguata l'informatico.

Q6. Dato il livello di bisogno percepito, la Società quanto sarebbe disposta ad investire sulla consulenza per migliorare l'Attività?

In corso di elaborazione.

- Non effettuata: 22% (n.4)

Q7. Su una scala da 0 a 10, quanto pensa possa essere utile per la Società iniziare ad effettuare tale Attività?

La media dell'utilità percepita della pianificazione strategica dalle società che non la effettuano è pari a 6,5. In particolare, il 25% (n.1) di queste non ravvede alcuna utilità in questa attività, mentre il restante 75% (n.3) percepisce un'utilità media di 8,7.

Q8. Qualora fosse stata indicata un'utilità superiore allo zero, quale pensa possa essere la figura professionale più adeguata al suo svolgimento?

Dei 3 intervistati che hanno ravvisato un'utilità in questa attività, il 33% (n.1) ha indentificato come figura professionale più adeguata il dottore commercialista, un altro 33% (n.1) il data analyst ed il restante 33% (n.1) un consulente aziendale.

Q9. Dato il livello di utilità percepito, la Società quanto sarebbe disposta ad investire per effettuarla?

In corso di elaborazione.

Parole chiave: Consulenza aziendale; tecnologia; innovazione; studi professionali; PMI; intermediazione tecnologica; interviste

L'intelligenza artificiale negli enti locali: casi d'uso ed evidenze empiriche per l'erogazione dei servizi e l'efficienza amministrativa

Alessandro Spano[1], Sonia Cocco[2], Virginia Angius[3]

1. Introduzione

L'intelligenza artificiale (IA) sta gradualmente entrando a far parte della quotidianità degli enti locali, aprendo nuove prospettive di applicazione, riconducibili a quattro dimensioni (Goossens et al., 2025). In primo luogo, consente di migliorare la qualità e la quantità dei servizi offerti ai cittadini, nonché le modalità di fruizione da parte degli utenti. In secondo luogo, contribuisce a incrementare l'efficienza dei processi produttivi e organizzativi interni. Un terzo ambito di applicazione, oggi in fase di crescita, riguarda l'utilizzo dell'IA come supporto ai processi decisionali, mentre all'orizzonte si profila la prospettiva della cosiddetta IA agentica, capace non solo di assistere ma, in alcuni casi, di sostituirsi al tradizionale decisore umano (Kim, 2023).

Questo studio si concentra sui primi due utilizzi dell'IA negli enti locali, analizzando un data set di casi d'uso raccolti dalla Commissione Europea nell'ambito dell'iniziativa Public Sector Tech Watch (PSTW, https://interoperable-europe.ec.europa.eu/collection/public-sector-tech-watch). Questo data set contiene oltre duemila casi d'uso riferiti a diversi livelli di pubbliche amministrazioni e a un'ampia gamma di tecnologie emergenti (tra cui IA, Blockchain, 5G, realtà virtuale e aumentata, e gemelli digitali). A partire da questa base, sono stati selezionati i casi già operativi di utilizzo dell'IA nella pubblica amministrazione locale, individuando, all'epoca di questo studio, 233 casi. L'analisi persegue un triplice obiettivo: innanzitutto tracciare una mappa di dove e in quali ambiti l'IA viene utilizzata; successivamente capire se prevale un orientamento al miglioramento dei servizi ai cittadini o all'efficienza interna dei processi; infine, individuare i casi che si distinguono per un forte miglioramento dell'efficienza interna tramite l'IA o dell'erogazione dei servizi verso l'esterno.

2. Background teorico

L'applicazione dell'IA nell'amministrazione pubblica si colloca in un contesto teorico interdisciplinare che integra contributi sull'innovazione tecnologica, sul management pubblico e sulla governance digitale. A livello generale, l'adozione dell'IA da parte degli enti pubblici, in particolare degli enti locali, può essere interpretata alla luce dei modelli di e-government (OECD, 2003), in cui la tecnologia non si limita a digitalizzare i processi esistenti, ma catalizza una profonda trasformazione delle modalità di erogazione dei servizi, delle strutture di governance e delle stesse strutture decisionali.

Recenti studi (Anshari et al., 2024; Yigitcanlar et al., 2024) evidenziano come l'IA rappresenti una leva strategica per la trasformazione amministrativa, capace di integrare efficienza, innovazione e sostenibilità nella gestione locale, in linea con gli obiettivi di sviluppo sostenibile (SDGs) e con le agende di smart governance europee.

In particolare, due filoni teorici sono centrali per l'inquadramento del presente studio; il primo è quello che formula il paradigma della smart governance, secondo cui le tecnologie intelligenti possono migliorare la capacità degli enti pubblici di pianificare, coordinare ed erogare servizi in modo più efficiente, flessibile e reattivo (Meijer & Bolívar, 2016; Namysłowska & Olbryk, 2025). Questo filone teorico sottolinea il potenziale dell'IA come facilitatrice

dell'interazione tra cittadini e amministrazione, attraverso l'uso di strumenti predittivi, chatbot, sistemi di decisione automatizzata e processi di personalizzazione del servizio, ma anche che tali strumenti richiedono di essere messi in relazione con il contesto normativo e competenziale (Wihlborg et al., 2016).

A tali prospettive si aggiunge la visione di una smart governance "data-driven" (Mahant, 2025), in cui l'IA diventa un'infrastruttura cognitiva capace di supportare la cooperazione interistituzionale, l'analisi predittiva e la presa di decisioni basate su evidenze, contribuendo a modelli di amministrazione digitale più reattivi e trasparenti.

Il secondo inquadramento teorico proviene dalla teoria del valore pubblico (Moore, 1997), che enfatizza il bilanciamento tra efficienza amministrativa, equità nell'erogazione dei servizi e democrazia. Utilizzando questa lente teorica, l'uso dell'IA da parte degli enti locali va valutato non solo in base agli output tecnici o ai risparmi di risorse, ma anche alla sua capacità di generare valore, in particolare valore sociale, e di promuovere trasparenza e fiducia (Goossens et al., 2025).

Come sottolineato da Ogu et al. (2024) e Bester (2024), il valore pubblico creato attraverso l'IA deriva dall'interazione tra la performance amministrativa e la soddisfazione dei cittadini: la tecnologia assume significato solo se inserita in processi di governance inclusiva e responsabile, capaci di produrre benefici percepiti dalla collettività.

Questi approcci si integrano con la letteratura sulle tecnologie emergenti nel settore pubblico (Wirtz et al., 2019), che identifica diversi livelli di maturità nell'adozione dell'IA e mette in evidenza sfide organizzative e nuove necessità in termini di competenze e di adeguamento degli asset organizzativi, nonché implicazioni politico-amministrative (Margetts & Dorobantu, 2019). In questo senso, autori come Igbokwe (2024) e Hassan & Fatile (2024) evidenziano che la readiness istituzionale, ossia il livello di preparazione digitale e organizzativa, rappresenta un fattore critico per il successo, poiché l'IA tende ad avere effetti più significativi nei contesti in cui sono presenti infrastrutture dati consolidate, leadership innovativa e capacità di governance multilivello.

Infine, il quadro teorico si completa con l'adozione del sistema COFOG (Classification of the Functions of Government), che consente di mappare gli ambiti di policy in cui le tecnologie sono applicate, fornendo uno schema utile per confronti e comparazioni a livello europeo. Questa dimensione classificatoria, combinata con una prospettiva di policy learning (Nzobonimpa, 2023), consente di analizzare come i diversi livelli di governo locale apprendano e adattino i modelli di IA in risposta a specifiche priorità di efficienza, equità e trasparenza.

Nell'insieme, il background teorico di questo studio esplorativo orienta l'analisi verso una comprensione multilivello dell'adozione dell'IA nella pubblica amministrazione locale, focalizzandosi non solo su come e dove essa venga implementata, ma anche sul perché, evidenziando la relazione tra innovazione e priorità strategiche di policy. Questa prospettiva integrata sottolinea che l'IA, più che una semplice tecnologia di supporto, costituisce un vero e proprio driver istituzionale per la creazione di valore pubblico e la riorganizzazione dei processi decisionali a livello locale.

3. Metodologia

3.1. Campionamento

Lo studio si basa sull'analisi secondaria dei dati raccolti dal PSTW. Tale iniziativa della Commissione Europea documenta progetti e casi d'uso di tecnologie emergenti nel settore pubblico in Europa, standardizzando le informazioni a livello amministrativo e classificandole in base a diversi fattori, tra cui la tecnologia impiegata (Wirtz et al., 2019), l'obiettivo funzionale e lo stato di implementazione.

Su questo database è stata condotta una selezione basata sui seguenti criteri di inclusione:

- Progetti riguardanti il livello amministrativo locale, comprendente comuni, città metropolitane e autorità regionali con funzione di erogazione di servizi diretti ai cittadini;

- Progetti che impiegano l'IA come tecnologia principale, incluse le sue sottocategorie (machine learning, natural language processing, ecc.);
- Progetti operativi, ossia progetti già attivi, escludendo quelli in fase pilota e in pianificazione.
- L'applicazione di tali criteri ha portato all'individuazione di 233 casi d'uso distribuiti in 26 paesi europei.

3.2. Analisi dei dati

L'analisi del campione si articola in due fasi. La prima fase adotta un approccio quantitativo descrittivo. I casi sono stati classificati in base a due dimensioni analitiche principali. La prima dimensione è quella territoriale, in particolare il paese in cui sono state implementate le iniziative. La seconda dimensione è l'ambito di policy, secondo il sistema di classificazione COFOG, per identificare i settori di maggiore concentrazione (ad es. mobilità, ambiente, sicurezza, amministrazione generale). Questa prima fase ha prodotto un resoconto descrittivo dei casi, utile sia per la comunità accademica che per i practitioners.

Successivamente è stata effettuata un'analisi testuale qualitativa incrociata dei casi, in chiave interpretativa, volta a valutare il bilanciamento tra obiettivi (servizi ai cittadini vs. efficienza interna), tecnologie adottate e ambiti applicativi. Tale analisi permette di delineare dei pattern ricorrenti nei progetti osservati, utile per formulare riflessioni sulla fattibilità, sulle implicazioni di governance e sugli orientamenti di policy attuali e futuri. Sulla base della precedente analisi, vengono individuati casi che si distinguono per il livello di efficienza interna e per la qualità dei servizi erogati, e vengono approfonditi integrando le informazioni del dataset con quelle dei canali ufficiali dell'ente specifico (sito web o canali social dell'ente e/o dell'iniziativa e altri database ufficiali).

Lo studio si conclude con un'agenda di ricerca che propone piste di approfondimento per indagare il crescente ruolo dell'IA nelle amministrazioni locali europee.

4. Risultati preliminari

4.1. La geografia dei progetti

Circa il 75% dei casi di tecnologie di IA implementate negli enti locali si concentra in meno di un terzo dei 26 paesi mappati: Italia, Paesi Bassi, Germania, Finlandia, Regno Unito, Spagna e Polonia. Il numero di progetti in questo gruppo di paesi oscilla tra 34 in Italia e 15 in Polonia. (Tabella 1). Questa distribuzione geografica suggerisce una progressiva convergenza verso modelli locali di IA che segue un processo di concentrazione in specifici contesti istituzionali, amministrativi e sociali. I casi di implementazione di sistemi basati sull'IA si concentrano prevalentemente in economie ad alto e medio-alto reddito, caratterizzate da un'elevata intensità di servizi avanzati e da ecosistemi dell'innovazione consolidati, mentre nei paesi a reddito medio-basso emergono soprattutto iniziative isolate, spesso legate a specifiche città o regioni e sostenute da programmi europei o nazionali. Nel complesso, questi pattern suggeriscono che l'adozione dell'IA nei governi locali sia tuttora un fenomeno capability-driven: l'IA tende a essere implementata dove già esistono infrastrutture digitali, risorse fiscali, competenze amministrative e reti di attori pubblici e privati in grado di promuoverne lo sviluppo e la governance. In questo senso, più che ridurre i divari territoriali, l'IA rischia di riflettere e riprodurre le disuguaglianze preesistenti nelle capacità di governo locale.

Paese	**N. casi**	**% sul totale**
Italia	34	14,59%

Paesi Bassi	28	12,02%
Germania	26	11,16%
Finlandia	25	10,73%
Regno Unito	24	10,30%
Spagna	23	9,87%
Polonia	15	6,44%
Belgio	8	3,43%
Svezia	8	3,43%
Danimarca	6	2,58%
Austria	5	2,15%
Francia	5	2,15%
Estonia	4	1,72%
Repubblica Ceca	3	1,29%

Norvegia	1	0,43%
Portogallo	1	0,43%
Serbia	1	0,43%
Slovacchia	1	0,43%
Slovenia	1	0,43%
Totale	*233*	*100,00%*

Tabella 1. Distribuzione dei casi di uso IA negli EE.LL

4.2. I settori di applicazione-COFOG

Considerando gli ambiti di intervento secondo la classificazione COFOG, l'IA trova spazio in un'ampia varietà di servizi degli enti locali. Quasi la metà dei progetti analizzati si concentra in tre macroaree principali (Tabella 2):

Servizi pubblici generali (55 casi, 23,6%): un'area molto trasversale, in cui si stanno diffondendo sportelli virtuali, chatbot e assistenti intelligenti a supporto della comunicazione con i cittadini;

Mobilità e trasporti (26 casi, 11,2%): in questo ambito vengono utilizzati, per esempio, sistemi predittivi e algoritmi per ottimizzare il traffico urbano e il trasporto pubblico. Ad Amsterdam ed Helsinki sono stati implementati sistemi predittivi di congestione e semafori

intelligenti. Sistemi di trasporto pubblico on-demand basati su algoritmi di ottimizzazione dei percorsi e guida della città sono stati implementati a Turku (Finlandia) e Trento.

Polizia (19 casi, 8,2%): in questo settore l'IA è utilizzata per investigazioni, per il riconoscimento intelligente, per effettuare previsioni, per il monitoraggio delle politiche e per la raccolta e l'analisi delle informazioni.

Completano il quadro altri settori rilevanti, come ordine pubblico e sicurezza, cultura e protezione sociale, che mostrano un crescente interesse per le soluzioni basate sull'IA, sebbene con un numero di progetti più limitato. Nel settore della sicurezza, Barcellona e Dubrovnik hanno adottato sistemi di video analytics e di riconoscimento automatico degli eventi per il monitoraggio di parcheggi e altri spazi pubblici. Ad Amsterdam, la gestione degli incidenti e della criminalità è supportata da sistemi di previsione basati sull'IA. Nell'ambito della protezione dell'ambiente e, in particolare, della raccolta differenziata, Messina e Rotterdam hanno implementato sistemi intelligenti per la gestione della raccolta differenziata. Genk e Berlino eseguono un monitoraggio basato sull'IA di fattori ambientali, come la qualità dell'aria, mentre Parigi e Helsinki sfruttano l'IA per monitorare il consumo energetico. Nell'ambito della fiscalità, emerge il caso del comune di Karlsruhe, in Germania, che supporta i cittadini nelle questioni relative alla dichiarazione dei redditi tramite un chatbot.

Da un'analisi più approfondita delle iniziative emerge che, nella maggior parte dei casi, i sistemi di IA implementati non si limitano a supportare una funzione specifica, ma sono trasversali a diverse aree dell'ente.

COFOG II	**N. casi**	**%**
Servizi pubblici generali	55	23,61%
Trasporti	26	11,16%
Polizia	19	8,15%
Servizi generali	17	7,30%
Ordine pubblico e sicurezza	14	6,01%
Cultura	8	3,43%
Protezione sociale	8	3,43%
Servizi ospedalieri	6	2,58%
Illuminazione stradale	6	2,58%
Totale primi 10 settori	**177**	75,97%
Altri settori minori	56	24,03%
Totale complessivo	*233*	*100,00%*

Tabella 2. Distribuzione dei casi di uso IA per categorie COFOG

4.3. Finalità dell'impiego di sistemi di IA negli enti locali: miglioramento dei servizi o dell'efficienza interna?

Uno degli aspetti più interessanti emersi dallo studio riguarda le finalità principali per cui l'IA è impiegata nei casi analizzati. Le informazioni al riguardo presenti nel dataset sono frutto di una valutazione dei benefici che si attende che le diverse applicazioni dell'IA apportino in base alla loro natura e al loro potenziale. Il fatto che si tratti soprattutto di iniziative recenti, infatti, non consente ancora di valutarne gli impatti, se non quelli nel brevissimo termine. Nel 58% dei casi (135) l'IA è utilizzata per migliorare i servizi pubblici, mentre nel 42% dei casi (99) per migliorare l'efficienza amministrativa.

Nel primo caso, i benefici apportati dalle applicazioni di IA implementate e quelli attesi riguardano principalmente l'ottenimento di servizi pubblici più reattivi ed efficienti e la riduzione dei costi (113 casi). Tra queste applicazioni rientra quella del Comune di Wroclaw che ha introdotto un sistema di illuminazione basato sull'IA. I sensori di controllo remoto e la tecnologia LED percepiscono i cambiamenti del traffico urbano, regolando di conseguenza l'intensità della luce. Questo sistema permette di ridurre i costi e il consumo di elettricità e di migliorare l'efficienza e la sicurezza.

Un altro vantaggio legato all'erogazione di servizi al pubblico è la creazione di nuovi canali o servizi (93 casi). Degli esempi sono il servizio London TravelBot, che permette di controllare lo stato dei treni e dei bus tramite Facebook Messenger e il sistema ARNO del comune di Tartu (Estonia), che permette di gestire le candidature e l'allocamento dei bambini negli asili. Un beneficio riportato in 85 casi è il miglioramento della qualità dei sistemi informativi e dei servizi, legati a casi come la piattaforma sviluppata dal Comune di Messina per la gestione dei rifiuti, che fornisce informazioni sulla raccolta, sul trasporto dei rifiuti e sui pagamenti. Sempre relativamente agli obiettivi legati all'erogazione dei servizi, 81 casi permettono di avere una maggiore personalizzazione dei servizi e 98 di ottenere dei servizi che siano citizen-centered. Questi due tipi di benefici vanno in genere di pari passo e vengono raggiunti principalmente attraverso la creazione di chatbot e assistenti virtuali a supporto dei clienti, in diverse aree, come la comunicazione, l'educazione, la gestione dei rifiuti, i servizi sanitari e i trasporti.

Relativamente all'efficienza interna, si delineano diversi benefici più specifici. Per 82 casi si riporta un miglioramento della qualità dei processi e dei sistemi, avvenuto o atteso. Un esempio che spicca è Neuropolis, un sistema basato sull'IA che consente una ricerca intelligente e personalizzata dei documenti necessari agli impiegati del comune di Friburgo. In questo modo essi, anziché impiegare una grande quantità di tempo nella ricerca delle informazioni, possono dedicarsi direttamente all'analisi delle informazioni già selezionate dal sistema in pochi secondi. In 43 casi è associata una maggiore reattività da parte dell'ente. Uno di questi casi è costituito dal sistema installato nel comune di Rotterdam, basato su sensori che monitorano i livelli di riempimento dei contenitori di rifiuti. 36 casi sono associati ad un miglioramento della gestione delle risorse pubbliche. Emerge il caso della Contea di Devon, nel Regno Unito, che ha implementato un sistema di allocazione delle risorse basato sull'IA, che supporta la pianificazione finanziaria nel settore dei servizi sociali, fornendo un primo calcolo di quante risorse sarebbero necessarie da destinare a ciascun individuo preso in considerazione. Un numero minore di casi (16) riporta il beneficio della riduzione dei costi, probabilmente complessivamente limitato dal fatto che, per raggiungere una maggiore efficienza dei costi nel lungo periodo grazie all'IA, si deve far fronte a costi importanti nel breve periodo. È esemplare il caso della Contea di Powys, nel Regno Unito, che ha ridotto significativamente i costi amministrativi sviluppando un'applicazione per la revisione automatica delle domande per il programma di supporto nazionale, in grado di accettare quelle che rispettano i criteri stabiliti, eliminare i duplicati e segnalare le richieste fraudolente. Per 5 casi sono riportati benefici legati a maggiore equità,

onestà e uguaglianza. Uno di questi spicca per la sua innovatività, il robot Tengai, creato nel Comune di Upplands-Bro (Svezia), per supportare il processo di reclutamento dei dipendenti e ridurre i bias. Il robot si occupa delle prime fasi del processo, ossia dell'assegnazione del punteggio sulla performance dei candidati e delle prime interviste, in cui analizza i comportamenti, il problem-solving e varie abilità. Successivamente lo staff si occupa della valutazione della motivazione. L'ultima categoria di benefici consiste in una maggiore collaborazione e comunicazione. Questo è raggiunto in quattro casi attraverso la collaborazione con i cittadini, per il monitoraggio della spazzatura (Amsterdam), del riempimento delle spiagge (Barcellona), delle abitudini dei turisti (Gipuzkoa) e delle condizioni delle strade (Vaasa, Finlandia). L'ultimo caso che riporta tali benefici riguarda invece la collaborazione tra più enti, in particolare autorità svedesi, comuni e regioni, e aziende private, che impiegano un assistente digitale condiviso.

5. Considerazioni conclusive

I risultati preliminari dell'analisi mostrano che l'impiego dell'IA negli enti locali europei non è più soltanto una prospettiva futura, ma una realtà in crescita, nella quale gli enti locali, soprattutto quelli dei paesi a reddito alto e medio-alto, risultano già attivamente coinvolti. I benefici sono tangibili: servizi più accessibili e personalizzati per i cittadini e per gli uffici, che possono contare su processi più rapidi, basati su dati più affidabili e con minor margine di errore. Questo si riflette anche in una migliore gestione delle risorse umane e finanziarie. È chiaro quindi che sempre più comuni si stanno avvicinando al concetto di smart governance, intesa non solo come l'adozione di strumenti tecnologici avanzati, ma anche come trasformazione dei processi decisionali e organizzativi, orientata a una maggiore efficienza, trasparenza e capacità di risposta ai bisogni della collettività (Meijer & Bolívar, 2016; Namysłowska & Olbryk, 2025). In questo senso, i risultati empirici confermano che l'adozione di sistemi di IA, in particolare nei settori della mobilità, dell'amministrazione generale e della sicurezza, riflette una progressiva istituzionalizzazione della governance data-driven (Mahant, 2025), in cui la capacità di coordinamento e di reattività delle amministrazioni è mediata dall'uso dell'analisi predittiva e dall'automazione dei processi decisionali. Inoltre, la predominanza di progetti finalizzati al miglioramento dei servizi pubblici (58%) rispetto a quelli mirati all'efficienza interna (42%) suggerisce come le amministrazioni locali europee stiano interpretando l'IA in una chiave di "valore pubblico" (Moore, 1997; Ogu et al., 2024): le tecnologie sono utilizzate non solo per ridurre i costi e i tempi, ma per creare esperienze amministrative più personalizzate e inclusive per i cittadini. Allo stesso tempo, i casi che evidenziano un miglioramento dell'efficienza interna, come Neuropolis a Friburgo o il sistema di allocazione delle risorse della contea di Devon, riflettono la dimensione di preparedness istituzionale discussa da Igbokwe (2024) e Hassan & Fatile (2024). Tali soluzioni emergono soprattutto in contesti caratterizzati da una maturità digitale, infrastrutture dati consolidate e leadership amministrative orientate all'innovazione.

Infine, le evidenze di collaborazione interistituzionale e con i cittadini (ad es. Amsterdam, Barcellona, Vaasa) sostengono la visione di un modello di smart governance collaborativa, coerente con la letteratura, che enfatizza il ruolo dell'IA come catalizzatore di nuove forme di co-produzione dei servizi pubblici (Osborne & Nasi, 2024; Wirtz et al., 2019; Yigitcanlar et al., 2024).

In questo quadro, l'IA si configura come un abilitatore strategico, capace di rafforzare le pratiche di governo basate sui dati e di favorire forme più strutturate di collaborazione tra amministrazioni, cittadini e altri attori territoriali, pur sollevando al contempo nuove sfide in termini di competenze, governance dei dati ed equità. In linea con la teoria del valore pubblico, la diffusione dell'IA negli enti locali europei non si traduce solo in efficienza tecnica, ma contribuisce alla costruzione di fiducia, trasparenza e accountability verso i cittadini,

confermando il nesso tra innovazione tecnologica e legittimazione democratica (Goossens et al., 2025).

Osservando le applicazioni di IA sviluppate negli enti locali europei emerge che la creazione di valore pubblico risulti centrale e il cittadino sia spesso messo al centro dei sistemi implementati, cercando di migliorare la sua esperienza con i servizi offerti, il suo benessere e la sua partecipazione. Risultano ancora pochi, ma non assenti, i casi di IA finalizzati ad ottenere maggiore equità, onestà ed uguaglianza.

Questa transizione verso amministrazioni "intelligenti" richiede una governance consapevole e responsabile. È necessario sviluppare linee guida chiare che garantiscano trasparenza, verificabilità e accountability degli algoritmi, gestendone i potenziali rischi. È inoltre necessario comprendere in che modo i sistemi di IA possono supportare in modo integrato le diverse aree dell'ente, favorendo un maggiore coordinamento tra di esse. In prospettiva, il legame tra teoria e risultati empirici suggerisce che l'efficacia dell'IA nella pubblica amministrazione locale dipenda dalla capacità di allineare innovazione tecnologica, capacità organizzativa e obiettivi di valore pubblico. Nel proseguimento di questo studio, l'approfondimento dei casi di best practice di applicazione dell'IA emergenti, tra gli altri, per i benefici ottenuti e per quelli attesi nel medio-lungo termine, contribuirà ad una maggiore comprensione della natura delle iniziative di maggiore successo e di come esse contribuiscano ad aumentare l'efficienza interna e l'erogazione di servizi verso l'esterno.

When social interaction matters: innovating in a hybrid work setting

Elisabetta Mariafioti[1], Mattia Martini[2], Miriam Tomasuolo[3]

1. Purpose of the paper

Hybrid work, characterised by a mix of in-office and remote work arrangements, has emerged as a dominant mode of work post-COVID-19. As digital technologies proliferate, hybrid work, sometimes defined as remote working, telework, telecommuting, or work-from-home, has become an increasingly common practice and constitutes an essential dimension in the future of work (Bai J. et al., 2021; Denicolai et al., 2022). The transition to this new way of working leads to changes in organisations, modifying the role of the HR function and the design of HR practices, with important implications and new expectations for employees (Bai et al., 2021). Hybrid work can be considered an effective strategy which can help organisations in reducing costs (e.g., Egan, 1997), improve work–family balance (e.g., Shamir & Telework Salomon, 1985) and reduce air pollution and traffic congestion (e.g., Handy & Mokhtarian, 1995). Hybrid work has also been promoted as a lever to increase female labour market participation and reduce gender inequalities (Angelici & Profeta, 2023; Butera, 2020). The literature has analysed the link between hybrid/remote working and a firm's performance (Agostoni, 2020; Brynjolfsson et al., 2020; Bloom et al., 2015) and highlights employees' well-being improvement as a possible mediator in this relationship (Agostoni, 2020; Krekel et al., 2019). More specifically, higher motivation and creativity, less absenteeism, loyalty, and a results-oriented culture are some of the factors through which employees' well-being may predict higher organisational performance (Agostoni, 2020; Krekel et al., 2019; Bertolini, 2006; Golden & Veiga, 2005). Furthermore, previous studies have primarily studied the link between employees' well-being and firm performance (e.g. Krekel et al., 2019). However, it is unclear under which strategic and organisational conditions the hybrid work can represent an effective practice for firms to simultaneously improve the organisational performance and the well-being of employees. While offering flexibility and cost-saving opportunities, it raises concerns about reduced social interaction, which is crucial for innovation.

The pandemic has resulted in significant disruptions of social and economic activities, as lockdowns forced non-essential businesses to close and individuals to stay home. This period of hardship has led to a rapid transition to flexible working to allow economic activities to survive. The rapidity of this transition has been crucial in disrupting the previous status quo (Marsh et al., 2022). Still, it has not allowed companies and their leaders to reconsider essential elements. In the new work setting, it is often necessary to rethink tasks and processes, find the right competencies and talents apt to the new working conditions, redefine the workplace in terms of space and time, and promote an innovative culture able to create added value by exploiting the opportunities deriving from the digital technology transformation (Marsh et al., 2022).

Within the previously described context, this paper aims to investigate how hybrid work influences companies' innovative capacities[4] addressing key questions such as: how does the limitation of physical presence in the workplace impact workers' social relations and, ultimately, innovation? What hybrid work models can better balance flexibility with the need for collaboration and creativity? What is the role and contribution of digital technologies to innovation and creativity?

The short paper is organised as follows. The first section presents the theoretical background and the research questions. The second section introduces the method and the expected results of the ongoing research project, while the last section reports the main contribution expected from this study.

2. Literature review and research questions

Innovation management is a multifaceted process involving the development and implementation of new ideas within an organisational context (Ven, 1986). Key concepts include managing attention, transforming ideas into reality, balancing part-whole relationships, and providing institutional leadership (Ven, 1986). The process integrates technological, market, and organisational changes (Tidd et al., 2001) and can be conceptualised as a framework comprising seven categories: inputs management, knowledge management, innovation strategy, organisational culture and structure, portfolio management, project management, and commercialisation (Adams et al., 2006). Effective measurement of innovation management is crucial for both practitioners and academics, yet the literature offers diverse, sometimes contradictory approaches (Adams et al., 2006). A holistic framework for innovation management measurement can help organisations evaluate their innovation activities, assess the extent of innovation embeddedness, and identify areas for improvement (Adams et al., 2006). This comprehensive approach is essential for turning ideas into useful and marketable products (Adams et al., 2006). Innovation is broadly defined as the process of translating ideas into goods, services, or processes that create value (Dodgson et al., 2013). It encompasses multiple dimensions, including product and process innovation, and can be classified as incremental or radical (Hidalgo & Albors, 2008; Leonard & Barton, 2013). Determinants of innovation performance include organisational culture, leadership, resource availability, and collaboration (Dodgson et al., 2013; Phillips, 2013). Research also highlights the critical role of knowledge sharing, social capital, and employee empowerment (Laursen & Foss, 2013).

Organisational dimensions significantly shape the capacity to innovate. A supportive culture and clear leadership facilitate experimentation and risk-taking, while structured yet flexible team dynamics encourage creativity (Dodgson et al., 2013; Leonard & Barton, 2013). Collaboration, both internal and external, is particularly vital. Innovation ecosystems thrive on partnerships that combine diverse expertise and resources, as highlighted by studies on organisational learning and external networks (Dodgson, 2013; Phillips, 2013). In hybrid work settings, the interplay between physical and virtual spaces presents unique challenges and opportunities for fostering interaction and trust, which are pivotal for innovation (Lauring & Jonasson, 2024; Petani & Mengis, 2023).

Building on this theoretical foundation, this study examines how hybrid work configurations influence innovation through social interaction. It focuses on identifying organisational practices that sustain innovation in hybrid environments.

Existing research underscores the importance of social interaction in fostering creativity and innovation within organisations. With its blend of physical and virtual spaces, hybrid work

[4] The paper is based on a research project conducted within the “Ecosystem MUSA -Multilayered Urban Sustainability Action" - Spoke 6- Digital Transformation and Wellbeing founded by the European Union - NextGeneration, PNRR (2022-2025).

presents unique challenges and opportunities for maintaining the social dynamics essential for collaborative innovation. Hybrid work, characterised by a blend of remote and in-office arrangements, has emerged as a dominant work model in the post-pandemic era. It is defined by its flexibility, which allows employees to alternate between physical and virtual spaces in line with organisational policies and individual needs (Lauring & Jonasson, 2024). Hybrid work configurations vary widely, from fixed schedules for in-office days to entirely fluid arrangements that prioritise autonomy. These configurations have a profound impact on team dynamics, communication, and collaboration, all of which are critical components of innovation processes. The challenge lies in optimising these configurations to retain the benefits of flexibility while minimising potential disruptions to social interaction and creative synergy.

The relationship between hybrid work and innovation is deeply intertwined with organisational management. Effective innovation management in hybrid settings requires reimagining traditional leadership, communication channels, and collaborative practices (Petani & Mengis, 2023). For instance, organisations must adopt digital tools and practices that support seamless collaboration across physical and virtual environments. At the same time, maintaining a culture that fosters trust, inclusivity, and creativity is essential. Leadership plays a pivotal role in ensuring that hybrid work models do not undermine the spontaneity and serendipity that often drive innovation. By strategically aligning hybrid work configurations with organisational goals, firms can harness the potential of this model to enhance innovation outcomes.

The following research questions guide the study:

- How does hybrid work adoption impact workers' social relations and, ultimately, companies' ability to innovate?
- Does the limitation of physical presence hinder innovation, and what hybrid work models can better balance flexibility with the need for collaboration and creativity?
- What hybrid work configurations and digital technologies support flexibility, innovation and creativity?

3. Method and expected results

This research employs a mixed-method approach, combining survey data from 500 firms in Lombardy with qualitative interviews. The survey focuses on hybrid work adoption, innovation performance, digital technology adoption, and team dynamics. We expect findings to reveal that hybrid work models that emphasise structured in-person collaboration days foster greater innovation than fully remote or ad-hoc hybrid arrangements. Digital technology adoption is generating a moderating effect. The research questions have been addressed by conducting a quantitative study. Original data are collected through a survey administered to a sample of Italian firms. The survey was conducted from December 2023 to February 2024 and focused on firms in the Lombardy region. Considering this region, we could select a homogeneous sample and control for all environmental factors that could alter the relationship between hybrid work configuration, social interaction, and innovation.

The sample selection is based on a dataset of about 2500 firms provided by the University of Milano-Bicocca's internship and placement services. Given that these firms are partners of the University, our expected response rate is about 20% (500 responses). The questionnaire lasts about 20 minutes, is targeted to HR/personnel managers, and is administered via CATI.

To answer the research questions, the questionnaire has been structured into four main sections, which allow for inspection of the following dimensions:

- SECTION A: Firm's structural characteristics and organisational performance
- SECTION B: Hybrid working adoption and its perceived effectiveness on Employee well-being and Firms' Performance
- SECTION C – Strategic and organisational characteristics (with a focus on the role of trust)

- SECTION D – Exponential technologies use and data-driven decision-making

To detect Hybrid working configurations, we selected different items from existing literature, which refer to:

- Hybrid working objectives (e.g. reduction of company costs, increased productivity, increased competitiveness, improved work-life balance, increased employee satisfaction, increased employee wellbeing)
- Hybrid working organisation (e.g. n. of days of hybrid working by roles, workstation reservation, the minimum number of employees expected to be present in the office, schedule of in-person meetings, space reorganisation, conventions with coworking spaces, etc.)
- Hybrid working management (e.g. employees' participation in the definition of hybrid working and performance objectives, constraints on remote working time and place, performance checks, reorganisation of working time, activities and tasks, autonomy in the performance of tasks, level of trust, etc.)
- Hybrid working organisational support (e.g. training courses on the use of digital technologies and soft skills; provision of computers, tablets, company telephones, ergonomic chairs, contributions to household utilities; initial period of presence for new employees)
- With regards to the outcome variables, we use the construct of perceived effectiveness of Hybrid working by focusing on the following dimensions:
- Social interaction: regular meetings, employee involvement, use of digital technology, cultural dimension, involvement and internal communication.
- Employee well-being: physical health of employees, psychological well-being of employees, employee stress levels, burnout levels, work-life balance, employees' quality of life, job satisfaction, employee motivation, sustainability of work rhythms, quality of work performed, commitment, quality of relations between colleagues, quality of relations between managers and employees

Firm's performance: employee productivity, knowledge exchange, innovation capacity, new products, services or programmes, customer satisfaction, ability to attract and retain critical profiles, and absenteeism.

Finally, about strategic and organisational characteristics, we included items and scales to measure, for example, competitive strategy, Corporate Social Responsibility (CSR) and business ethics, training, performance assessment, job design, employee participation, internal communication, job autonomy, functional flexibility, etc. Furthermore, the survey included specific questions to detect exponential technology use and data-driven decision-making.

The data analysis explores and checks which hybrid work configuration is more effective in improving employee wellbeing and the firm's performance, and which strategic and organisational characteristics shape these relationships. The goal is to identify opportunities, challenges and drawbacks related to hybrid work adoption on social interaction and innovation. We expect that flexibility, HR practices, and culture are designed to support employees in using digital technologies, in developing new skills, and in adopting a new concept of work to avoid negative consequences related to hybrid work, stimulate innovation for the firm, and enhance employees' creativity and well-being.

4. Contribution

This study contributes to the emerging literature on hybrid work by providing empirical evidence on its impact on innovation. It highlights the role of social interaction as a mediator and examines how different hybrid work configurations can either hinder or enhance innovation. The findings are expected to inform organisational strategies for designing hybrid work policies that maximise both employee well-being and innovation outcomes. This study advances the theoretical understanding of workplace relationships by challenging the conventional view that

positions them along a simplistic positive-negative continuum. By bridging theories of emotions and workplace relationships, this study provides a novel framework that captures the dynamic interplay between emotions and relational configurations (Baumaister et al, 2007; Staw et al., 1994).

Furthermore, the paper contributes to the growing body of research on relational complexity by systematically delineating the sources, outcomes, and dynamics of ambivalent and indifferent relationships. It establishes a typology that integrates digital technology adoption with relationship functionality, enabling a more precise categorisation of workplace relationships. This typology not only fills significant gaps in the literature but also offers a conceptual foundation for future studies to explore how these relationships evolve and influence organisational processes.

Keywords: Hybrid work; innovation management; creativity and innovation; flexible work models

Educazione imprenditoriale, sostenibilità e benessere urbano: una revisione sistematica della letteratura

Giorgia Maria D'Allura[1], Valentina Mallamaci[2], Federica Romano[3]

1. Introduzione

Le grandi aree urbane rappresentano oggi laboratori cruciali delle trasformazioni economiche e sociali: in esse si concentrano innovazione, creatività e capitale umano, ma anche disoccupazione giovanile, disuguaglianze, esclusione e pressioni ambientali (Behrens & Robert-Nicoud, 2014; Juntti & Ozsezer-Kurnuc, 2023). In questo contesto, l'imprenditorialità viene spesso presentata come strumento chiave per generare occupazione, promuovere coesione sociale e accelerare la transizione verso modelli di sviluppo sostenibile (Acs et al., 2013; Shabbir, 2023).

L'educazione all'imprenditorialità è considerata uno strumento fondamentale per sviluppare competenze, atteggiamenti e mindset imprenditoriali (Cui et al., 2021; Dissanayake et al., 2022), non solo in funzione della creazione di impresa, ma anche per stimolare capacità di iniziativa, problem solving e innovazione sociale (Solomon et al., 2019; Blankesteijn, 2024). Ciononostante, resta poco chiaro in che misura e con quali meccanismi l'educazione imprenditoriale contribuisca effettivamente al benessere e alla sostenibilità nelle città (Neumann, 2021; Wiklund et al., 2019).

Questo short paper, basato su una revisione sistematica della letteratura (Tranfield et al., 2003; Adams et al., 2017), si pone tre obiettivi principali:

- Mappare i principali filoni di ricerca che collegano imprenditorialità ed educazione imprenditoriale.
- Verificare quanto e come vengano considerati i contesti urbani, la sostenibilità e il benessere.
- Proporre un'agenda di ricerca che enfatizzi il ruolo delle grandi aree urbane e delle istituzioni educative nel promuovere imprenditorialità inclusiva e sostenibile.

2. Quadro teorico

La letteratura sull'imprenditorialità è stata tradizionalmente guidata da tre grandi prospettive. Una prima prospettiva è quella psicologica, che guarda soprattutto agli atteggiamenti, alle intenzioni e alle caratteristiche individuali dell'imprenditore, con particolare attenzione all'intenzione imprenditoriale, al senso di autoefficacia e alle motivazioni personali (Cui et al., 2021; Dana et al., 2021). Una seconda prospettiva, di tipo istituzionale ed ecosistemico, sposta lo sguardo sui contesti: qui diventano centrali le regole formali e informali, le politiche pubbliche e, più in generale, il funzionamento degli ecosistemi imprenditoriali fatti di attori, risorse e relazioni (Aldrich & Fiol, 1994; Bruton et al., 2010; Isenberg, 2010; Terjesen et al., 2016). Negli ultimi anni si è poi affermata una terza prospettiva, socio-ambientale, che si concentra sull'imprenditorialità sociale, green e sostenibile e sui suoi effetti in termini di sviluppo sostenibile e coesione sociale (Hall et al., 2010; Johnson & Schaltegger, 2020; Shabbir, 2023).

[1] Professoressa associata, ECON-07/A, Università degli studi di Catania; gdallura@unict.it – corresponding author

[2] Research Fellow, ECON-07/A, Università degli studi di Catania; valentina.mallamaci@unict.it

[3] Ph.D. Candidate, ECON-07/A, Università degli studi di Catania; federica.romano1@phd.unict.it

L'educazione imprenditoriale si colloca in un punto di intersezione tra queste tre linee di ricerca. Da un lato, infatti, interviene su dimensioni cognitive e motivazionali, influenzando intenzioni imprenditoriali, percezioni di autoefficacia e motivazioni dei potenziali imprenditori (Cui et al., 2021; Mambali et al., 2024). Dall'altro lato, è fortemente modellata dalle istituzioni e dalle politiche che ne definiscono obiettivi, strumenti e risorse (O'Connor, 2013; Walter & Block, 2016). Allo stesso tempo, può essere progettata in modo tale da orientare i percorsi imprenditoriali verso finalità di sostenibilità ambientale e di benessere collettivo, promuovendo nuove forme di imprenditorialità sociale e responsabile (Mets et al., 2021; Solomon et al., 2019).

In questo quadro, le grandi aree urbane rappresentano contesti particolarmente significativi. Esse ospitano infatti ecosistemi imprenditoriali articolati, nei quali convivono università, incubatori, investitori e fitte reti sociali (Bischoff et al., 2018; Bolzani et al., 2021). Allo stesso tempo concentrano molte delle principali sfide sociali e ambientali del nostro tempo, come disuguaglianze, marginalità e forme diverse di degrado ambientale (Behrens & Robert-Nicoud, 2014; Fan et al., 2023; Juntti & Ozsezer-Kurnuc, 2023). Proprio per questo possono trarre un beneficio diretto da iniziative imprenditoriali capaci di generare impatti sociali e ambientali positivi, ad esempio attraverso modelli di business inclusivi o orientati alla rigenerazione dei territori (Yunus et al., 2010; Neumann, 2021).

Nonostante tali premesse, il nesso tra educazione imprenditoriale, contesti urbani, sostenibilità e benessere rimane ancora poco esplorato nella ricerca, lasciando aperto uno spazio rilevante per ulteriori approfondimenti teorici ed empirici.

3. Metodologia

La revisione sistematica si basa sui database Scopus e Web of Science, selezionando articoli e review in lingua inglese, pubblicati in riviste di Business & Management indicizzate in Journal Citation Reports (Clarivate, 2023). La procedura segue approcci consolidati nelle systematic reviews in ambito management e public administration (Cook et al., 1997; Tranfield et al., 2003; Rashman et al., 2009; Adams et al., 2017).

Dopo le fasi di identificazione, screening e selezione, il campione finale comprende 234 contributi. L'analisi combina:

- esame qualitativo dei contenuti, per individuare temi, definizioni di educazione imprenditoriale e riferimenti a sostenibilità e benessere (Webster & Watson, 2002; Neumann, 2021);

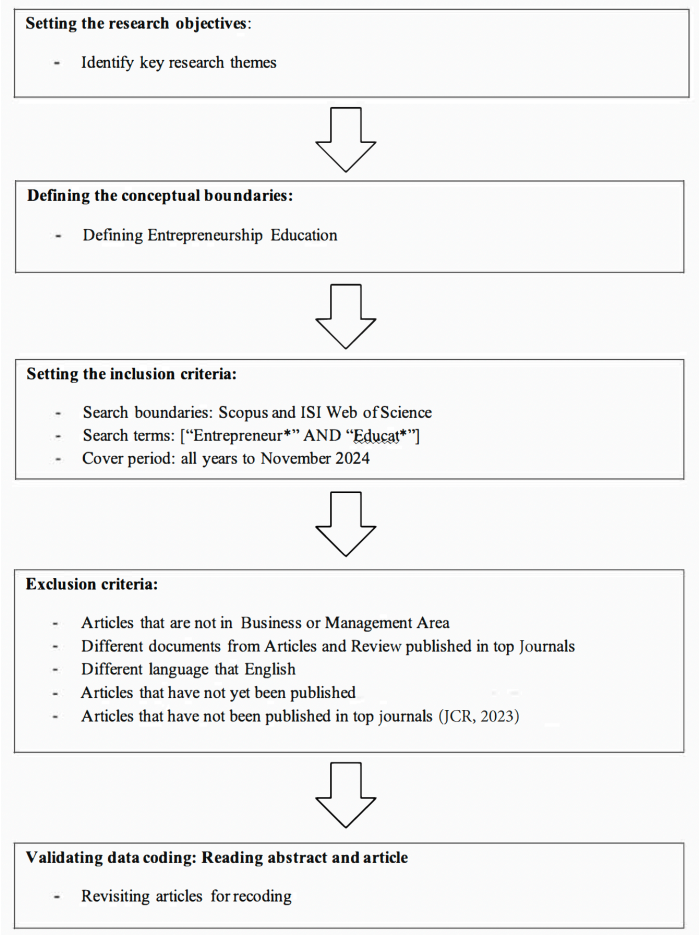

Figura 1. Processo di revisione

- text mining e analisi di co-occorrenza, tramite software di network analysis, per identificare cluster tematici e relazioni tra parole chiave, in linea con pratiche consolidate di bibliometric e mapping studies (Dissanayake et al., 2022).

Figura 2. Text mining, elaborazione originale

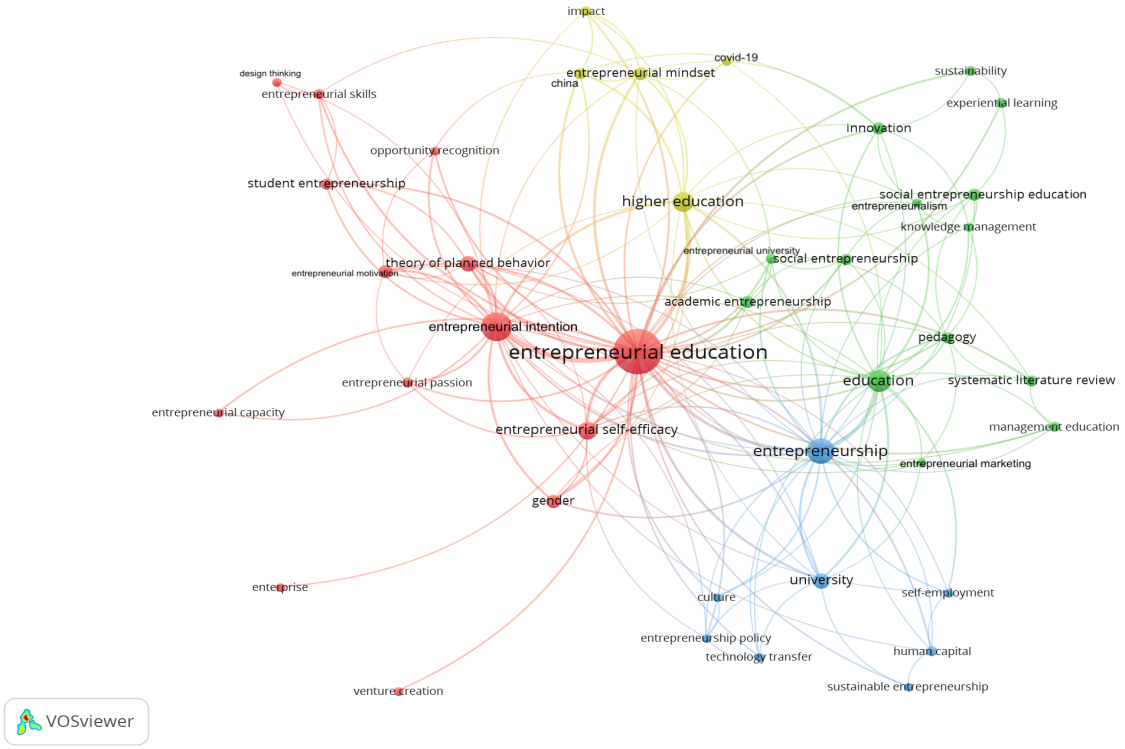

Figura 3. Analisi di Co-occorrenza delle parole chiave, elaborazione originale

4. Risultati

L'analisi della letteratura permette di distinguere quattro grandi gruppi di contributi.

Il primo cluster riguarda i fattori psicologici e l'intenzione imprenditoriale. In questo filone gli autori si concentrano soprattutto su come intenzione imprenditoriale, atteggiamenti, norme soggettive e percezione di controllo comportamentale si sviluppino e si trasformino lungo i percorsi formativi (Cui et al., 2021; Dana et al., 2021). Molta attenzione è dedicata anche agli effetti dei corsi di educazione imprenditoriale su autoefficacia, motivazione e propensione effettiva all'avvio di un'impresa, con un focus particolare sugli studenti universitari (Huang et al., 2021; Ahn & Winters, 2023). In questo insieme di studi, però, il contesto urbano compare solo sullo sfondo: l'interesse è rivolto quasi esclusivamente alle variabili individuali, mentre gli elementi territoriali o istituzionali rimangono marginali (Yi & Duval-Couetil, 2022).

Un secondo cluster, in rapida espansione, è quello dedicato all'imprenditorialità sociale, all'innovazione e alla sostenibilità. Qui rientrano le ricerche su imprenditorialità sociale e ibrida (Bacq & Janssen, 2011; Yunus et al., 2010), sulle iniziative che nascono con l'obiettivo esplicito di affrontare problemi sociali o ambientali (Hall et al., 2010; Johnson & Schaltegger, 2020) e sui modelli di business pensati per generare valore sociale e orientati alla sostenibilità (George & Bock, 2011; Shabbir, 2023). Alcuni lavori si occupano in modo più diretto di come educare a queste forme di imprenditorialità sociale e sostenibile (Solomon et al., 2019; Al Issa et al., 2024; Mambali et al., 2024; Mets et al., 2021). Anche in questo caso, tuttavia, il riferimento ai contesti urbani è spesso implicito e poco tematizzato.

Il terzo cluster mette al centro il ruolo delle università e dei loro Technology Transfer Offices (TTOs) all'interno degli ecosistemi imprenditoriali. Le università vengono descritte come snodi fondamentali di sistemi imprenditoriali complessi (Isenberg, 2010; Bischoff et al., 2018), in cui trovano spazio spin-off, incubatori universitari e programmi di accelerazione (Bolzani et al., 2021). In questo ambito rientrano anche gli studi sulle politiche e sugli strumenti a supporto dell'imprenditorialità accademica e studentesca (O'Connor, 2013; Walter & Block, 2016). Sebbene tali ecosistemi si sviluppino spesso in grandi città, il legame tra l'azione delle università, lo sviluppo urbano sostenibile e il benessere dei territori non viene quasi mai tematizzato in modo esplicito e sistematico.

Infine, un quarto cluster riguarda la higher education e l'idea di imprenditorialità come mindset trasversale. Qui l'attenzione si sposta su programmi rivolti a studenti provenienti da discipline molto diverse, non solo economiche o manageriali (Dissanayake et al., 2022; Blankesteijn, 2024), e su approcci formativi di tipo esperienziale, come project work, service learning e learning by failing (Testa & Frascheri, 2015; Solomon et al., 2019). In questi contributi emergono riflessioni sull'importanza dell'imprenditorialità per sviluppare resilienza e capacità di adattamento, soprattutto in contesti di crisi come la pandemia di Covid-19 (Wiklund et al., 2019). Si affacciano così i temi della cittadinanza attiva, del benessere e dello sviluppo personale, ma ancora una volta con pochi riferimenti espliciti alle specificità sociali, economiche e ambientali delle grandi aree urbane.

5. Discussione

Dall'analisi emerge che, pur esistendo una vasta produzione scientifica su imprenditorialità ed educazione imprenditoriale, il collegamento con i temi della sostenibilità e del benessere urbano resta ancora parziale e poco sistematico (Neumann, 2021; Wiklund et al., 2019). In particolare, si possono individuare tre nodi critici.

Il primo riguarda la prevalenza del livello micro: la maggior parte degli studi continua a concentrarsi sugli individui, sulle loro intenzioni imprenditoriali e sui fattori psicologici che le influenzano (Cui et al., 2021; Dana et al., 2021). Rimangono invece meno esplorati i livelli meso e macro, come gli ecosistemi urbani, le istituzioni, le politiche pubbliche e le dinamiche specifiche delle città (Bruton et al., 2010; Walter & Block, 2016). Di conseguenza diventa difficile comprendere perché programmi formativi simili possano produrre esiti differenti in contesti urbani diversi (Terjesen et al., 2016).

Un secondo limite riguarda la misurazione degli impatti. L'efficacia dei percorsi di educazione imprenditoriale viene spesso valutata osservando variazioni nelle intenzioni degli studenti, nei loro atteggiamenti o nella soddisfazione rispetto ai corsi (Yi & Duval-Couetil, 2022; Dissanayake et al., 2022). Molto meno attenzione viene dedicata a ciò che accade dopo: quante nuove imprese vengono realmente avviate e con quali risultati (Acs et al., 2013; Lyons & Zhang, 2018), quali effetti sociali e ambientali generano sui territori urbani (Hall et al., 2010; Johnson & Schaltegger, 2020), e in che misura contribuiscono a ridurre disuguaglianze e a migliorare il benessere delle comunità locali (Apetrei et al., 2019; Neumann, 2021).

Infine, la terza criticità riguarda la limitata attenzione ai gruppi più vulnerabili. Solo una porzione ridotta della letteratura considera in modo esplicito giovani NEET, migranti, donne, persone con basso reddito o basso livello di istruzione (Lyons & Zhang, 2018; Apetrei et al., 2019), pur essendo questi gruppi spesso sovrarappresentati nelle grandi città (Behrens & Robert-Nicoud, 2014). Ciò finisce per ridurre il potenziale dell'educazione imprenditoriale come vero strumento di empowerment urbano e di rafforzamento della coesione sociale.

6. Agenda di ricerca

Alla luce delle lacune emerse, si può delineare un'agenda di ricerca articolata in tre grandi direzioni.

La prima riguarda l'integrazione tra prospettiva istituzionale ed educativa. Servono studi che mettano davvero in dialogo questi due piani (Bruton et al., 2010; Walter & Block, 2016), chiedendosi in che modo politiche locali, regolamentazioni e infrastrutture urbane influenzino l'efficacia dei programmi di educazione imprenditoriale. Allo stesso tempo occorre capire come università ed enti formativi si inseriscano negli ecosistemi urbani, interagendo con amministrazioni pubbliche, imprese e organizzazioni del terzo settore (Isenberg, 2010; Bischoff et al., 2018). Un simile approccio aiuterebbe a spiegare perché iniziative formative simili producano risultati molto diversi da una città all'altra.

Una seconda direzione di lavoro riguarda lo sviluppo di metriche di impatto maggiormente orientate al benessere. La valutazione dei programmi non dovrebbe limitarsi agli esiti economici, ma includere esplicitamente dimensioni come il benessere individuale e collettivo, la coesione sociale e la sostenibilità ambientale (Neumann, 2021; Shabbir, 2023). Ciò implica la costruzione di indicatori di impatto sociale e ambientale in linea con gli Obiettivi di sviluppo sostenibile e con la definizione di sviluppo sostenibile proposta dalla WCED (1987), oltre alla promozione di studi longitudinali che seguano nel tempo gli effetti dell'educazione imprenditoriale, mettendo in relazione dati micro (competenze, intenzioni, comportamenti) e dati di contesto urbano (Fan et al., 2023; Juntti & Ozsezer-Kurnuc, 2023). L'approccio suggerito da Yi & Duval-Couetil (2022), basato sulla validità descrittiva e sulla trasparenza metodologica, può rappresentare un importante punto di riferimento.

Infine, una terza direttrice riguarda la promozione di forme di imprenditorialità realmente inclusive nelle città. In questa prospettiva diventa cruciale esplorare come l'educazione imprenditoriale possa coinvolgere in modo mirato gruppi urbani vulnerabili – ad esempio attraverso programmi specifici e alleanze con attori del territorio, come associazioni, enti locali e organizzazioni di quartiere (Lyons & Zhang, 2018; Apetrei et al., 2019). Metodologie didattiche di tipo esperienziale e comunitario – come i living labs urbani, i progetti di rigenerazione o il service learning – possono trasformare gli studenti in co-progettisti di soluzioni ai problemi delle città (Solomon et al., 2019; Blankesteijn, 2024). In quest'ottica, l'integrazione stabile di contenuti legati all'imprenditorialità sociale e green nei curricula formativi (Mets et al., 2021; Mambali et al., 2024) rappresenta un passaggio essenziale per coniugare educazione imprenditoriale, sostenibilità e benessere urbano.

7. Conclusioni e implicazioni pratiche

Lo short paper mette in evidenza come il dibattito scientifico sull'imprenditorialità, sull'educazione imprenditoriale e sul ruolo delle università sia ormai molto articolato e maturo (Dissanayake et al., 2022; Bolzani et al., 2021). Tuttavia, quando si guarda al nesso tra queste dimensioni e i temi della sostenibilità e del benessere nelle grandi aree urbane, il quadro risulta ancora frammentato: i collegamenti sono presenti, ma raramente affrontati in modo sistematico e integrato (Hall et al., 2010; Neumann, 2021; Wiklund et al., 2019).

Da questa constatazione derivano alcune implicazioni concrete per policy maker, amministratori urbani e istituzioni universitarie. In primo luogo, diventa cruciale progettare percorsi di educazione imprenditoriale che non si limitino a promuovere la creazione di impresa in senso stretto, ma che dichiarino esplicitamente obiettivi di impatto sociale e ambientale, in coerenza con il paradigma dello sviluppo sostenibile (WCED, 1987; Johnson & Schaltegger, 2020). In secondo luogo, si suggerisce di lavorare alla costruzione di veri e propri ecosistemi urbani collaborativi, in cui città, università, imprese, terzo settore e comunità locali condividano visioni, risorse e responsabilità (Isenberg, 2010; Bischoff et al., 2018). A ciò dovrebbe affiancarsi l'istituzione di sistemi di monitoraggio più completi, capaci di misurare non solo il numero di

start-up avviate, ma anche il loro contributo alla riduzione delle disuguaglianze, al miglioramento del benessere e alla qualità della vita nei contesti urbani (Neumann, 2021; Fan et al., 2023).

In una prospettiva di medio-lungo periodo, l'educazione imprenditoriale nelle grandi città può così diventare un dispositivo strategico per tenere insieme innovazione, inclusione e sostenibilità. Perché ciò avvenga, però, è necessario superare una visione dell'imprenditorialità intesa esclusivamente come generazione di valore economico e riconoscerla invece come leva centrale delle strategie di sviluppo urbano sostenibile, capace di incidere sulle dimensioni sociali, ambientali e di benessere collettivo (Hall et al., 2010; Shabbir, 2023).

Parole chiave: Educazione imprenditoriale, sostenibilità, benessere individuale

Organizational model for the underwater cultural heritage: experiences from Southern Italy

Cristina Canoro[1], Luisa Varriale[2], Maria Ferrara[3]

1. Introduction

Diving tourism is considered a segment of particular interest within the tourism sector, representing a niche market of sports and adventure tourism. The number of scuba divers and visitors engaging in snorkelling activities continues to increase year after year. It has become a hybrid form of tourism, attracting a wide range of travellers, including nature and marine environment enthusiasts who embrace the values of sustainable and slow tourism (Izzo et al., 2021).

The literature on diving tourism has primarily focused on sustainability by addressing environmental and economic dimensions, while largely overlooking social aspects (Lucrezi et al., 2017). The analysis of inter-organizational networks, also through the lenses of stakeholder theory and social network analysis, helps to address this gap by highlighting cooperative relationships as a means to enhance competitiveness and effectiveness - outcomes that are difficult to achieve through traditional hierarchical and market-based governance mechanisms (Powell, 1990).

In particular, there is growing scholarly interest in examining the implications of managing tourist destinations through network-based organizational structures (Barnes et al., 2017; Bodin et al., 2020).

The focus on combining structural network analysis with stakeholder perceptions and cultural frames is consistent with current debates in management and cultural policy studies, which increasingly conceptualize governance as a socially embedded and negotiated process, rather than a purely technical or instrumental one (Ruzol et al., 2017).

This study aims to investigate inter-organizational networks for the enhancement of UCH tourism by integrating cultural tourism and diving tourism models, with the objective of describing different organizational configurations across three regions of Southern Italy - Campania, Puglia, and Calabria – involved in the MUSAS project (Museums of Underwater Archaeology), which focuses on the protection, enhancement, and networking of underwater archaeological heritage.

The emergence and development of Underwater Archaeological Parks (Davidde, 2002) have further increased interest in this field, outlining a new model of UCH tourism (Canoro et al., 2024) that can be identified as a form of sustainable underwater tourism (Dimmock and Musa, 2015) at underwater cultural heritage sites.

As Arnaboldi and Spiller (2011:641) pointed out tourism studies increasingly emphasize the relevance of network-based approaches that integrate tourism with other value chains (d'Angella and Go, 2009; Lemmetyinen and Go, 2009; Novelli et al., 2006), particularly those related to cultural heritage (Aas et al., 2005; Ballesteros and Ramírez, 2007; Xie, 2006), in order to foster sustained value creation (Ryan, 2002). However, despite the widely acknowledged advantages of

[3] Full Professor, ECON-08/A, University of Naples Parthenope; maria.ferrara@uniparthenope.it

more holistic and systemic management models, the development and long-term maintenance of tourism and cultural networks remain complex and challenging processes. At the core of such systems lies stakeholder collaboration, which has been consistently identified in the literature as a crucial element for effective network governance (e.g. Bramwell and Sharman, 1999; Jamal, 2004; Jamal and Getz, 1995; Jamal and Stronza, 2009; Medeiros de Araujo and Bramwell, 2002).

2. Method

The research project adopts a multiple case study methodology, which allows for the exploration of complex phenomena (Eisenhardt, 1989; Eisenhardt and Graebner, 2007; Yin,1994) and, through a longitudinal approach, enables an understanding of evolutionary processes and ongoing dynamics.

The exploratory analysis highlights the social dimensions of the relationships established within and beyond the network, seeking to address the gap identified in the literature by drawing on social network analysis and stakeholder theory.

Specifically, the study examines networks for the enhancement of underwater cultural heritage through three case histories in Southern Italy: Campi Flegrei Active in Campania Region, Esac in Puglia and Reggio Calabria welcome in Calabria.

The paper provides insights for a better understanding of the phenomenon through the analysis of these networks within a longitudinal study conducted in the post-pandemic period, (June 2023 - December 2025), using semi-structured interviews and desk analysis.

Following Aaboen et al. (2012), this study adopts a longitudinal multiple case study approach to capture inter-organizational processes. Specifically, it investigates the processes through which networks are formed and developed to promote tourism at underwater cultural heritage sites.

The study seeks to investigate the evolutionary processes and ongoing dynamics characterizing the networks in three cases examined in the Regions of Puglia, Calabria, and Campania, all of which fall within the scope of the MUSAS project (Museums of Underwater Archaeology), aimed at the protection, enhancement, and networking of underwater archaeological heritage. Initiated in 2017 and concluded in 2023, the MUSAS project was adopted as the analytical point of departure, as it represents the first systematic attempt to establish a network among underwater cultural heritage sites in Southern Italy. The longitudinal research design makes it possible to trace the evolution of these networks, from the MUSAS project to nowadays.

The first phase of the research is based on literary review and desk analysis carried out through the examination of documents - including statutes, internal regulations, network agreements, websites, reports, articles. During this phase and thanks to the involvement of one of the authors in some projects and processes to develop UCH tourism, we identify stakeholders to interview. Besides, in some cases the interviewee suggested protagonists of the network building process who were contacted and included in the sample.

The second phase involves a semi-structured interview guide to get a full understanding of the networks, the actors, the management of relationships among members, the coordination mechanisms and the stakeholders.

The interviews were conducted by phone, recorded and transcribed. Eight key stakeholders (see table 1) were selected by considering a range of actors drawn from different organizations and backgrounds, in order to ensure representation of the various stakeholder, groups involved and to achieve a wide representation of interests. These stakeholders include representatives from public organizations, diving centres, associations and Universities.

Respondent	**Organization**	**Role**	**Region**

Fabio Pagano	Archaeological Park of Baia	Director	Campania
Vincenzo Maione	Campi Flegrei Diving Center	General Manager	Campania
Rita Auriemma	University of Salento	Associate Professor	Puglia
Gianpaolo Colucci	Anfora Association	President	Puglia
Salvatore Medaglia	University of Calabria	Researcher in Archaeology	Calabria
Fabio Bruno	University of Calabria	Full Professor	Calabria
Roberta Eliodoro	Megale Hellas Diving	Legal Representative	Calabria
Loredana Ierace	Chamber of Commerce	Head of Studies and Promotion Service	Calabria

Table 1. Key Stakeholders

3. Multiple case study

The longitudinal multiple case study allows us to investigate the following research questions (RQs):

RQ1: Who are the actors involved in the inter-organizational network for the development of underwater archaeological tourism?

RQ2: Who are the stakeholders, and how have they been involved?

RQ3: How are relationships within the network managed?

RQ4: What coordination mechanisms are adopted to effectively manage interdependencies?

The study is based on three case history to compare network experiences in the three regions of southern Italy: Campi Flegrei Active in Campania, ESAC in Puglia and Reggio Calabria Welcome in Calabria. The results of the comparative analysis are summarised in Table 2.

	CAMPANIA	**PUGLIA**	**CALABRIA**
Inter-organizational network	**Campi Flegrei Active**	**ESAC**	**Reggio Calabria Welcome**
Type of network	Bureaucratic Network	Bureaucratic Network	Bureaucratic Network
Actors	20 companies of the tourist system	Superintendencies-University- Region	Chamber of commerce and companies
Stakeholders	UAP of Baia, Region, Municipalities, Universities, Associations, Community	Diving centres, Hotels, B&B, MPA's, SME's, Associations	Companies of the tourist system, diving centres, tourist and environmental guides
Relationship Management	Network Agreement	Consortium between public bodies	Association

Coordination mechanism	Regulation	Coordination Body	Disciplinary

Table 2. Case histories

3.1. Campania region

In Campania, the analysis begins with the Underwater Archaeological Park (UAP) of Baia, one of the most significant areas for UCH tourism in Italy. Established in 2002 together with the Gaiola Underwater Park - among the first underwater archaeological parks created in the country and designated as marine protected areas (MPA) - the UAP of Baia today represents a benchmark model for the use and enjoyment of UCH. In 2023, it was recognized by UNESCO as a best practice for the implementation of the 2001 Convention on the Protection of the Underwater Cultural Heritage. The steady increase in visitor numbers and the strong interest not only in the site's biological features but especially in its archaeological assets make it an exemplary case of sustainable underwater archaeological tourism (Canoro and Ferrara, 2024).

The Park covers approximately 200 hectares within the municipalities of Pozzuoli and Bacoli, in the volcanic area of the Campi Flegrei, which is characterized by a high concentration of landscape, natural, architectural, and archaeological resources. Internationally known as the "submerged Pompeii," the site has experienced a significant increase in tourist demand related to archaeological diving in recent years. A meaningful indicator of this trend is provided by PADI Adventures, a global booking platform for diving activities: in 2024, the Baia UAP, visited through the Centro Sub Campi Flegrei, ranked first worldwide among the top diving destinations (Canoro et al., 2024).

A first attempt at establishing an inter-organizational network for the enhancement of cultural tourism, driven by businesses and associations in the sector, is represented by the Campi Flegrei Active project. Launched in 2019 by Federalberghi Campi Flegrei, the initiative involved accommodation facilities, tourism enterprises, and cultural associations with the aim of developing an integrated tourism offer and promoting authentic experiences within the territory. Formalized in 2021 through a network contract among twenty local enterprises, the project seeks to develop a shared promotional model in which underwater heritage plays a central role.

The network agreement regulates coordination and control mechanisms. Management is entrusted to a committee composed of three members, responsible for implementing the network program and fostering cooperation among the enterprises. The Assembly, which brings together all participating firms, operates on a collegial basis and deliberates on amendments to the program and on strategic guidelines.

The stakeholders involved include diving centre and a glass-bottom boat, accommodation facilities, restaurants, cultural enterprises, tour operators, as well as residents living in areas affected by archaeological heritage. Associations that are not formally part of the business network represent key stakeholders, namely the local community, which contributes to the creation of authentic experiences, while the network enterprises coordinate tourism services and promote these experiences through a dedicated web portal.

The inter-organizational business network, which can be characterized as a bureaucratic network regulated by network agreements and coordination mechanisms based on internal regulations, highlights the absence of public institutions in their role of defining strategic directions, supporting territorial tourism development, and fostering forms of public - private collaboration.

The management model of the UAP of Baia demonstrates the effectiveness of this collaborative approach: the public authority is responsible for protection, research, and maintenance, while private operators manage visits, site access, promotion, and enhancement of the site.

Thanks to initiatives promoted by private operators, new technologies for virtual visits have been implemented, such as the Baia Experience 3D virtual tour accessible through Oculus Go, as well as video game–based tourism through the serious game Dive in the Past (Canoro et al., 2021; Izzo et al., 2021; Greco et al., 2024). The latter was developed within the European project MeDryDive, which enabled the creation of a freely downloadable app accessible via any smartphone. Baia Experience, by contrast, originated from a self-funded research project launched in the 1980s, which enabled underwater surveying of the site. Starting from the mapping of the submerged ruins, this long-term research process has evolved to the present day, allowing anyone to visit the UAP of Baia by wearing a virtual reality headset and to admire reconstructions of the Claudius Nymphaeum and the thermal complex as they appeared in the 3rd century AD.

The findings from the desk analysis and the interviews conducted with the Archaeological Park of Campi Flegrei - which manages the UAP of Baia - and with a diving operator indicate that the future prospects of UCH tourism in Campania require the consolidation of relationships among system actors. The establishment of shared governance bodies, such as Destination Management Organizations (DMOs), could facilitate coordination among institutions, tourism operators, cultural service providers, and local communities. In the absence of a stable governance structure, efforts remain fragmented, and the potential of underwater heritage is not fully realized in relation to its actual capacity to foster territorial development.

Despite the presence of one of the most important underwater archaeological parks in the Mediterranean, Campania still lacks a stable network dedicated to the enhancement of UCH. The absence of coordination among institutional, economic, and cultural actors has led to fragmented initiatives, often promoted by forward-looking private operators seeking to develop forms of cultural tourism based on the site's underwater potential. In this context, the UAP of Baia represents a strategic resource that remains insufficiently integrated into a shared territorial promotion system capable of generating positive spillover effects across the wider area.

3.2. Puglia region

In Puglia, the network for the promotion of UCH tourism was created on the initiative of the Euro Mediterranean Seascapes Archaeology Centre (ESAC), which brings together the experience and expertise of three regional universities (the University of Salento, the University of Bari "Aldo Moro", the University of Foggia), the Puglia Region (Department of Tourism, Cultural Economy and Territorial Enhancement) in collaboration with the National Superintendence for Underwater Cultural Heritage (established in 2019), and the territorial Superintendencies for the provinces of Brindisi and Lecce, Barletta and the metropolitan city of Bari. The Centre was established in 2021 with a three-year agreement approved by the Regional Council [4] to systematize the knowledge, skills and abilities acquired through national and international projects born out of collaboration between the University and the Region, for the enhancement of coastal and underwater heritage of Puglia.

ESAC's main objectives are research, training, conservation and enhancement of Puglia's underwater heritage. It aims to implement a structured and conscious path for the enhancement of underwater sites and coastal landscapes most illustrative of the historical values of Puglia and its strong Mediterranean vocation, understood as a resource for socio-cultural growth and sustainable tourism development of the territories. The governance of the Centre is carried out through a coordinating body, as the Propositive, Advisory and Evaluation Steering Body, which is responsible for deciding on the activities to be conducted in the various areas of interest of the Centre. The coordination is composed of a pro tempore contact person from each of the subjects involved.

[4] Regional Council Decree n. 1104 0f 7 July 2021

The decision-making process is largely attributed to the Region, which plays an operational role in valorisation activities through the "Poli biblio-museali"[5]. The Superintendency assumes an advisory and authorising function, contributing on the basis of its competences in the field of protection and the state of conservation of the sites, while the Universities play a project role by developing proposals and partnerships for national and cross-border territorial cooperation.

The project "Andar per Mare, underwater and coastal itineraries of Puglia" was born within this framework to enhance the region's submerged heritage, ensuring its expanded accessibility, both through direct use and with the aid of innovative technologies.

The project aims to plan and structure an integrated tourism and cultural offering, with low environmental impact and high sustainability, divided into thematic coastal and underwater tours, to be included in the Regional Museum System circuit and the Puglia Paths network.

Starting from approximately 700 artifacts and contexts surveyed, approximately 40 sites suitable for public use, already accessible or susceptible to immediate enhancement, were identified, selected according to criteria of: location, conservation conditions, depth, visibility, and accessibility. The element of fundamental importance in building and achieving these results is precisely the involvement of local stakeholders in developing a shared strategy for the participatory management of the selected sites. This co-design process is based on other virtuous experiences already existing in Italy (UAP of Baia) and in Puglia itself (Egnazia; wreck of San Pietro in Bevagna).

Project stakeholders were involved through technical discussions in the various relevant territorial areas, which included the participation of diving canters, SMEs in sports, recreational, and hospitality activities, nautical service providers, cultural and environmental associations. Stakeholders involved in the project have signed a Memorandum of Understanding (MoU), contributing to varying degrees to the design activities. They have also been included in both the digital portal and the paper guide.

In 2025, the agreement between the institutions promoting ESAC was not renewed, effectively ending an experience of synergistic collaboration between the Universities, the Puglia Region, and the Superintendencies. Recent institutional reorganizations within the Region and the National Superintendency, combined with conflictual relations between the Region and the Ministry of Culture, have compromised the continuity of this cooperation, disrupting a governance model that had demonstrated effectiveness in enhancing underwater archaeological heritage.

Currently, with the conclusion of the ESAC experience, there is no stable coordination system for activities and projects related to the development of underwater archaeological tourism. A new institutional structure is pending from the Region, which could take on a leadership role through the "Poli biblio-museali" or other operational bodies and tools. These entities should be able to integrate research, valorisation, and heritage management at the territorial level, promoting a unified and shared vision.

The Puglia Region operates in the tourism sector through the Puglia Region's Tourism and Culture Department, the Puglia Promozione Regional Tourism Agency, the Puglia Public Theatre Consortium, and the Puglia 365 Strategic Tourism Plan, a participatory planning and development tool for cultural tourism. Furthermore, through the Destination Management System (DMS), the Region promotes hotel and non-hotel accommodations and cultural operators. Since 2018, this

[5] The Puglia Region has established "Poli biblio-museali" as a regional system of museums, libraries, and cultural venues capable of engaging with the state's peripheral structures regarding cultural heritage, standardizing service standards, and valuing the vast wealth of assets, knowledge, and experiences of the provinces of Puglia and municipalities in a single, coordinated policy of valorization and enjoyment (https://www.piiilculturapuglia.it/poli-biblio-museali/).

tool has evolved into a digital ecosystem of culture and tourism, serving both visitors and operators offering their services, facilitating supply and demand matching.

Desk analysis and interviews reveal a marked fragmentation of supply in the underwater archaeological tourism sector. On the one hand, the Puglia Region's Department of Tourism, Cultural Economy, and Land Valorisation-through "Poli biblio-museali" and in collaboration with the stakeholders who promoted ESAC- works to support UCH tourism, including through Puglia365, encouraging the networking of diving canters and tourism businesses. On the other hand, Puglia Promozione does not always proceed in a coordinated manner with ESAC, with the result that the integration of UCH tourism into the regional cultural offering is partial and uneven.

This fragmentation ultimately diminishes and weakens the role of researchers in promoting heritage awareness, through the dissemination of knowledge of the enormous underwater heritage, recognized as an element of identity in the construction of collective memory and a sense of belonging in a community. However, the lack of public valorisation and recognition of this work risks undermining its legitimacy: when research is not understood and validated by the community, its ability to impact the local area weakens (Rita Auriemma, University of Salento).

On the contrary, the experience gained within ESAC - thanks to collaboration with the Puglia Region and the coordination of "Poli biblio-museali" - has produced concrete results. In numerous museums in Puglia, the narration of the history of the area today integrates the underwater heritage, through immersive technology such as Oculus Go and three-dimensional reconstructions. Among the most significant achievements is the exhibition "In the Sea of Intimacy: Underwater Archaeology Tells the Story of Puglia", held at Brindisi Airport from 2019 to 2021, which made the underwater dimension of the regional heritage accessible to a wide audience.

The path continues through the museums of the museum network of Puglia and is enriched with new exhibition experiences, such as the multimedia installation of the Egnazia Museum - a site selected by the MUSAS project - which presents the archaeological park and its submerged site in an integrated manner.

The experience of Puglia shows that the network to function must be structured with a defined governance. Despite the absence of structured coordination, activities are continuing. Among the most significant challenges is the definition of the management plan for the Porto Cesareo underwater and coastal park, developed as part of a project funded by the Puglia Region. Following the conclusion of the archaeological campaign conducted by the University, restoration work was carried out, along with the preparation of trails, the design of underwater trails, and the introduction of lightweight infrastructure - such as signal buoys, canoes, and transparent SUPs - as well as spaces like training rooms.

These interventions are possible in the Underwater Park thanks to the presence of a regulation and a management body. Otherwise, for the coastal sites of Salento there is not a single authority capable of coordinating the set of localities involved. In this context, the Region could play a strategic role in regulating the relationship between users and service operators through provider accreditation systems, like the UAP of Baia, where underwater activities and visits with transparent-bottom boats and other marine sports are authorized and regulated.

3.3. Calabria region

In Calabria Region, the stakeholders involved in the development of UCH tourism include the Calabria Region, the Chambers of Commerce, and the University of Calabria, with the support of the Superintendencies, responsible for protection and enhancement activities. Despite the strong territorial continuity between sea and land that characterizes the region, there is a lack of structural and ongoing interventions dedicated to the valorisation of the underwater heritage. The scientific community has repeatedly highlighted the need to implement participatory processes

that include local diving canters, economic operators, Superintendencies, and the Coast Guard, to build a stable and qualified offering of UCH tourism.

According to Salvatore Medaglia (University of Calabria), there is still no real supply system: only episodic or discontinuous initiatives are recorded. Among the attempts to structure a regional model is the Sustainable Tourism Development Plan 2023-2025, which, through the "Calabria Straordinaria" project, aims to deseasonalize flows and diversify the offering, enhancing villages, inland areas, the sea, mountains, food and wine, and culture. The digital portal created by the Region supports this strategy, offering a modern information ecosystem oriented towards the integrated promotion of heritage.

The Kaulonia Archaeological Park, together with the submerged area in front, represents one of the main regional references for research and dissemination activities, also thanks to participation in projects such as MUSAS. Calabria is also a hub of excellence in the field of technologies applied to underwater cultural heritage, thanks to the Department of Mechanical, Energy and Management Engineering (DIMEG) of the University of Calabria and the spin-off 3D Research, which develop virtual and augmented reality tools, 3D reconstructions, underwater tablets, and digital applications.

The Punta Stilo area, in Monasterace Marina, offers an emblematic example of integration between archaeological heritage and the marine environment. Progressive coastal erosion and geological phenomena have led to a westward shift of the ancient coastline, making part of the archaeological site accessible today even at shallow depths. Megale Hellas diving, in collaboration with the Locri Epizephirii Museum and Archaeological Park and the Kaulonia site, has been running underwater archaeology camps and courses since 2013, combining scientific rigor and outreach activities.

Interviews conducted with stakeholders reveal a recurring critical issue: the lack of adequately structured diving services and the difficulty of collaborating with independent museums following the reform of cultural heritage governance. Previously, cooperation between the Superintendency and Megale Hellas diving was a virtuous model of an informal network; the introduction of new ministerial procedures following the reorganization of the museum sector has instead made the signing of public-private agreements more complex.

The University of Calabria, leader subject of the "BlueCulTour project, is promoting sustainable tourism models based on the valorisation of the maritime and UCH of the Ionian Sea. Partners include the Calabria Region, the National Superintendency for Underwater Cultural Heritage, and the Greek Municipality of Kyllini in collaboration with the Ministry of Culture's Underwater Antiquities Ephorate of Greece and the Capo Rizzuto Marine Protected Area. The project funded by the Interreg Greece - Italy Programme, also includes a training part for both diving and cultural and creative industries to increase the quality level of the services offered, with a focus on communication strategies relating to submerged goods. The project, launched in 2025, will last two years.

This project, like other national and international projects, has a limited duration and represents temporary networks for the development of underwater archaeological tourism, of strong interest due to its potential for a vision of cultural and sustainable tourism.

A further attempt to structure a system of enterprises was promoted by the Chamber of Commerce of Reggio Calabria, through the creation of a product club "Reggio Calabria Welcome". This form of network is configured as a bureaucratic governance model, in which horizontal companies-sometimes competitors-cooperate to manage common resources and adopt shared standards. Interdependence between actors is governed by membership criteria, behavioural rules and decision-making procedures defined by the assembly bodies and formalized in statutes and regulations, ensuring a stable framework for coordination between enterprises and institutions.

Despite such efforts, the picture that emerges is that of a fragmented operational network, characterized by isolated initiatives and weak integration between research, diving canters,

cultural institutions, and public administrations. The construction of a truly integrated regional system would require a stronger coordinating role on the part of the Calabria Region, capable of permanently connecting scientific research, cultural valorisation, tourism services, and territorial governance.

4. Concluding remarks

The comparative analysis of three development models in Campania, Puglia, and Calabria highlights a persistent fragmentation in attempts to build inter-organizational networks around UCH, largely driven by interinstitutional conflicts and unclear governance arrangements. While decentralization processes following the reform of Title V of the Italian Constitution have strengthened the role of Regions in tourism governance (Art. 117 Cost.), they have also increased institutional complexity, often resulting in coordination failures, communication barriers, and power asymmetries that constrain entrepreneurial development and long-term network consolidation.

Consistent with the literature on network governance, the findings confirm that cooperative relations among firms tend to emerge within decentralized and bottom-up models of collaboration. However, their effectiveness remains contingent upon stable public - private partnerships and clear institutional leadership. The cases show that, in the absence of coordinated governance, initiatives remain isolated and vulnerable, despite growing policy attention to UCH tourism - particularly in the post-pandemic period and following the national legislative efforts[6] recognizing diving and UCH tourism as strategic for safety, environmental protection, and heritage valorization.

The UAP of Baia, in Campania, represents the largest submerged archaeological site in the world, accessible through diving, snorkelling, canoeing, and glass bottom boats. One of the main attractors of diving tourism internationally is the first site in Italy to be recognized as a UNESCO best practice for the application of the 2001 UNESCO Convention for the Protection of the Underwater Cultural Heritage

The UAP of Baia represents a paradigmatic case of effective public-private collaboration, anticipating contemporary governance models by integrating protection, research, and tourism use through regulated access and accredited service providers. Similarly, bottom-up networks in the Campi Flegrei area demonstrate how trust-based social relations (Masiello et al., 2015) and collaborative relationships between businesses and local associations can foster cultural tourism, although their sustainability requires institutional support through destination management tools such as DMOs and DMSs (Canoro, 2021).

The coordination of such interorganizational networks that are based on cooperative relationships can be effectively managed by coordination mechanisms such as knowledge sharing and decision participation in bottom-up co-design processes of territorial development models.

In Puglia, the ESAC experience illustrates both the potential and fragility of interinstitutional networks. While the Centre successfully coordinated research, protection, and valorization through a hierarchically structured governance model, its temporary nature and subsequent institutional conflicts undermined continuity.

Entrepreneurial development needs a clear and defined context in which the rules define a framework that fosters investment. In this context, the Puglia Region should play a strategic role in regulating the relationship between users and service operators through provider accreditation systems, like the UAP of Baia, where diving activities and visits with glass-bottom boats and other marine sports are authorized and regulated.

[6] See the Bill on the Enhancement of the Sea Resource presented in 2024 - subsequently amended in 2025 (https://www.senato.it/leggi-e-documenti/disegni-di-legge/scheda-ddl?did=59478)

In Calabria Region, submerged sites of archaeological interest are not yet developed from a tourist point of view. A further attempt to structure an entrepreneurial system to support UCH tourism was promoted by the Reggio Calabria Chamber of Commerce through the creation of the product club "Reggio Calabria Welcome". This experience represents a bureaucratic form of governance, in which companies belonging to the same segment - sometimes even competitors - cooperate to manage common resources and adopt shared standards. Interdependence between actors is regulated by membership criteria, behavioural norms and decision-making procedures defined by assembly bodies and formalized in statutes and regulations, providing a stable framework for coordination between enterprises and institutions.

Despite these attempts, the regional system still appears fragmented: isolated initiatives prevail, limited integration between the scientific community, diving centres, cultural institutions, and public administrations, and an absence of shared strategies. Consolidating a truly effective network would require a more decisive leadership role from the Calabria Region, capable of permanently connecting research, cultural valorisation, tourism services, and territorial governance. Only through an integrated vision and coordinated direction will it be possible to transform the submerged archaeological heritage into an engine of sustainable development for the area.

These findings confirm that the evolution of UCH governance increasingly depends on the alignment between legal frameworks, policy instruments, and operational practices (Calantropio and Chiabrando, 2023). Moreover, in line with Ruzol et al. (2017), the study confirms that formal network structures alone are insufficient to explain cooperation dynamics. Socio-cultural and interpretive factors - values, worldviews, and perceptions of authority - play a crucial role in shaping actors' behavior and the resilience of governance arrangements. This also aligns with Pinto's (2019) argument that effective organizational performance emerges from managing paradoxes among multiple stakeholders rather than resolving them through purely technical solutions.

From a methodological perspective, while the multiple case study approach enabled in-depth comparative insights, the findings remain context-specific and cannot be generalized. The value of the research lies in its participatory nature and engagement with ongoing processes, which allowed for a nuanced understanding of evolving inter-organizational dynamics.

Overall, the study contributes to management and cultural policy debates by framing UCH tourism governance as a socially embedded and negotiated process.

However, the study has several limitations to consider and evaluate in future research. In particular, future research should further advance the analysis by deepening the application of social network analysis to UCH management.

As suggested by Gospodini et al. (2025), the creation of local social networks, together with participatory decision-making processes and collaborative projects, can foster tourism and economic development through sustained cooperation among local stakeholders.

The study provides insights for policy makers and tourism operators, highlighting how diving practiced in natural contexts of scenic and cultural value can become a driver of sustainable tourism, while also promoting protection, awareness, and a sense of belonging to the territory. Underwater parks and MPA emerge as complex tourist destinations where institutions, firms, and communities act as network facilitators. In synergy with institutions, such networks can promote a path of economic growth based on the quality of cultural provision and the valorization of local resources.

Promuovere la Transizione Digitale nel Settore Culturale: Strategie e Modelli di Business

Lorenzo Venezia[1], Elena Borin[2], Ruba Saleh[3]

1. Introduzione

Nel panorama contemporaneo, le organizzazioni culturali si trovano al centro di una profonda trasformazione imposta dalla digitalizzazione. La crescente pressione verso l'adozione di tecnologie innovative, unita alla complessità dei cambiamenti sociali ed economici in atto, impone a musei, biblioteche, archivi, organizzazioni e centri culturali di ripensare in modo radicale le proprie strategie organizzative e i propri modelli di business. In questo panorama, la transizione digitale non rappresenta soltanto un'opportunità di aggiornamento tecnologico, ma una vera e propria sfida imprenditoriale (Li et al., 2022; Ost C Saleh, 2021), capace di ridefinire le modalità con cui queste istituzioni generano valore, dialogano con i propri pubblici (Lerro et al., 2022; Sukhovskaya C Ermakova, 2020) e perseguono la propria missione culturale e sociale.

Nonostante l'urgenza del cambiamento, molte organizzazioni del settore culturale si confrontano con ostacoli strutturali e culturali che rallentano o impediscono l'implementazione efficace di strategie digitali. Tra questi, si segnalano la frammentazione degli interventi, la mancanza di visione strategica, la scarsità di competenze digitali interne (fra cui quelle legate all'utilizzo dell'intelligenza artificiale) (Van Laar et al., 2019; Cerquetti, 2023), la resistenza al cambiamento, l'assenza di infrastrutture adeguate e la scarsità delle risorse finanziarie. Di fronte a tali criticità, emerge la necessità di sviluppare strumenti operativi capaci di accompagnare in modo strutturato e sostenibile il percorso di trasformazione di tali organizzazioni, tenendo conto delle loro specificità e risorse limitate (Nasta, 2025; Pererva C Mazorenko, 2025).

A partire da questo contesto, il presente contributo si propone di analizzare lo stato della transizione digitale nel settore dei centri culturali nella Regione di Bruxelles-Capitale. La scelta di questa area metropolitana come contesto di indagine è dettata dall'identificazione di Bruxelles come centro di potenziale prima ricezione delle linee europee in materia di transizione digitale, in quanto sede delle strutture politiche ove le strategie a livello europeo vengono elaborate. Inoltre, è considerata particolarmente interessante la sua struttura istituzionale, caratterizzata dalla coesistenza di due comunità linguistiche con competenze culturali distinte, da un tessuto associativo eterogeneo e da una popolazione tra le più diverse d'Europa (Janssens, 2001; Saeys et al., 2025), che genera sfide specifiche in termini di governance digitale, mediazione culturale e raggiungimento di pubblici plurali. Studiare come i centri culturali di questa regione affrontano la trasformazione digitale permette perciò di esaminare, in un contesto ad alta complessità, il rapporto tra innovazione tecnologica e missione culturale, educativa e sociale delle organizzazioni.

Il presente contributo intende rispondere alle seguenti domande di ricerca:

RQ1: Quale è il livello di digitalizzazione dei centri culturali della Regione di Bruxelles-Capitale?

[1] Dottorando di ricerca, ECON-07/A, Università Mercatorum; lorenzo.venezia@studenti.unimercatorum.it – corresponding author

[2] Professoressa ordinaria, ECON-06/A, Università Telematica Pegaso; elena.borin@unipegaso.it

[3] Professoressa associata, ICAR/20, ICHEC Bruxelles Management School; ruba.saleh@chec.be

RQ2: Come si distribuisce il livello di digitalizzazione tra le diverse tipologie di centri culturali, ovvero i centri culturali francofoni, i centri culturali fiamminghi, gli istituti nazionali di cultura e i centri culturali multidisciplinari?

RQ3: Quali dimensioni della transizione digitale risultano più sviluppate e quali invece presentano le lacune significative nel campione analizzato?

Il progetto di ricerca è stato inizialmente sviluppato all'interno dell'iniziativa C-SHIP[4] 2025 coordinata da ICHEC Management School (Bruxelles, Belgio). Tale modello, si pone l'obiettivo non solo di contribuire alla discussione teorica, ma anche di proporre un approccio integrato e adattivo volto a sostenere le organizzazioni culturali nella progettazione di strategie digitali personalizzate e sostenibili, dando infine anche un supporto ai decision-makers nella definizione di strategie digitali orientate all'innovazione, alla resilienza e all'impatto sociale.

Il presente contributo è strutturato in cinque sezioni. Dopo una prima introduzione, il paper propone una revisione della letteratura. Nella sezione seguente, vengono presentati il research design e la metodologia di ricerca. La sezione successiva presenta i risultati dell'indagine, e si delineano i risultati attesi nel prosieguo dei lavori di ricerca. Infine, l'ultima sezione traccia delle conclusioni sulla base dei risultati della ricerca, delineando ulteriori sviluppi futuri e limitazioni.

2. Revisione della letteratura: la transizione digitale nell'imprenditoria culturale e creativa

Il settore culturale e creativo rappresenta una componente fondamentale dell'ecosistema socioeconomico europeo: nel 2022, oltre 2 milioni di imprese culturali nell'UE hanno generato circa 199 miliardi di euro di valore aggiunto, pari al 2,0% dell'economia complessiva delle imprese. Il fatturato netto del settore culturale è stato di circa 503 miliardi di euro, pari all'1,3% del fatturato netto totale generato nell'economia delle imprese dell'UE nel 2022 (EUROSTAT, 2023). Oltre all'impatto economico, il settore si caratterizza per la forte componente di trans-settorialità (Della Lucia C Segre, 2017; Solima C Minguzzi, 2014), che lo pone all'incrocio tra finalità civiche, logiche di impatto sociale e riflessioni legate al valore della produzione artistica e culturale (Kalfas C al., 2024). I principali attori di questo settore (fra cui sono inclusi una molteplicità di organizzazioni, quali musei indipendenti, centri culturali, fondazioni, associazioni e biblioteche pubbliche o private) sono spesso caratterizzati da una spiccata attenzione a tematiche sociali e culturali (tanto che si parla spesso di imprenditoria sociale culturale) (Birnkraut, 2017; Chin C Mees, 2021; García et al., 2015; Li et al., 2022; Ost C Saleh, 2021; Tricarico et al., 2022), da una forte connessione con i territori (Costa, 2020, 2020; Lazzeroni et al., 2013; Solima C Minguzzi, 2014), da una mission orientata allo sviluppo culturale partecipato (Boiano et al., 2019; Négrier C Dupin-Meynard, 2020; Piber et al., 2019), ma anche da fragilità strutturali, quali risorse finanziarie limitate e forte dipendenza da fondi pubblici (Bonet C Donato, 2011; Borin et al., 2017; Cea-D'Ancona et al., 2022), carenza di competenze manageriali (Gustafsson C Lazzaro, 2021; Shadkam et al., 2025) e difficoltà nell'adozione delle innovazioni tecnologiche, nonostante

[4] Cultural Entrepreneurship. C-SHIP è un programma intensivo di apprendimento attivo dedicato all'imprenditorialità culturale, pensato per artisti e professionisti della cultura, così come per chi aspira a diventarlo. È definito apprendimento attivo perché si basa su sessioni interattive, incontri e discussioni, attività pratiche e momenti di coaching. Attraverso casi di studio reali, i partecipanti innovano i propri modelli di business e operativi, creano partenariati, esplorano metodi cooperativi ed etici per gestire progetti culturali e ottimizzano l'impatto sociale delle proprie iniziative, tra le altre attività. Durante la formazione, i partecipanti a C-SHIP progettano, testano e realizzano un progetto sostenibile e ad alto impatto. C-Ship program | ICHEC.

il settore sia stato identificato come uno dei settori a forte impatto innovativo (Leslie C Rantisi, 2017; Wilson C Stokes, 2005).

In questo scenario, l'innovazione e l'imprenditorialità assumono significati peculiari. Da un lato le organizzazioni culturali spesso non perseguono il profitto come fine primario, ma sono chiamate a sviluppare logiche imprenditoriali per garantire sostenibilità, innovazione e impatto (Chuayounan et al., 2022; Dobreva C Ivanov, 2020). Dall'altro, alcune spinte verso logiche di tipo imprenditoriale sono molto sentite dal settore, vista la sua forte attenzione alle dinamiche di innovazione (Strøm et al., 2020), quali le sfide e opportunità della sostenibilità e della digitalizzazione (Borin, 2023; Kovaitė et al., 2022; Massi et al., 2020; Dematos Guimarães C Maehle, 2026). Di recente, il settore culturale e creativo sta riflettendo sul cambio di paradigma legato all'AI (Gurel, 2025), che comporta l'adozione di strumenti propri del management strategico ma anche riflessioni legate alla maggiore attenzione alla creazione di valore condiviso, che viene spesso sentita come uno sbocco naturale dagli attori dell'ecosistema culturale e creativo.

In sintesi, l'imprenditorialità nel settore culturale si distingue per la sua natura ibrida: combina la creatività, l'attenzione a tematiche sociali, e cerca di conciliare l'interpretazione negativa di logiche di profitto (che caratterizza il settore artistico) con l'interesse per lo sviluppo di competenze strategiche e gestionali dell'imprenditoria. A differenza dell'imprenditoria classica, essa mira a generare non solo valore economico, ma anche valore sociale e culturale, in ottica partecipativa e trasformativa. In questo contesto, la digitalizzazione viene quindi spesso interpretata non solo un fattore tecnologico, ma una leva per ripensare il modello organizzativo, il posizionamento strategico e la relazione e il coinvolgimento dei pubblici (Lerro et al., 2022; Sukhovskaya C Ermakova, 2020).

La letteratura scientifica sull'argomento sottolinea perciò come l'imprenditorialità culturale stia adottando approcci non lineari alla transizione digitale, capaci di incorporare elementi di rischio, sperimentazione e adattamento continuo (Valiati C Möller, 2025). La figura del "cultural entrepreneur", intesa come colui che coniuga visione, sensibilità culturale e capacità di innovazione sistemica, assume una centralità crescente (Liu et al., 2022; Oppioli et al., 2025). Il contesto della transizione digitale, con le sue logiche di rete, abilitazione e disintermediazione, accentua il bisogno di leadership distribuita e di competenze nuove, spesso ancora carenti nelle istituzioni culturali tradizionali. La riflessione sulle Intelligenze "artificiali", che ora dominano il dibattito sulla produzione artistica, sta progressivamente entrando anche nel dibattito sul miglioramento del management culturale (Valiati C Möller, 2025).

Infatti, l'affermarsi dell'ecosistema digitale sta modificando in profondità anche le condizioni di operatività del settore culturale. Le tecnologie digitali (dalla realtà aumentata all'intelligenza artificiale, dai sistemi di gestione dei dati al digital storytelling) offrono nuove modalità per produrre, distribuire e fruire contenuti culturali ma anche per ottimizzare i processi di gestione delle aziende culturali stesse. Il digitale non è quindi solo uno strumento: è un ambiente, un'infrastruttura relazionale e cognitiva, che ridisegna le dinamiche tra attori, risorse e pubblico.

All'interno del dibattito accademico-scientifico sulla transizione digitale nelle aziende culturali, possiamo individuare vari strand emergenti di ricerca.

Un primo strand emergente è quello relativo agli ecosistemi digitali nel settore culturale e alla governance di tali ecosistemi (Borin C Donato, 2022; Derakhshan, 2025). Da un lato, si sottolinea come le organizzazioni culturali non siano più entità isolate, ma nodi interconnessi di una rete fatta di partner, stakeholder, comunità e piattaforme tecnologiche, secondo un modello sempre più partecipativo e inclusivo (Flew et al., 2019; Hsu et al., 2023; Ngo C Ngo, 2025). L'adozione di logiche di open innovation (Bujor C Avasilcăi, 2023; Dianova et al., 2023), la co-creazione con i pubblici (Dematos Guimarães C Maehle, 2026) e la collaborazione tra istituzioni rappresentano fattori chiave per attivare processi di innovazione sostenibile (Abhari C Davidson, 2017). Si invita quindi alla partecipazione e alla co-creazioni con i pubblici e il sistema di stakeholders, che possano anche promuovere la creazione di comunità online che contribuiscano

attivamente alla mission dell'istituzione (Costa, 2020; Boaino et al., 2019; Piber et al., 2019; Dragouuni et al., 2025; Arrigoni et al., 2019). Dall'altro, viene sottolineato come queste dinamiche richiedano una trasformazione culturale e organizzativa profonda, non sempre facile da implementare in contesti a volte caratterizzati da rigidità strutturali e risorse limitate.

Un secondo strand emergente, è quello relativo alla riflessione sullo sviluppo di strategie digitali, anche legate ai business models innovativi (Benghozi et al., 2021; Borin C Donato, 2022; Cruz-Martinez, 2024; Lian C Xie, 2024; Pererva C Mazorenko, 2025). La definizione di strategie digitali efficaci e sostenibili costituisce infatti una delle principali sfide per le organizzazioni del settore culturale. Si sottolinea infatti come tali strategie debbano integrare obiettivi artistici, sociali ed economici, rispecchiando la missione dell'organizzazione e al contempo garantendone la sostenibilità nel lungo periodo, anche in un'ottica di contributo allo sviluppo sostenibile (Hosseini C Rajabipoor Meybodi, 2023). In questo contesto, viene evidenziata l'importanza di modelli di business flessibili, orientati al valore e capaci di adattarsi all'evoluzione del contesto digitale diventano strumenti fondamentali e soprattutto ci si focalizza sull'allineamento fra la strategia digitale e la missione culturale, educativa o sociale dell'organizzazione culturale stessa (Li, 2015; Lian C Xie, 2024; Nasta, 2025). Rilevante è anche la riflessione, legata ad importanti interventi a livello europeo e globale (Council of Europe, 2024; UNESCO, 2021), sulla necessità di sviluppare principi etici specifici nell'implementazione di strategie digitali nel settore culturale e oltre, che esplicitino le politiche dell'azienda verso le sfide digitali (ad es, deepfake, AI biases, ecc…).

Infine, un terzo strand studia l'integrazione tra competenze e cultura organizzativa come base per un'efficace trasformazione digitale nel settore culturale (Cerquetti, 2023; Gradin, 2022; Salvador C Comunian, 2024; Van Laar et al., 2019). In questa linea di ricerca, emerge che le strategie digitali non possono essere calate dall'alto, ma devono risultare da un processo partecipativo, adattativo e di apprendimento continuo, capace di valorizzare le conoscenze diffuse ma anche di promuovere una costante formazione sull'uso della tecnologia e su nuovi mezzi di interazione con i pubblici. In questo strand di ricerca possiamo includere riflessioni tecniche sull'utilizzo delle tecnologie emergenti (Povroznik, 2018; Bolognesi C Aiello, 2020), sul marketing digitale (Dianova, 2023; Larkin, 2023; Li, 2023) ma anche le ricerche che si focalizzano sull'esperienza dell'utente (Nappi et al., 2024).

Da questa analisi della letteratura sulla trasformazione digitale nel settore culturale, si evince tuttavia che, nonostante la crescente attenzione al tema della digitalizzazione nel settore, c'è ancora limitata attenzione nella riflessione sulla mancanza di modelli operativi specifici che supportino in modo strutturato il cambiamento e che possano integrare tutte le prospettive sopra-menzionate. Molti contributi si concentrano sulle tecnologie disponibili o sulle esperienze pionieristiche, ma pochi offrono strumenti pratici, scalabili e facilmente implementabili da parte di organizzazioni a risorse limitate. A questa lacuna nella letteratura, prova a rispondere il recente rapporto Digital culture - a review of evidence and experience, with recommendations for UK policy, practice and research (Oman 2024), focalizzato sul Regno Unito, che costituisce una sintesi di evidenze empiriche, prospettive istituzionali e raccomandazioni operative relative all'impatto della digitalizzazione sulle organizzazioni culturali. Il report affronta in modo sistemico le dimensioni chiave della trasformazione digitale: governance e strategia, competenze del personale, modelli di partecipazione e co-creazione, infrastrutture tecnologiche e processi operativi, sostenibilità economica e sistemi di monitoraggio.

Il presente contributo mira quindi a contribuire ulteriormente a colmare questo gap di ricerca, analizzando lo stato dell'arte nell'area della Regione di Bruxelles-Capitale, con un campione di ricerca selezionato, che serve come base teorica per la successiva proposta di un framework per la transizione digitale. Tale framework, si baserà sia sulle evidenze emerse dal report di Oman, ma il modello proposto sarà a sua volta ri-calibrato in funzione delle specificità socio-culturali e linguistiche del territorio, della frammentazione istituzionale caratteristica della capitale belga e della composizione del pubblico e degli stakeholder.

3. Struttura e metodologia della ricerca

Al fine di analizzare le domande di ricerca, si è deciso di adottare un approccio quantitativo (quantitative research method), seppur di carattere esplorativo e preliminare. Pur riconoscendo che la dimensione del campione circoscritta ai centri culturali della Regione di Bruxelles-Capitale non consente generalizzazioni statistiche di ampia portata, questo studio si configura come un primo passo di un'indagine più ampia, volta a mappare lo stato della trasformazione digitale nel settore e a identificare tendenze e pattern ricorrenti su cui fondare future ricerche di maggiore scala. In questo senso, l'approccio quantitativo risulta comunque appropriato per diverse ragioni metodologiche. In primo luogo, consente di condurre uno studio sistematico su un campione definito di soggetti, garantendo comparabilità dei dati e una prima base empirica per la generalizzazione dei risultati (Creswell C Creswell, 2023; Leavy, 2017). La ricerca quantitativa si caratterizza inoltre per un elevato grado di oggettività e accuratezza: lavorando su un numero limitato di variabili applicate a un insieme di casi e seguendo procedure standardizzate, è possibile garantire sia la validità che l'affidabilità dei risultati ottenuti (Kothari, 2004).

Un ulteriore vantaggio di questo approccio risiede nella sua replicabilità: il rispetto di standard metodologici consolidati permette ad altri ricercatori di riprodurre lo studio e di confrontarne gli esiti con quelli di ricerche analoghe, contribuendo così alla cumulabilità del sapere scientifico (Neuman, 2011; Creswell and Creswell, 2023). La metodologia quantitativa consente inoltre di sintetizzare grandi quantità di informazioni e di effettuare confronti sistematici tra categorie diverse o attraverso intervalli di tempo, rendendo possibile un'analisi strutturata e comparabile dei fenomeni indagati (Kothari, 2004). Infine, questo approccio permette di ridurre al minimo l'influenza del bias personale del ricercatore, favorendo una maggiore neutralità nell'interpretazione dei dati (Leavy, 2017).

La ricerca è consistita nell'analisi delle fonti secondarie di 57 centri culturali (la lista completa è disponibile nell'allegato 1) dell'area della Regione di Bruxelles-Capitale), condotta dai ricercatori coinvolti nella ricerca. Il campione dei casi studio analizzati comprende 14 centri culturali francofoni, 22 centri culturali fiamminghi, 18 istituti nazionali di cultura dell'Unione europea o altrove, e 3 centri culturali multidisciplinari a vocazione trasversale. La scelta di focalizzare la ricerca all'area geografica della Regione di Bruxelles-Capitale è stata dettata da molteplici criteri. Innanzitutto, l'interesse dell'area, identificata come primo luogo di potenziale applicazione delle politiche europee vista la vicinanza con le istituzioni europee stesse, e quindi dalla potenziale attitudine degli attori della Regione di Bruxelles-Capitale ad aderire a processi di innovazione facilitati dalle politiche europee (Chin C Mees, 2021; Dotti C Spithoven, 2017), in questo caso quelle relative alla Digital and Green Transition. Inoltre la regione di Bruxelles è un territorio complesso, in cui sono presenti due comunità principali (francofona e fiamminga) ma anche innumerevoli nazionalità. Infine, la scelta di questa città è stata dettata da criteri di disponibilità di raccolta dati (due degli autori operano in tale area geografica). L'analisi è stata condotta nei mesi di Novembre e Dicembre 2025 tramite una codifica basata su un framework interpretativo suddiviso in sei tematiche.

Come sopra accennato, il framework interpretativo è stato elaborato sulla base della fase preliminare di analisi della letteratura (illustrata nella precedente sezione) che ha permesso di identificare alcuni elementi fondamentali legati alla strategia digitale. Le principali caratteristiche del presente framework sono sintetizzate nella Tabella 1. I sei criteri analitici specifici presi in esame sono i seguenti:

Strategia digitale: l'adozione o meno di una strategia digitale in linea con la missione culturale, educativa o sociale fondamentale del centro;

Tecnologie emergenti: l'uso di tecnologie emergenti e "dirompenti" (ad esempio, IA, XR/VR/AR, digitalizzazione 3D);

Marketing digitale: l'utilizzo di strumenti di marketing digitale (ad es. la gestione sicura dei biglietti online, le offerte di eventi virtuali o l'utilizzo del crowdfunding;

Aspetti etici: l'esplicitazione di principi etici nelle strategie digitali, (per es. tramite dichiarazione etica) che spieghino come i centri culturali si approccino alle molteplici sfide digitali (ad es. AI biases, deepfake, ecc);

Esperienza utente: l'attenzione alle esperienze degli utenti, visibili ad es. in investimenti in piattaforme unificate e di facile utilizzo che offrano contenuti coinvolgenti e di alta qualità;

Partecipazione e co-creazione: l'invito alla partecipazione, co-creazione e l'uso di piattaforme (come wiki o API) per sollecitare commenti e critiche da parte del pubblico, oppure per promuovere comunità online che contribuiscono attivamente alla missione dell'istituzione.

Per comprendere come questi aspetti legati alla transizione digitale si concretizzino nei centri culturali del campione, è stata svolta un'analisi approfondita di fonti secondarie (illustrate nella tab. 1). Tali aspetti sono stati codificati secondo tre codici descrittivi: disponibile, non disponibile, parzialmente disponibile.

Criteri di analisi	**Principale letteratura di riferimento**	**Aspetti analizzati**	**Fonti consultate per l'analisi delle aree**
Strategia digitale	Cruz-Martinez (2024); Lian and Xie (2024)	Adozione o meno di una strategia digitale Allineamento della strategia digitale con la missione culturale, educativa o sociale fondamentale del centro.	Rapporto annuale, sito web
Tecnologie emergenti	Povroznik (2018); Bolognesi C Aiello (2020)	Uso di tecnologie emergenti e "dirompenti" (ad es. IA, XR/VR/AR, digitalizzazione 3D, ecc…).	Sito web, eventi
Marketing digitale	Dianova (2023); Larkin (2023); Li (2023)	Impiego del marketing digitale (ad es. applicato alla gestione dei biglietti online e mobili, offerta di eventi virtuali, iniziative di crowdfunding, ecc…).	Sito web e social media
Aspetti etici	Council of Europe, 2024 UNESCO, 2021	Esplicitazione di principi etici (ad es. tramite un Code of Ethics) tramite dichiarazioni, codici, ecc… volta ad esprimere i principi sui quali si fonda l'approccio aziendale alle sfide digitali (ad es. relativamente a AI biases, deepfake, ecc).	Comunicazione ed eventi
Esperienza utente	Nappi *et al.*, 2024	Utilizzo di piattaforme orientate al miglioramento dell'esperienza utente (ad es. che consentano un facile utilizzo, che offrano contenuti coinvolgenti e di alta qualità, ecc…).	Sito web

Partecipazione e co-creazione	Costa (2020); Boaino *et al.* (2019); Piber *et al.* (2019); Dragouni *et al.,* (2025); Arrigoni *et al.,* (2019)	Invito alla partecipazione nella co-creazione di strategie e contenuti tramite online tools, uso di piattaforme (come wiki o API) per sollecitare commenti e critiche da parte del pubblico, oppure per promuovere la creazione di comunità online che contribuiscano attivamente alla missione dell'istituzione.	Social media, podcast, webinar, questionari, sito web

Tabella 1. Focus di analisi, letteratura di riferimento, aspetti analizzati, fonti consultate per l'analisi

4. Risultati

Prima di procedere all'analisi dei risultati per ciascun criterio, è opportuno delineare alcune caratteristiche strutturali del campione analizzato, che emergono trasversalmente dai dati raccolti e costituiscono un contesto interpretativo essenziale per la comprensione dei risultati.

Un primo elemento di rilievo riguarda la dimensione delle risorse umane. L'analisi delle fonti secondarie evidenzia come la grande maggioranza dei centri culturali del campione non disponga di figure professionali specificamente dedicate alla gestione della transizione digitale, quali un Digital Transition Officer o un Digitalisation Strategist. Tale assenza non appare riconducibile esclusivamente a vincoli finanziari, ma sembra riflettere una carenza strutturale più profonda nella concezione del lavoro culturale, in cui le competenze digitali strategiche non sono ancora percepite come una priorità organizzativa autonoma. Questa condizione non è peraltro peculiare al contesto brussellese: i report del progetto europeo ENUMERATE documentano come, già nel 2012, solo il 3,3% del personale retribuito delle istituzioni culturali europee fosse impegnato a tempo pieno nelle attività di digitalizzazione (Stroeker C Vogels, 2012), con team dedicati composti in media da circa 5,5 persone nelle istituzioni di dimensioni medio-piccole. Il report successivo del 2014 registra un incremento di circa il 50% del personale coinvolto rispetto alla rilevazione precedente, segnalando al contempo che nelle istituzioni con budget più limitati (tra €10.000 e €50.000 annui) fino al 92% del personale risulta coinvolto nelle attività di digitalizzazione (Stroeker C Vogels, 2014), a testimonianza di come la scarsità di risorse umane dedicate costituisca una criticità strutturale e di lungo periodo nel settore culturale europeo. A tutto questo si aggiunge il sovraccarico lavorativo del personale che riduce significativamente la disponibilità di tempo e risorse cognitive da dedicare a processi di apprendimento e implementazione di nuove strategie digitali.

Un secondo elemento riguarda le asimmetrie tra le comunità linguistiche del campione. I 22 centri culturali fiamminghi beneficiano dell'appartenenza al network N22 – Brussels Gemeenschaps Centra, sostenuto dalla VGC – Vlaamse Gemeenschapscommissie, che favorisce la condivisione di risorse, buone pratiche e strategie digitali comuni. I 14 centri francofoni, invece, dispongono di un ecosistema di federazioni (ACC[5], Astrac[6] e La Concertation ASBL Action

[5] https://www.centres-culturels.be/

[6] https://astrac.be/

Culturelle Bruxelloise [7]) e reti (RABKO [8], BRUXEO [9], CESSoC [10]) per il lavoro di sensibilizzazione, coordinamento e scambio delle pratiche ma le loro collaborazioni appaiono frammentate e determinate prevalentemente dalla prossimità geografica, senza tradursi in un coordinamento strategico a livello di comunità linguistica. Questa asimmetria suggerisce che il livello di digitalizzazione di un centro culturale non dipenda esclusivamente dalle risorse interne, ma sia significativamente influenzato dal grado di connettività istituzionale della rete di appartenenza.

Un terzo elemento riguarda i 18 istituti nazionali di cultura, la cui autonomia strategica risulta limitata dalla dipendenza formale o sostanziale dalle rispettive ambasciate nazionali e dai Ministeri degli Affari Esteri dei paesi di riferimento. Le scelte in materia di transizione digitale riflettono pertanto le politiche culturali e digitali definite a livello nazionale piuttosto che i bisogni specifici del contesto brussellese, producendo un profilo di digitalizzazione fortemente eterogeneo e difficilmente comparabile con quello degli altri sottogruppi.

Un quarto elemento riguarda i 3 centri multidisciplinari a vocazione trasversale, (BOZAR, Les Halles de Schaerbeek e Le BAMP), che si distinguono per la loro indipendenza dalle logiche comunitarie e per una vocazione pluridisciplinare che attraversa le comunità linguistiche della regione. Questa doppia trasversalità, disciplinare e linguistica, potrebbe favorire approcci più sperimentali alla transizione digitale (Bujor C Avasilcăi, 2023), ma si traduce al contempo in approcci alla digitalizzazione disomogenei, rendendo difficile l'identificazione di un profilo digitale comune per questo sottogruppo. Questi elementi trasversali costituiscono quindi un primo spunto di riflessione, su cui si sono poi interpretati i risultati della preliminare analisi quantitativa, che verranno illustrati nei seguenti paragrafi e analizzati per ciascuno dei sei criteri del framework interpretativo adottato (strategia digitale, tecnologie emergenti, marketing digitale, aspetti etici, esperienza utente, partecipazione e co-creazione).

Il criterio della strategia digitale (vedi Grafico 1) registra il risultato più critico dell'intera analisi: il 100% dei centri analizzati risulta classificato come "non disponibile", poiché nessuno dei 57 centri culturali del campione dispone di una strategia digitale pubblica documentata. Questo dato si inserisce in modo significativo nel quadro teorico delineato dal secondo strand della letteratura, che sottolinea come la definizione di strategie digitali efficaci e sostenibili costituisca una delle principali sfide per le organizzazioni del settore culturale (Cruz-Martinez, 2024; Lian C Xie, 2024; Pererva C Mazorenko, 2025). L'assenza totale di strategie digitali documentate nel campione analizzato suggerisce che i centri brussellesi si trovino ancora in una fase pre-strategica della transizione digitale, in cui mancano non solo i modelli di business innovativi teorizzati dalla letteratura, ma anche le condizioni organizzative di base per la loro elaborazione. In particolare, l'allineamento tra strategia digitale e missione culturale, educativa e sociale dell'organizzazione, identificato dalla letteratura come elemento fondamentale per una trasformazione digitale sostenibile (Li, 2015; Lian C Xie, 2024; Nasta, 2025), risulta di fatto impossibile da valutare in assenza di una strategia esplicitamente formulata e resa pubblica. Questo dato richiede tuttavia una lettura differenziata a seconda del sottogruppo considerato. Nel caso dei centri fiamminghi, l'assenza di una strategia digitale autonoma non implica necessariamente una mancanza di orientamento strategico: l'N22 elabora e gestisce centralmente la strategia di digitalizzazione per i centri affiliati, definendo linee guida grafiche standardizzate

[7] https://www.laconcertation-asbl.org/

[8] https://rabbko.be/fr/

[9] https://www.bruxeo.be/

[10] https://www.cessoc.be/

per i rispettivi siti web. Per i centri francofoni, gli istituti nazionali e i centri multidisciplinari invece l'assenza riflette una lacuna più profonda che trova una spiegazione teorica nel terzo strand della letteratura relativo all'integrazione tra competenze e cultura organizzativa come base per un'efficace trasformazione digitale (Cerquetti, 2023; Salvador C Comunian, 2024; Van Laar et al., 2019). Come evidenziato da questo filone di ricerca, le strategie digitali non possono essere calate dall'alto, ma devono risultare da un processo partecipativo e adattativo che valorizza le competenze diffuse all'interno dell'organizzazione. La scarsità di risorse umane specializzate, il sovraccarico lavorativo del personale e l'assenza di un coordinamento istituzionale strutturato che caratterizzano questi sottogruppi impediscono di fatto l'avvio di tale processo, confermando empiricamente quanto teorizzato da Gustafsson C Lazzaro (2021) e Shadkam et al. (2025) circa le fragilità strutturali che ostacolano la trasformazione digitale nelle organizzazioni culturali a risorse limitate.

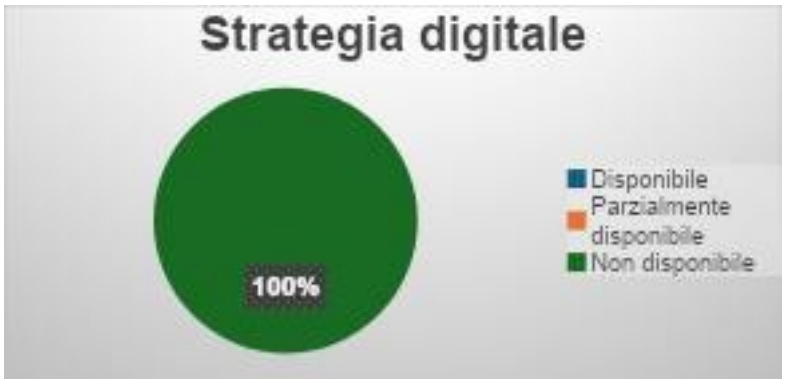

Figura 1.Strategia digitale

Il criterio delle tecnologie emergenti (Grafico 2) presenta un quadro parzialmente più articolato rispetto al precedente. Il 35% dei centri risulta classificato come "parzialmente disponibile", evidenziando l'esistenza di alcune esperienze di adozione sperimentale di tecnologie quali l'intelligenza artificiale, la realtà estesa (XR/VR/AR) o la digitalizzazione 3D. Tuttavia, il restante 65% non mostra alcuna evidenza di utilizzo di tali tecnologie, e l'assenza di valori pienamente "disponibili" per l'intero campione indica che, laddove presenti, queste tecnologie vengono adottate in modo occasionale e non sistematico, senza raggiungere un livello di integrazione strutturale nei processi organizzativi. Questo risultato si colloca nel quadro del terzo strand della letteratura, che include riflessioni tecniche sull'utilizzo delle tecnologie emergenti come leva per ripensare le modalità di produzione, distribuzione e fruizione dei contenuti culturali (Povroznik, 2018; Bolognesi C Aiello, 2020). La letteratura evidenzia inoltre come il settore culturale e creativo stia riflettendo sul cambio di paradigma legato all'intelligenza artificiale (Gurel, 2025; Valiati C Möller, 2025), che comporta non solo l'adozione di nuovi strumenti tecnologici ma anche una revisione profonda dei modelli organizzativi e gestionali. L'adozione ancora frammentata e sperimentale di tecnologie emergenti nel campione analizzato suggerisce che i centri brussellesi si trovino in una fase ancora lontana da questa revisione sistemica, confermando quanto osservato dalla letteratura circa le difficoltà del settore culturale nell'adozione strutturale delle innovazioni tecnologiche (Leslie C Rantisi, 2017; Wilson C Stokes, 2005).

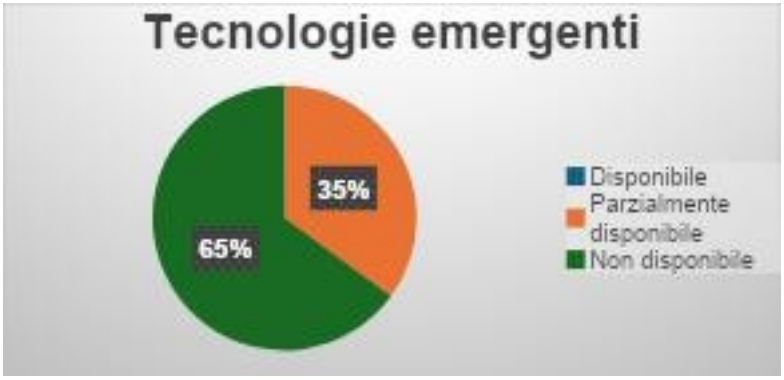

Figura 2. Tecnologie emergenti

Il criterio del marketing digitale (grafico 3) registra il risultato più positivo dell'intera analisi. Il 79% dei centri culturali del campione risulta classificato come "disponibile", a testimonianza di una presenza digitale orientata alla comunicazione e alla promozione delle proprie attività attraverso strumenti quali la biglietteria online, i social media e la promozione di eventi. Solo il restante 21% non mostra evidenze significative di strumenti di marketing digitale strutturati. Questo risultato trova un ancoraggio nel terzo strand della letteratura, che identifica nel marketing digitale una delle dimensioni più accessibili della trasformazione digitale per le organizzazioni culturali (Dianova, 2023; Larkin, 2023; Li, 2023), in quanto richiede competenze relativamente diffuse e investimenti contenuti rispetto ad altre dimensioni della transizione digitale. Tuttavia, come sottolineato dal secondo strand, la definizione di strategie digitali efficaci e sostenibili richiede che gli strumenti di marketing digitale siano integrati in una visione strategica più ampia, allineata alla missione culturale, educativa e sociale dell'organizzazione (Lian C Xie, 2024; Nasta, 2025). L'elevata adozione di strumenti di marketing digitale in assenza di una strategia digitale documentata, come emerge dal confronto tra questo criterio e il precedente, suggerisce quindi che i centri brussellesi abbiano sviluppato una digitalizzazione prevalentemente operativa e comunicativa, senza che questa si sia ancora tradotta nella visione strategica integrata teorizzata dalla letteratura.

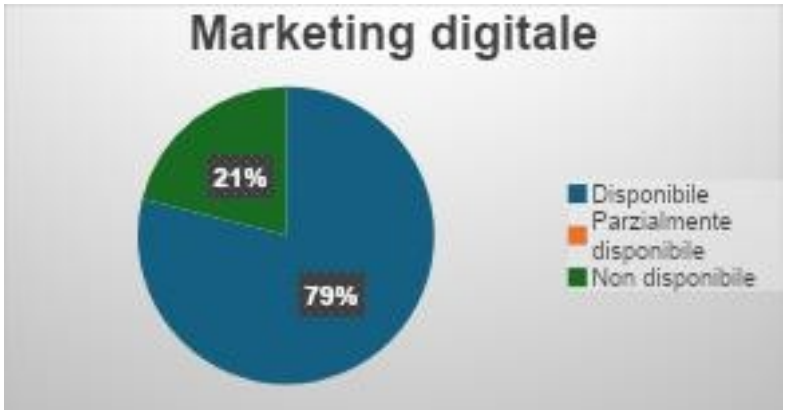

Figura 3. Marketing digitale

Il criterio degli aspetti etici (Grafico 4) rivela una delle lacune più significative dell'intera analisi. Solo il 9% dei centri del campione dispone di una dichiarazione etica pubblica in materia digitale, ad esempio relativamente ai bias dell'intelligenza artificiale o ai deepfake, mentre il 91% non mostra alcuna evidenza pubblica in questo senso. Questo risultato si collega direttamente al

secondo strand della letteratura, che sottolinea la rilevanza crescente della riflessione etica nell'implementazione di strategie digitali nel settore culturale, in linea con importanti interventi a livello europeo e globale (Council of Europe, 2024; UNESCO, 2021). Tali documenti evidenziano la necessità che le organizzazioni culturali sviluppino principi etici espliciti che orientino il loro approccio alle sfide digitali, quali i bias algoritmici, i deepfake e la gestione dei dati personali. L'assenza quasi totale di dichiarazioni etiche pubbliche nel campione analizzato indica che questa dimensione, pur teoricamente riconosciuta come prioritaria dalla letteratura e dalle istituzioni internazionali, non si è ancora tradotta in pratiche organizzative concrete nei centri brussellesi. Questo risultato assume una rilevanza particolare alla luce del cambio di paradigma legato all'intelligenza artificiale in corso nel settore culturale e creativo (Gurel, 2025; Valiati C Möller, 2025), che rende sempre più urgente lo sviluppo di una governance etica del digitale anche nelle organizzazioni di dimensioni medio-piccole.

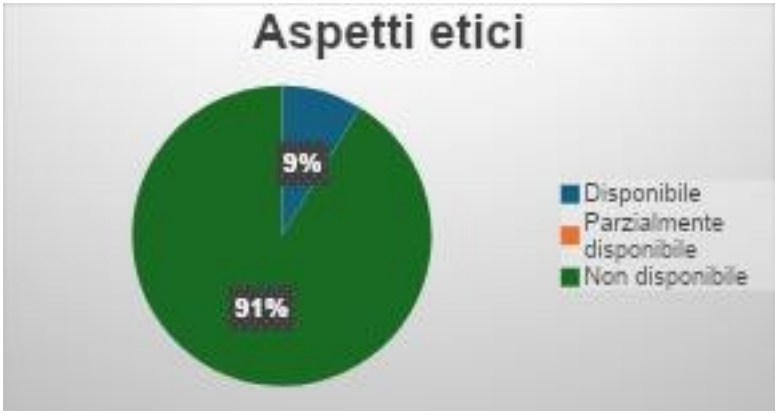

Figura 4. Aspetti critici

Il criterio dell'esperienza utente (Grafico 5) è l'unico a registrare un valore pienamente positivo per l'intero campione: il 100% dei centri culturali analizzati dispone di un sito web funzionante, confermando che la presenza digitale di base costituisce ormai una condizione acquisita per la totalità delle organizzazioni considerate. Questo risultato si collega al terzo strand della letteratura, che identifica nell'esperienza utente una dimensione fondamentale della trasformazione digitale nel settore culturale (Nappi et al., 2024), sottolineando come le piattaforme digitali debbano essere progettate per offrire contenuti coinvolgenti e di alta qualità, capaci di rispondere alle aspettative di pubblici sempre più diversificati. Va tuttavia segnalata una particolarità rilevante: i siti web dei 22 centri fiamminghi affiliati all'N22 presentano una struttura grafica e un'interfaccia utente pressoché identiche, frutto delle linee guida standardizzate definite dal network. Se da un lato questa uniformità garantisce qualità e coerenza visiva, dall'altro solleva interrogativi sulla capacità di ciascun centro di esprimere la propria identità digitale in modo autonomo e distintivo, e di adattare l'esperienza utente alle specificità del proprio pubblico di riferimento, in linea con quanto teorizzato dalla letteratura circa la necessità di una digitalizzazione capace di valorizzare la relazione e il coinvolgimento dei pubblici (Lerro et al., 2022; Sukhovskaya C Ermakova, 2020).

Figura 5. Esperienza utente

Il criterio della partecipazione e co-creazione presenta, insieme a quello della strategia digitale, il risultato più critico: il 100% dei centri risulta classificato come "non disponibile", poiché nessun centro del campione utilizza strumenti digitali strutturati, quali wiki, API aperte o piattaforme di community online, per coinvolgere attivamente il pubblico nella co-creazione di contenuti e strategie. Questo risultato acquista una rilevanza teorica particolare alla luce del primo strand della letteratura, relativo agli ecosistemi digitali nel settore culturale e alla governance di tali ecosistemi (Borin C Donato, 2022; Derakhshan, 2025). Tale filone di ricerca sottolinea come le organizzazioni culturali non siano più entità isolate, ma nodi interconnessi di una rete fatta di partner, stakeholder, comunità e piattaforme tecnologiche, secondo un modello sempre più partecipativo e inclusivo (Flew et al., 2019; Hsu et al., 2023). L'adozione di logiche di open innovation e la co-creazione con i pubblici sono identificate come fattori chiave per attivare processi di innovazione sostenibile (Abhari C Davidson, 2017; Bujor C Avasilcăi, 2023), mentre la promozione di comunità online che contribuiscano attivamente alla missione dell'istituzione è considerata un elemento centrale di una governance digitale matura (Costa, 2020; Boiano et al., 2019; Dragouni et al., 2025). L'assenza totale di tali pratiche nel campione analizzato indica quindi che i centri culturali brussellesi si trovano ancora al di fuori di questa logica di ecosistema digitale, operando secondo un modello prevalentemente unidirezionale nella loro relazione con il pubblico, in cui il digitale viene utilizzato come canale di diffusione piuttosto che come infrastruttura relazionale e cognitiva condivisa. È importante precisare che questa codifica non implica che i centri siano chiusi alla partecipazione in senso lato: molti comunicano una vocazione all'apertura e all'inclusione attraverso i propri canali di comunicazione. Tuttavia, come evidenziato dalla letteratura, tale apertura non si traduce in forme di partecipazione digitale strutturata e misurabile, confermando quanto osservato da Flew et al. (2019) circa la difficoltà di implementare dinamiche di ecosistema digitale in contesti caratterizzati da rigidità strutturali e risorse limitate. Questo divario tra la dimensione valoriale dichiarata e le pratiche digitali effettivamente implementate rappresenta uno degli elementi più significativi emersi dall'analisi, e suggerisce che lo sviluppo di forme strutturate di co-creazione digitale costituisca una delle principali aree di intervento prioritario per i centri culturali della Regione di Bruxelles-Capitale.

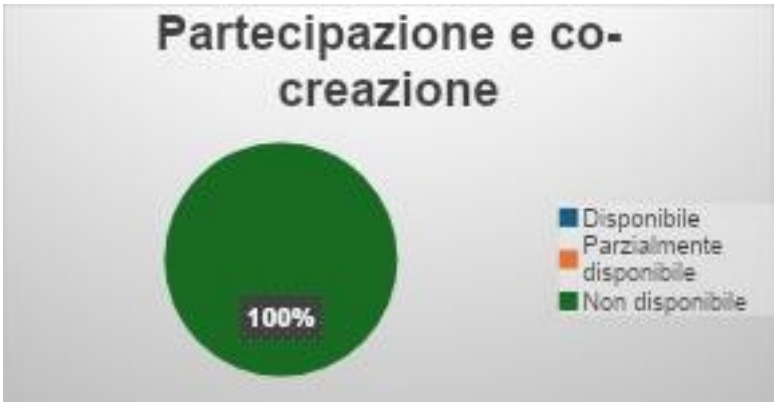

Figura 6. Partecipazione e co-creazione

Nel complesso, i dati restituiscono un panorama digitale caratterizzato da una forte asimmetria tra dimensioni. La presenza digitale di base, testimoniata dalla disponibilità universale di siti web e dalla diffusa adozione di strumenti di marketing digitale, appare consolidata, mentre le dimensioni più strategiche e valoriali della transizione digitale, quali la definizione di strategie esplicite, l'adozione di principi etici e lo sviluppo di forme di partecipazione strutturata, risultano ancora largamente assenti. Questo divario indica che i centri culturali brussellesi si trovano in una fase di digitalizzazione prevalentemente operativa, in cui gli strumenti digitali vengono utilizzati principalmente come canali di comunicazione e promozione, senza che si sia ancora sviluppata una visione strategica integrata della transizione digitale.

5. Conclusioni, limitazioni e sviluppi futuri della ricerca

Il presente contributo si è proposto di analizzare il livello di digitalizzazione dei centri culturali della Regione di Bruxelles-Capitale attraverso un framework interpretativo basato su sei criteri derivati dalla letteratura scientifica sul tema. L'obiettivo non era soltanto descrittivo, ma mirava a comprendere in che misura le pratiche digitali osservabili siano integrate in una visione strategica coerente con la missione culturale, educativa e sociale delle organizzazioni analizzate.

La letteratura esistente aveva già documentato come la trasformazione digitale nel settore culturale si caratterizzi per una profonda asimmetria tra la dimensione operativa e quella strategica, e come ostacoli quali la carenza di competenze specializzate, il sovraccarico lavorativo del personale e la frammentazione istituzionale costituiscano freni strutturali ricorrenti (Salvador C Comunian, 2024; Gustafsson C Lazzaro, 2021; Bujor C Avasilcăi, 2023). I risultati della presente ricerca confermano questo quadro, ma lo arricchiscono di elementi empirici originali che consentono di andare oltre la diagnosi generale.

Il dato più significativo che emerge dall'analisi riguarda la natura sistemica e multifattoriale della digitalizzazione culturale. I centri brussellesi mostrano un profilo complessivamente basso di maturità digitale nelle dimensioni strategiche e valoriali (nessuno dispone di una strategia digitale pubblica documentata, pochissimi di una dichiarazione etica, nessuno ha sviluppato forme strutturate di partecipazione digitale) a fronte di una presenza digitale operativa ormai consolidata, testimoniata dalla disponibilità universale di siti web e da una diffusa adozione di strumenti di marketing digitale. Questo divario non è riconducibile a un unico fattore, ma è il prodotto dell'interazione tra variabili endogene, quali le competenze del personale e la visione strategica, e variabili esogene, quali le policies istituzionali e la disponibilità di fondi dedicati. In particolare, il caso dell'N22, cioè la rete che coordina i 22 centri fiamminghi del campione, fornisce un'evidenza empirica concreta e inedita del ruolo abilitante delle reti istituzionali

strutturate per la digitalizzazione culturale: un elemento che la letteratura aveva teorizzato (Flew et al., 2019) ma che raramente era stato documentato in modo diretto e misurabile a livello di campione.

Sul piano del contributo teorico e pratico, la ricerca suggerisce che la transizione digitale nei centri culturali non possa essere affrontata come un processo puramente tecnico-organizzativo interno, ma richieda un approccio sistemico che tenga conto del contesto istituzionale di appartenenza, delle dinamiche di rete e delle politiche culturali a livello locale e regionale. Questo ha implicazioni dirette per i policy maker e per i finanziatori del settore culturale: investire nella costruzione di reti istituzionali strutturate e nel coordinamento strategico tra organizzazioni può produrre un impatto sulla digitalizzazione culturale più significativo rispetto a interventi frammentati e centrati sul singolo ente.

La ricerca presenta alcune limitazioni che è opportuno dichiarare esplicitamente. L'analisi si basa esclusivamente su fonti secondarie pubblicamente disponibili, con il rischio di sottostimare il livello reale di digitalizzazione di centri che non comunicano pubblicamente le proprie pratiche. Il campione è inoltre circoscritto alla Regione di Bruxelles-Capitale, il che limita la generalizzabilità dei risultati, e la natura dell'approccio adottato non consente di cogliere le motivazioni e le dinamiche interne che sottendono i livelli di digitalizzazione osservati.

Queste limitazioni definiscono al contempo i principali sviluppi futuri. In una seconda fase della ricerca, attualmente in corso di progettazione, si prevede di affiancare all'analisi quantitativa una componente qualitativa basata su interviste semi-strutturate con i responsabili di alcuni dei centri analizzati. I risultati emersi costituiranno inoltre la base empirica per la proposta e la validazione del framework come uno strumento teorico-operativo progettato per accompagnare i centri culturali in percorsi di innovazione digitale adattivi e sostenibili, la cui trasferibilità si intende testare su scala europea attraverso un ampliamento comparativo della ricerca.

1. Introduction

Overtourism refers to a situation where visitor numbers exceed a destination's sustainable capacity, leading to deteriorating local environments, strained infrastructure, and diminished quality of life for residents as well as poorer visitor experiences (Mihalič, 2020; Blázquez-Salom et al., 2023). Therefore, overtourism represents an extreme form of unsustainable tourism growth that irritates local stakeholders and undermines the long-term viability of the destination (Mihalič, 2020). This phenomenon has become a pressing concern in many popular urban destinations worldwide – from Barcelona (Paredes-Rodríguez & Spierings, 2020) and Amsterdam (Yuval, 2022) to Venice (Scarpi et al., 2022) – where historic city centers struggle with congestion, noise, and rising housing costs due to tourism. In these contexts, local authorities have intervened to limit the excessive intensity of tourism with various regulatory measures (Tokarchuk et al., 2021), including short-term rental regulations (Bei & Celata, 2023), temporary restrictions on tourism-related activities (Liu et al., 2020), and taxation policies (Yang et al., 2023), with consequences also on the activities of businesses operating in the area. Consequently, our aim is to understand the perception that hospitality firms have about regulations designed to protect heritage and manage visitor pressure.

Florence has been recognized UNESCO World Heritage site since 1982. Florence hosts roughly 9 million overnight tourists in 2023 and 1.5 million day-trippers (Florence daily news, 2024), translating to over 16 million overnight stays per year in a city of only approximately 720,000 residents (The Guardian, 2024), which now generates on the order of 70 million annually for municipal coffers (Eurispes, 2024). These heavy visitors flow has turned Florence into a case of overtourism, which is concentrated in approximately five square kilometers of the medieval center (Liberatore et al., 2023). Residents have voiced complaints about noise and congestion, and many are leaving the historic center, leading to a progressive depopulation of the area (The Guardian, 2024).

In response, Florence's municipal government has enacted a series of regulatory measures aimed at mitigating the impacts of overtourism while safeguarding the city's cultural heritage. These policies include UNESCO-endorsed protection plans and heritage management guidelines, special zoning in the historic core (allowing only conservation-oriented development) (UNESCO, 2021), tourism levies, and licensing limits on tourist accommodations. For example, the city has introduced regulations to preserve the historic character of its city center by limiting new commercial activities that clash with its artisanal identity, restricting visual advertising and the use of public space, enforcing noise and nightlife controls to safeguard residents' quality of life, and it moved in late 2023 to ban new short-term rental permits (e.g. Airbnb) in the UNESCO-designated center (The Guardian, 2024). Additional rules range from group size limits and noise

regulations (such as banning loudspeaker use by tour guides) to restrictions on devices like rental lockboxes that facilitate unmanaged visitor flows (Florence daily news, 2024). These interventions reflect Florence's strategic stance that uncontrolled tourism must not undermine the city's livability. However, such regulations also put new pressures on the hospitality sector, which must comply and adapt (Liberatore et al., 2023). In the hospitality sector, it manifests through service congestion, diminished guest satisfaction, and reputational risks, thereby justifying city-level measures to redistribute tourist flows and enforce compliance (Papadopoulou et al., 2022; Mihalič, 2020). As regulatory responses to overtourism increase, firms are compelled to adapt operationally to maintain performance while aligning with sustainable destination goals.

The motivation for this study stems from the need to understand hospitality firms' perceptions of, and reactions to, municipal regulation in an over touristed World Heritage context (i.e. Florence) – a perspective that is critical for balancing economic vitality with heritage preservation and resident well-being.

We are collecting the opinion of hospitality firms through a survey addressed to owners and managers of hotels and B&Bs in Florence. Then, we will apply Structural Equation Modeling (SEM) to examine the relationships among the variables derived from the survey.

This study provides a contribution by focusing on the oft-overlooked businesses perspective in the context of overtourism management in a World Heritage city (Hagemans et al., 2024; Plichta, 2019). While prior research on overtourism has largely emphasized tourist experiences or resident attitudes, few empirical studies have examined how local hospitality firms perceive and react to government regulations designed to protect heritage and manage visitor pressure (Hagemans et al., 2024).

2. Theoretical framework

Given Florence's dependence on tourism, it is strategically important to evaluate how local businesses are responding to municipal policy measures. Understanding hospitality firms' perceptions and responses to regulation requires a theoretical foundation that acknowledges their position as both contributors to and subjects of tourism development. Stakeholder theory provides a conceptual starting point for exploring how tourism enterprises perceive their role in governance processes (Al Mahrizi et al., 2024). Tourism stakeholders are those involved with tourism activities, and they may be positively or negatively influenced by those activities (Pham et al., 2025; Sheehan & Ritchie, 2005). Accordingly, they may have different perceptions and reactions to policy measures that address tourism levels and activities. They may perceive regulations as detached from local realities or may show policy acceptance when the aim of the regulations reflects their concerns on heritage protection and destination's sustainability. According to this reflection, sustainable development theory suggest that tourism actors, including businesses, evaluate regulations not only in economic terms but also based on how they affect destination integrity and long-term viability (Tops & Lamers, 2024). Literature on heritage site protection (Aas et al., 2005) and tourism's alignment with sustainable development goals (UNWTO, 2018) suggests that when firms perceive municipal regulation as supporting destination—rather than constraining business—they are more likely to view such measures positively. Conversely, the exclusion of stakeholders from decision-making can generate mistrust, weaken legitimacy, and intensify resistance (Tops & Lamers, 2024).

These theories help explain hospitality firms' attitude toward regulatory measures in contexts that suffer from overtourism, depending on whether they feel aligned with the goals of sustainable development or limited by regulatory provisions. However, prior literature highlight a lack of studies focused on these topics (Khazaei et al., 2015).

This study aims to fill this gap investigating how hospitality businesses in Florence perceive the impacts of local government interventions aimed at managing tourism. The purpose is to clarify the business-side perspective on whether and how current municipal regulations affect

their competitiveness, innovation capacity, and commitment to sustainable practices. We focus on hotels and B&Bs as key stakeholders, with the aim of answering the following research question:

Do hoteliers and guesthouse operators view heritage-protection rules, tourism taxes, and operational restrictions as stifling constraints, or as catalysts for positive change?

By analyzing perceptions of regulatory pressure, we seek to determine the perceived influence of these interventions on business performance and adaptability.

3. Research design

The research employs a quantitative survey design. We developed a structured questionnaire consisting of 28 Likert-scale items to capture hospitality managers' attitudes and evaluations across several dimensions. All items were measured on a seven-point Likert scale, ranging from 1 ("strongly disagree") to 7 "strongly agree.' Survey constructs include: (1) Perceptions of municipal regulation (e.g. perceived stringency, fairness, and effectiveness of local tourism rules and enforcement) adapted from Lopez-Gamero et al., 2011 and Kasim & Ismail, 2012; (2) Cultural heritage protection priorities (the business's awareness of and support for protecting Florence's historic identity) adapted from Cantele & Cassia, 2020; (3) Business adaptability and innovation (actions taken to adjust business models, services or technologies in response to regulatory and market changes) adapted from Sobaih et al., 2021; and (4) Perceived business performance/competitiveness (self-reported indicators of how the business is faring in terms of occupancy, revenue, guest satisfaction, and long-term viability under the current policy environment) adapted from Akter et al., 2020 and Cantele & Cassia, 2020. The questionnaire was targeted to owners and managers of hotels and B&Bs in Florence. Data collection is being conducted through industry associations and online distribution, aiming for a robust sample of the local hospitality sector. For analysis, the study will apply Structural Equation Modeling (SEM) to examine the relationships among the latent constructs derived from the survey. SEM is chosen due to its strength in simultaneously estimating multiple hypothesized relationships and handling latent (unobserved) variables measured by our Likert-scale items. The following figure illustrates the hypothesized research model:

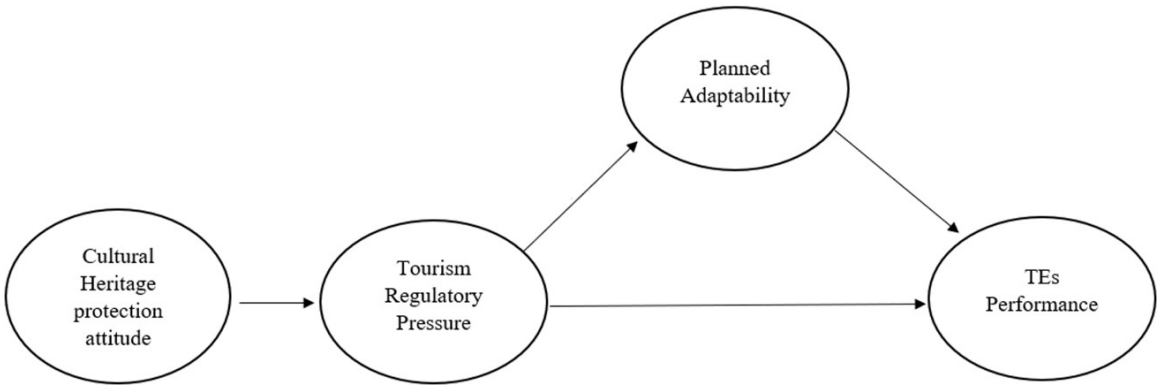

Figure 1. Research model

4. Expected results and contribution

We expect the results to show that a strong cultural heritage protection attitude positively influences the perception of tourism regulatory pressure, aligning with Cantele & Cassia (2020) and Lopez-Gamero et al. (2011), who find that environmental values heighten responsiveness to requirements, rules, or pressures imposed on a business from outside the organization—typically

by government authorities, regulatory bodies, or institutions. Regulatory pressure is expected to enhance both planned adaptability and tourism enterprises (TEs) performance, as firms often respond to external demands with structured, performance-enhancing strategies (Sobaih et al., 2021; Akter et al., 2020). Planned adaptability itself is predicted to improve TEs performance, consistent with findings that adaptive practices support competitiveness and stakeholder satisfaction (Cantele & Cassia, 2020). The findings of this research could offer valuable practical guidance for both policymakers and business operators in urban heritage destinations. For local government and destination managers, understanding the hospitality sector's perceptions will help in designing more balanced and effective tourism policies (Yuval, 2022; Boom et al., 2021). In line with Litvin (2024), the expected results suggest that stakeholders' perceptions should be considered by local government and that, in line with the stakeholder theory, tourism stakeholder should play a more active role in local government (McKercher, 2022). The practical outcome is to support a more collaborative approach in which municipal authorities and businesses work in tandem: policies are crafted with an awareness of industry realities, and businesses adjust their strategies to align with the city's long-term vision for sustainable tourism (Yuval, 2022). Effective destination management "done well…protects a place and the businesses that rely on the travel industry" whereas neglecting these issues can erode both the city's heritage and its tourism economy (WEF, 2024).

An intriguing new location for hospitality: The "lighthouse accommodation"

Marco Contri[1], Silvia Fissi[2], Elena Gori[3], Alberto Romolini[4]

1. Introduction

Most buildings have a finite lifespan, after which they experience various types of obsolescence—physical, economic, functional, technological, social, and/or legal—leading to their abandonment, demolition, or revitalization. Unfortunately, the economic crisis has exacerbated this phenomenon, revealing how traditional planning policies are no longer adequate (Lami, 2020). The debate over whether to demolish or revitalize unused and abandoned buildings that have lost their primary function has long been controversial among the public and government officials. This issue is particularly critical for historic buildings, which can be defined as cultural heritage assets with significant historic value; indeed, many of these structures lie in a state of abandonment or underuse, often due to high maintenance costs, economic constraints, or changing urban priorities (Fusco Girard and Gravagnuolo, 2025).

One effective practice for revitalizing and preserving valuable historic buildings is adaptive reuse (AR), which involves repurposing a building for a use other than its original function (Vafaie et al., 2023). This practice is not new; throughout history, people have often changed the uses of buildings when they became inappropriate for the purposes for which they were built (Lee, 2015). Several studies agree that the AR of historic buildings can offer significant economic, environmental, and social benefits, contributing notably to the urban circular economy (Fusco Girard and Gravagnuolo, 2025). Saleh and Ost (2023, p. 41) stated that "AR of cultural heritage is considered today as key in the implementation of sustainable development in the urban context." Moreover, the public sector, traditionally responsible for cultural heritage preservation and valorization, is increasingly implementing AR projects on historic buildings through public-private partnerships (PPPs). In this respect, research has shown that shared governance models involving broad public and private stakeholder engagement foster sustainable urban regeneration (Fusco Girard and Gravagnuolo, 2025). Additionally, reusing historic buildings may boost local tourism and thus has become increasingly popular in many tourist destinations worldwide, where obsolete or underused historic structures and sites are being converted into restaurants, cafés, hotels, shops, museums, and more (Vardopoulos et al., 2023).

AR of historic buildings has attracted the attention of scholars across disciplines, including historians, engineers, architects, interior designers, and urban planners (Plevoets and Van Cleempoel, 2019). Conversely, few studies address the managerial challenges of converting such buildings, and, in particular, none has thoroughly investigated the AR of lighthouses—a specific type of historic property that has often lost its original function and been repurposed for tourist accommodation, which Opačić et al. (2010) called "lighthouse accommodation." Indeed,

lighthouses can benefit from AR projects that transform them into a new tourism product segment with attraction power and economic value (Azevedo, 2018; Chylińska, 2021; Magnani and Pistocchi, 2017). To provide an overview of the sector's potential growth, it is worth examining the number of active and inactive lighthouses worldwide: over 3,000 in Japan, more than 1,600 in Greece, approximately 700 in the United States and Canada, about 250 in the United Kingdom, and around 150 in Italy. With this in mind, this paper aims to fill the knowledge gap regarding AR projects on lighthouses and to explore the tourism potential of lighthouse accommodation in the contemporary hospitality industry, shedding light on potential markets for this new hospitality type and outlining a rich research agenda.

2. The adaptive reuse of historic buildings: benefits and critical factors

The concept of "adaptive reuse" combines the ideas of "adaptation" and "reuse" and refers to the process of changing the original purpose of an existing building to accommodate new and more suitable functions while preserving its original features and structure. This practice can be an effective strategy for regenerating obsolete or underutilized historic buildings, leading to economic, environmental, and social benefits and thus significantly contributing to the urban circular economy (Fusco Girard and Gravagnuolo, 2025; Vafaie et al., 2023).

From an economic standpoint, repurposing existing buildings is often faster and less costly than demolition and reconstruction. Indeed, revitalizing a given floor area through AR typically takes about half the time required to demolish and rebuild it from scratch. Moreover, the reuse of existing structural components significantly reduces the need for new materials, while the shorter contract periods typical of AR projects further contribute to cost savings. In this regard, Vafaie et al. (2023) noted that AR projects can generate savings of approximately 10-12% compared to new construction. Beyond direct cost advantages, AR of historic buildings can support neighborhoods' economic revitalization through urban regeneration. This contributes to creating an appealing environment that attracts, on the one hand, higher-income residents and, on the other, tourists drawn by enhanced streetscapes and cultural appeal. This increased attractiveness stimulates local economies by generating tourism revenues, supporting local businesses, and creating employment opportunities for the local workforce. The AR of historic buildings also offers the opportunity to preserve and valorize cultural heritage, often through PPPs. Indeed, cultural heritage is typically considered a "common good" and thus is traditionally funded by the public sector. However, in recent decades, increasing pressure on public budgets has reduced investment in the cultural sector (OECD, 2022). In response, public institutions increasingly leverage AR projects through PPPs, using private capital—partially or fully—to support the conservation and reuse of historic buildings.

From an environmental perspective, the building sector has a major impact on ecosystems—in this regard, the European Commission has recently emphasized that this sector is responsible for more than 35% of the EU's total waste generation[5]. On a global scale, the United Nations and the Yale Center for Ecosystems + Architecture recognize the building sector as "the largest contributor to climate change," underscoring the urgency of transitioning towards more sustainable practices[6]. In this context, several studies support the environmental benefits of AR; indeed, compared to demolition and new construction, repurposing historic buildings significantly reduces energy demand, greenhouse gas emissions, fossil fuel consumption, water use, and the

[6] https://wedocs.unep.org/20.500.11822/43293 (accessed 9 July 2025).

need for new raw materials. Furthermore, AR can enhance seismic resilience, limit urban sprawl, and thus preserve the existing ecosystem and local biodiversity.

Finally, regarding sociocultural impacts, Vafaie et al. (2023) note that preserving and repurposing heritage buildings strengthens the connection between local communities and their cultural roots, fostering shared identity and social cohesion. Indeed, these buildings are defined not only by their physical characteristics but also by the intangible associations they hold, such as cultural narratives, community identity, and historical context. Their AR can enhance residents' sense of belonging, particularly when local communities are actively involved in planning and implementation processes. Moreover, AR helps maintain attractive urban landscapes and supports successful regeneration strategies. This revitalization can improve residents' quality of life by enabling sociocultural activities (facilitated by these renewed spaces) and increasing safety, as enhanced urban environments are often associated with reduced crime and vandalism.

Despite these benefits, AR projects also involve significant challenges (Vafaie et al., 2023). First, several regulatory challenges, along with related functional and technical issues, must be addressed. Indeed, historic buildings often do not comply with current regulatory standards for fire protection, indoor air quality, thermal insulation, emergency escape routes, seismic protection, and accessibility for individuals with disabilities, necessitating structural upgrades. In addition, AR projects must align with urban planning regulations, zoning laws, and, where applicable, strict heritage protection requirements. In such cases, it is essential to maintain a harmonious balance between the building's original character and any new additions, which should be clearly identifiable and reversible for future adaptations. Consequently, the AR of historic buildings requires a careful balance between new functionality and the preservation of architectural integrity, historical authenticity, and cultural identity. In this regard, collaborative decision-making processes are crucial in achieving this balance, as they allow the integration of multiple stakeholder perspectives. As highlighted by Fiorani et al. (2017), effective participation should involve authorities, experts, and local communities. However, these constraints often lead to higher renovation costs and longer project timelines.

Another critical issue concerns the return on investment, particularly for highly deteriorated buildings. Such conditions may discourage private investors, especially in PPP contexts, where the private sector may favor projects with higher expected returns. As a result, less profitable but culturally valuable assets may remain under public responsibility. In addition to financial risks, private actors face regulatory and administrative uncertainties, including delays in permit approvals and the complexity of navigating multilevel governance systems. Moreover, adapted buildings typically require more intensive, ongoing maintenance than new construction, thereby increasing long-term operating costs. To mitigate these risks, public authorities should strengthen regulatory clarity and provide incentives through well-designed policies that facilitate implementation and reduce bureaucratic barriers.

Finally, the success of AR projects is strongly influenced by location and surrounding context. Accessibility, proximity to infrastructure and services, availability of transport and parking, and the overall quality of the neighborhood all affect the attractiveness of reused buildings and their economic performance.

3. Adaptive reuse of historic buildings for tourism

Tourists are often drawn to the combination of heritage, architectural character, and service offerings, as well as to the narratives associated with repurposed historic buildings. These elements contribute to memorable and evocative experiences, positively influencing visitors' willingness to stay in such places (Lee, 2015). As a result, a wide range of historic buildings worldwide have been adapted for tourism purposes, including religious structures, castles and fortresses, industrial sites, rural heritage, and coastal buildings (Fusco Girard and Gravagnuolo, 2025).

Religious structures are among the most frequently repurposed, largely due to their growing vacancy caused by declining congregations, changing societal values, and shifts in urban development patterns. Cultural uses are generally considered the most compatible with churches, leading to conversion into theaters or museums. Examples include the Church of Preachers in Neuveville (Switzerland) and the Church of San Francesco in Bolsena (Italy), both transformed into theaters, as well as the Ex Teresa Arte Actual in Mexico City, now an exhibition space. However, as Fiorani et al. (2017) noted, many churches have also been converted for commercial uses. Several of them have been converted into restaurants, pubs, or nightlife venues, such as the former Church of St. John the Baptist in Pittsburgh, now a brewery, and the Church of the Holy Communion in New York, which has been transformed into a nightclub. Similar examples can be found in Europe, including St. Mary's Church in Dublin (restaurant) and former churches in Milan and Montpellier (nightclubs). While conversions into hotels are less common, the reuse of convents and monasteries for hospitality purposes is more widespread, as demonstrated by projects such as the Kruisherenhotel in Maastricht and the Augustine Monastery in Prague, both of which are now luxury hotels.

Castles and fortresses represent another important category of heritage assets repurposed for tourism. Their monumental character, historical significance, and often scenic and less urbanized locations enhance their attractiveness (Péterfi, 2020). Some of them have been transformed into luxury hotels, such as the Château de Bagnols in France and Neemrana Fort-Palace in India, while others have been adapted for cultural use, including Gjirokastër Castle in Albania and Fort de Loncin in Belgium, both of which function as museums. In some cases, multiple functions are integrated within the same site. For instance, Ehrenbreitstein Fortress in Germany hosts exhibitions, cultural events, and a youth hostel, while CastelBrando in Italy combines accommodation, a museum, and conference facilities.

Emblematic examples of institutionalized and strategic AR projects on the aforementioned types of buildings can be found in the Iberian Peninsula, through the longstanding experience of "Paradores" in Spain and "Pousadas" in Portugal. Paradores de Turismo de España, established in 1928, is a state-owned chain of 99 high-end hotels located in historically significant public buildings (mostly monasteries and castles) that are often situated in protected or less conventional tourist areas. Similarly, the Portuguese Pousadas network, founded in 1941 and later partially privatized, operates luxury hotels in historic properties such as convents, castles, and palaces, demonstrating the long-term viability of structured AR strategies.

A third category of sites that are often the objects of AR projects comprises industrial buildings such as old factories, mills, warehouses, and stores. Indeed, the transition to a postindustrial economy has led to the abandonment of numerous factories, warehouses, and production facilities (Fiorani et al., 2017). AR projects focused on former industrial areas, whose success depends on their integration into the city and their ability to generate cultural, economic, and social benefits, can be important for documenting a critical historical period. Some of these old industrial buildings have been converted into museums, such as the Tate Modern in London. Others have been adapted into hotels or leisure venues, including the Factory Hotel in Münster (Germany) and the Distillery Inn in Colorado (USA), or into bars or pubs, like the Fábrica de Hielo in Valencia. Some projects adopt a multifunctional approach, as illustrated by the Lingotto complex in Turin, a former Fiat factory now hosting commercial, cultural, and leisure activities.

Other types of buildings used in AR tourism projects include farmhouses, barns, granaries, and other agricultural structures commonly found in rural areas. In response to an increasing demand for alternative, experience-based holidays, rural destinations are attracting more attention, and when properly restored and repurposed, their historic buildings can become distinctive assets for rural tourism (Kurnaz and Anıktar, 2024). A notable example is the "Trulli" of Alberobello (Apulia, Italy), which were originally temporary field shelters and warehouses or permanent dwellings for small-scale landowners and agricultural laborers and were later converted into hotels, restaurants, souvenir shops, and cultural venues. Similarly, in the Catalonia

region of Spain, traditional rural estates known as "Masias" have undergone AR to host boutique hotels and wineries, while disused agro-industrial sites have been converted into museums and art centers.

Finally, lighthouses and coastal buildings have emerged as particularly distinctive subjects for AR projects in tourism. Originally built for navigation and coastal defense, many have lost their original function due to technological advancements (Fusco Girard and Gravagnuolo, 2025). Rather than being abandoned or demolished, these structures—often located in highly scenic, remote settings—are increasingly being transformed into museums, hotels, and restaurants. Notable examples include the Capo Spartivento Lighthouse in Sardinia (Italy), converted into a luxury resort, the Belle Tout Lighthouse in the United Kingdom, now a bed and breakfast, and several Croatian lighthouses adapted into tourist apartments. In the United States, the Saugerties Lighthouse in New York operates as both a living museum and a bed-and-breakfast. These cases highlight how AR can revitalize coastal heritage, offering unique tourist experiences while preserving cultural heritage.

4. Discussion and conclusions

AR represents an approach to revitalizing lighthouses by transforming them into a unique form of accommodation within the hospitality industry. However, to date, scholars have not dedicated particular attention to this topic, which merits examination from both theoretical and managerial perspectives.

4.1. Practical implications: Lighthouses as accommodation for multiple tourism markets

Over the last few decades, an increasing number of lighthouses have been repurposed for tourist accommodation, offering a fascinating new location for hospitality, which Opačić et al. (2010) called "lighthouse accommodation." If lighthouse tourism is recognized in academia as a special form of tourism, in many countries it has not yet been systematically embedded in the tourism offer. Lighthouse accommodation would be ideal for contributing to the differentiation of the tourist offer, expanding the tourist season, and enhancing the attractiveness of the destination throughout the year, while also opening up new employment opportunities for local people (Šerić et al., 2023). In sum, lighthouse accommodation enables the development of new tourism offerings across different activity sectors. From a managerial perspective, it is therefore essential to understand the potential market positioning of this emerging form of accommodation, and for this reason, the following sections will analyze the possible target markets for this type of tourism initiative.

Escape Tourism

In today's increasingly stressful lifestyles, many individuals feel the urge to outrun everyday pressures, such as domestic responsibilities, professional obligations, or broader social constraints. In this respect, a report on the state of tourism and hospitality published by McKinsey & Company has recently pointed out that, nowadays, travelers, particularly from Europe and North America, are eager to "escape their daily routines" and place significant importance on "getting away from it all[7]."

In this context, lighthouses can be seen as providing ideal accommodation for what is known as "escape tourism," which is primarily driven by the desire to disconnect from everyday life and

[7] https://www.mckinsey.com/industries/travel/our-insights/the-state-of-tourism-and-hospitality-2024 (accessed 16 July 2025).

enjoy a peaceful and isolated environment that allows for a temporary change of lifestyle (Chylińska, 2021). Indeed, lighthouses are typically located in remote and scarcely urbanized areas, thus promising isolation, peace, and connection with unspoiled nature. As van Wee and Mokhtarian (2023) noted, while accessibility is generally considered a positive attribute in tourism, the opposite holds for escapist experiences, where tourists value low accessibility between the place they want to escape from and the location they want to escape to. Moreover, the isolation that typically characterizes the location of lighthouses is often accompanied by the absence of, or severely limited access to, information and communication technologies, which enhances tourists' perception of being "away from home" and experiencing a "true escape" (Zhang and Zhang, 2022). Consequently, lighthouses can attract tourists seeking to escape their daily lives and engage in relaxing and detoxifying experiences (Mylonopoulos et al., 2022), while "playing" the role of the lighthouse keeper (Azevedo, 2018). In particular, Opačić et al. (2010) point out that lighthouses may serve as ideal refuges for overstressed individuals who often have higher levels of education, financial capacity, and ecological sensitivity, providing them with opportunities for psychophysical restoration.

However, as Frochot and Lenglet (2023) emphasize, "escapism" in tourism is not only driven by the desire to escape the routine of daily life, as it can also arise from a deeper and more introspective motivation: the desire to temporarily disconnect in order to reconnect with oneself. In this regard, many tourists are increasingly seeking "silent travels," namely journeys to destinations away from crowded tourist hotspots, in locations that offer untouched landscapes, tranquility, and genuine silence, to disconnect from the noise of urban life, reconnect with nature, and find opportunities for meditation[8]. Travel becomes an opportunity to reflect and return to everyday life with renewed mental energy. Viewed from this perspective, lighthouses provide ideal accommodation for such conscious escapes. Their physical remoteness, symbolic solitude, and historical association with reflection and introspection offer an evocative atmosphere for tourists seeking a place where time slows down (Chylińska, 2021). Moreover, lighthouses may even become a source of inspiration for writers and artists (Mylonopoulos et al., 2022).

When located in isolated and largely uninhabited open-sea islands, lighthouses can also be ideal destinations for enthusiasts of "Robinson tourism," an extreme form of escape tourism that attracts tourists seeking solitude and the unbridled beauty of the open sea. These tourists enjoy activities such as swimming, fishing, and/or diving to explore the undersea world, valuing these experiences more than the quality of their accommodation (Opačić et al., 2010).

Heritage Tourism

Heritage tourism is a form of cultural tourism in which the primary motivation for visitors is to experience places, artifacts, and activities in a given location that are believed to be authentic representations of people and stories from the past. This sector has emerged as one of the fastest-growing segments of the global tourism industry[9], as increasing numbers of travelers seek meaningful experiences that combine cultural engagement, education, entertainment, and a strong sense of authenticity (Lee, 2015). The growing interest in heritage tourism has also led to a rising demand for heritage-based tourist accommodation (Vardopoulos et al., 2023). Indeed, travelers are increasingly opting for accommodation that offers unique stories and a distinctive character. Known as "heritage hotels," this kind of accommodation reflects or recreates its original

appearances and provides deep insights into local traditions and culture, allowing guests to experience and understand the history and culture of a particular region (Park et al., 2025).

In this context, lighthouses represent particularly compelling heritage assets for AR, serving as accommodation facilities that embody both tangible and intangible cultural values.

The tangible dimension refers to the physical components of the lighthouse itself—its tower, the keeper's house, and ancillary infrastructure—typically situated in remote, often dramatic coastal landscapes that enhance their scenic, iconic, and photogenic appeal. These elements not only bear architectural and historical significance but may also evoke a sense of authenticity and uniqueness that heritage tourists actively seek. Because of this, in the heritage hospitality sector, preserving the physical integrity of the original site is crucial. Indeed, guests tend to evaluate the quality of their heritage experience based on the perceived authenticity of the environment, which is closely linked to the presence of traditional architectural features, historically resonant interiors, and a coherent historical atmosphere (Park et al., 2025).

The intangible heritage associated with lighthouses is equally significant, as it encompasses maritime traditions, the legacy of lighthouse keepers, and the symbolic meanings attached to lighthouses as beacons of safety, solitude, and human resilience against natural forces. Their integration into coastal landscapes and local narratives reinforces a sense of continuity with the past and contributes to the creation and preservation of territorial identities (Magnani and Pistocchi, 2017). As Azevedo (2018) noted, lighthouses act as "identity maker[s]," shaping place-based narratives and individual memories. Notable examples, such as the ancient Lighthouse of Alexandria (Egypt), the Maiden's Tower in Istanbul (Turkey), and Robbins Reef Lighthouse in New Jersey (USA), illustrate how lighthouses can serve as cultural and symbolic reference points within their respective regions. As a result, tourists are attracted not only by the architectural uniqueness or panoramic views but also by the chance to inhabit spaces that embody seafaring myths, solitude, heroism, and community resilience.

The combination of these tangible and intangible elements makes lighthouses particularly evocative sites, capable of offering immersive and memorable experiences (Lee, 2015). Lighthouses act as powerful mediators between past and present, making them especially suitable for AR projects aimed at promoting heritage tourism.

Dark Tourism

Lighthouses hold several symbolic meanings and emotional resonances, which help explain their longstanding presence in art, literature, and cinema (Azevedo, 2018; Chylińska, 2021). Historically, they marked the limes (i.e., boundaries) of the known world, symbolizing the end of one land (finis terrae) and the beginning of a new one (initium terrae) simultaneously. This inherent duality, often enhanced by myths and legends, has inspired travelers to explore, discover, and overcome these limits (Magnani and Pistocchi, 2017). Consequently, lighthouses evoke a romantic past, filled with images of sailing vessels, maritime isolation, and endless sea journeys, which may attract tourists through a sense of nostalgia (Lee, 2015). Moreover, lighthouses are part of an "extraordinary non-daily life" (Chylińska, 2021), making them particularly suitable for experience-based tourism, including overnight stays in former keepers' quarters repurposed as accommodation.

However, lighthouses do not always evoke positive feelings. Indeed, their geographical isolation and exposure to violent weather conditions also associate them with stories of shipwrecks, drownings, and maritime tragedies. A notable example is the infamous "Coast of Death" in Galicia, Spain, where a stretch of coastline known as "The Way of Lighthouses" is named after the many lighthouses built along its cliffs to help ships avoid wrecks in an area renowned not only for its natural beauty but also for its extreme maritime danger. Moreover, several lighthouses are associated with disquieting disappearances and unsolved mysteries. The Flannan Isles Lighthouse in Scotland is one of the most enigmatic: In 1900, all three lighthouse

keepers vanished without explanation, leaving behind a fully functional light station and no signs of struggle. Across the Atlantic, the St. Augustine Lighthouse in Florida, USA, is reputed to be one of the most haunted lighthouses in the country. Numerous visitors and staff have reported sightings of ghostly figures, particularly those of two young girls who are believed to have drowned during the construction of the lighthouse in the 19th century. Accordingly, lighthouses also have a "darker" dimension (Azevedo, 2018; Mylonopoulos et al., 2022).

Dark tourism is an umbrella term that indicates any tourism historically or symbolically "related to death, suffering, atrocity, tragedy or crime" (Light, 2017, p. 277). To analyze the various facets of dark tourism, researchers have proposed a number of classifications. One influential categorization is Stone's (2006) "darker-lighter" tourism paradigm, which posits that sites of death and suffering are darker than those merely associated with death and suffering. At the darkest sites, the primary focus is on education and remembrance, with visitor services being a lower priority; in contrast, the lightest sites are more like tourist attractions, making them more commercial and often incorporating elements of entertainment.

In this second, Azevedo (2018) states that lighthouses can be classified as a "lighter dark tourism product" and appeal mainly to niche segments of tourists, such as "recreational storm chasers" (Xu et al., 2012), i.e., travelers who actively seek out extreme weather experiences for leisure and excitement. When reimagined as accommodation, lighthouses can thus offer these tourists not just a place to sleep but a deeply immersive spatial and emotional experience. This symbolic weight can satisfy a variety of dark tourism motivations, from morbid curiosity and a desire for reflective contemplation to thrill-seeking and an interest in confronting mortality within controlled environments. These experiences mirror the aesthetic and psychological appeal found in "lighter" forms of dark tourism, where the encounter with death or danger is suggestive rather than explicit (Azevedo, 2018).

4.2. Theoretical implications and avenues for future research

To date, lighthouse accommodation has been primarily investigated within the fields of engineering and architecture, receiving limited attention from management and tourism studies. However, AR projects on lighthouses for tourism purposes offer promising avenues for future research.

A first key area of inquiry concerns the identification and analysis of the most appropriate business model for lighthouse accommodation, including core elements such as the underlying business idea, innovation processes, and mechanisms of value creation. Theoretical contributions in this area could provide valuable insights for entrepreneurs and managers operating in, or intending to enter, this niche sector.

Sustainability is another crucial lens through which lighthouse accommodation can be examined. Relevant research areas include sustainable tourism, cultural sustainability (Zhang et al., 2025), and the circular economy, all of which can be applied meaningfully in this innovative hospitality model. Indeed, lighthouse accommodation can serve as a catalyst for the development of marginal coastal areas and small rural villages, which are typically excluded from mainstream national and international tourism circuits. In this sense, it could also contribute to heritage-led, community-oriented tourism development.

Another fruitful avenue for research is entrepreneurship. Lighthouse accommodation projects typically involve the AR of existing structures and the launch of entrepreneurial ventures with strong territorial embeddedness. Relevant research topics in this domain include financial planning and investment strategies, defining business models, designing proper organizational structures, and developing sustainability-oriented approaches to managing heritage buildings.

Moreover, lighthouse accommodation initiatives could be studied for their potential contribution to the preservation and valorization of public heritage assets, particularly through PPPs involving collaboration between entrepreneurs and public institutions. Given the increasing

constraints on public budgets, PPPs may represent an effective approach for rehabilitating and managing coastal public properties.

Additional managerial research areas include the development of effective and targeted marketing strategies, primarily through social media and online platforms, to position lighthouse tourism in an increasingly competitive tourism market. The unique identity and symbolic capital of each lighthouse can serve as the starting point for compelling narratives, thereby enhancing visibility and differentiation (Šerić et al., 2023).

Finally, management control and performance measurement systems represent an additional area of interest. Lighthouse accommodation initiatives would benefit from tailored tools for monitoring operational efficiency, financial sustainability, and broader social and environmental impacts. In this regard, identifying appropriate key performance indicators (KPIs) is crucial for evaluating and improving the effectiveness of such projects.

Building on these perspectives, future research could be guided by the following key questions:

- What business model underpins the lighthouse accommodation concept?
- What are the key features of lighthouse accommodation that generate value for tourists?
- In what ways does the lighthouse accommodation model contribute to innovation in tourism and hospitality?
- What sustainability strategies are currently being implemented or could be implemented within lighthouse accommodation projects?
- How can lighthouse accommodation contribute to the development of local tourism ecosystems?
- What are the core components of these entrepreneurial initiatives?
- What role can lighthouse accommodation play in the regeneration of coastal public heritage assets through PPPs?
- What marketing strategies can effectively support the positioning of lighthouse accommodation in the tourism market?
- Which management control tools are most suitable for improving cost-efficiency?
- Which KPIs should be used to assess the performance and sustainability of lighthouse hospitality ventures?

The managerial and theoretical implications outlined thus far are summarized in Figure 1.

Prospector vs. Analyzer in Tourism SMEs: How Strategic Orientation Drives Green Innovation Performance?

Ludovica Antenozio[1]

1. Introduction

The increasing pressure toward sustainable development and environmental responsibility is reshaping the competitive landscape of the tourism industry. In particular, small and medium-sized enterprises (SMEs), which represent the backbone of the business economics in Europe (Katsinis et al., 2024) are increasingly called to align their strategic orientation with sustainability principles to remain competitive and resilient (Kim et al., 2024). Sustainability is no longer a reputational or ethical option, but a strategic imperative (Khan et al., 2023) that requires firms to rethink how they configure their resources, innovate their process, and create value in balance with environmental and social objectives (Wang et al., 2024).

Tourism SMEs play a crucial role in regional economies, employment, and destination development, but their innovation patterns differ substantially from those of large firms and manufacturing SMEs (Martínez-Román et al., 2015). Their innovation activities tend to be less formalised, more experiential, and deeply dependent on local networks, cooperation, and customer interaction (Martínez-Román et al., 2015; Nguyen et al., 2021). Proximity to consumers, combined with their flexibility and adaptability (Ahmed et al., 2022; Kahveci, 2023), make them particularly suited to implement sustainability oriented practices, even under resource constraints (Le & Govindan, 2024; Pronti et al., 2023). As Martínez-Román et al. (Martínez-Román et al., 2015) underline, the innovative behaviour of tourism SMEs is shaped by both internal factors (knowledge, organisational structure, human capital) and contextual factors (cooperation, funding, and institutional environment). Embedded in destination-based networks (Kallmuenzer et al., 2021), they often rely on relational resources rather than formal R&D, making learning-by-doing, partnerships, and cross-sectoral collaborations fundamental to their competitiveness (Kahveci, 2023; Muskat et al., 2021; Tajeddini et al., 2023).

Whitin this context, strategic orientation emerges as a key determinant of how tourism SMEs approach innovation and sustainability. According to Miles and Snow (1978), firms develop consistent strategic patterns to respond to environmental changes and to align internal processes with external demands. These patterns, known as strategic orientations, reflect different configurations of organizational behaviour and strategic posture (Aragón-Sánchez & Sánchez-Marín, 2005; Kim et al., 2024) and is seen as ‘‘the overall strategic direction of the company and the need to design new initiatives’’ (Okumus, 2001, p. 328). Specifically, in recent literature three dominant strategic orientations are identified: (i) prospector-oriented firms characterised by proactive and innovative posture. They continually seek new market opportunities, experiment with products and service and prioritise innovation over efficiency; (ii) analyzer-oriented firms represent a hybrid type, combining the stability of defenders with the adaptability of prospectors. They balance exploration and exploitation, adopting new practices once they have been tested by others; (iii) defender-oriented firms focusing on the maintenance of operational efficiency and the protection of a stable market niche. Their priorities lie in cost control, reliability, and incremental innovation. This typology of business strategy is also validate in tourism firms where firms follow

[1] Research Fellow, ECON-07/A, Scuola Superiore Sant’Anna, Center of Advance Studies – Interdisciplinary Center for Sustainability and Climate (CISC); ludovica.antenozio@santannapisa.it – corresponding author

one of the three strategic orientations to achieve firm performance (Avci et al., 2011; Khan et al., 2023). Specifically, in tourism context, prospector are typically those SMEs that anticipate sustainability trends, develop eco-friendly services, and adopt green certifications to differentiate themselves in competitive markets (Khan et al., 2023). Moreover, analyser strategies for tourism SMEs may translate into adopting green innovation selectively, implementing eco-efficient process and sustainable marketing practices once their economic benefits are proven. Finally, defenders in tourism sector, often comply with environmental regulations and adopt basic eco-efficiency measures but are less inclined to engage in more transformative green innovations due to their emphasis on short-term cost optimizations (Avci et al., 2011)

While prospectors actively build new dynamic capabilities to sustain eco-innovation, analysers leverage a mix of established routines and selective experimentation, and defenders rely on existing resources to achieve compliance-driven sustainability (Aragón-Sánchez & Sánchez-Marín, 2005). These mechanisms enhance efficiency, improve reputation, and attract environmentally conscious customers, generating competitive advantages that extend beyond short-term profitability (Vasileiou et al., 2022). Additionally, green innovation can be viewed as a valuable and inimitable capability that arises from a firm's ability to reconfigure its resources toward environmental performance (Kim et al., 2024).

In the tourism industry, the relationship between strategic orientation and green innovation acquires a distinctive relevance. The co-creation of sustainable experiences, the need for energy-efficient operations in accommodation and transport, and the increasing attention to ESG standards from tourists and institutions make sustainability a central dimension of competitiveness (Maziliauske, 2024) especially in tourism SMEs where regulatory bodies promote ESG-oriented initiatives, customers increasingly demand sustainable experiences, and competitive imitation pushes firms to adopt green innovation to remain legitimate within their ecosystems (Sharma & Sharma, 2024). Empirical evidence suggests that green innovation, encompassing eco-friendly products, energy-efficient processes, and environmentally responsible business models (Calderon-Monge & Ribeiro-Soriano, 2024; Ghag et al., 2022), enhances both environmental and economic performance when aligned with firms' strategic orientation and managerial commitment (Le & Govindan, 2024; Vasileiou et al., 2022).

Green innovation, encompassing eco-friendly products, energy-efficient processes, and environmentally responsible business models (Calderon-Monge & Ribeiro-Soriano, 2024; Ghag et al., 2022), is increasingly recognised as a strategic necessity rather than a reputational choice (Le & Govindan, 2024; Singh & Chakraborty, 2021; Tang et al., 2018). For tourism SMEs, green innovation translates into concrete actions such as waste reduction, circular practices, adoption of renewable materials, and integration of environmental certifications into quality standards (Maziliauske, 2024). Studies on Italian firms show that environmental innovation generates synergic effects with other types of innovation (e.g., marketing, organisational, and digital), enhancing financial performance when aligned with managerial commitment and stakeholder expectations (Vasileiou et al., 2022). Similarly, Qin et al. (Qin et al., 2024) emphasise the role of green entrepreneurial orientation as a dynamic capability that enables firms to leverage sustainability for business success. These mechanisms acquire a distinctive relevance in the tourism context.

Despite these benefits, tourism SMEs still face substantial barriers to implementing green innovation, including resource constraints, limited managerial expertise, and fragmented governance structure (Martínez-Román et al., 2015; Tang et al., 2018). Strategic orientation, therefore, becomes a critical lens through which to understand why some firms successfully engage in sustainability-driven innovation while others remain passive or reactive.

Building on these premises, the study aims to examine how the three strategic orientations shape the adoption of green innovation among tourism SMEs. Specifically, it addresses the following research questions: RQ1 "How do prospector-oriented tourism SMEs show a higher propensity to adopt green innovation practices?", RQ2 "How do analyzer-oriented tourism SMEs

integrate green innovation into their strategic and operational activities?" and RQ3 "How defender-oriented tourism SMEs implement green innovation?". By addressing these research questions, the study contributes to the literature on strategic management and sustainability in SMEs, by providing insights into how internal strategic orientation drive environmental innovation in tourism context. This research not only fills a relevant gap in the existing literature but also offers valuable implications for SME managers.

2. Purpose of the research

The objective of this paper is to investigate how different strategic orientations, influence the adoption of green innovation within tourism SMEs. While previous studies have explored how strategic orientation affect firm's performance and innovation capacity (Aragón-Sánchez & Sánchez-Marín, 2005; Avci et al., 2011; Camisón & Villar-López, 2014; Forés et al., 2023; Kim et al., 2024; Kwak et al., 2023), limited attention has been paid to how strategic patterns drive eco-innovation and environmental sustainability in small tourism businesses. This gap is particularly relevant given that tourism SMEs operate in highly competitive and resource-constrained environments where sustainability has become both a strategic priority and a source of long-term differentiation (Le & Govindan, 2024; K. Wang et al., 2024). Building upon these premises, this study posits that each strategic orientation configures firm's resource and capabilities in distinct ways, leading to different propensities for green innovation. Specifically, prospector-oriented tourism SMEs, are expected to show a stronger commitment to developing eco-innovative services and processes. Analyzer-oriented, may implement sustainability practices selectively once they are validated by the market. Conversely, defender-oriented tourism SMEs may engage in green innovation primarily for compliance purpose rather than as a proactive strategic choice.

Using data from the Istat, ISNART (Istituto Nazionale Ricerche Turistiche) and AIDA database, the study aims to examine how strategic orientation influence and extent the type of environmental innovation in tourism SMEs by identifying firm's strategic posture (i.e. innovation-led, hybrid, or efficiency-led) and their corresponding eco-innovation activities (i.e. reduction in energy and material use, recycling, renewable inputs, environmental certifications, innovation with environmental benefits). Understanding how these firms can leverage strategic orientation to pursue green objectives is crucial not only for their survival but also for the resilience of the broader tourism ecosystem. Additionally, it offers practical insights for policymakers aiming to support SMEs in their green adoption strategies, helping to bridge the gap between theoretical research and real-world applications. The empirical analysis will provide insights into the relationship of business strategy and sustainability in the context of tourism SMEs by aiming to advance existing research in two ways (i) by integrating strategic orientation and green innovation paradigms in tourism SMEs, (ii) by identifying which strategic profiles are most conductive to eco-innovation. By contributing to both theory and practice, this paper aims to serve as a reference point for future studies exploring the evolving role of strategy and green practices in tourism SME success, ultimately guiding firms toward competitive advantage.

3. Methodology

The empirical analysis draws on official Italian sources combining ISTAT and ISNART – Istituto Nazionale Ricerche Turistiche and AIDA database that allow us to compared data at the European level. These databases provide harmonised information on firms' innovation strategies, behaviours and outcomes and represents the official data source for monitoring innovation in both industrial and service sectors.

The study focuses on the subsample of Italian tourism SMEs, identified according to NACE Rev. 2, Section I (Accommodation and Food Service Activities) and corresponding ATECO divisions such as 55,56,79. This sector represents an ideal setting for analysing how different

strategic orientation shape environmental innovation, as tourism SMEs combine service-based value creation with increasing exposure to sustainability and competitiveness challenges. The SME definition follows the European Commission Recommendation 2003/361/EC, identifying firms with fewer than 250 employees and annual turnover below €50 million (Antenozio et al., 2024, 2026; Di Berardino & Antenozio, 2025).

The methodological design integrates two complementary phases, an exploratory-descriptive analysis and an econometric validation phase, aimed to capturing both the structural features and the determinants of green innovation adoption in tourism SMEs. The first phase provides an overview of the innovation behaviour among Italian tourism SMEs. Through descriptive statistics, the analyses identify the prevalence and intensity of environmental innovations, distinguishing between benefits obtained within the firms and during product or service use by final consumers. Specifically, internal eco-innovation includes lower material and water consumption per unit of product; reduced energy use or CO_2 emissions; reduced air, water, noise, or soil pollution; substitution of traditional materials with less harmful or polluting ones; replacement of fossil fuels with renewable energy sources; recycling of materials and waste and reuse of water for internal or commercial purposes. Consumer-related eco-innovation includes reduced energy consumption and CO_2 emissions during product or service use; lower environmental pollution during usage; greater ease of product recycling at end-of-life; and longer product or service life. The second phase empirically tests the relationships between strategic orientation and green innovation. The aim it to evaluate whether strategic oriented tourism SMEs differ in propensity to adopt eco-innovation practices. To operationalise strategic orientation variables, the study draws on the strategic variables, which capture firms' competitive strategies and market approaches. For prospector orientation, we include the following variables like introduction of new product or services; improvement of existing products or services; reaching new consumer groups; offering customized or tailor-made solutions. The analyzer orientation is constructed using data regarding quality leadership; broad product/service range; serving a stable customer base; bridging factor between innovation and stability. The corresponding variables for the defender's orientation related to price leadership; offering one or a few key products/services; offering standardised products/services; maintaining stable customers.

Composite indices are created to capture the multidimensional nature of eco-innovations. Additionally, control variables such as firms size, age, turnover, geographical macro-area, funding obtained, contextual pressure (institutional, market, cultural) are also included in the analysis to account for structural heterogeneity within the Italian tourism ecosystem.

We aim to employ regression models with robust standard errors to estimate the determinants of green innovation. Models are specified as:

$$Yi = \alpha + \beta 1\ X\ \text{strategy}\ ,\ i + \gamma Zi + \varepsilon i$$

where Yi denotes the green innovation adoption, Xstrategy,i variable represent the firm's strategic orientation and Zi includes control variables. Heteroskedasticity-robust estimators and cluster corrections are applied to ensure coefficient reliability, while multicollinearity and specification tests (VIF) validate model stability.

By leveraging these databases, the study ensures methodological comparability with previous European analyses while offering a novel focus on tourism SMEs and the link between strategic orientation and green innovation.

4. Preliminary results

Preliminary descriptive evidence highlights several emerging patterns regarding the strategic orientation and green innovation behaviour of Italian tourism SMEs. Most firms report at least one innovation activity but the diffusion of environmental innovation remains heterogeneous,

revealing marked differences depending on the strategic posture adopted. Firms classified as prospector-oriented demonstrate the highest propensity toward green innovation, especially in terms of eco-processes and product redesigns aimed at reducing energy use, emissions, and material consumption. These firms typically engage in multiple types of environmental benefits, both internal and consumer-related, suggesting that exploratory and opportunity-seeking behaviour drives a more proactive approach to sustainability. Conversely, analyzer-oriented tourism SMEs exhibit an intermediate position. They selectively adopt green innovations that have proven to be cost-effective or institutionally supported, such as improving product quality through eco-efficiency measures or integrating environmental certifications to enhance reputation. This behaviour reflects their balanced strategy between exploration and exploitation, where environmental initiatives are implemented only after market validation or regulatory reinforcement. Preliminary evidence also indicates that analyzers tend to prioritise internal environmental benefits over consumer-related outcomes, aligning sustainability with operational efficiency rather than market differentiation. Finally, defender-oriented firms show the lowest levels of green innovation activity. Their environmental initiatives are generally limited to compliance with environmental regulations or incremental efficiency improvements, such as minor reductions in energy use or pollution control. These firms are typically characterised by cost leadership, product standardisation, and a focus on a stable customer base, which limit their flexibility and willingness to engage in radical sustainability transitions. This finding aligns with the theoretical expectation that defenders, due to their efficiency-oriented configuration, perceive green innovation primarily as a constraint rather than an opportunity.

Preliminary results also suggest that strategic orientation significantly shapes the type and intensity of eco-innovation among tourism SMEs. Prospectors lead in environmental innovation through proactive exploration and differentiation; analyzers adopt a more cautious, efficiency-driven approach; and defenders remain primarily reactive, focused on compliance. These patterns confirm the Miles and Snow (Miles & Snow, 1978) framework's relevance for understanding sustainability-oriented strategic behaviour in small firms and extend it to the environmental domain of tourism enterprises. These findings provide preliminary validation of the conceptual model and underscore that strategic orientation is a key internal driver of sustainability transformation. While prospector strategies enable proactive eco-innovation and market differentiation, analyzer strategies favour incremental and cost-effective environmental practices, and defender strategies maintain compliance-based efficiency.

5. Managerial and policy implications

This study provides valuable insights for both managers of tourism SMEs and policymakers aiming to foster sustainability-oriented innovation. From a managerial perspective, the findings underline that green innovation success depends on the firm's underlying strategic orientation and the coherence between competitive priorities and sustainability goals. Managers of tourism SMEs should therefore interpret sustainability as a strategic lever rather than a mere compliance requirement, aligning environmental initiatives with the firm's strategic identity. For prospector-oriented firms, the results suggest that sustainability can serve as a platform for differentiation and market positioning. Their exploratory attitude and openness to experimentation enable them to integrate eco-innovation directly into new product and service development. Managers in these firms should exploit their natural proactivity by translating environmental challenges into new business opportunities, for example, by launching eco-certified experiences, investing in renewable resources, or adopting circular business models that enhance both brand value and environmental impact. For analyzer-oriented firms, sustainability requires a balance between innovation and efficiency. Managers should focus on adopting green practices that have already demonstrated operational or economic benefits, such as energy-efficient technologies, waste management systems, or green supply chain partnerships. This incremental, data-driven approach

allows analyzers to consolidate reputation and customer loyalty while maintaining cost competitiveness. To support this balance, firms should implement systematic monitoring mechanisms to evaluate the return on sustainability investments and progressively scale up successful initiatives. For defender-oriented firms, environmental innovation is not a natural driver of competitiveness but can still be leveraged to strengthen efficiency and regulatory compliance. Managers in these firms should integrate sustainability into core operations by prioritising low-cost, high-impact actions which improve both performance and compliance with environmental standards. Adopting voluntary certifications and transparent reporting can further enhance legitimacy in increasingly sustainability-conscious markets. The development of specific KPIs linking economic, environmental, and reputational outcomes can help firms maintain strategic coherence and measure progress toward sustainability. Furthermore, collaboration emerges as a critical enabler as engaging with universities, research centres, and destination networks can compensate for limited internal resources and provide access to new knowledge, technologies, and funding opportunities. Building organisational cultures that encourage learning-by-doing, cross-functional teamwork, and employee involvement in eco-innovation strengthens firms' adaptive capacity in the long term.

Policymakers should design differentiated incentive schemes that recognise the distinct pathways through which prospector, analyzer, and defender firms engage with sustainability. For instance, prospectors could be supported through grants for radical eco-innovation projects and internationalisation of sustainable tourism offerings; analyzers could benefit from vouchers or tax credits for adopting certified green technologies; and defenders could receive targeted training and consultancy support to improve compliance and efficiency. Moreover, public authorities should invest in local collaborative ecosystems, promoting innovation hubs, clusters, and sustainability incubators that connect SMEs with research institutions, local governments, and industry associations. These platforms facilitate knowledge transfer, access to funding, and collective experimentation, all essential to scale up environmental innovation in tourism destinations. These policy directions align with the European Union's objectives (i.e SME Strategy for a Sustainable and Digital Europe (2020), the European Tourism Agenda 2030), which emphasise sustainable competitiveness and low-carbon transformation of tourism ecosystems. Furthermore, NextGenerationEU funds and Cohesion Policy instruments offer an unprecedented opportunity to accelerate sustainability transitions by financing collaborative innovation projects, destination-based clusters, and tourism-focused living labs. Finally, the establishment of integrated European monitoring frameworks that combine environmental, social, and competitiveness metrics could help policymakers assess the real impact of sustainability-oriented strategies. Aligning national and regional initiatives with EU-wide objectives will be crucial to ensure that investments in green innovation strengthen not only firm-level performance but also the long-term resilience and attractiveness of European tourism business.

6. Research Limitations

This study presents several limitations that also open directions for future research. First, the analysis focuses exclusively on Italian tourism SMEs, whose structural and institutional characteristics make the context particularly relevant but may limit the generalizability of findings to other national settings. Future research could extend the analysis to other European countries. Second, the study relies on cross-sectional data, which, while methodologically robust and harmonised, does not capture dynamic effects or temporal evolution. Future econometric analyses will aim to quantify these relationships by estimating the marginal effect of each strategic orientation on different types of green innovation (internal vs. consumer-related). Additional robustness checks will explore whether firm size, geographical area, and tourism sub-sector (accommodation vs. food services) moderate these effects, offering a more granular understanding of how tourism SMEs align strategic behaviour with sustainability objectives.

Third, although the databases include detailed indicators on innovation and strategy, variables are self-reported and categorical, potentially underestimating the qualitative depth of strategic behaviour and environmental engagement. Future studies could integrate these data with qualitative evidence or complementary sources, such as firm websites or sustainability reports, to capture the nuances of green innovation processes. Future research could explicitly test the role of inter-firm collaborations, stakeholder pressures, and institutional incentives as external enablers of sustainability-oriented innovation, confirming whether cooperation and learning-by-doing act as substitutes for formal R&D in resource-constrained tourism SMEs. Despite these limitations, this study represents an initial step toward understanding how strategic orientations shape sustainability transitions in tourism SMEs and provides a foundation for future multi-country, multi-method research on strategy-innovation alignment in the green economy.

Keywords: Tourism SMEs; strategic orientation; green innovation; sustainability strategy

Strategie di sostenibilità nelle DMO Italiane: uno studio esplorativo mediante Fuzzy Formal Concept Analysis (FFCA)

Francesca d'Angella[1], Anna Scuttari[2], Manuela De Carlo[3], Stefania Boffa[4]

1. DMO e sostenibilità

La letteratura sul turismo ha ampiamente discusso l'importanza della sostenibilità per lo sviluppo duraturo ed equilibrato dei territori, definendola un elemento prioritario dato il suo impatto multidimensionale (sociale, culturale, economico e ambientale) sulle destinazioni. L'attuazione di modelli di sviluppo locale e di business sostenibili soddisfa le esigenze e le aspettative dei turisti, delle imprese e dei residenti e offre opportunità di crescita ambientale, sociale, economica e culturale (Lee, 2001).

La letteratura di matrice manageriale ha approfondito il ruolo della sostenibilità nello sviluppo turistico e nella competitività delle destinazioni (McDonagh e Prothero, 2014, Pike e Page, 2014; Sharmin et al., 2021, Lee, 2001), nonché come leva per il coinvolgimento degli stakeholder (Byrd, 2007; Ruhanen et al., 2015; Bramwell et al., 2017; Sharpley, 2020). Inoltre, diversi studi hanno evidenziato il ruolo centrale svolto dalle destination management organization (DMO) nel guidare questo processo (d'Angella et al., 2025; Scuttari et al., 2023; Wagenseil et al., 2022). Nella gran parte di questi studi è stata applicata una prospettiva di analisi territoriale, focalizzata sulla destinazione. Al contrario, i modelli attraverso i quali le DMO implementano la sostenibilità a livello organizzativo sembrano essere un tema meno esplorato, sebbene esso sia di grande interesse per qualsiasi organizzazione. In questa prospettiva, la sostenibilità è un elemento strategico fondamentale per le DMO non solo come obiettivo di lungo termine delle destinazioni che gestiscono, ma diventa un principio cardine per la loro stessa operatività e sopravvivenza in quanto organizzazioni. Essa garantisce la resilienza nel lungo termine, la credibilità presso gli stakeholder, la capacità di interecettare nuovi bisogni dei visitatori e, in alcuni casi, favorisce l'accesso a finanziamenti. La multidimensionalità dell'argomento richiede un approccio alla sostenibilità strategico e complesso, soprattutto da parte delle organizzazioni - come quelle che operano nel settore del turismo - la cui stessa sopravvivenza e il cui modo di fare business dipendono dalla loro capacità di essere sostenibili (Weaver, 2011).

Questo lavoro di ricerca mira a comprendere il livello di maturità delle DMO nel processo di trasformazione verso la sostenibilità e a dimostrare l'efficacia della Fuzzy Formal Concept Analysis come metodo per identificare i modelli di attuazione della sostenibilità. Tale metodologia appare infatti particolarmente efficace nell'estrarre modelli comuni di attuazione della sostenibilità nel caso in cui la ricerca si basi su un set di dati con più variabili ordinali e categoriche.

Alla luce di questi obiettivi, questo studio vuole rispondere alle seguenti domande di ricerca:

- Qual è il livello di maturità delle DMO nel processo di trasformazione verso la sostenibilità?

[1] Professoressa associata, ECON-06/A, Università IULM; francesca.dangella@iulm.it – corresponding author

[2] Professoressa associata, ECON-06/A, Università IULM; anna.scuttari@iulm.it

[3] Professoressa ordinaria, ECON-06/A, Università IULM; manuela.decarlo@iulm.it

[4] Ricercatrice, INF-01/A, Università IULM; stefania.boffa@iulm.it

- Esistono dei modelli di implementazione della sostenibilità adottati dalle DMO?
- La metodologia FFCA rappresenta un metodo di analisi efficace per identificare i modelli di implementazione della sostenibilità?

I primi risultati dello studio, ancora in corso, mostrano come questa metodologia permetta di riconoscere fattori di comunanza nelle azioni intraprese dalle diverse DMO verso la sostenibilità.

2. Metodologia

Il disegno della ricerca si fonda su un approccio quantitativo, in cui i dati sono stati raccolti attraverso un sondaggio. È stata condotta un'indagine censuaria su 268 DMO regionali e subregionali italiane tramite posta diretta (CAWI), con tre successivi richiami telefonici (CATI). I rispondenti (n=109; tasso di risposta: 40,7%) coprono 18 delle 21 regioni italiane, con una copertura maggiore nella parte nord-orientale del Paese (47,0%). Trattandosi di uno studio non interventistico che ha raccolto solo dati organizzativi e non personali, è stato considerato a basso rischio per i partecipanti e non ha richiesto alcun consenso alla privacy per il trattamento dei dati.

La misurazione della sostenibilità delle DMO italiane si basa sugli standard internazionali proposti nella sezione Destination Management Performance del GDS-Index (GDS-Movement, 2024), uno score basato su un sistema di criteri di valutazione sviluppato e testato da un comitato internazionale di esperti, tra cui eminenti studiosi nel campo del turismo sostenibile. Il GDS Index dispone di una serie di indicatori dedicati alla misurazione della Destination Management Performance. Ai fini di questo studio sono stati selezionati 23 dei 29 elementi originari raggruppati in 11 dimensioni di sostenibilità (6 elementi sono stati esclusi da un gruppo di esperti in quanto non adatti al contesto italiano). Ogni elemento è collegato a un punteggio corrispondente (destination sustainability score - DSS); il punteggio massimo associato ai 23 elementi selezionati è 61,5, che corrisponde ad un'eccellente performance in termini di gestione sostenibile delle destinazioni (Tabella 1).

Nome della dimensione	Descrizione	Item associati	Max DSS
Strategy	Esistenza, contenuti, caratteristiche e metriche di una strategia della DMO dedicata alla sostenibilità o rigenerativà della visitor economy	1, 5	7.5
Visitor Management	Implementazione di azioni da parte della DMO per la gestione dei visitatori nella destinazione	7	3
Climate action	Implementazione di azioni da parte della DMO per la mitigazione degli impatti	8	3
DEI	Esistenza di un programma e di iniziative da parte della DMO per l'inclusione sociale	9 e 10	4.5
Policy & Certification	Esistenza di policy della DMO dedicate alla gestione della sostenibilità e ottenimento di certificazioni di sostenibilità a livello di DMO e di destinazione	11, 12, 13, 14	9
Governance	Essitenza di manager o comitati che assumono le responsabilità di gestione della sostenibilità della DMO	15	2
Capacity building	Implementazione di attività di diffusione, sensibilizzazione e formazione sulla sostenibilità destinate al personale della DMO o agli attori del turismo	17, 18, 19	8
Measurement & Reporting	Esistenza di un Sistema per il monitoraggio, il reporting e la diffusione degli obiettivi e dei risultati ottenuti dalla DMO con riferimento alla sostenibilità	20, 21, 22, 23	12
Marketing & Communications	Contenuti e caratteristiche delle attività di comunicazione della DMO relative alla sostenibilità rivolte a turisti e interlocutori commerciali	24	3

Mobility	Esistenza di attività di promozione svolte dalla DMO relative alla mobilità dolce rivolte a visitatori e partecipanti agli eventi	26, 27	5
Impact and Regeneration	Esistenza e implementazione di attività di sensibilizzazione della DMO di progetti locali sulla sostenibilità rivolte ai visitatori, ai partecipanti agli eventi e ai propri clienti e presenza di un piano per la legacy degli eventi	28, 29	4.5
Totale			61.5

Tabella 1. Le dimensioni del DSS, fonte: elaborazioni proprie

La Formal Concept Analysis (FCA) è una teoria matematica introdotta da Rudolf Wille per esplorare e organizzare i dati (Ganter e Wille 2012). Nel corso degli anni è stata applicata in diversi ambiti, dall'apprendimento automatico alla biologia. Nonostante il suo potenziale, solo pochi lavori, fra cui Yuxia e Bian (2015) e Cimiano, Hotho e Staab (2005), impiegano la FCA negli studi sul settore turistico, mentre più nello specifico non si sono rilevate applicazioni in lavori di ricerca sulla gestione delle destinazioni. Ciò è in parte dovuto al fatto che le tecniche FCA non sono molto conosciute al di fuori dell'informatica e che la ricerca negli ambiti del turismo si basa principalmente su metodi statistici più ampiamente utilizzati (regressione, analisi dei cluster e così via).

Nell'ambito della FCA, il set di dati iniziale, chiamato contesto formale, rappresenta la relazione tra due categorie: oggetti e attributi. Di solito viene visualizzato come una tabella binaria, in cui le righe corrispondono agli oggetti, le colonne agli attributi e ogni cella contiene 1 (se l'oggetto ha l'attributo) o 0 (in caso contrario). Il risultato dell'FCA è una raccolta di particolari cluster, chiamati concetti formali. Un concetto formale è costituito da un insieme di oggetti e da tutti gli attributi che li caratterizzano. In questo studio, gli oggetti corrispondono alle DMO e gli attributi corrispondono alle dimensioni di sostenibilità del punteggio GDS, ovvero alla performance composita delle DMO in ciascuna dimensione (vedi Tabella 1).

La Fuzzy Formal Concept Analysis (FFCA) estende questa teoria matematica esprimendo la relazione tra oggetti e attributi in gradi di verità, anziché solo attraverso due opzioni di risposta (1 o 0) (Alwersh & László, 2022). Secondo questo approccio, ogni cella può assumere un valore compreso tra 0 e 1, che rappresenta il grado con cui un oggetto possiede un determinato attributo. Di conseguenza, la FFCA è adatta a domini in cui le proprietà sono graduali piuttosto che rigorosamente presenti o assenti.

Nel contesto della nostra analisi, i gradi sono costruiti sulla base della capacità di una determinata DMO di implementare parzialmente o completamente una specifica dimensione di sostenibilità del DSS score (Tab.1): 0 (non ancora), 0,5 (parzialmente) e 1 (completamente). Ad esempio, se i valori associati a una specifica DMO per le categorie Strategia, DEI e Gestione dei visitatori sono rispettivamente 0, 0,5 e 1, ciò significa che la DMO non ha ancora attivato la dimensione della Strategia, ha implementato parzialmente la DEI e ha implementato completamente le attività di Gestione dei visitatori.

In letteratura sono stati proposti vari approcci basati sulla teoria della logica fuzzy (Klir & Yuan, 1995) per estrarre concetti da un contesto formale con valori di verità multipli. In questo studio si è optato per uno dei metodi più semplici chiamato approccio "fuzzy to crisp" (Majidian, et al, 2011). Secondo questo approccio, un concetto è definito come un insieme di oggetti A e un insieme di attributi B. A differenza di un concetto classico, in cui gli oggetti e gli attributi sono semplicemente inclusi o esclusi, ogni oggetto a in A è associato a un valore $\beta(a)$ (da 0 a 1), che indica il grado di verità con cui a soddisfa tutti gli attributi in B. Matematicamente, $\beta(a)$ è calcolato come il grado minimo della relazione tra a e ciascun attributo in B. Ad esempio, si consideri il caso ipotetico in cui un concetto comprenda la coppia (A, B), dove A include una ipotetica DMOx e B è costituito da Misurazione e rendicontazione, Mobilità e Strategia. In questo

caso, β(DMOx) = 0,5, il che significa che la DMOx ha implementato tutte queste categorie almeno in parte.

Il numero di concetti generati a partire dal dataset è solitamente elevato, il che richiede l'identificazione e la focalizzazione dell'analisi solo su quelli più rilevanti. Alcuni concetti sono infatti più generali (includono molti oggetti ma pochi attributi), mentre altri sono più specifici (comprendono meno oggetti ma più attributi definiti). I concetti intermedi sono i più informativi perché raggiungono un equilibrio tra generalità e specificità. Un altro fattore importante da considerare è il "supporto" di un concetto, definito come la somma dei gradi associati ai suoi oggetti. I concetti con un supporto più elevato sono generalmente più significativi (Elhady, G. F., et al, 2024).

In questo studio, i nomi delle DMO sono stati pseudonimizzati, poiché la ricerca si concentra sui modelli di implementazione della sostenibilità e non sulle prestazioni delle singole organizzazioni.

3. Primi risultati

Alcune prime analisi descrittive hanno mostrato che l'implementazione della sostenibilità a livello di DMO è ancora in una fase iniziale, poiché il punteggio medio dei rispondenti è di 15,9 punti (max score 61,5 punti), in un range di valori rilevati compreso tra 0 e 53 punti, con solo 4 DMO che superano i 40 punti. Per identificare i modelli di sostenibilità è stato quindi applicato il metodo FFCA. Dal set di dati iniziale sono stati ricavati 253 concetti C_0,…, C_{252}, che catturano la relazione tra 109 DMO e le 11 dimensioni di sostenibilità, con valori uguali a 0, 0,5 e 1. I concetti rappresentano modelli di associazione tra le dimensioni, interpretati come modelli condivisi o archetipi di implementazione della sostenibilità.

I concetti sono organizzati in 12 livelli in base alla loro generalità, definita dal numero di attributi che contengono. Il concetto superiore (C_0) include tutte le DMO ma nessun attributo ed è quindi privo di informazioni. All'estremo opposto, il concetto inferiore (C_{252}) combina tutti gli 11 attributi ma include solo una DMO, con grado 0,5, e rappresenta quindi il modello di implementazione più efficace (ovvero il migliore nel nostro set di dati).

Per selezionare i concetti più significativi, si è proceduto in due fasi: 1) identificazione dei livelli centrali e 2) selezione dei concetti.

In primo luogo, si sono identificati i livelli centrali attorno al valore mediano nel reticolo concettuale (livelli 5 e 6). Si è quindi calcolato il supporto di ciascun concetto, partendo dal presupposto che un valore di supporto elevato indica un modello di implementazione solido e ricorrente. Tra i 2 livelli centrali – 5 e 6 - abbiamo quindi selezionato il livello 6 in base alla "regola del gomito" (Liu e Deng, 2020) applicata ai valori di supporto. La tabella 2 elenca i concetti dei livelli 5 e 6 con il supporto più elevato, insieme alle dimensioni di sostenibilità associate e al numero corrispondente di DMO.

	Concetti	**Attributi (dimensioni della sostenibilità)**	**Supporto**	**N. DMO**
Layer 5	C_{206}	Mobility, Strategy, Visitor Management, DEI, Governance	12.5	23
	C_{90}	Mobility, Visitor Management, DEI, Governance, Capacity Building	12.5	25
Layer 6	C_{213}	Mobility, Strategy, Visitor Management, DEI, Governance, Capacity Building	9.5	19
	C_{233}	Mobility, Strategy, Visitor Management, Climate Action, DEI, Governance	5.5	10

Tabella 2. Concetti, attributi della sostenibilità, supporto e n. di DMO relativi dei livelli 5 e 6, fonte: elaborazioni proprie

I concetti di livello 5 presentano supporti simili, il che rende difficile distinguere un modello dominante. Al contrario, al livello 6, il concetto C_{213} spicca in modo particolare, mostrando valori di supporto molto più elevati rispetto al concetto successivo (9,5 per C_{213} rispetto a 5,5 per C_{233}).

Per questo motivo, da qui in avanti la nostra analisi si concentra sul concetto C_{213}, che comprende 19 DMO e 6 categorie di sostenibilità: Mobility, Strategy, Visitor Management, DEI, Governance e Capacity Building. Ogni DMO è associata a C_{213} con un grado di veridicità pari a 0,5, che indica un'implementazione parziale di tutte e sei le dimensioni.

Nel loro complesso, le sei dimensioni includono sia attività prettamente interne alla DMO, sia attività di gestione della destinazione.

La tabella 3 fornisce una visione dettagliata del modello C_{213} mostrando in che misura ogni DMO ha implementato ognuna delle sei categorie. Inoltre, mostra la cardinalità di ciascuna DMO, che è la somma dei suoi gradi di appartenenza agli attributi. Una cardinalità più elevata riflette quindi un'implementazione più forte. Si osservi che due DMO - "DMOg" e "DMOl" - raggiungono la cardinalità più alta - pari a 5,5 su un valore massimo di 6 - emergendo come le migliori in termini di prestazioni all'interno di questo modello.

DMO	**Strategy**	**Visitor Management**	**DEI**	**Governance**	**Capacity Building**	**Mobility**	**Cardinalità**
DMOa	1	0.50	0.50	1	1	1	5
DMOb	1	1	0.50	1	0.5	0.5	4.5
DMOc	0.5	1	1	1	0.5	0.5	4.5
DMOd	1	1	0.50	1	1	0.5	5
DMOe	1	1	0.50	0.5	0.5	0.5	4
DMOf	1	0.50	0.50	0.5	0.5	1	4
DMOg	1	1	1	1	0.5	1	5.5
DMOh	1	1	1	0.5	0.5	1	5
DMOi	1	0.5	0.5	1	0.5	0.5	4
DMOj	1	0.5	0.5	1	0.5	0.5	4
DMOk	1	0.5	0.5	1	0.5	0.5	4
DMOl	1	1	1	1	0.5	1	5.5
DMOm	1	1	0.5	1	0.5	1	5
DMOn	1	1	0.5	0.5	0.5	1	4.5
DMOo	1	1	0.5	1	1	0.5	5
DMOp	1	1	0.5	1	1	0.5	5
DMOq	1	0.5	0.5	1	0.5	1	4.5
DMOr	1	1	1	0.5	1	0.5	5
DMOs	1	1	1	0.5	1	0.5	5

Tabella 3. Grado di implementazione di ciascuna categoria di sostenibilità da parte delle DMO appartenenti al concetto C_{213} e relativa cardinalità, fonte: elaborazioni proprie

Secondo la tabella 3, strategy è la variabile pienamente implementata da tutte le DMO tranne una. Visitor management e governance sono pienamente implementate da 13 su 19. DEI e capacity building sono invece quelle meno implementate appieno, solo 6 DMO su 19. Questi dati suggeriscono quindi che le DMO italiane che hanno realizzato questo modello di sostenibilità,

abbiano già raggiunto un livello avanzato soprattutto nella formalizzazione di una strategia di sostenibilità, in seconda battuta nella gestione sostenibile dei visitatori e nell'integrazione della sostenibilità nei loro sistemi di governance. Le politiche di diversità e inclusione insieme alle attività di formazione sulla sostenibilità necessitano ancora di ulteriori sforzi per una piena realizzazione.

La lettura orizzontale dei dati, invece, mostra come nessuna DMO abbia implementato pienamente tutte le sei dimensioni che compongono il concetto, poiché la cardinalità massima è pari a 5,5. Essa viene raggiunta da solo 2 DMO su 19, mentre 8 DMO mostrano una cardinalità pari a 5, 4 DMO hanno un valore complessivo pari a 4,5 e le rimanenti 5 DMO pari a 4. Ciò suggerisce come anche all'interno del concetto ci sia ancora spazio per un potenziamento futuro delle attività di sostenibilità realizzate dalle DMO.

In conclusione, il concetto C_{213} evidenzia un modello di sostenibilità che combina attività di gestione operativa dei flussi turistici (gestione dei visitatori e mobilità) con iniziative strategiche volte a promuovere la sostenibilità (strategy, DEI, governance e capacity building). Questi risultati suggeriscono che oggi in Italia, un gruppo importante di DMO implementano la sostenibilità lungo quattro direttrici. Una prima direttrice riguarda l'urgenza di affrontare problemi operativi legati alla gestione dei flussi e della mobilità che spesso rappresenta il primo concreto stimolo all'implementazione di pratiche di sostenibilità. Ad essa si associa una seconda direttrice più orientata al lungo periodo che riguarda la formulazione di strategie condivise e il loro monitoraggio. Una terza direttrice include la presenza di ruoli (sustainability manager) e strutture (comitati interni o aperti ad operatori esterni) dedicati alla governance della sostenibilità. Infine, una quarta e ultima direttrice riguarda le politiche di inclusione e le attività di formazione rivolte sia ai dipendenti della DMO che ai pubblici esterni (visitatori e stakeholder della destinazione).

I risultati dello studio mostrano come un'efficace implementazione delle pratiche di sostenibilità implichi una combinazione di molteplici dimensioni di azione, implementate dalle DMO a diverse velocità.

4. Conclusioni e prossimi passi

Questo lavoro evidenzia il potenziale dell'FFCA nel rivelare modelli articolati di implementazione della sostenibilità, costituiti da gruppi di attività e funzioni implementati con alta frequenza in contemporanea da diverse DMO localizzate in luoghi diversi del Paese.

Il metodo FFCA si presenta quindi come un approccio metodologico potente per estrarre modelli comuni di implementazione della sostenibilità, specialmente nel caso di dataset composti da variabili categoriali. L'applicazione della FFCA nel turismo e, più in generale, nell'individuazione dei modelli di implementazione delle strategie di sostenibilità è innovativa e appropriata perché: 1) riconosce il carattere graduale e progressivo del processo di implementazione della sostenibilità fornendo uno strumento in grado di individuare livelli intermedi di adozione; 2) consente di cogliere le combinazioni delle molteplici dimensioni che caratterizzano l'implementazione della sostenibilità distinguendo quelle generali da quelle più specifiche.

I prossimi passi dell'analisi si concentreranno su: i) un ulteriore sviluppo applicativo del metodo FFCA e ii) sul suo confronto con altri metodi ben noti di analisi multivariata (es. PCA). Per quanto riguarda il primo aspetto, intendiamo effettuare un'esplorazione più dinamica del reticolo concettuale, ad esempio sviluppando strumenti per navigare attraverso i suoi diversi livelli e mettere a fuoco come i concetti evolvono da generali a specifici. Inoltre, studieremo le implicazioni logiche tra gli attributi, per comprendere meglio come le dimensioni della sostenibilità meno implementate iniziano ad emergere in relazione a quelle più forti e consolidate. In questo metodo, un'implicazione è definita come una regola che esprime una dipendenza o una relazione costante tra gli attributi all'interno di un contesto. In termini semplici: "Se un oggetto

possiede l'attributo A, allora possiede necessariamente anche l'attributo B". Questa analisi consentirà quindi di identificare non solo le dimensioni che caratterizzano i modelli di implementazione della sostenibilità nelle DMO italiane, ma anche i nessi causali tali dimensioni. Per quanto riguarda invece il secondo aspetto, valuteremo la capacità dell'FFCA di superare altri metodi comunemente utilizzati (ad esempio l'analisi dei cluster) in termini di: gestione dei dati categoriali; capacità di rilevare i gradi di appartenenza di ciascuna unità statistica a un costrutto specifico; struttura e interpretabilità dei risultati.

Parole chiave: Strategia; sostenibilità; DMO; FFCA

Configurations for successful artificial intelligence adoption in hospitality: Evidence from a fsQCA analysis of managerial perceptions

Claudia Cozzio[1], Francisco Santos Arteaga[2], Oswin Maurer[3]

1. Introduction

Artificial Intelligence (AI) is reshaping hospitality through automation, personalization, and operational efficiency (Buhalis, 2025; Wong et al., 2023). As competitive pressures intensify and guest expectations evolve, hospitality firms are increasingly compelled to explore AI-enabled solutions ranging from intelligent revenue management systems to AI-powered concierge services and predictive maintenance tools. However, despite its potential, adoption is uneven, particularly in small and medium-sized enterprises constrained by resource limitations and digital knowledge gaps (Cozzio et al., 2025). In this context, understanding the specific combinations of managerial, strategic, and perceptual factors driving AI implementation is essential. This study focuses on the South Tyrol region, a representative tourism ecosystem characterized by family-run, leisure-oriented hotels, offering a microcosm of Italian hospitality. The research aims to uncover which factors, and in what combinations, determine successful AI adoption using Fuzzy-Set Qualitative Comparative Analysis (fsQCA), a method capable of capturing causal complexity (Pappas & Woodside, 2021). Unlike variance-based approaches that examine the net effects of individual predictors, fsQCA identifies combinations of conditions that are jointly sufficient to produce an outcome, making it particularly suited to SME environments where no single factor operates in isolation. The analysis compares configurations of internal awareness, investment, perceived impact on customer, and data security to reveal the conditions under which AI implementation succeeds or fails.

2. Literature Review

Four antecedents are analyzed: AI awareness and strategic integration, investment in staff training and organizational change, perceived customer impact and experience enhancement, and the relevance of data security and privacy.

Artificial intelligence awareness reflects both technical understanding and strategic commitment to technology integration (Leung, 2019). Managers who view AI as a strategic enabler tend to align its use with competitive advantage, driving more extensive adoption (Cozzio et al., 2025). Strategic awareness therefore functions as a prerequisite for deliberate and sustained AI integration, rather than ad hoc or reactive experimentation. Conversely, a lack of awareness fosters uncertainty, resistance, and fragmented innovation efforts.

Investing in human capital is essential for aligning AI with employee capabilities. Training mitigates fear of job loss, increases acceptance, and fosters cultural readiness (Ersoy & Ehtiyar, 2023; Li et al., 2019). Drawing on Mayo's Human Relations Theory (Sarachek, 1968), employee

[3] Full Professor, ECON-07/A, Free University of Bolzano; oswin.maurer@unibz.it

inclusion and trust are pivotal to technological change. Hospitality organisations that systematically invest in upskilling programmes tend to exhibit lower resistance to AI implementation and higher rates of sustained adoption, suggesting that investment in training functions as both a technical and a cultural enabler.

AI-driven personalisation and operational efficiency enhance service satisfaction and loyalty (Li et al., 2022; Go et al., 2020). Intelligent systems capable of anticipating guest preferences, from personalised room settings to tailored dining recommendations, represent a qualitative shift in service delivery that goes beyond routine automation. Such applications redefine the guest journey by creating individualised touchpoints that increase perceived value and emotional attachment to the brand. Managers who perceive AI as augmenting, rather than replacing, the human dimension of hospitality demonstrate higher engagement with technology and are more likely to champion its adoption internally (Zhong et al., 2022).

Data protection and regulatory compliance remain both obstacles and enablers. In the hospitality context, where guests share sensitive personal and financial information, transparent data governance is particularly salient. Regulations such as the General Data Protection Regulation (GDPR) impose formal obligations on hospitality firms, yet also provide a structural impetus for developing responsible AI practices. Properly integrated data management strategies can therefore transform perceived risks into trust-building mechanisms, reinforcing guest confidence and long-term loyalty (Chen & Kuo, 2017; Rasheed et al., 2024).

Overall, these factors do not operate in isolation but interact dynamically. Prior research has often examined these antecedents independently, thereby underestimating the configurational logic that governs technology adoption decisions in practice. The fsQCA approach is uniquely suited to capture this interdependence, identifying how multiple conditions combine to yield successful AI adoption and distinguishing the configurations that lead to non-adoption. This perspective aligns with complexity theory, which posits that organisational outcomes rarely stem from a single cause but emerge from the conjunction of mutually reinforcing conditions.

3. Methodology

Data were collected from 76 hotel professionals (hotel owners, hotel managers, and first-line managers) between September 2023 and March 2024. South Tyrol provides a particularly relevant research setting owing to its high tourism density, strong concentration of independently operated family hotels, and active regional digitalisation initiatives. Semi-structured interviews were conducted in person or via video call, lasting between 45 and 75 minutes, allowing participants to elaborate on their direct experience with AI tools and yielding richer contextual data than structured survey instruments alone could provide. The interview protocol explored participants' awareness of AI, investment in training, perceived customer impact, and data privacy practices. The outcome variable Successful AI Adoption (Adop) was analyzed in relation to four antecedent conditions: AI awareness and strategic integration (Awa), Investment in staff training and organizational change (Inv), Perceived customer impact and experience enhancement (Imp), and Relevance of data security and privacy (Sec). The analyses follow the evaluation structure defined by Cangialosi (2023) and Pappas & Woodside (2021). All numerical computations were performed using R software (Duşa, 2018). Construct reliability and validity were assessed through confirmatory factor analysis. Although the reliability indices (Cronbach's $\alpha = 0.568$; $\Omega = 0.602$) were modest, the model fit indices (CFI = 0.948; SRMR = 0.055) demonstrated acceptable consistency. Factor loadings indicated that Awa had the strongest influence (0.855), confirming its central theoretical role in the model.

The implementation of fsQCA requires transforming the values of the variables from numerical data bounded within the [0, 1] interval into fuzzy membership scores. The main technique used to transform the data is the direct calibration procedure, which requires defining three reference values delimiting the inclusion, exclusion, and cross-over of the data within the

membership function assigned to the corresponding fuzzy numbers. Two different sets of reference values are usually defined through the percentiles of the observed variables, namely, the 5th, 50th, and 95th or the 20th, 50th, and 80th. The latter are recommended when dealing with asymmetric or not normally distributed data. The standard calibration procedure is performed by applying a logistic function to transform the data. The resulting scores range from the maximum ambiguity value of 0.50 to the full inclusion and exclusion values defined by 1 and 0, respectively. In this regard, calibrated scores cannot be equal to 0.50 since the resulting membership would remain ambiguous, leading to the subsequent configuration to be excluded from the analysis. A standard solution consists of adding 0.001 to any 0.50 score (Fiss, 2011). Any score of 0.50 was therefore replaced with 0.501 to ensure that all potential configurations were preserved (Mattke et al., 2021).

4. Results and discussion

The main objective of fsQCA is to identify all the variable configurations leading to the outcome defined in the construct. The "Quine–McCluskey" algorithm applied for Boolean minimization delivers three sets of solutions, complex, intermediate, and parsimonious, describing the variable combinations reaching the frequency threshold required for meaningful inferences regarding their effect on the outcome variable. Complex solutions are generally omitted due to the large set of potential configurations among variables that they deliver. Therefore, the main variable configurations considered are those derived from the parsimonious solution, which describes the "core conditions," and the intermediate one, which delivers both "core" and "peripheral" conditions (Fiss, 2011).

Tables 1 and 2 present the results of the analysis while distinguishing between core and peripheral conditions. Following standard convention, the core solutions are written in bold characters. The raw coverage (proportion of outcome cases explained by a given configuration), unique coverage (proportion of outcome cases explained by a specific configuration, excluding any overlap with other variable configurations), and consistency (strength of the relationship, namely, the extent to which the configuration leads to the outcome) of the different variable configurations are also described in the table.

As illustrated in Tables 1 and 2, the main configuration fostering Adop is given by Awa∗Imp∗Sec, while the combinations triggering ∼Adop are ∼Awa∗Sec and ∼Inv∗∼Imp∗Sec. The variable Imp defines a core solution together with Awa when fostering adoption, reflecting the importance of a clearly articulated guest-centric rationale in justifying AI investment. Managers who can communicate the direct value of AI for enhancing guest experiences appear better positioned to build the internal consensus needed to sustain adoption over time. The coordinated effect of ∼Inv and ∼Imp defines a compounding barrier that data security considerations alone cannot overcome. Sec remains a consistent peripheral condition across all configurations, functioning as a contextual enabler rather than a primary driver of adoption.

	inclS	**PRI**	**covS**	**covU**
1 **Awa∗Imp**∗Sec	0.875	0.786	0.682	–
M1	0.875	0.786	0.682	

Table 1. Configurations fostering Adop decisions

	inclS	**PRI**	**covS**	**covU**
1 **∼Awa**∗Sec	0.958	0.933	0.692	0.302
2 **∼Inv**∗**∼Imp**∗Sec	0.889	0.844	0.390	0.000
M1	0.897	0.845	0.692	

Table 2. Configurations fostering ∼Adop decisions

The results of the two previous tables are summarized in Table 3 using the standard fsQCA notation. This table describes the existence of a unique configuration of variables sufficient to generate high levels of Adop. A second set composed of two configurations leading to low levels of Adop complements these results, highlighting, in both cases, the substantial importance of Awa and ∼Awa in the Adop and ∼Adop decisions, respectively.

	Adop	**∼Adop 1**	**∼Adop 2**
Awa	●	Ø	
Inv			Ø
Imp	●		Ø
Sec	•	•	•
Consistency	0.875	0.958	0.889
Raw coverage	0.682	0.692	0.390
Unique coverage	–	0.302	0.000
Solution consistency	0.875	0.897	
Solution coverage	0.682	0.692	

• denotes high levels of a given variable being present in the configuration leading to the outcome; Ø denotes low levels of a given variable being present in the configuration leading to the outcome; blank spaces imply that the variable is not relevant in the configuration leading to the outcome; large characters describe core variables while small ones refer to peripheral ones.

Table 3. Configurations derived from the parsimonious and intermediate solutions.

Several sensitivity analyses were performed to validate the robustness of the results. More precisely, the thresholds selected when performing fsQCA are based on the guidelines provided in the literature; thus, the parameters selected initially are modified and the results obtained are compared to those defining the initial configurations. Comparisons focus on the overall consistency and coverage derived from the modifications implemented in the frequency, consistency, and PRI thresholds, as well as the percentiles selected to transform the data into fuzzy numbers. The high consistency scores observed across all configurations (ranging from 0.875 to 0.958 for Adop and ∼Adop respectively) provide strong evidence that the identified conditions reliably predict the outcome variable, lending credibility to the theoretical model proposed in this study.

As summarized in Table 4, the main significant changes in the Adop and ∼Adop scenarios are observed when shifting the calibration thresholds and obtaining consistent Awa∗Sec and ∼Awa∗Sec configurations, respectively. In this case, Awa and ∼Awa remain as the main reference determinants triggering Adop and ∼Adop decisions, respectively.

	Adop	**∼Adop**
Awa	●	Ø
Inv		
Imp		
Sec	•	•
Consistency	0.986	0.951
Raw coverage	0.876	0.783
Unique coverage	–	–
Solution consistency	0.986	0.951
Solution coverage	0.876	0.783

Table 4. Alternative Calibration Thresholds fostering Adop and ∼Adop decisions

5. Conclusion

The fsQCA analysis reveals that AI awareness and strategic integration represent the essential foundation for successful adoption within the hospitality sector. Awareness emerges as the core condition, consistently present across all configurations leading to high levels of adoption. Data security, while peripheral, plays a stabilizing and legitimizing role in shaping managerial confidence in technological systems. In addition, hotels that combine strong awareness with a clear customer orientation (Awa∗Imp∗Sec) demonstrate an ability to align strategic intent with perceived guest benefits, achieving adoption through the synergy of internal

readiness and external value creation. In contrast, configurations characterized by the absence of awareness and training (~Awa or ~Inv) correspond to non-adoption scenarios, where even a focus on data security, often viewed as a defensive or compliance-driven aspect, cannot offset the lack of strategic and cultural readiness. This finding carries a particularly important message for hotel owners and general managers: investing in data security infrastructure without first cultivating organisational awareness and a shared understanding of AI's potential value is unlikely to produce meaningful adoption outcomes. The sequencing of capability-building efforts therefore matters, and awareness must be established as a foundation before other enabling conditions can exert their full effect.

These findings underline the multifaceted nature of AI adoption, confirming that organizational success depends not on isolated factors but on their coherent interaction. The overall results highlight the principle of equifinality, indicating that multiple combinations of conditions can lead to the same outcome of successful adoption. Nonetheless, configurations sharing a high level of awareness reveal superior consistency and coverage across models, reaffirming its pivotal role. These patterns suggest that awareness serves not only as a technical understanding of AI tools but also as a manifestation of organizational learning and leadership commitment. Hotels with high awareness levels tend to perceive AI as a complement to, rather than a substitute for, human service quality, which in turn supports a positive organisational narrative around technology adoption. This narrative dimension is particularly significant in family-run establishments, where strategic decisions are often shaped by personal values and long-term stewardship orientations rather than short-term efficiency calculations. Conversely, a lack of awareness reinforces inertia and resistance to change, particularly in traditional contexts where the perceived risk of disrupting established service routines outweighs the anticipated benefits of AI adoption.

Taken together, the results provide both theoretical and managerial insights. From a theoretical perspective, they support the idea that organizational readiness is a multidimensional construct encompassing knowledge, strategy, and legitimacy. From a managerial standpoint, they emphasize that successful AI adoption requires an integrated approach that combines awareness-building, investment in employee development, and transparent communication of data security practices. Hotel managers are therefore advised to treat AI adoption not as a discrete technological project, but as an ongoing organisational capability that requires continuous reinforcement through training, clear communication of strategic intent, and governance frameworks that safeguard guest data. These findings confirm that technology integration in hospitality is not a purely technical process, but a cultural and strategic transformation shaped by collective understanding and trust.

The implications extend beyond hospitality, offering insights for other service sectors navigating AI transformation. Policymakers should support digital literacy and training programmes, especially in regions dominated by SMEs, where structural barriers to AI adoption are most pronounced. Industry associations and regional bodies could play a meaningful role in facilitating knowledge transfer and providing shared infrastructure that reduces the entry costs associated with AI implementation. Future research could expand cross-regional comparisons or incorporate longitudinal data to trace how awareness evolves with AI maturity, and to examine whether the configurations identified here hold across different cultural and broader institutional contexts.

Navigare la Transizione: AI e Stakeholder Engagement nella gestione dei porti turistici. Il Sistema Porto Turistico di Maratea

Vincenzo Dell'Anno[1], Anna Prisco[2], Davide Dell'Anno[3]

1. Introduzione

Negli ultimi anni, la letteratura sul turismo costiero e marittimo ha indagato con forte interesse il tema della sostenibilità e della gestione integrata nei porti turistici, in particolare nel Mediterraneo, riconoscendoli come elementi centrali per lo sviluppo equilibrato delle aree costiere (Martínez-Vázquez et al., 2021; Poletan Jugović et al., 2022).

In tale prospettiva, il porto turistico non deve essere considerato come un'infrastruttura isolata, ma come un sistema articolato di funzioni e servizi integrati, che comprende molteplici attività, tra cui quelle nautiche e commerciali, oltre a servizi collaterali e spazi di supporto (carroponte, aree tecniche, distributori di carburante, intrattenimento).

Il "sistema porto turistico", dunque, risulta essere un'infrastruttura fondamentale che collega l'economia locale, il turismo e l'ambiente ma al contempo, rappresenta anche uno spazio vulnerabile sia dal punto di vista ecologico che sociale (Kovačić et al., 2011).

Questa loro duplice natura, da un lato essenziale per l'integrazione delle dinamiche economiche, turistiche e ambientali; dall'altro vulnerabile agli impatti dei cambiamenti climatici e alle pressioni derivanti dalla crescita del turismo, solleva interrogativi cruciali per una gestione efficiente. Sebbene questi porti rappresentino una risorsa strategica per la prosperità delle aree costiere, è fondamentale che la loro pianificazione e gestione siano orientate a garantire un equilibrio sostenibile, che contemperi la crescita economica con la tutela dell'ambiente e la coesione sociale delle comunità locali. Nel caso specifico del turismo costiero e marittimo, i porti turistici, da semplici punti di ormeggio assumono un ruolo cruciale nella blue economy, diventando piattaforme di valore territoriale e rappresentando punti di connessione tra ecosistemi naturali, imprese turistiche e comunità locali (Kovačić et al., 2011).

In questo scenario, la sostenibilità non riguarda soltanto gli aspetti ambientali, ma impatta in maniera incisiva anche sulla dimensione sociale, influenzando le interazioni con le comunità locali, le istituzioni e gli operatori del settore, in linea con i principi della sostenibilità (Spinelli & Benevolo, 2022; Coles, 2024). Salvatore et al. (2021) evidenziano come la costruzione di reti collaborative e modelli di governance condivisi, si rivelino essenziali per promuovere processi di apprendimento collettivo e per favorire la legittimazione delle decisioni strategiche.

Infatti, in questo quadro, il successo delle destinazioni turistiche marittime dipende sempre più dalla qualità della governance e dalla capacità di coordinare una molteplicità di attori, pubblici e privati, chiamati a contribuire a un equilibrio tra competitività e tutela del territorio (Butler, 1999; Biondi & Lara, 2015). Un elemento fondamentale della governance condivisa è il coinvolgimento attivo di tutti gli stakeholder, che deve tradursi in un processo decisionale

[3] Professore associato, ECON-07/A, Università degli Studi della Campania Luigi Vanvitelli; davide.dellanno@unicampania.it

partecipativo in cui le esigenze ecologiche, economiche e sociali siano bilanciate in modo equo e trasparente.

Ciononostante, il contributo di Luoma et al. (2017) mette in luce come la sostenibilità nei porti turistici venga ancora interpretata in modo disomogeneo tra i diversi attori coinvolti, evidenziando la mancanza di un'unica direzione circa gli obiettivi, rendendo complesso il processo di co-creazione di valore sostenibile e la costruzione di una visione integrata tra i diversi stakeholder.

Infatti, come osservato da Koo et al. (2019), la resilienza degli ecosistemi turistici costieri dipende dalla capacità delle istituzioni di coinvolgere i cittadini nel definire soglie di cambiamento accettabili e promuovere processi di apprendimento collettivo e adattamento continuo.

Dunque, il processo di coinvolgimento multi-stakeholder diventa un driver primario per la transizione verso il modello di green port che integra obiettivi di efficienza economica, tutela ambientale e responsabilità sociale (Poletan Jugović et al., 2021).

Tuttavia, tale approccio resta spesso frammentato e debolmente integrato nei piccoli porti turistici, dove mancano risorse economiche, competenze gestionali, oltre a strumenti di monitoraggio efficaci e di raccolta dati basati su tecnologie digitali e strumenti predittivi (Spinelli & Benevolo, 2024; Martínez-Vázquez et al., 2021), capaci di anticipare criticità e di migliorare la trasparenza dei processi decisionali.

Non di meno, di recente, la letteratura ha cominciato ad individuare una forte connessione tra stakeholder engagement, digitalizzazione e sostenibilità (Myrovali et al., 2025). In questo senso, l'utilizzo di sistemi digitali potrebbe svolgere un ruolo chiave, introducendo forme di governance basate sull'innovazione tecnologica e sulla partecipazione degli stakeholder, capaci di supportare processi decisionali più trasparenti e inclusivi (Skaržauskienė et al., 2022).

Dunque, l'utilizzo di strumenti di intelligenza artificiale (AI) può attenuare le difficoltà legate a questi aspetti per il "sistema porto turistico", contribuendo al monitoraggio ambientale, alla gestione dei flussi e all'utilizzo degli ormeggi, alla previsione della domanda e alla trasparenza dei dati, facilitando decisioni più informate e sostenibili (Ioras e Bandara, 2025). Al contempo, la letteratura mostra anche che gli strumenti tecnologici basati su AI, non sono sufficienti a garantire una governance efficiente che implementa scelte sostenibili. Fiducia, partecipazione e dialogo con gli stakeholder, sono elementi fondamentali per supportare l'innovazione sostenibile, che altrimenti rischia di produrre resistenze e squilibri istituzionali (Battistella et al., 2018; Benevolo & Spinelli, 2022).

Alla luce di queste evidenze, lo stakeholder engagement emerge come una condizione abilitante per la governance sostenibile nei porti turistici. Gli stakeholder che orbitano intorno a tale contesto devono essere considerati co-produttori di valori e non semplici destinatari di decisioni top-down (Georgopoulos et al., 2025). Infatti, in linea con Luoma et al. (2017), dialogo costante e strumenti di comunicazione condivisa risultano fondamentali per promuovere obiettivi di sostenibilità nei contesti portuali.

La letteratura di riferimento ha analizzato in modo approfondito, sia nei porti commerciali che in quelli turistici, le dimensioni tecniche e ambientali della sostenibilità, soffermandosi in particolare sugli strumenti di monitoraggio ambientale e sui meccanismi di gestione delle performance ecologiche (Martínez-Vázquez et al., 2021; Angelopoulos, Leonardou & Pallis, 2022; Spinelli & Benevolo, 2022).

Ciononostante, emerge un gap significativo. Considerando quanto detto, la letteratura sui porti turistici ha trascurato il modo in cui le pressioni istituzionali (Di Maggio & Powell, 1983; Scott, 2008), impattano sulla sostenibilità sociale che, coadiuvata dagli strumenti di AI, si riflette sull'efficienza della governance di tali organizzazioni.

In questa prospettiva, il "sistema porto turistico" di Maratea (Basilicata, PZ) rappresenta un contesto di ricerca emblematico. A seguito della recente scadenza delle concessioni dei servizi in area portuale e alla sua aggiudicazione da parte di una società privata di recente costituzione,

l'infrastruttura si trova in una fase di transizione, in cui la nuova gestione non è ancora pienamente operativa.

2. Scopo della ricerca

Il presente studio si configura come un work in progress esplorativo, volto a interpretare come la dimensione sociale della sostenibilità, con particolare attenzione allo stakeholder engagement e al ruolo dell'intelligenza artificiale, si combini per supportare la transizione della governance dei porti turistici, contribuendo a migliorare l'efficienza complessiva dei servizi erogati. Tale costrutto potrebbe essere rappresentato nel caso individuato. Nel contesto dei porti turistici, l'interconnessione tra Institutional Theory (Di Maggio & Powell, 1983; Scott, 2008) e Stakeholder Theory (Freeman, 1984), orientata alla dimensione sociale della sostenibilità e all'adozione dell'AI, non è stata ancora pienamente esplorata.
L'indagine proposta è volta a fornire un'ulteriore visione sul tema, con l'auspicio di comprendere come, date le pressioni istituzionali, AI e stakeholder engagement interagiscono nel determinare l'efficienza della governance portuale.
Alla luce di queste considerazioni, l'obiettivo è condurre un'analisi integrata dei suddetti fattori, articolata attorno alla seguente domanda di ricerca.
RQ1: Come l'interazione tra AI e sostenibilità nella dimensione dello stakeholder engagement può migliorare l'efficienza complessiva della governance portuale?

3. Metodologia

Questo studio adotta il disegno di caso singolo illustrativo (Yin, 2015), volto a comprendere come le pratiche di stakeholder engagement e l'adozione di AI possano determinare un miglioramento dell'efficienza della governance portuale, nella cornice della Stakeholder Theory (Freeman, 1984) e della Institutional Theory (Di Maggio e Powell, 1983; Scott, 2008).

Si è ritenuto che la scelta di analizzare un singolo caso studio, anziché procedere con un'analisi di più entità, fosse più adatta all'indagine da condurre in quanto ciò consente uno studio più approfondito e contestualizzato delle dinamiche tra i diversi stakeholder che orbitano intorno all'oggetto di indagine (Dyer & Wilkins, 1991).

Tale metodologia si rivela particolarmente idonea per indagare fenomeni complessi e fortemente dipendenti dal contesto (McCutcheon & Meredith, 1993), offrendo una singolare ricchezza interpretativa, in linea con la tradizione qualitativa interpretativa (Eisenhardt, 1989).

La scelta del porto turistico di Maratea (Basilicata, Pz) risponde a criteri di rilevanza teorica e pragmatica. Infatti, il caso rappresenta un contesto di transizione istituzionale, a seguito della scadenza delle concessioni portuali e dell'assegnazione a una nuova società privata non ancora pienamente operativa. Questa fase di cambiamento offre un'opportunità utile per analizzare come la governance portuale si adatti e ridefinisca la propria visione alla luce delle pressioni istituzionali e alle nuove sfide legate alla sostenibilità e alla digitalizzazione.

L'analisi adotta una prospettiva estesa al "sistema porto turistico di Maratea", includendo non solo l'infrastruttura portuale in senso stretto, ma anche i servizi collaterali e le attività economiche e sociali che gravitano intorno ad essa. Tale approccio consente di cogliere la complessità del network locale e di comprendere come le pratiche di governance e di innovazione tecnologica influenzino l'intero ecosistema di servizi connessi al porto.

Seguendo l'approccio di Rahmadian et al. (2023), lo studio ha l'obiettivo di illustrare come la creazione di valore relazionale e la legittimazione istituzionale possano essere favorite da pratiche di cooperazione, sostenute dall'utilizzo di strumenti digitali ed in particolare dall'utilizzo dell'AI.

In linea con la letteratura esistente (Yin, 1994; 2003), il processo di raccolta dei dati avverrà in due fasi.

Nella prima, saranno condotte interviste semi-strutturate con i principali stakeholder coinvolti nella gestione del "sistema porto": i membri della nuova società concessionaria, i rappresentati delle istituzioni, gli operatori turistici, le associazioni locali, i residenti, i diportisti e i gestori di attività commerciali, che hanno forti legami con il sistema porto turistico di Maratea. Le interviste, di durata media variabile, saranno registrate e saranno strutturate sulla base di domande guida, definite collettivamente dai ricercatori, presentate a ciascun intervistato, seguendo un ordine flessibile per incoraggiare un dialogo spontaneo e una narrazione libera e approfondita.

Le aree tematiche centrali verteranno sui temi della governance istituzionale e dei processi aziendali, sullo stakeholder engagement e sul capitale relazionale, sull'adozione dell'intelligenza artificiale e degli strumenti digitali e infine, sulla sostenibilità e sugli impatti ambientali e sociali nel contesto di studio.

Successivamente, le interviste saranno integralmente trascritte e rese anonime per garantire la riservatezza dei partecipanti.

Nella seconda fase, a completamento delle interviste, sarà condotta un'analisi documentale di fonti secondarie tra cui: bandi di gara, regolamenti e articoli di stampa. Allo stesso tempo, parte del team dei ricercatori coinvolti, osserverà in maniera diretta pratiche di interazioni tra i diversi stakeholder.

La triangolazione tra dati primari e secondari (Patton, 1980), consentirà di garantire validità agli elementi raccolti e sarà seguita dalla codifica tematica delle informazioni raccolte (Miles, 1994).

Inoltre, il coinvolgimento di più ricercatori arricchirà l'analisi, in quanto la diversità delle prospettive migliorerà l'interpretazione dei dati e la convergenza delle osservazioni, rafforzandone la credibilità (Eisenhardt, 1989).

4. Risultati attesi

L'analisi del caso oggetto di studio metterà in luce un processo di transizione istituzionale, nel quale, ci si attende, che l'efficienza della governance del sistema porto turistico di Maratea derivi da un equilibrio dinamico tra dimensioni istituzionali (Di Maggio & Powell, 1983; Scott, 2008), relazionali (Freeman, 1985) e tecnologiche, che interrelate tra loro, possano favorire la costruzione di un sistema di governance portuale efficiente e orientato alla sostenibilità.

Come illustrato in figura 1, si ipotizza che i meccanismi abilitanti, espressi nell'interazione tra stakeholder engagement e AI, emergano come risposta alle pressioni istituzionali e alle aspettative degli stakeholder. Si prevede, dunque, che il contesto istituzionale e le esigenze degli attori coinvolti, non vengano recepite dalla governance portuale in modo passivo, bensì rappresentino una linea guida fondamentale per la costruzione di una strategia futura ottimale, che sia capace di coniugare legittimazione sociale e apertura verso nuove modalità di coordinamento.

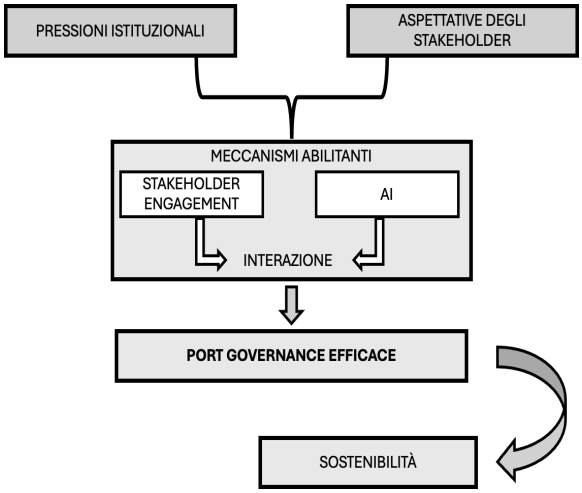

Figura 1. Modello integrato per l'efficacia della governance portuale

Sul piano tecnologico, l'AI è destinata a diventare un valido strumento, a disposizione della nuova governance, capace di monitorare una vasta gamma di dati. Tuttavia, essa non può assurgere a elemento sostitutivo della componente umana (Dağıstan et al., 2025) anche se l'utilizzo di strumenti digitali non potrà che migliorare la condivisibilità e la verificabilità dei dati, riducendo le asimmetrie informative tra governance e stakeholder. Questo processo potrebbe produrre risultati tangibili come indicatori chiari e tracciabilità delle decisioni, contribuendo ad alimentare la fiducia da parte degli stakeholder nella nuova governance portuale.

Parallelamente, sul piano relazionale, ci si attende che il livello d'impiego degli attori interessati, passi da una condizione passiva a un approccio di ascolto che prevede il consulto degli stakeholder da parte della governance del sistema porto turistico di Maratea (Gao & Zhang, 2006). Dunque, si auspicano forme di cooperazione e co-decisione come: tavoli periodici, feedback costanti con operatori e diportisti, analisi congiunte sugli indicatori potenziati dall'utilizzo dell'AI. In contesti come i porti turistici, dove le percezioni sulla sostenibilità sono spesso eterogenee, la condivisione strutturata delle informazioni è essenziale per allineare gli obiettivi e ridurre i fraintendimenti (Luoma et al., 2017).

Si auspica che strumenti digitali supportati da AI, che forniscono le basi informative e la partecipazione strutturata degli stakeholder, tradotta in dialogo sociale, si rafforzino reciprocamente.

Complessivamente, da questa interazione si prevede possa emergere un modello di governance portuale più efficiente e legittimo fondato su maggiore trasparenza, coordinamento e responsabilità condivisa, che possa offrire un esempio paradigmatico di come un piccolo contesto locale, sostenuto da strumenti digitali e processi partecipativi, sia in grado di trasformare le pressioni istituzionali in leve di innovazione sostenibile e di sviluppo territoriale.

5. Limiti della ricerca

Questo studio presenta alcune limitazioni che definiscono il campo di applicazione e ne orientano le prospettive di sviluppo future. In primo luogo, l'analisi si concentra su un singolo caso studio, il "sistema porto turistico di Maratea", per cui i risultati non possono essere immediatamente generalizzati ad altri contesti al netto di una validazione comparativa. In secondo luogo, poiché la nuova governance portuale non si è ancora insediata al momento della ricerca, non è ancora possibile osservare gli effetti dei processi di coinvolgimento degli stakeholder e dell'introduzione degli strumenti digitali basati su AI. Al contempo però, la condizione di transizione che sta vivendo il contesto di indagine offre l'opportunità di osservare in tempo reale

come questi fattori abilitanti possano contribuire a definire un modello di governance più trasparente, partecipativo e orientato alla sostenibilità. Infine, la natura qualitativa dello studio, consente futuri approfondimenti di natura quantitativa sia sul contesto in oggetto che in altri porti turistici simili.

6. Implicazioni manageriali

Dalla validazione del modello ipotizzato, risulteranno evidenti la connessione logica e l'influenza sui comportamenti e sulle scelte gestionali dei sistemi porti turistici, in grado di favorire la transizione della loro governance verso un eco-sistema efficiente. Una gestione, dunque, che tenga conto anche della sostenibilità sociale oltre che di quella ambientale, in grado di migliorare l'efficienza complessiva dei servizi resi con la creazione di valore positivo per la collettività.

Le implicazioni manageriali nell'implementazione dell'AI nella logica seguita in questo studio, possono essere diverse, tutte riconducibili e sintetizzabili nell'opportunità di riconciliare le esigenze dei diversi stakeholder. Tra queste: la creazione di un valore sociale condiviso, una gestione economica e finanziaria dei servizi offerti dal sistema porto turistico coerente con le aspettative della clientela - diportisti e non - con conseguente loro maggiore soddisfazione, time reference di medio-lungo periodo con itinerari strategici gestionali e di marketing in particolare, migliore predisposizione all'implementazione di tecnologie innovative, già da tempo utilizzate nella gestione dei porti commerciali, che a breve riguarderanno anche il diporto nautico (tracciamento degli itinerari, attenzione al trattamento dei reflui di bordo, sicurezza della navigazione).

Quanto appena indicato è considerabile in un rapporto di causa-effetto che dovrebbe guidare il management, da sempre interessato ad aumentare la soddisfazione della clientela, implementando sistemi e procedure adeguati agli assetti organizzativi delle loro imprese, dunque con investimenti anche nella formazione, soprattutto di natura esperienziale, in modo da poter disporre di quelle competenze specialistiche riconducibili all'Intelligenza Aziendale.

7. Originalità del paper

L'originalità dello studio in oggetto risiede nella prospettiva integrata e multidimensionale adottata per analizzare la governance sostenibile del "sistema porto turistico", combinando in modo innovativo l'Institutional Theory (Di Maggio & Powell, 1983; Scott, 2008) e la Stakeholder Theory (Freeman, 1984), in relazione, anche, all'adozione dell'IA. A differenza della letteratura esistente, prevalentemente focalizzata sugli aspetti ambientali e tecnici della sostenibilità (Martínez-Vázquez et al., 2021; Spinelli & Benevolo, 2022), lo studio partendo dalle pressioni istituzionali e dalle aspettative degli stakeholder, propone una lettura centrata sulla dimensione sociale della sostenibilità, interpretando stakeholder engagement e strumenti digitali basati su AI, come fattori abilitanti di una governance portuale efficiente che favorisce pratiche di gestione sostenibili e condivise. L'originalità del contributo emerge, inoltre, dal contesto di studio analizzato. Il caso del "sistema porto turistico di Maratea", attualmente in fase di transizione istituzionale, permette di osservare in modo approfondito come la governance si adatti alle sfide della sostenibilità e della digitalizzazione (Rahmadian et al., 2023; Georgopoulos et al., 2025). Il lavoro propone una visione innovativa dell'AI, non solo come strumento tecnico di monitoraggio e gestione (Ioras & Bandara, 2025), ma come leva di legittimazione sociale capace di rafforzare trasparenza, fiducia e partecipazione degli stakeholder, favorito dal dialogo tra questi ultimi e la governance portuale (Battistella et al., 2018; Benevolo & Spinelli, 2022). In questo modo, il paper contribuisce a colmare un gap significativo nella letteratura sui porti turistici, offrendo un modello interpretativo originale che connette in un quadro unitario innovazione tecnologica e sostenibilità

sociale, delineando un percorso di evoluzione verso forme di governance portuale più efficienti, inclusive e orientate allo sviluppo sostenibile (Myrovali et al., 2025; Poletan Jugović et al., 2022).

Parole chiave: Stakeholder engagement; intelligenza artificiale (AI); governance portuale; sostenibilità sociale

Verso la sostenibilità dei sistemi turistici fragili: un framework per la gestione dei rifugi alpini

Giulia Cambruzzi[1], Umberto Martini[2]

1. Introduzione

Il turismo svolge un ruolo centrale nelle economie globali e regionali, ma il concetto di nature-based tourism evidenzia un persistente paradosso: gli stessi ambienti che attraggono visitatori sono quelli più vulnerabili alle esternalità negative generate dal turismo. Il turismo montano mondiale-secondo segmento più visitato dopo le destinazioni costiere (United Nations Environment Programme, 2007) rappresenta circa il 15–20% del valore turistico globale (Debarbieux et al., 2014) e dipende in modo critico dall'integrità del paesaggio, dalla biodiversità e dall'equilibrio ecologico.

Con l'intensificarsi della domanda, aumentano le pressioni ambientali (es. produzione di rifiuti, consumo di risorse, disturbo degli habitat), soprattutto negli ecosistemi alpini più fragili. In questo contesto, i rifugi svolgono un ruolo cruciale quali nodi di accoglienza e logistica, ma affrontano sfide specifiche: distanza, isolamento, vincoli di approvvigionamento, vincoli ambientali, stagionalità marcata e profili eterogenei dei visitatori. Queste caratteristiche complicano la gestione, amplificando rischi e trade-off di sostenibilità.

È in questo quadro concettuale e pragmatico che il presente work in progress propone un quadro analitico integrato per interpretare i rifugi alpini come organizzazioni ibride, considerando sia la loro missione di interesse pubblico (riparo, sicurezza, tutela del territorio), sia le attività orientate al mercato (servizi di ospitalità, generazione di ricavi) (Brandsen e Karrè, 2011).

Il concetto di "ibridazione economica", pur oggetto di un ampio dibattito (OECD, 2004) e di critiche che ne sottolineano i potenziali rischi finanziari (Koppell, 2003) e culturali (Jacobs, 1994; Bozeman, 2007) per il settore pubblico, costituisce in questa fase della ricerca uno strumento utile per analizzare i rifugi alpini lungo diverse dimensioni: la finalità (creazione di valore sociale/ambientale e sostenibilità economica); la natura dell'offerta (beni e servizi erogati); i modelli di proprietà e governance (configurazioni associative o pubblico-private, come nel caso del Club Alpino Italiano (CAI), rispetto alla proprietà privata). Tali dimensioni si manifestano in modo particolarmente evidente nelle pratiche micro-organizzative, attraverso processi di negoziazione e interazione che contribuiscono a plasmare la forma ibrida dei rifugi (Bishop e Waring, 2016).

In questa prospettiva, le organizzazioni ibride non possono essere comprese come meri enti "a metà" tra profit e non-profit: esse integrano in modo sistematico logiche di mercato e logiche della società civile, configurando una vera e propria identità organizzativa integrata (Jäger e Schröer, 2014). Muovendo da tali fondamenti teorici, ci siamo interrogati su come le organizzazioni impegnate nella gestione del turismo montano incorporino, reinterpretino e utilizzino questi concetti all'interno di uno spazio gestionale caratterizzato da confini labili e in parte intangibili.

A tal fine, abbiamo selezionato un'area che presentasse caratteristiche, materiali e immateriali, idonee a consentire un'analisi dei rifugi alpini come organizzazioni ibride anche sotto

[1] Università degli Studi di Trento, giulia.cambruzzi@unitn.it - corresponding author

[2] Università degli Studi di Trento, umberto.martini@unitn.it

il profilo manageriale. In questo senso, la regione italiana del Trentino-Alto Adige/Südtirol rappresenta un caso di studio particolarmente interessante, sia dal punto di vista teorico sia da quello politico-amministrativo. I criteri che hanno guidato la scelta di questo caso sono illustrati in dettaglio nel capitolo 3.4.

Research gap e obiettivi della ricerca

Nonostante la rilevanza economica, sociale e ambientale dei rifugi alpini, la letteratura accademica è scarsa e frammentata. Gli studi esistenti raramente integrano misurazione delle performance, design della governance e dinamiche stakeholder in un'unica prospettiva di sostenibilità. Per rispondere a tale gap, gli obiettivi della ricerca sono:

- Identificare le caratteristiche intrinseche e contestuali che rendono alcuni rifugi più inclini a generare esternalità ambientali negative rispetto ad altri.
- Sviluppare uno strumento di classificazione replicabile basato su indicatori, utile per misurare le performance sostenibili, supportare disclosure non finanziarie "assurance-ready" e orientare scelte di governance a livello di rifugio e destinazione.
- Analizzare come differenti modelli di governance (es. modello associativo/pubblico-privato CAI vs. proprietà privata) influenzino performance, resilienza e pratiche di rendicontazione.

Si propone un sistema di indicatori che traduce caratteristiche fisiche e contestuali dei rifugi in misure di performance sostenibile (es. modalità di approvvigionamento, stress legato a capacità/stagionalità). La pipeline metodologica basata su FAMD e Cluster Analysis produce tipologie di rischio e un risultato sintetico che destinazioni e operatori possono utilizzare per dashboard, benchmarking e definizione di obiettivi.

Il confronto tra governance associativa/pubblico-privata (es. CAI con concessione a gestori privati) e governance privata evidenzia come le strutture organizzative condizionino l'uso delle risorse, le scelte di approvvigionamento e l'esposizione ambientale. I profili di cluster, interpretati alla luce della governance, orientano modelli di gestione adeguati per le PMI, consorzi e destinazioni che mirano a un approccio "sustainability-by-design".

Lo studio mira a supportare processi decisionali partecipativi basati su indicatori, allineando la pratica manageriale con aspettative degli stakeholder e limiti ambientali.

Attualmente il progetto fornisce: (i) un dataset curato a livello di singolo rifugio e una mappatura geospaziale del Trentino-Alto Adige; (ii) una specificazione FAMD e (iii) una logica di clustering per la suddetta profilazione.

Le attività in corso includono verifiche di robustezza (pesi alternativi, sensibilità delle variabili) e approfondimenti sulla governance tramite interviste, utili a raffinare la rappresentazione e orientare decisioni innovative informate dagli stakeholder.

2. Letteratura

2.1. Il contesto montano e le sue fragilità

Le montagne sono ampiamente concettualizzate come sistemi socio-ecologici fragili, nei quali limiti ambientali e attività umane sono strettamente interconnessi (Nyaupane e Chhetri, 2009). La geomorfologia-pendenze elevate, altitudine, dinamiche geologiche attive e condizioni climatiche severe-comporta una forte esposizione a rischi quali erosione, frane, valanghe, alluvioni e perdita di biodiversità (Jodha, 2001; Nepal e Chipeniuk, 2005). Questa fragilità intrinseca limita la capacità di carico, pur contribuendo all'attrattività dell'area, entro soglie sostenibili per ecosistemi e infrastrutture (Sharma, 2000). In tale contesto, crescita del turismo, comportamenti dei visitatori e gestione dei rifugi interagiscono in modo complesso. La diversità dei paesaggi, la stagionalità e le esperienze basate sulla natura costituiscono i principali fattori di attrattività delle destinazioni montane (Zuzana e Zuzana, 2015).

2.2. Turismo montano

Negli ultimi dieci anni il turismo montano ha subito un'espansione a livello globale (Moss et al., 2009; Pröbstl-Haider et al., 2016; Bertocchi et al., 2021) rendendo la destinazione montana la seconda tipologia di meta più visitata subito dopo le zone costiere (UNEP/PNUMA, 2007; Zuzana e Zuzana, 2015), contribuendo per circa il 15–20% al turismo globale, con un valore economico stimato tra i 70 e i 90 miliardi di dollari l'anno (Taher et al., 2015). Le Alpi europee da sole generano circa il 7–10% dei ricavi turistici globali nel 2002 (Duglio e Beltramo, 2019).

Nelle Alpi, la posizione centrale e l'aumento dell'accessibilità-reti stradali, impianti di risalita, e-bike-hanno ridotto gli attriti spazio-temporali (Paunović e Jovanović, 2017; Bausch e Gartner, 2020) favorendo la frequentazione da parte dei visitatori nei luoghi più popolari (inclusi i rifugi) rendendoli così delle mete iconiche (Río-Rama et al., 2019; Eurostat, 2025; Becken e Hay, 2008; Duglio e Beltramo, 2019). Tale aumento di accessibilità ha determinato un notevole incremento dei visitatori persino verso rifugi di alta quota una volta difficili da raggiungere, generando impatti ambientali significativi (Becken e Hay, 2008). La concentrazione del turismo di massa in poche aree alpine solleva interrogativi urgenti per lo sviluppo e la gestione sostenibile (Eurostat, 2025). Di conseguenza, la crescente facilità con la quale è ad oggi possibile raggiungere mete che in passato erano considerate proibitive, ha anche modificato i profili dei visitatori e i modelli di consumo. Rifugi un tempo frequentati prevalentemente da alpinisti che spesso richiedevano più giornate, ora accolgono una clientela eterogenea-famiglie, escursionisti giornalieri, mountain biker e visitatori "casuali" alla ricerca di natura e cucina locale (Zuzana e Zuzana, 2015; Río-Rama et al., 2019). I soggiorni sono più brevi, i picchi più intensi e le aspettative in termini di comfort e varietà di menù più elevate (Goymann et al., 2008). Questi cambiamenti influenzano la gestione, portando spesso ad una sovraproduzione durante i pasti e generando ingenti consumi di energia, acqua e rifiuti (Zuzana e Zuzana, 2015). Inoltre la domanda è altamente variabile-solitamente con picchi estivi e talvolta invernali-e richiede flessibilità nella gestione in risposta a incertezze climatiche, vincoli ambientali e regolamentari.

2.3. Turismo montano, esternalità negative e ruolo della governance

La combinazione di norme di libero accesso e la concentrazione del flusso di visitatori, amplifica le esternalità negative quali sovraffollamento, erosione dei sentieri, disturbo della fauna e accumulo di rifiuti, soprattutto nelle aree d'alta quota più sensibili (Demirović et al., 2017; Nepal, 2002). Nei rifugi, l'elevata densità di visitatori trasforma la normale ospitalità in gestione dei picchi: approvvigionamenti limitati, scarsità di acqua ed energia e percorsi di smaltimento dei rifiuti fortemente vincolati vengono facilmente messi sotto pressione durante i periodi di maggiore affluenza (Becken e Hay, 2008). Le risposte gestionali sono cruciali ma eterogenee, variando in funzione delle caratteristiche strutturali, della fragilità ambientale e del contesto istituzionale. L'obiettivo è identificare le caratteristiche strutturali e contestuali che rendono un rifugio potenzialmente più impattante di un altro e sviluppare un metodo per classificare e valutare la probabilità di generazione di esternalità negative. Di conseguenza, raggruppiamo i principali determinanti della pressione ambientale in quattro criteri: dimensione, localizzazione, vincoli e governance (Asadi et al., 2020; Demirović et al., 2017; Billis, 2010 Nepal, 2002; Boyd et al., 2009).

Il rifugio alpino come organizzazione ibrida

La governance risulta un aspetto centrale a causa della natura organizzativa complessa dei rifugi. Originariamente concepiti come ripari, oggi offrono anche alloggio, ristorazione e una serie di comfort. Poiché devono erogare servizi essenziali generando allo stesso tempo ricavi, i rifugi

possono essere concettualizzati come organizzazioni ibride, al crocevia tra modelli for-profit e non-profit (Haigh e Hoffman, 2014).

L'ibridità, realtà analitica inerente alla loro struttura e funzione (Boyd et al., 2009), si manifesta secondo tre dimensioni:

- Finalità organizzativa: bilanciare missione sociale (riparo e ospitalità) con obiettivi di redditività.
- Natura dell'offerta: combinazione di beni e servizi (Lusch e Vargo, 2011).
- Proprietà e governance: modelli privati, cooperativi o pubblici (Boyd et al., 2017; Billis, 2010).

In Italia, i rifugi alpini rientrano nella legislazione turistica generale (Legge 135/2001), tuttavia non esiste una regolamentazione nazionale organica che disciplini in modo unitario la loro costruzione e gestione. Parallelamente, la recente crescita economica delle aree montane, insieme a un aumento della sensibilità sociale e ambientale verso tali territori, ha stimolato un rinnovato interesse da parte delle amministrazioni pubbliche. Ciò ha favorito l'adozione di nuovi provvedimenti orientati alla tutela e alla valorizzazione dell'ambiente naturale e del patrimonio culturale locale. In particolare, la Legge 131 del 2025 prevede l'attuazione di interventi finalizzati allo sviluppo socio-economico, alla salvaguardia e alla valorizzazione delle specificità dei territori montani, promuovendo processi di crescita coerenti con le caratteristiche locali in diversi settori -tra cui il turismo e la valorizzazione del patrimonio culturale e ambientale-e incoraggiando la riduzione del consumo di suolo. Un elemento di rilievo introdotto da questa recente normativa è il riconoscimento della specificità dei territori montani e la promozione del loro sviluppo sostenibile quale fattore essenziale per il perseguimento di obiettivi comuni di coesione e sostenibilità territoriale.

All'interno di questo quadro normativo generale, spetta alle singole regioni e province autonome definire disposizioni specifiche relative alle caratteristiche funzionali dei rifugi (comprese le modalità di smaltimento, gli impianti, i requisiti igienico-sanitari minimi) calibrandole in base alla capacità ricettiva e alle condizioni ambientali dei luoghi (Legge 131/2025, art. 21). Tale competenza decentrata produce un contesto regolatorio frammentato e talvolta ambiguo, che può complicare i processi decisionali e gestionali.

In questo scenario irregolare e disomogeneo emerge l'esigenza di delineare un quadro di riferimento chiaro e sintetico per la gestione dei rifugi di montagna e trasversalmente del comparto turistico montano. In tale prospettiva, risulta utile analizzare le differenti forme di governance che influenzano in modo significativo la capacità di gestione di queste organizzazioni ibride:

- Governance associativa / pubblico–privata: associazioni come il Club Alpino Italiano (CAI) o l'Alpenverein Südtirol (AVS), in quanto enti pubblici non economici, possiedono numerosi rifugi che vengono spesso affidati in gestione a operatori privati. Questo modello consente di bilanciare la sostenibilità economica, garantita dalla gestione privata, con finalità sociali e ambientali, tutelate attraverso lo statuto e la supervisione dell'associazione.
- Governance privata: i rifugi di proprietà privata sono gestiti direttamente dai titolari, che mantengono pieno controllo strategico e operativo. In assenza di una supervisione associativa, tali strutture si conformano esclusivamente alla normativa nazionale e regionale, godendo di maggiore autonomia ma richiedendo una più elevata capacità di adattamento alle condizioni locali.

Concepire i rifugi come organizzazioni ibride consente di comprendere come differenti sistemi di governance e gradi di autonomia manageriale possano incidere sulle pratiche di sostenibilità e sulla generazione potenziale di esternalità positive.

Indicatori per la valutazione delle esternalità

Basandoci sulla letteratura, definiamo un set di criteri e indicatori per stimare la potenziale generazione di esternalità ambientali negative di un rifugio di montagna da una prospettiva manageriale (Malkina-Pykh, 2002).

Criterio	**Indicatore**	**Misura**
Dimensione	Capacità ricettiva	Numero di posti letto
	Stagionalità	Apertura su una stagione o più
Vincoli	Notorietà	Appartenenza area UNESCO
	Restrizioni	Area di rilevanza naturale (Parchi, aree protette)
	Approvvigionamento	Modalità di approvvigionamento materie prime
Localizzazione	Altitudine	Metri s.l.m.
	Distanza	Tempo minimo di cammino
Governance	Giurisdizione	Provincia
	Regime normativo	Tipo di governance

Tabella 1.

Questi indicatori supportano la classificazione e la valutazione comparativa della pressione ambientale dei rifugi, collegando caratteristiche strutturali e contestuali al potenziale livello di esternalità.

Questo studio in corso analizza i rifugi alpini nel più ampio contesto del turismo montano, adottando la teoria delle organizzazioni ibride come lente concettuale. L'obiettivo è comprendere:

- quali caratteristiche intrinseche e contestuali accrescono il potenziale di generazione di esternalità ambientali;
- come tali caratteristiche possano essere tradotte in un framework di misurazione e rendicontazione della sostenibilità "assurance-ready", utile alle decisioni e adattabile a diversi modelli di governance.

3. Metodologia

3.1. Research design e finalità

Sulla base della revisione della letteratura, che definisce le aree montane come sistemi socio-ecologici fragili e i rifugi alpini come organizzazioni ibride esposte a flussi turistici concentrati, lo studio analizza come le caratteristiche strutturali e contestuali dei rifugi influenzino il loro rischio di generare esternalità ambientali negative. L'obiettivo generale è duplice:

(i) sviluppare un metodo replicabile per valutare il rischio potenziale di esternalità negative ambientali tra diverse tipologie di rifugi; e (ii) tradurre i risultati in uno strumento di supporto decisionale utile a enti pubblici e gestori per orientare il turismo montano verso la sostenibilità.

Per tale finalità, la ricerca procede in due fasi integrate:

- Fase 1: Mappatura sistemica e classificazione desk-based. Si costruisce un censimento dei rifugi nell'area di studio, li si geolocalizza per l'identificazione spaziale, e si estraggono le caratteristiche strutturali per categorizzarli secondo gli indicatori definiti dalla letteratura (dimensione, localizzazione, governance, vincoli). Questa fase fornisce la base analitica per la valutazione del rischio ambientale e l'ossatura dello strumento decisionale.
- Fase 2: Analisi multivariata e clustering. Si applica la Factor Analysis of Mixed Data per individuare le strutture latenti che guidano il rischio di esternalità, seguita dalla Cluster Analysis per raggruppare i rifugi in profili omogenei. Questi risultati alimentano un indicatore sintetico interpretabile e generano insight utili per la governance.

3.2. Contesto e teoria

Sebbene le implicazioni ambientali, sociali ed economiche del tema siano considerevoli, la letteratura scientifica sui rifugi alpini è limitata. Una ricerca esplorativa su Scopus (Duglio e Beltramo, 2025) con un ampio set di parole chiave ha restituito solamente 54 pubblicazioni (40 articoli, 9 paper da conferenze, 3 capitoli di libro, 2 review) riguardanti i rifugi alpini, dal 1980 ad oggi (con un picco nel 2022). Con questo studio vogliamo porre un mattoncino che possa fornire una solida base per la letteratura in essere e per le prossime ricerche.

Dal disegno teorico del presente studio si sintetizzano evidenze di vulnerabilità ambientale, diversità paesaggistica e sistemi di governance, lasciando che relazioni e pattern ricorrenti (Babbie, 2007; Denzin, 1978; Polit, Beck e Hungler, 2003) guidino raccolta e analisi dei dati. Le categorie concettuali (dimensione, localizzazione, governance, vincoli) sono pertanto operative e non meramente descrittive.

3.3. Domanda di ricerca

Partendo dall'assunto che gli ambienti montani possiedono bassa capacità di carico, accessibilità limitata ed elevata esposizione climatica, indaghiamo:

- Quali caratteristiche intrinseche e contestuali dei rifugi determinano un rischio maggiore di generazione di esternalità ambientali negative?
- Come tali caratteristiche possono essere tradotte in un framework di misurazione e rendicontazione della sostenibilità "assurance-ready", utile alle decisioni e adatto a diversi modelli di governance?

Queste domande si concentrano sull'interdipendenza ambiente-uso e focalizzano l'analisi sul rischio potenziale, non sugli impatti effettivamente misurati.

3.4. Caso di studio: Trentino-Alto Adige/Südtirol

Il contesto empirico di questa ricerca è il Trentino-Alto Adige/Südtirol, comprendente le Province autonome di Trento e Bolzano, un territorio classificato come interamente montano (ISTAT, 2018). L'area rappresenta un laboratorio storico per l'evoluzione del turismo alpino organizzato e ospita numerosi siti di rilevanza ambientale e culturale, tra cui aree riconosciute come Patrimonio UNESCO e un'estesa rete di parchi naturali. Tra questi, spicca il Parco Nazionale dello Stelvio, uno dei più antichi e vasti d'Italia (130.734 ha), affiancato da ulteriori riserve e aree protette di interesse internazionale.

Il territorio è caratterizzato da una lunga tradizione di rifugi alpini, nati originariamente come semplici ricoveri e gradualmente trasformatisi in vere e proprie infrastrutture ricettive (Provincia

Autonoma di Trento, 2018; 2020; SAT, 2022). Questa evoluzione ha accompagnato, e in parte stimolato, la crescita del turismo alpino, che nel tempo si è affiancato e sovrapposto alle pratiche alpinistiche e sportive, ampliando la funzione sociale e ricreativa dei rifugi. Tale processo è stato ulteriormente accelerato dallo sviluppo tecnologico e infrastrutturale, che ha reso la montagna più accessibile attraverso impianti di risalita, nuove strade, rete di sentieri attrezzati, e-bike e altre forme di mobilità dolce. L'aumento dell'accessibilità ha prodotto un incremento significativo dei flussi turistici, rendendo la regione una destinazione altamente attrattiva ma anche soggetta a picchi di frequentazione che esercitano pressioni rilevanti sulle infrastrutture dei rifugi e sugli ecosistemi alpini.

Oggi i rifugi del territorio servono una domanda estremamente eterogenea e costituiscono un punto di riferimento nella gestione delle risorse in alta quota. Essi incarnano, allo stesso tempo, modelli di sostenibilità, presidi culturali, nodi logistici e catalizzatori di esperienze turistiche. Per queste ragioni, il Trentino-Alto Adige/Südtirol rappresenta un caso emblematico per analizzare la tensione tra sviluppo economico, sostenibilità ambientale e preservazione dell'identità culturale alpina (Associazione Rifugi Trentino, 2025; Dini et. al, 2020).

La scelta di questo caso di studio non è dettata da considerazioni di convenienza o prossimità, bensì da una motivazione analitica precisa. Il territorio si configura come un case study intenzionale, particolarmente adatto a indagare fenomeni complessi legati alla gestione dei rifugi alpini in contesti ad alta intensità turistica. La regione, infatti, combina in modo unico una forte pressione turistica, una ricca tradizione alpinistica, una struttura istituzionale peculiare e una significativa varietà di modelli gestionali. Queste caratteristiche la rendono un ottimo case study per osservare come le organizzazioni di alta quota affrontino sfide ibride legate alla sostenibilità, alla governance e alle dinamiche socio-ambientali.

3.5. Raccolta dati e sistema di indicatori

Poiché l'obiettivo è valutare il rischio potenziale di esternalità ambientali, l'analisi si concentra su dimensioni collegate e correlate a tale contesto, favorendo replicabilità e comparabilità tra contesti montani differenti.

I dati a livello di singolo rifugio sono scarsi e spesso aggregati a livello amministrativo.

Di conseguenza, abbiamo integrato cinque tipologie di fonti (associazioni, statistiche provinciali/comunali, registri ufficiali, siti web dei rifugi, dataset geospaziali) per costruire un dataset consolidato di 245 rifugi in Trentino-Alto Adige/Südtirol, ovvero il 76% di tutti i rifugi presenti in quest'area.

Indicatori

Guidati dalla letteratura e dalla fattibilità empirica, gli indicatori sono raggruppati in quattro criteri:

- Dimensione: capacità ricettiva (numero letti), stagionalità (apertura per una stagione o più stagioni).
- Localizzazione: altitudine (m s.l.m.), distanza (tempo minimo di cammino).
- Vincoli: notorietà (appartenenza a sito UNESCO), tutela (area di rilevanza naturale), approvvigionamento (modalità).
- Governance: giurisdizione (provincia), regime normativo (tipo di governance).

Gli indicatori hanno pesi uguali perché misurano caratteristiche strutturali e fisiche, non comportamenti gestionali.

Il sistema rappresenta un compromesso pragmatico tra rilevanza teorica e disponibilità dei dati.

3.6. Metodo analitico: FAMD e Cluster Analysis

In linea con le best practice sui sistemi di indicatori compositi (Saisana e Tarantola, 2002; Nardo et al., 2005), evitiamo di predefinire una regola di aggregazione "ottimale". Seguiamo invece una strategia multivariata in due fasi:

- Factor Analysis of Mixed Data (FAMD) - Riduce la dimensionalità, estraendo componenti che sintetizzano la varianza di variabili quantitative e qualitative.
- Cluster Analysis - Raggruppa i rifugi in base alla vicinanza nello spazio fattoriale, individuando cluster omogenei con caratteristiche strutturali e contestuali simili e quindi rischio potenziale simile.

3.7. Dall'analisi alla decisione

Il censimento, la mappatura e la categorizzazione forniscono lo "spazio decisionale": quali rifugi esistono, dove si trovano e con quali attributi.

La pipeline FAMD–cluster permette di trasformare quello spazio in:

- Tipologie di rischio (cluster) per guidare interventi mirati (es. logistica degli approvvigionamenti, manutenzione sentieri, gestione dei flussi).
- Indice sintetico utilizzabile da gestori ed enti pubblici per scenari di simulazione (es. come varia il rischio modificando accesso o capacità).
- Base per dashboard di monitoraggio integrabili successivamente con metriche gestionali/comportamentali per supportare reporting di sostenibilità a livello di rifugio e destinazione.

I risultati riflettono dati disponibili e misurano il rischio potenziale, non impatti effettivi. Le categorie di governance sono semplificate per migliorare comparabilità; approfondimenti futuri potranno esplorare sfumature istituzionali più fini.

4. Ricerche future

Questo paper in lavorazione costituisce la base per studi successivi. Partendo dall'analisi condotta, proponiamo un metodo che, sulla base di un insieme di variabili statisticamente rilevanti, identifica le organizzazioni ibride (rifugi alpini) con maggiore rischio potenziale di generare esternalità ambientali negative.

Come osservato, il modello considera intenzionalmente attributi strutturali e manageriali dei rifugi.

Tuttavia, dal punto di vista delle esternalità, i comportamenti lato offerta e lato domanda influiscono in modo determinante sulla performance di sostenibilità dei rifugi.

Le prossime fasi del programma di ricerca affronteranno pertanto tali dimensioni comportamentali, riconoscendo la sfida operativa e ambientale ricorrente nelle strutture di alta quota e considerando le diverse tipologie di governance.

Parole chiave: Turismo montano; organizzazioni ibride; misurazione delle performance di sostenibilità; modelli di governance; FAMD; cluster Analysis

Imprenditrici e donne manager come driver di sostenibilità sociale nelle imprese del settore hospitality. Percorsi di carriera e paradossi di genere tra cambiamento e tradizione

Anna Scuttari[1], Amiel Monique Ortega[2], Samuele Maccioni[3], Giulia Isetti[4], Valentin Wallnoefer[5], Helena Nerl[6]

1. Introduzione

La disparità di genere nel settore turistico e dell'ospitalità assume tratti peculiari. Infatti, nonostante l'elevata partecipazione femminile alla forza lavoro, con il 54% di donne sul totale globale (UNWTO, 2019), permane il cosiddetto divario di genere nella leadership (Pritchard & Morgan, 2017), che riflette una ben nota dinamica di segregazione verticale (Baum, 2013). Oltre al cosiddetto fenomeno del "soffitto di cristallo", le evidenze empiriche su studi internazionali mostrano anche una persistente segregazione orizzontale (Campos-Soria et al., 2011), ovvero una sovra-rappresentazione delle donne in occupazioni specifiche che riflettono i ruoli domestici tradizionali (ad esempio, housekeeping e pulizie). Questi fenomeni si traducono in opportunità mancate per lo sviluppo del settore hospitality, minori opportunità di carriera per le donne e, in ultima analisi, rappresentano un ostacolo al raggiungimento degli Obiettivi di Sviluppo Sostenibile delle Nazioni Unite (cfr. SDG 5,8).

Per comprendere il contributo delle donne allo sviluppo sostenibile delle imprese turistiche e alla riduzione del divario di genere, è fondamentale riflettere criticamente sul loro ruolo di genere, poiché questo influenza le loro decisioni e azioni all'interno dell'azienda e, in ultima analisi, la struttura organizzativa aziendale nel suo complesso (Acker, 1990). Il presente studio approfondisce due aspetti: 1) il genere e le dinamiche di empowerment nelle imprese turistiche, familiari e altre e 2) gli elementi di intersezionalità nella leadership femminile legati alla religione, all'istruzione e alla cultura delle donne leader. A questo proposito, la definizione di genere si riferisce a "un costrutto sociale e culturale che distingue le differenze nelle caratteristiche di uomini e donne, ragazze e ragazzi, e di conseguenza si riferisce ai ruoli e alle responsabilità di uomini e donne. I ruoli basati sul genere e altre caratteristiche, quindi, cambiano nel tempo e variano a seconda dei diversi contesti culturali. Il concetto di genere include le aspettative relative alle caratteristiche, alle attitudini e ai comportamenti probabili di entrambi i sessi (femminilità e mascolinità)" (UNICEF, 2017).

Il genere come una struttura sociale nell'industria dell'ospitalità

Il quadro di riferimento per il presente studio è il modello teorico "Gender as a Social Structure in the Hospitality Industry" (Segovia-Pérez et al., 2019) – che rappresenta una

applicazione nel settore hospitality della teoria "Gender as a Social Structure" di Barbara Risman (1998). Esso si sviluppa attorno all'ipotesi che un divario di genere nello sviluppo delle carriere femminili nel settore dell'ospitalità si rifletta in almeno tre livelli di analisi: individuale, interazionale, istituzionale e intersezionale. Il livello individuale riguarda questioni personali, quali la percezione di sé e delle proprie capacità, i limiti autoimposti, le aspirazioni di carriera e il percorso formativo delle lavoratrici. Il livello interazionale si riferisce alle dinamiche relazionali del "doing gender" (West & Zimmerman, 1987), ovvero al modo in cui le interazioni quotidiane rispettano (o contraddicono) le norme di genere di una certa società. La dimensione istituzionale, infine, si riferisce alle norme e alle consuetudini radicate nella cultura organizzativa, nonché nel contesto socioculturale in cui opera l'azienda, ovvero leggi, regolamenti e politiche. Il contributo di Segovia-Pérez et al. (2019) risiede nella teorizzazione di un quarto livello di analisi nel settore dell'ospitalità: il livello intersezionale. Partendo dalla teorizzazione dell'intersezionalità di Crenshaw (1989), Segovia-Pérez et al. (2019) identificano i ruoli di genere e l'equilibrio tra vita lavorativa e vita privata come le due variabili comuni all'intersezione dei livelli di analisi individuale, interazionale e istituzionale. Nel presente contributo si intende espandere questo livello di analisi, considerando ulteriori elementi di intersezionalità sopra citati.

Inoltre, ai fini di comprendere le dinamiche di evoluzione positiva delle carriere femminili, è fondamentale fare riferimento al concetto di empowerment (Kabeer, 1999), intendendo con esso l'ampliamento della capacità delle persone, e in particolare delle donne, di compiere scelte di vita strategiche in un contesto in cui tale capacità era loro preclusa in precedenza. Kabeer (1999) distingue queste scelte strategiche come quelle fondamentali per stabilire il corso della propria vita, cioè le "grandi decisioni" che determinano la direzione dell'esistenza di una persona aprendo o precludendo percorsi che strutturano le opportunità future. Ne sono esempi non soltanto il perseguimento dell'istruzione, il matrimonio o il divorzio, ma anche le decisioni sulla fertilità e la maternità e i percorsi di carriera. Le dinamiche di empowerment vengono mobilizzate, secondo Kabeer (1999), attraverso risorse, azioni e risultati. Tra le risorse figurano: a) i beni materiali, quali reddito, proprietà e altre risorse finanziarie; e b) i beni immateriali, quali risorse umane che si manifestano sotto forma di istruzione, competenze e conoscenze; e c) le risorse sociali, che possono essere reti, relazioni e connessioni. L'azione è al centro dell'empowerment con la sua capacità di definire i propri obiettivi, andando oltre le nozioni convenzionali di processo decisionale, e includendo la contrattazione, la negoziazione, la resistenza, la manipolazione, la sovversione e persino l'inganno. Infine, i risultati colgono la misura in cui l'empowerment viene realizzato. I risultati non si limitano a quelli materiali o finanziari, sebbene questi siano i più visibili e misurabili. Possono anche manifestarsi in contesti relazionali o sociali, ad esempio acquisendo influenza nella comunità, svolgendo il ruolo di mentori o contribuendo allo sviluppo delle politiche. Tali risultati possono anche essere profondamente interiori, come ad esempio il rafforzamento della fiducia in se stessi, l'acquisizione di indipendenza o lo sviluppo del rispetto verso se stessi.

Alla luce delle evidenze riportate, il presente studio mira a rispondere alle seguenti domande di ricerca (RQ):

- In che modo il genere influenza il ruolo di leader e il percorso di empowerment delle donne nelle imprese ricettive familiari?
- Insieme al genere, quali altri elementi di intersezionalità (tra cui istruzione, religione e cultura) possono influenzare le dinamiche di empowerment femminile e contribuire alla sostenibilità sociale delle imprese turistiche?

Il tema della sostenibilità sociale emerge nel design di ricerca in modo consapevolmente implicito, facendo riferimento alle aree tematiche suggerite da UN Tourism all'interno del documento Gender-inclusive Strategy for Tourism Businesses (UNWTO, 2022) per il raggiungimento degli obiettivi di sviluppo sostenibile delle Nazioni Unite (SDG 5,8): la riduzione dei gap di genere per le lavoratrici dipendenti, il sostegno all'imprenditoria femminile, la creazione di una leadership, di politiche e di dinamiche di decision-making attente alle pari

opportunità, l'educazione e la formazione delle donne, la promozione della parità di genere anche all'interno della società civile e infine il monitoraggio delle performance in termini di parità di genere.

La considerazione delle imprese familiari nello studio e il confronto con imprese non familiari è motivata non solo dall'elevata presenza di queste ultime nel settore hospitality in Italia, ma anche dal fatto che le imprese familiari, al contrario di quelle non familiari, sembrerebbero costituire un ambiente più inclusivo per le donne (Campopiano et al., 2017; Chadwick & Dawson, 2018; Tognazzo & Gubitta, 2022), capace di integrarle in ruoli di leadership più rapidamente (Barrett & Moores, 2009) e di garantire un migliore equilibrio tra vita lavorativa e vita privata, soprattutto in zone rurali (Nickel et al., 2023; Nulleshi & Kalonaityte, 2022). Nonostante queste prime evidenze, il modo in cui i ruoli di leadership sono modellati nel tempo, insieme ai fattori individuali e sociali che influenzano questi ruoli, rimangono temi poco esplorati, motivo per il quale si giustifica lo studio.

2. Metodologia

Lo studio adotta un approccio costruttivista-interpretativo (Schwandt, 1994), che sottolinea come i percorsi professionali delle donne manager o imprenditrici possano essere compresi al meglio studiando i significati che vengono soggettivamente attribuiti alle loro esperienze e il modo in cui tali significati vengono co-costruiti all'interno delle strutture sociali e organizzative, in primis l'impresa.

Per indagare queste dinamiche sono state condotte interviste 24 semi-strutturate con donne che a) possiedono o sono comproprietarie di un'attività ricettiva turistica oppure b) ricoprono o hanno ricoperto in passato posizioni dirigenziali o esecutive di alto livello per almeno cinque anni in aziende dell'ospitalità non a conduzione familiare[7].

Nel contesto europeo e italiano, la realtà della regione Alto Adige è stata selezionata a causa della sua elevata intensità turistica, la più alta in Italia con 12 pernottamenti all'anno per abitante in esercizi alberghieri nel 2024 (ISTAT, 2025). Le Filippine sono invece una realtà particolarmente rilevante per almeno due ragioni: 1) sono una destinazione turistica emergente caratterizzata da buone performance in termini di parità di genere (ventesimo posto nel mondo e al primo posto in Asia per parità di genere secondo il Global Gender Gap Report (World Economic Forum, 2025)); 2) sono state oggetto di analisi esplorative sul ruolo delle donne nell'economia turistica e nello sviluppo territoriale sostenibile (Gutierrez, 2024). All'interno del territorio filippino, la National Capital Region è la regione più visitata (DOT, 2025) e per questa ragione è stata selezionata.

Attraverso un campionamento ragionato sono state individuate 35 potenziali intervistate in Alto Adige e 23 nelle Filippine, che sono state contattate via e-mail e/o telefono. La saturazione dei dati è stata raggiunta con 13 interviste per il campione italiano e 11 interviste per il campione filippino. La struttura del settore hospitality in Alto Adige, formata quasi esclusivamente da imprese familiari, ha portato alla selezione di imprenditrici, mentre nelle Filippine (National Capital Region), ancora una volta per motivi legati alla struttura del settore, hanno prevalso le donne in ruoli manageriali in aziende non familiari. Tra le partecipanti selezionate figurano manager, vicedirettrici, direttrici, vicepresidenti, direttrici generali e fondatrici o proprietarie di

[7] È stato richiesto un periodo minimo di cinque anni in ruoli dirigenziali per garantire che le partecipanti avessero un'esperienza sufficiente per riflettere in modo significativo sui processi di empowerment e sui percorsi di carriera. Soglie simili sono state applicate nella ricerca sulla leadership e sul turismo, dove l'anzianità di servizio è considerata un indicatore di credibilità nell'esame dei percorsi di carriera (Ladkin, 2011).

imprese ricettive. Le imprese sono tutte PMI a conduzione familiare per l'Alto Adige, mentre per la National Capital Region vi sono 4 PMI e 7 aziende divenute parte di catene alberghiere.

La scelta di casi non omogenei risulta metodologicamente giustificata alla luce della natura del presente studio. Come sottolineato da Yin (2018), lo studio di caso non è finalizzato primariamente alla generalizzazione statistica, bensì alla generalizzazione analitica, ovvero al contributo allo sviluppo, all'arricchimento o alla riformulazione della teoria. In questa prospettiva, la selezione di casi differenti tra loro non rappresenta una debolezza del disegno di ricerca, ma al contrario costituisce una strategia intenzionale per ampliare lo spettro delle evidenze empiriche osservabili. Pertanto, poiché l'obiettivo dello studio non è quello di verificare ipotesi predefinite né di individuare relazioni causali generalizzabili a un universo più ampio, bensì di esplorare fenomeni ancora poco indagati, l'eterogeneità dei casi consente di cogliere una pluralità di dinamiche, configurazioni e meccanismi che difficilmente emergerebbero da un campione omogeneo (Eisenhardt, 1989). In un disegno esplorativo come quello del presente studio la priorità è stata attribuita alla scoperta di pattern, concetti e domande di ricerca emergenti, piuttosto che alla comparabilità rigorosa tra unità di analisi. Quindi, la selezione non omogenea di casi ha risposto all'esigenza di massimizzare il potenziale euristico dello studio, favorendo l'individuazione di elementi inattesi o marginali in grado di arricchire il quadro teorico di riferimento (Eisenhardt, 1989; Yin, 2018). I risultati ottenuti non avanzano pretese di generalizzazione empirica, bensì si configurano come contributi interpretativi e concettuali, utili a stimolare ulteriori ricerche e a raffinare le categorie analitiche già presenti.

Le interviste semi-strutturate hanno consentito ai ricercatori di approfondire argomenti delicati o complessi adattandosi al flusso della conversazione (Berg & Lune, 2012). Inoltre, l'orientamento della traccia dell'intervista alle storie di vita delle partecipanti ha consentito di collocare i percorsi professionali in contesti organizzativi e culturali più ampi, evidenziando i punti di critici e i cambiamenti che hanno plasmato le storie professionali. La traccia dell'intervista, uguale per le donne italiane e filippine, era strutturata in sei sezioni: i) percorsi di carriera; ii) fattori che hanno favorito la carriera; iii) ostacoli alla carriera; iv) discriminazioni e squilibri di potere sul posto di lavoro; v) equilibrio tra vita lavorativa e vita privata; vi) osservazioni conclusive. Infine, sono state raccolte anche informazioni demografiche per fornire ulteriore contesto ai dati raccolti.

Lo studio dei dati qualitativi è avvenuto applicando un'analisi tematico-narrativa (Braun & Clarke, 2006; Riessman, 2007) integrata con un approccio di grounded theory costruttivista (Charmaz, 2006; 2014) e un'analisi qualitativa di tipo deduttivo (Gilgun, 2019). Questo ha permesso di approcciare i dati sia attraverso costrutti teorici preesistenti, individuati tramite un'ampia revisione della letteratura, sia mantenendo al contempo un'apertura ai significati e alle categorie emergenti dal campo. Inoltre, l'analisi è stata guidata da quelli che vengono definiti concetti sensitivizzanti (Bowen, 2006); ovvero quei costrutti e concetti emersi durante la revisione della letteratura esistente che hanno guidato l'analisi e le prospettive dei ricercatori. In particolare, nel presente studio ci si riferisce al modello teorico "Gender as a Social Structure in the Hospitality Industry" (Segovia-Pérez et al., 2019) e al concetto di empowerment femminile (Kabeer, 1999). Partendo da questi presupposti i ricercatori hanno inoltre assunto una posizione riflessiva e critica, coerente con la prospettiva costruttivista, che ha consentito di usare i concetti precedentemente nominati come lenti interpretative preliminari senza però che essi venissero cristallizzati in schemi rigidi, quanto piuttosto impiegandoli per orientare l'analisi lasciando spazio alla riformulazione e all'integrazione delle nuove categorie che emergevano dai dati. Dal punto di vista operativo ciò ha fatto sì che la procedura di codifica dei dati fosse condotta adottando un approccio sistematico e iterativo volto a bilanciare sensibilità teorica e apertura all'emergenza empirica (Gioia et al., 2013). In una prima fase, l'analisi è stata orientata da costrutti teorici derivati dalla letteratura di riferimento, utilizzati come cornice interpretativa iniziale. Coerentemente con l'impostazione del modello, tale cornice non ha assunto un carattere vincolante, consentendo l'emersione progressiva di categorie interpretative nuove e non previste

a priori. Operativamente, ciò ha comportato l'aggregazione delle unità testuali (le sentenze) in temi di primo ordine, formulati mantenendo un linguaggio il più possibile aderente ai dati e caratterizzati da un elevato grado di specificità descrittiva. Questi temi rappresentano il livello di analisi più prossimo all'evidenza empirica e riflettono le categorie concettuali utilizzate dagli attori o implicitamente desumibili dal materiale analizzato. In una fase successiva, attraverso un processo comparativo e riflessivo, i temi di primo ordine sono stati ricondotti a temi di secondo ordine, concettualmente più astratti e maggiormente informati dalla teoria, che esprimono il dialogo interpretativo tra dati empirici e costrutti teorici. Infine, tali temi di secondo ordine sono stati ulteriormente sintetizzati nelle dimensioni aggregate secondo il modello di Segovia-Pérez et al. (2019), capaci di integrare e strutturare i livelli precedenti, fornendo una rappresentazione complessiva e teoricamente significativa dei principali pattern emersi dall'analisi (Gioia et al., 2013). La procedura di codifica è avvenuta in una prima fase a livello manuale, successivamente sono state operazionalizzate e gerarchizzate le codifiche utilizzando il software per l'analisi di dati qualitativi MaxQDA. Di seguito si riporta una tabella (Tab. 1) che illustra il processo di codifica con un testo di esempio. Al momento dell'invio del contributo, la codifica per l'Alto Adige è stata conclusa, mentre quella per le Filippine è ancora in corso. Per questo motivo, non si è proceduto ad una quantificazione dei dati qualitativi, riportando frequenze e importanza relativa dei diversi codici.

3. Aree di studio

Prima di evidenziare i risultati emersi dallo studio qualitativo, appare necessario contestualizzare brevemente il turismo come fenomeno socio-economico nelle due realtà geografiche oggetto di studio, l'Alto Adige (IT) e la National Capital Region (PH).

L'Alto Adige nel 2024 ha registrato un totale di 37 milioni di presenze turistiche, di cui 27 milioni in strutture ricettive alberghiere, a fronte di mezzo milione circa di abitanti (ASTAT, 2025). L'importanza dell'economia turistica si riflette in un contributo sostanziale del turismo all'economia locale, che rappresenta l'11,4% del PIL locale solo contando gli effetti diretti (Windegger et al., 2023). Il settore alberghiero e della ristorazione in Alto Adige impiega la maggior parte delle donne che lavorano a tempo pieno nel settore privato (37,4% di tutte le lavoratrici), ma l'Alto Adige registra ancora un divario retributivo di genere dell'11,4% (ASTAT, 2023). In termini di imprenditoria femminile nel turismo l'Alto Adige si colloca leggermente al di sopra della media nazionale: delle 7.824 imprese turistiche attive nel 2022 (incluse quelle non alberghiere), 2.851 (36,4%) erano guidate da donne (Windegger et al., 2023); in Italia la percentuale scende al 21,2% (Federalberghi, 2023).

La National Capital Region presenta una intensità turistica molto inferiore rispetto alla realtà altoatesina, con 7 milioni di pernottamenti a fronte di 14 milioni di abitanti della regione. Il

numero di strutture ricettive accreditate è pari a 469, di molto inferiore a quelle altoatesine, ma con una dimensione media molto più elevata (120 stanze per struttura). Ciò spiega la diversa natura delle aziende nelle quali lavorano le donne intervistate e la presenza di strutture grandi e hotel in catena nel campione filippino.

Indicatori sul turismo (2024)*	**Alto Adige (IT)**	**National Capital Region (PH)**
Pernottamenti in strutture ricettive alberghiere	27,042,230	7,348,669 (2024)
Strutture ricettive alberghiere	3,950	469
Camere in strutture ricettive alberghiere	77,229	56,349
Dimensione delle strutture ricettive (Numero medio di camere per struttura)	19,6	120,1
Popolazione residente	537,533 (31.12.2023)	13.934.432 (1.7.2024)

Tabella 2. Indicatori sul turismo quale fenomeno socio- economico nelle aree di studio

4. Primi risultati

I primi risultati dello studio qualitativo sono riportati nelle due tabelle sottostanti (Tab. 3 e 4). e nella figura di comparazione dei due casi (Fig. 1), che sintetizzano le variabili sopra indicate con riferimento al caso italiano e a quello filippino e operano un confronto ragionato. Il percorso analitico e comparativo non è concluso e, nei prossimi passi mira a mappare tipologie di percorsi di carriera e modelli per studiare la progressione dell'empowerment femminile.

4.1. Le imprenditrici familiari altoatesine: percorsi di carriera e di empowerment

Nel campione altoatesino, le intervistate hanno riportato un percorso di carriera particolare, per almeno due ragioni: 1) l'azienda familiare ha costituito un luogo di esperienze sin dall'infanzia, con emozioni contrastanti; 2) l'assunzione del ruolo di imprenditrice per successione intra-familiare è avvenuto spesso in modo rapido, non contemplando una progressione graduale di carriera.

Per quanto riguarda il livello di analisi individuale, in tutto il percorso di carriera le intervistate hanno menzionato di aver sperimentato una mancanza di fiducia in sé stesse e nelle proprie capacità, che ha portato a barriere autoimposte con il potenziale di impedire alcune opportunità professionali. Rafforzano questo tipo di barriere le condizioni di contesto: una tradizione rurale e un contesto culturale e religioso in cui prevale un ruolo materno per la donna. Stanti queste condizioni di contesto, il processo di empowerment riportato a livello individuale fa leva su diverse risorse: l'eredità familiare, sia in termini materiali (l'azienda e alcune role models) che immateriali (culturali, valoriali), ma anche un'istruzione specializzata, spesso avvenuta all'estero, così come la creatività come risorsa personale. Tra le attività messe in campo ai fini di un empowerment individuale, ricorre un pattern di allontanamento da famiglia e azienda e la collezione di esperienze lavorative all'estero o in contesti avulsi dal turismo.

Il momento della successione intrafamiliare è un importante tappa dell'impresa familiare (Badia, Troisio, 2025) e risulta rilevante per l'empowerment delle intervistate. Sia in caso

accettino la gestione dell'impresa familiare su prevalente invito di una figura maschile (il padre), sia che fondino una propria azienda diversa da quella familiare per evitare conflitti, le donne diventano in questo momento imprenditrici a tutti gli effetti e acquisiscono progressivamente coscienza della propria libertà di progettare l'accoglienza e l'ospitalità. Entrambi i percorsi tratteggiano un processo di graduale (o radicale) ricerca della propria identità e del proprio stile dirigenziale all'interno (o all'esterno) dell'azienda familiare di origine, anche in contrasto con gli stili delle generazioni precedenti. In particolare, si possono riscontrare nel campione delle innovazioni intraprese dalle manager per conciliare la vita familiare con la dimensione aziendale, ad es., in meirto alle aperture durante le festività. Una intervista riporta: "Abbiamo deciso fin dall'inizio che il Natale è semplicemente importante, siamo chiusi dal 24 al 27 e qui ci sono solo i familiari, gli ospiti partono il 23 e tornano il 27. Bisogna solo educarli." (Int. 2).

Nell'ambito di questo percorso di assunzione di un ruolo di leadership, le donne intervistate riscontrano una sottostima delle proprie abilità e una eccessiva modestia, che determina a volte dei limiti autoimposti, come riporta una intervistata: "Uno degli ostacoli principali è che semplicemente rendiamo la vita più difficile a noi stesse. Siamo molto più caute quando facciamo qualcosa e tendiamo a sottovalutarci. In base alla mia esperienza professionale, gli uomini affrontano le cose dicendo: "Ok, chi lo fa? Certo che lo faccio io, perché sono in grado di farlo". Le donne, invece, pensano cinque volte prima di alzare la mano e dire: "Posso farlo". Io mi includo in questo gruppo. [...] E questo è il nostro problema più grande: spesso siamo troppo modeste" (Int.1).

Tabella 3. Ostacoli alla carriera, fattori abilitanti e intersezionalità dei ruoli di genere delle imprenditrici nel settore dell'ospitalità delle imprese familiari in Alto Adige

Una volta assunto il ruolo di imprenditrici, a livello relazionale si innestano, sulla base di quanto riportato, alcuni meccanismi di screditamento del ruolo di leadership: ad esempio, le intervistate riportano che gli ospiti, il personale e i fornitori si rimettono all'autorità degli uomini (mariti o padri) e non riconoscono l'autorità femminile. Ciò avviene anche ad opera degli ospiti, come riporta una intervistata: "Quindi, per esempio, se sono seduta qui [alla reception] e il mio collega è seduto accanto a me, le persone si avvicinano a me, vedono che sono disponibile e mi dicono: 'Mi scusi, ho un problema', ma poi vogliono parlare con il mio collega per risolverlo" (Int.12). Per ovviare a tali criticità, le reti familiari e associative forniscono un supporto importante: da un lato sostengono le imprenditrici creando attorno a loro le condizioni di legittimazione del ruolo e di supporto per una più serena gestione dell'equilibrio lavoro-famiglia, dall'altro permettono di attribuire un (nuovo) significato collettivamente accettato del ruolo dell'imprenditrice nella società, mettendo in discussione i tradizionali ruoli di genere. Una delle intervistate ha condiviso una strategia personale per affrontare le situazioni di screditamento del proprio ruolo da parte dei dipendenti, dicendo: "Molto spesso scelgo la via più facile e uso la scusa 'mio marito ha richiesto che fosse così' quando le cose non funzionano, anche se mio marito non ne sa nulla. Ricorro spesso a questa scusa perché penso: perché dovrei sprecare un'ora a discutere quando tanto non funzionerà?" (Int.1) Un'altra intervistata ha rivelato una tattica simile, riportando di dire ai propri dipendenti che "sta arrivando il capo" (Int.3), riferendosi al marito, anche se è lei stessa a dirigere l'azienda.

Infine, a livello istituzionale, l'intervento e il supporto delle istituzioni sono avvertiti come fondamentali e al tempo stesso deficitari. La maggior parte delle donne riferisce infatti di assumersi la responsabilità primaria della cura dei figli e dei parenti anziani, in assenza di un supporto istituzionale adeguato (in particolare, di servizi di assistenza all'infanzia compatibili con gli orari del settore alberghiero e della ristorazione). Per far fronte al lavoro di cura, molte accettano una necessaria riduzione dell'orario di lavoro e beneficiano ancora una volta del sostegno familiare. In alternativa, optano per il multitasking, normalizzando la gestione dei propri figli all'interno della struttura ricettiva con una stressante sovrapposizione tra i doveri e i ruoli professionali e di cura. Una intervistata riporta: "[...] i nostri figli sono cresciuti nell'hotel. Potevano andare a nuotare, erano sempre nei paraggi e anche noi eravamo sempre lì. Quindi, se avevano fame, venivano da noi e pranzavamo insieme, cosa che facciamo ancora oggi. Avevano semplicemente la sensazione che io fossi lì, che la loro mamma fosse in hotel e che potevano sempre venire da me. "» (I.11). È interessante notare come diverse donne intervistate abbiano affrontato queste sfide diventando agenti attivi del cambiamento e trovando soluzioni creative per ovviare al mancato supporto delle politiche pubbliche, offrendo a propria volta soluzioni concilianti per i propri dipendenti, quali una turnazione attenta alle esigenze familiari, asili nido aziendali, o chiusure dell'attività durante le festività. Ad esempio, una intervistata riporta: "Uno degli uomini qui è appena diventato papá e gli abbiamo proposto, visto che ci sono asili nido vicino al posto di lavoro, di coprire noi i costi dell'asilo. Lo faremo sia per i papà che per le mamme." (I.2). Questi aspetti si riflettono in un empowerment sociale e politico delle imprenditrici, che si traduce a sua volta in risorsa per altre persone in azienda e nella società.

4.2. Le manager filippine: percorsi di carriera e di empowerment

Le interviste condotte su donne provenienti dalla National Capital Region delle Filippine rivelano come l'avanzamento di carriera in contesti aziendali non familiari sia negoziato attivamente a livello interno, interattivo e istituzionale. A livello individuale, la tabella mostra come l'interiorizzazione dei tratti culturali da parte delle partecipanti, in particolare di tratti come la modestia, strettamente legata alla posizione sociale e al background familiare, abbia influenzato il modo in cui hanno sviluppato inizialmente la fiducia in sé stesse e superato l'insicurezza, consentendo di prendere decisioni su quando e come cogliere le opportunità di carriera. Ad esempio, una partecipante ha costantemente minimizzato il proprio successo, introducendo i racconti dei propri risultati con queste parole: "Non è solo merito mio; direi piuttosto che sono stata fortunata nella strada che ho intrapreso" (Int.14). Un'altra riporta "A quel tempo, mi sentivo inadatta a lavorare nei grandi hotel di Manila." (Int. 16). Motivate dalla necessità di perseverare e lavorare sodo per essere considerate competenti, le partecipanti hanno assunto carichi di lavoro superiori a quelli richiesti all'inizio della loro carriera. Una intervistata, ad esempio, riferisce "Ho lavorato due settimane di fila. Senza un giorno libero... Dovevo farlo, dovevo essere lì perché sono una manager. Ma è stato estenuante." (Int. 15) considerandoli come un'opportunità di apprendimento, un modello che ha rivelato il loro valore in termini di perseveranza, di impegno e resilienza, ma che ha anche aumentato il rischio di burnout e in seguito ha influenzato il modo in cui hanno assunto il ruolo di madri, trovando difficile conciliare lavoro, vita personale e familiare.

Tabella 4. Ostacoli alla carriera, fattori abilitanti e intersezionalità dei ruoli di genere delle imprenditrici nel settore dell'ospitalità delle imprese familiari nelle Filippine

Nel bilanciare l'aspettativa culturale di dimostrare umiltà con l'aspettativa della leadership di prendere decisioni assertive, le partecipanti si sono affidate a mentori e colleghi che hanno sostenuto e legittimato la loro credibilità sul posto di lavoro. Ad esempio, una partecipante ha riportato "Avevo un professore all'università che era il direttore generale di questo hotel... è stato il primo a darmi una possibilità." (Int. 18). A livello interazionale, queste sono state le risorse più preziose delle partecipanti che le hanno sostenute nel loro progresso verso il livello manageriale. Per coloro che avevano già una famiglia, anche i coniugi e i membri della famiglia allargata sono stati fondamentali, poiché hanno fornito sostegno nel lavoro di cura e domestico. Le partecipanti sposate hanno riportato di aver avuto bisogno di partner in grado di discutere e prendere decisioni con loro e di comprendere i loro obiettivi e le loro priorità di carriera. Una intervistata ha riportato "Avevo bisogno di un marito che sapesse cucinare... Sono davvero grata a mia suocera perché ha cresciuto mio marito insegnandogli a occuparsi della casa." (Int. 17), e un'altra riporta "La

decisione [di avanzamento di carriera] è stata presa da entrambi... lui mi ha davvero sostenuta. Sa che la mia carriera è parte integrante della mia persona" (Int. 20).

A livello istituzionale, l'istruzione, in particolare l'università frequentata, è stata una risorsa importante all'inizio della carriera, quasi come se fungesse da gatekeeper delle opportunità future: da un lato influiva sull'autopercezione, dall'altro sulla maggiore validazione esterna delle proprie competenze. Una partecipante riferisce a questo proposito "Sono stata una studentessa dell'UST... Provengo da una delle migliori università delle Filippine." (Int. 18). L'avanzamento progressivo di carriera e l'ottenimento di riconoscimenti formali sul posto di lavoro e nel settore alimentavano progressivamente le aspirazioni di avere un'influenza positiva nelle proprie organizzazioni, con un effetto positivo a cascata. Le partecipanti descrivono che il loro più grande risultato è quello di essere considerate buone mentori e modelli di riferimento nella loro azienda.

4.3. Analisi comparativa: tratti comuni e paradossi di genere

La comparazione dei due casi di studio offre spazio per alcune riflessioni sui tratti comuni e le convergenze dei risultati ottenuti.

Emerge con forza nel campione il ruolo dei fattori di contesto abilitanti o limitanti il percorso di carriera. Tra i fattori abilitanti, l'istruzione appare fondamentale in entrambe le aree di studio e ha la funzione non tanto e soltanto di trasferire conoscenze, ma di favorire l'autostima, limitare l'eccessiva modestia e supportare la legittimazione esterna delle donne. Tra i fattori limitanti, si rileva come in entrambi i casi la persistenza di ruoli di genere ascrivibili al concetto di famiglia "tradizionale" e l'assenza di un supporto istituzionale per il lavoro di cura generino conflitti lavoro-famiglia, che sono più marcati nel settore dell'ospitalità a causa dei ritmi di lavoro serrati, della stagionalità e del lavoro su 7 giorni e 24 ore. Paradossale è notare come, per supportare il percorso di carriera di imprenditrici e donne manager, entrino in gioco altri membri della famiglia allargata, molto spesso di sesso femminile, che investono tempo nel lavoro di cura, a dimostrazione che il superamento degli stereotipi di genere è solo parziale.

La legittimità del ruolo dell'imprenditrice o della manager non è un fatto scontato. Piuttosto, in entrambi i paesi, si configura come un processo di legittimazione a tappe e uno scardinamento progressivo di stereotipi e pregiudizi, anch'esso non esente da paradossi. Si può affermare infatti che le donne intervistate, soprattutto quelle con famiglia, siano agenti di cambiamento intrisi di tradizione e che vivano, quotidianamente, un conflitto interno tra ruoli non completamente conciliati.

Un'ultima riflessione va spesa sulla diversa natura dei percorsi di carriera in aziende familiari e non familiari. In aziende non familiari il percorso di carriera si configura come un percorso lento e a più tappe, in cui l'empowerment e la legittimazione esterna avvengono in modo progressivo. Viceversa, nelle imprese familiari l'assunzione di ruoli di leadership avviene in modo più repentino, tipicamente attraverso la successione intra-familiare. Ciò comporta un riequilibrio dei ruoli familiari e aziendali molto più repentino, rendendo la legittimazione esterna del ruolo della nuova leader più difficoltosa e faticosa. Se è vero, quindi, che fare carriera in un'impresa familiare è più rapido (cfr. Barrett & Moores, 2009), non è detto che sia più semplice.

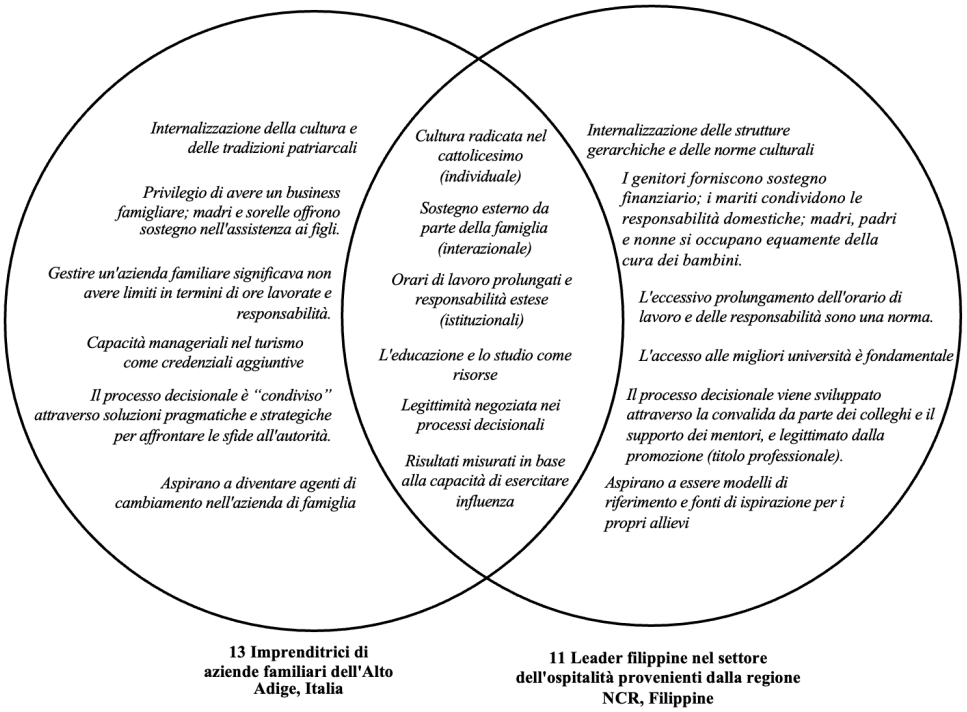

Figura 1. Analisi comparative del caso altoatesino e filippino

5. Analisi comparativa: tratti comuni e paradossi di genere

Lo studio qualitativo e comparativo sulle traiettorie di carriera di donne italiane e filippine ha permesso di mettere in luce alcuni aspetti legati all'implementazione della sostenibilità sociale all'interno delle imprese dell'ospitalità. La ricerca ha messo in luce, attraverso 24 interviste narrative tra loro diverse ma assonanti, come l'avanzamento di carriera femminile avvenga all'interno, e non contro, un sistema che resta inequivocabilmente intriso di stereotipi e paradossi di genere. Il divario di genere nella leadership (Pritchard & Morgan, 2017) non può essere colmato se non attraverso un percorso di continua negoziazione dei ruoli di genere, sia maschili che femminili, e una attività creativa di problem-solving sia individuale che istituzionalizzata. L'interiorizzazione del driver della sostenibilità sociale appare quindi un percorso multilivello, negoziato sulle sfere individuale, relazionale e istituzionale e fortemente influenzato dal contesto. In particolare, le caratteristiche peculiari del lavoro nel settore hospitality richiedono a tutti i livelli un'attenzione particolare alla conciliazione lavoro-famiglia. L'assunzione di un ruolo di leadership pone le donne in una posizione paradossale di sfida lavorativa e di delegittimazione sociale, complice il contesto culturale e religioso di riferimento, affrontabile con successo se le istituzioni o le reti familiari e associative riescono a fornire supporto e sostegno, con una condivisione del lavoro di cura e un riconoscimento della legittimità dei ruoli. Paradossali, a questo proposito, sono le dinamiche da gestire sia a livello familiare che aziendale, quali il trasferimento del lavoro di cura ad altre donne, la legittimazione del ruolo di leadership femminile ricorrendo a figure maschili, il ricorso, per le imprese familiari, al multitasking esercitando il ruolo di madre e di imprenditrice all'interno della struttura ricettiva. Queste dinamiche, pur indicando un progresso verso gli obiettivi di equità e parità di genere (SDG 5), potrebbero generare effetti rebound potenzialmente negativi.

In una prospettiva di ricerca futura, il concetto di disapprendimento (unlearning, ovvero la capacità di individui e organizzazioni di abbandonare routine e credenze datate, fuorvianti o dannose) (Tsang & Zhara, 2008; Maccioni et al., 2024) potrebbe costituire una lente analitica

particolarmente feconda per affrontare e gestire i paradossi che caratterizzano i percorsi di carriera di imprenditrici e donne manager e la sostenibilità sociale del lavoro imprenditoriale. Quest'ultima appare infatti intrinsecamente paradossale, in quanto non solo richiede di mantenere la continuità di assetti consolidati (impresa familiare, ruoli di cura, aspettative culturali e organizzative) bensì al contempo, di mettere radicalmente in discussione proprio quei presupposti che riproducono disuguaglianze di genere e forme di penalizzazione. In tale prospettiva, il disapprendimento andrebbe analizzato in modo sistematico su tutti e tre i livelli contemplati dal presento studio (individuale, relazionale e istituzionale) e non solo come processo a carico delle donne, ma anche come processo che coinvolge uomini, reti familiari, colleghi, organizzazioni e attori istituzionali. Infatti, in assenza di un disapprendimento diffuso, il lavoro di adattamento e costante negoziazione richiesto alle imprenditrici rischia di rimanere individualizzato, circoscritto all'ambiente protetto dell'impresa familiare ereditata, caratterizzato da metriche di valutazione sbilanciate e poco generativo di cambiamenti duraturi per le coorti successive.

In chiave più riflessiva, assumere il disapprendimento come lente teorica potrebbe quindi aiutare a riconoscere che la sostenibilità sociale non coincide con la semplice rimozione degli ostacoli, ma con la capacità di convivere con tensioni strutturali e caratterizzanti lo scenario contemporaneo tra cura e lavoro, umiltà e assertività, dipendenza familiare e autonomia imprenditoriale. Questo, senza trivializzarle a problemi da risolvere, bensì trattandole come dinamiche da negoziare continuamente. Non a caso, le traiettorie di carriera esaminate sembrerebbero mostrare come l'avanzamento professionale sia reso possibile da processi di disapprendimento di tratti culturali interiorizzati (ad esempio la modestia come vincolo alla visibilità della propria competenza), accompagnati da una ridefinizione congiunta dei ruoli di genere con mentori, colleghi, partner e organizzazioni. Pertanto, applicare il disapprendimento a questa linea di ricerca consentirebbe così di interrogare criticamente non solo ciò che le imprenditrici acquisiscono in termini di competenze e risorse, ma anche ciò che (insieme agli ecosistemi che abitano) devono disapprendere per rendere sostenibili, sul piano sociale, i propri percorsi di vita e di lavoro.

Towards a Model of Regenerative Tourism and Place-Based Value Creation in Urban Commons

Eleonora Napolano[1], Elena Lupolo[2], Valentina Della Corte[3]

1. Introduction

In recent years, the growing attention to sustainability and the reconfiguration of urban economies have stimulated a renewed interest in governance models capable of combining social inclusion, ecological awareness and economic resilience. Within this debate, the concept of the regenerative economy has emerged as a framework that moves beyond the linear and extractive logic of traditional growth models, advocating instead for systems that restore, renew and sustain the resources on which they depend (Gibbons, 2020; Andreucci et al., 2021).

This approach highlights the role of urban commons-based institutions in regenerating ecological systems as well as rebuilding community relations. Cities across Europe have witnessed the rise of urban commons, self-organized and community-managed spaces that represent alternative modes of governance, where the collective use and care of resources challenge the dichotomy between public and private ownership (Borch, Kornberger, 2015; Hussain, Kohn, 2018). Within this emerging paradigm, regenerative tourism has gained visibility as an extension of these principles, promoting visitor experiences that actively contribute to the restoration of local ecosystems and the empowerment of host communities (John et al., 2024).

The present study investigates the Beni Comuni di Napoli as a living laboratory capable to generate social innovation, environmental care and shared governance. The research aims to explore how these initiatives operationalize regenerative principles at the urban scale and how their governance structures contribute to long-term sustainability and territorial cohesion. Although previous research has primarily focused on the governance dimension of the commons (Armitage, 2008; Guttmann, 2021; Geagea, De Tullio, 2024) and on the regenerative economy as a driver of social and environmental value (Mehmood et al., 2020; Dos Santos Figueiredo et al., 2022), there is still a lack of studies examining how these urban commons are perceived by different stakeholders, particularly in relation to their potential contribution to regenerative and community-based tourism.

Naples represents a particularly significant case within this broader European context. Over the last decade, the city has institutionalized the recognition of the Beni Comuni di Napoli (Commons of Naples) as civic-use assets. These experiences, ranging from cultural hubs and social centers to community gardens and reclaimed public infrastructures, embody an experimental governance framework that redefines the relationship between citizens, institutions and the urban environment (Comune di Napoli, 2020).

Beyond the specificities of the Neapolitan context, the study aspires to shed light on the potential of commons-based models to inform broader strategies of sustainable development, particularly in sectors such as cultural and community-based tourism. The analysis, still in progress, seeks to integrate conceptual, empirical and methodological insights to assess the

transformative value of commons governance within the transition toward regenerative urban economies.

2. Literature review and conceptual framework

The conceptual foundation of this study lies at the intersection of regenerative economics and the governance of urban commons. Regeneration implies a systemic process of renewal that restores the ecological and social foundations upon which economies depend (Raworth, 2017; Morseletto, 2020). In contrast to the extractive and degenerative logic of linear capitalism, regenerative approaches emphasize reciprocity, interdependence and the co-evolution of human and natural systems (Cole et al., 2013; Buckton et al., 2023). This vision situates economic activity within ecological boundaries, seeking to maintain balance by continuously reinvesting value into the health and vitality of socio-ecological systems (Čegar et al., 2024).

The urban commons perspective introduces a governance dimension to these debates. Commons are collectively managed resources sustained by communities through rules, norms and practices of care (Ostrom, 1990). In the urban context, commons management redefines the relationship between citizens and institutions by transforming neglected or underused assets into spaces of cooperation and civic production (Graziadei, 2023). The city thus becomes a co-produced environment, where governance emerges through continuous negotiation among public authorities, private actors and civil society (Frantzeskaki, Kabisch, 2016).

Combining these approaches allows a novel interpretation of regenerative governance, understood as a process that not only preserves or optimizes resources but actively renews social and ecological capacities through collective action. This study employs this integrated lens to examine how the Beni Comuni di Napoli embody regenerative dynamics. Their governance practices are deeply rooted in community participation, enabling processes of ecological and social renewal. By generating forms of social, cultural and environmental value grounded in local communities, these commons also contribute to shaping a model of regenerative tourism. This form of tourism moves beyond traditional notions of sustainability to promote visitor experiences that are participatory, educational and restorative for both people and places (Bellato et al., 2022).

According to Teruel (2018), regenerative tourism is: “an emergent, evolutionary and dynamic understanding, which includes sustainability within the framework of living systems and emphasises the relationship of man with himself, with the other and with the earth; where the other is invited to visit the place, slowing down the visitor’s pace and creating an experience that activates deep and positive connections between the visitor, the local community (the other), the place and the systems that support life there, aligning both the local and the visitor to the rhythms of nature” (Teruel, 2018, p. 64).

In this scenario, the Beni Comuni di Napoli can be interpreted as catalysts for a tourism economy that values authenticity and community engagement. By transforming the city into a living ecosystem where visitors actively participate in processes of regeneration rather than consumption. This process is made possible by the intrinsically regenerative nature of urban common goods, which function as living social infrastructures capable of hosting slow, participatory and conscious tourism practices. Common goods, thus, become places of environmental education, cultural regeneration and experimentation with new local economies, promoting a model of tourism that actively contributes to improving the resilience of the territory.

3. Methodology

The city of Naples provides a distinctive context for exploring the implementation of regenerative tourism through community-based governance. Since 2012, the Municipality of Naples has progressively recognized a series of disused or underutilized public buildings as Beni Comuni granting communities the right of civic use and collective management.

This legal and institutional innovation, unique in Italy and rare in Europe, formalizes the co-production of public value between local authorities and civic collectives (Comune di Napoli, 2020). As such, the Beni Comuni di Napoli represent an evolving system of shared governance, where social innovation, cultural production and ecological care converge within a unified urban framework. This institutional setting makes Naples a particularly relevant case for investigating emergent forms of regenerative governance and place-based value creation.

Seven emblematic initiatives compose this system: Ex Asilo Filangieri, Scugnizzo Liberato, Ex OPG Je so' Pazzo, Giardino Liberato di Materdei, Lido Pola, Ex Schipa and Santa Fede Liberata.Each occupies a building or area formerly abandoned, reactivated through citizen engagement and collective stewardship. The Ex Asilo Filangieri, situated in the historical center, has become a cultural and educational hub promoting cooperative production, open knowledge and shared artistic creation. Scugnizzo Liberato, housed in a former juvenile detention center, functions as a social incubator hosting workshops, co-working activities and local micro-enterprises. The Ex OPG Je so' Pazzo operates within a former psychiatric hospital, providing social services, political education and spaces for community health initiatives. The Giardino Liberato di Materdei embodies ecological regeneration through community gardening, biodiversity protection and inclusive leisure activities. Along the coast, Lido Pola in Bagnoli restores access to the sea and integrates environmental reclamation with social and cultural activities. The Ex Schipa, once a music school, now supports artistic experimentation and training for young creatives, while Santa Fede Liberata, a deconsecrated church, has been transformed into a space for cultural production, social theatre and civic dialogue. In this study, all seven officially recognized Beni Comuni di Napoli were included in the analysis. This choice reflects the specific nature of the Neapolitan commons framework, which ensures institutional homogeneity in terms of legal recognition and governance principles, while allowing for strong heterogeneity in objectives, types of activities, organizational practices and stakeholder configurations. Analysing the urban commons as an integrated system makes it possible to observe how shared regulatory foundations generate diverse forms of social innovation, regenerative practices and place-based value creation across different urban contexts. Taken together, these experiences form a distributed urban ecosystem rooted in cooperation, adaptive reuse and mutual learning. Their collective practice of "civic co-management" reinterprets the notion of the city as a living common, a relational space in which economic and social value is generated through care, reciprocity and trust. The Beni Comuni di Napoli, thus, represents a tangible manifestation of regenerative governance, in which the city's physical and symbolic resources are continuously renewed through collective agency.

The study adopts a qualitative and interpretive methodological approach, designed to capture the complexity, relationality and contextual embeddedness of the Beni Comuni di Napoli experience.

The focus is not on measuring quantitative outputs but on understanding the processes, meanings and interactions through which regenerative governance is enacted. This approach is particularly suited to the analysis of emergent governance arrangements and non-market forms of value creation that cannot be adequately captured through standardized indicators. This choice aligns with the epistemological orientation of urban and organizational studies that emphasize situated knowledge, reflexivity and the co-construction of meaning between researcher and participants (Javadi et al., 2024).

Given the exploratory nature of the research, the Beni Comuni di Napoli system constitutes an exemplary case that allows for an in-depth investigation of governance innovation and socio-ecological regeneration within a defined territorial context. The case study design facilitates both analytical depth and theoretical generalization, allowing insights to emerge inductively from empirical material (Eisenhardt, Graebner, 2007; Mills et al., 2017).

Data collection combines primary and secondary sources. First, document analysis was conducted on municipal resolutions, civic-use agreements and charters of self-governance

produced by the commons communities. These documents provide an institutional and discursive foundation for understanding how the idea of the commons is framed, negotiated and legitimized at the municipal level. The empirical phase of the research is still ongoing. However, several key stakeholder groups have already been identified. These include members of commons communities involved in everyday governance practices; civic activists engaged in urban regeneration processes; event organizers, educators and trainers delivering social and educational initiatives, such as Italian language courses for migrants and community-based sports programmes; and representatives of the local administration responsible for commons-related policies. So far, a total of 18 semi-structured interviews has been conducted, focused on the key issues of urban commons-based institutions and tourism regeneration.

Participant observation was undertaken during public assemblies, cultural events and collective maintenance activities in selected commons, allowing for the documentation of interactional practices and social rituals that sustain collective ownership.

The triangulation of these data sources strengthens the reliability and validity of the analysis by enabling the comparison between institutional narratives, community perspectives and observed practices. Data are being analysed through thematic coding, identifying recurrent patterns and interpretive categories related to urban commons-based institutions and tourism regeneration. The analytical process follows an iterative logic in which empirical insights and theoretical reflection continuously inform one another.

As the research is still in progress, data analysis remains open and reflexive. The aim is to construct a thick description of how regenerative principles materialize through commons-based governance.

4. Preliminary findings and discussion

Preliminary findings indicate that the Beni Comuni di Napoli enact a multi-layered form of regenerative governance that integrates participatory management, socio-ecological awareness and practices that lay the groundwork for regenerative tourism. Governance innovation emerges through collective decision-making and transparent accountability processes that challenge hierarchical models and foster distributed responsibility.

Furthermore, these commons cultivate socio-ecological regeneration by linking cultural activity, environmental care and community well-being. Gardens, workshops and cooperative events stimulate both ecological literacy and civic empowerment, weaving together the social and natural dimensions of sustainability. In this sense, the commons operate as regenerative nodes within the urban ecosystem, knowledge and care through community action. These initial interviews show that urban common goods provide a solid foundation for the implementation of regenerative tourism practices, thanks to their ability to integrate ecological, cultural and social values. They promote tourism that is rooted in caring for the place, the responsible use of spaces and the strengthening of local ties, promoting an approach that sees visitors as an active part of urban regeneration processes.

Collective practices for managing and reactivating spaces generate a virtuous cycle in which tourism becomes an opportunity to strengthen social cohesion, support local economies and enhance the city’s tangible and intangible heritage.

5. Conclusions and implications

The Beni Comuni di Napoli represent a living experiment in regenerative urban governance, where commons-based institutions mobilize civic participation and socio-ecological awareness. They demonstrate that regeneration can be achieved through collaborative processes that renew the relationships between communities, institutions and environments. This study makes three complementary contributions to the academic debate. Firstly, it contributes to the integration of

regenerative perspectives with theories of the urban commons by showing how collective governance practices enable the continuous renewal of social and ecological relations, moving beyond extractive and market-oriented approaches to urban development. While the literature has extensively examined common goods as a mechanism for resource management and civic participation, studies exploring its potential to generate regenerative dynamics at the urban scale remain limited. This study addresses this gap by examining the Beni Comuni di Napoli as a form of regenerative governance, where collective decision-making, practices of care and the production of relational value contribute to the continuous renewal of social and ecological systems. From this perspective, the research challenges the dominant tourism paradigm based on growth and consumption. Instead, it advances the idea of tourism as a participatory, educational and transformative practice deeply embedded in local contexts.

Secondly, it offers one of the few in-depth analyses of Naples' commons system as an institutionalised experiment in regenerative urban management, highlighting how a shared regulatory framework can support heterogeneous practices and locally grounded forms of value creation. This study adopts a systemic perspective capable of capturing the heterogeneity of practices and coherence of governance principles that characterise different urban commons. Through interviews with a range of stakeholders who are often marginalised in urban policy and tourism-related discourses, the research foregrounds their voices. Furthermore, the study provides empirical evidence that urban commons can function as living laboratories for regenerative tourism, offering participatory, slow and educational experiences that differ substantially from conventional urban tourism models. The preliminary findings demonstrate how visitors are incorporated, albeit temporarily, into local socio-ecological processes, thereby contributing to community life, environmental stewardship and cultural production. These empirical insights deepen our understanding of how tourism can actively support urban regeneration processes.

Thirdly, from a managerial and policy perspective, it emphasises the potential of commons-based governance to inform regeneration strategies within local economic systems, particularly those relating to culture, tourism and collective responsibility as key organizing principles. The research also has methodological value, as it explores interpretative approaches that can capture non-financial value dimensions such as trust, inclusion and ecological resilience. These dimensions are becoming increasingly relevant to sustainability accounting and urban policy design. There is emerging evidence to suggest that integrating regenerative principles into governance practices. In tourism and territorial development, the Beni Comuni project in Naples inspires participatory models that enhance cultural and environmental heritage while preventing its commodification. Preliminary findings suggest that tourism-related practices emerge as a secondary and relational outcome of commons-based regeneration processes. The regenerative tourism model is based on the ability of common goods to activate processes of care, participation and regeneration, which generate tangible benefits for the territory. They enable the creation of tourist itineraries that reflect local life, experiences immersed in the active culture of neighbourhoods and learning opportunities related to sustainability. Thus, they contribute to redefining the role of tourism as a force for renewal rather than a pressure on urban systems. In this way, tourism is reconfigured as a practice of encounter and mutual learning, contributing to urban renewal rather than exerting pressure on local systems.

6. Limitations and future research

While the study offers an original and valuable contribution, which derives from its examination of urban commons as drivers of regenerative tourism, its qualitative scope and geographically specific focus inevitably limit its generalizability. Nevertheless, these characteristics enable a more nuanced and in-depth understanding of the processes, practices and narratives underpinning regenerative governance in urban commons. Future research could expand the comparative dimension by exploring similar commons-based initiatives in other

Mediterranean and European cities, with particular attention to how different institutional frameworks shape the governance, sustainability and scalability of regenerative practices. Comparative analyses help assess the transferability of the Naples experience while accounting for contextual specificities. Further research should also investigate more systematically how commons-based governance interacts with local enterprises, cultural operators and tourism networks, clarifying the conditions under which regenerative practices can be integrated into broader local economic systems without compromising their civic and non-extractive nature. Finally, additional studies are needed to address how regenerative value generated by urban commons can be measured and accounted for, contributing to emerging debates on sustainability reporting, social impact evaluation and alternative metrics capable of capturing relational, ecological and place-based dimensions of value.

Sostenibilità sociale e inclusione nel settore ricettivo: scelte strategiche ed operative delle imprese alberghiere in Italia

Umberto Martini[1], Federica Buffa[2], Flavio Santi[3]

1. Obiettivo della ricerca e contesto teorico di riferimento

La ricerca si pone l'obiettivo di indagare le scelte strategiche ed operative adottate dalle imprese alberghiere e le direzioni future che esse prevedono di intraprendere in risposta a due tematiche ad oggi particolarmente sfidanti, nonché tra esse interconnesse: la sostenibilità sociale e l'inclusione. Con riferimento alle più ampie scelte strategiche perseguibili dalle imprese (Miles e Snow, 1978; Mintzberg e Waters 1985; Mintzberg 1995; Rispoli, 2002) la ricerca pone attenzione sia a strategie deliberate, sia a scelte ed azioni intraprese dalle imprese alberghiere (Rispoli e Tamma, 1995) che, implicitamente, sono orientate al raggiungimento di obiettivi di sostenibilità sociale e inclusione.

La ricerca - attualmente in progress - ideata, patrocinata e finanziata da Federalberghi (Federazione delle Associazioni Italiane Alberghi e Turismo) e ASAT (Associazione Albergatori ed Imprese Turistiche della Provincia di Trento) coinvolge il Dipartimento di Economia e Management (DEM) dell'Università degli Studi di Trento. Lo studio, che affronta un tema rispetto al quale oggi permane un gap conoscitivo, permetterà di ricostruire lo status quo rispetto alle scelte strategiche delle imprese alberghiere in Italia, analizzando se e come tale comparto della ricettività si stia interrogando e reagendo di fronte agli obiettivi che la sostenibilità sociale richiede.

Il focus di analisi sulle scelte delle imprese alberghiere in ambito di sostenibilità sociale ed inclusione scaturisce dalla crescente attenzione che il contesto istituzionale (nazionale ed internazionale) pone al tema della sostenibilità e dei criteri ESG (Environmental, Social and Governance) nella gestione delle imprese. Si considerino a titolo esemplificativo (e certamente non esaustivo) gli obiettivi di sviluppo sostenibile (Sustainable Development Goals - SDGs) definiti nel 2015 dall'Organizzazione delle Nazioni Unite attraverso l'Agenda 2030, piuttosto che le direttive e le raccomandazioni della Commissione Europea in tema di rendicontazione e responsabilità sociale di impresa (si pensi alla più recente Corporate Sustainability Reporting Directive - CSRD emanata nel 2022).

Anche nell'ambito della letteratura di tourism and hospitality management emerge chiaramente l'attenzione per queste tematiche, ma permane un knowledge gap rispetto alle scelte strategiche delle imprese alberghiere. A riguardo, Kalargyrou e Costen (2017) sottolineano tale gap con specifico riferimento alla dimensione sociale della sostenibilità e ai temi riconducibili all'inclusione (EDI - equality, diversity and inclusion). Con riferimento alle più ampie tematiche concernenti gli ESG, Su e Chen (2020) evidenziano un marcato gap di studi e ricerche sviluppati con riferimento al settore dell'ospitalità e del turismo.

Analizzare strategie ed azioni delle imprese alberghiere con riferimento a queste tematiche contribuisce a comprendere le scelte che esse stanno adottando o prevedono di implementare

anche alla luce di un mutato contesto competitivo interessato da alcuni fattori specifici. Si considerino, infatti, alcuni dei principali trend che caratterizzano la domanda turistica (Randstad Research, 2024). I dati più recenti mettono in luce una crescita dei flussi turistici imputabile alla domanda internazionale (si vedano anche i dati di Banca d'Italia, 2023 e Rana, 2025). Tale target presenta profili socioculturali non necessariamente allineati con aspettative, abitudini e comportamenti espressi dalla domanda domestica. Si riscontra altresì un aumento di turisti senior che esprimono bisogni e attenzioni che spesso richiedono un'integrazione del tradizionale servizio alberghiero e/o una riorganizzazione delle modalità di erogazione dello stesso (si pensi, ad esempio, ad esigenze alimentari piuttosto che di accessibilità).

L'affermarsi di nuove abitudini di viaggio, tra cui la crescita del segmento "solo travel" (Laesser et al., 2009; Otegui-Carles et al., 2022) e il consolidarsi di un interesse sempre più marcato da parte della domanda turistica per hotel certificati o attestanti azioni e comportamenti sostenibili (Buonincontri e Micera, 2022) sono ulteriori fattori che possono avere un impatto significativo sulle scelte strategiche delle imprese alberghiere orientate alla dimensione sociale della sostenibilità e all'inclusione.

La capacità delle imprese alberghiere di fronteggiare le sfide che questi nuovi trend comportano, pone degli interrogativi proprio su scelte strategiche e azioni operative indirizzate sia ai dipendenti, in quanto forza lavoro che entra in diretto contatto con gli ospiti (si pensi, a titolo di esempio, al personale di front office dedito all'accoglienza degli ospiti in fase di check-in o al personale di sala), sia ai clienti, che attraverso il loro soggiorno fanno esperienza sia dell'atmosfera di accoglienza che caratterizza l'hotel, sia dei servizi e facilities offerti.

L'approccio multi-stakeholder che contraddistingue l'orientamento alla sostenibilità non si limita ad osservare clienti e dipendenti delle imprese, ma pone in primo piano anche le relazioni che si sviluppano tra l'impresa alberghiera e altri soggetti ritenuti strategici per la competitività della stessa. Rientrano in tali categorie i fornitori coinvolti nella supply chain dell'hotel, così come la comunità locale presente nel territorio in cui esso è inserito.

La considerazione di queste categorie di stakeholder e le azioni ad esse rivolte da parte dell'impresa alberghiera in tema di sostenibilità sociale e inclusione, pongono l'attenzione su obiettivi specifici dell'Agenda 2030 quali la salute, la parità di genere, le condizioni lavorative e le disuguaglianze. Nell'ambito degli studi di tourism and hospitaliy management tali tematiche sono state affrontate in diversi contesti Paese, con diversi approcci di metodo e da prospettive di analisi distinte (consumatore; dipendente; impresa). Si considerino, ad esempio, gli studi di Daruwalla e Darcy (2005) e Darcy (2010) che affrontano i temi della disabilità e dell'accessibilità dal punto di vista dell'ospite nei processi di scelta delle strutture ricettive; il contributo di Bengisu e Balta (2011) che approfondisce i principali fattori che influenzano il reclutamento di persone con disabilità nelle imprese ricettive, piuttosto che la più recente ricerca di Changa et al. (2025) che indaga pratiche di sostenibilità sociale adottate da direttori, manager e altre figure professionali coinvolte nell'hotel. Tali studi contribuiscono ad approfondire dimensioni connesse alla sostenibilità sociale e all'inclusione, ma, come già evidenziato, rispetto a tali topic permane un gap di conoscenze connesse alle scelte di condotta strategica delle imprese alberghiere.

Alla luce di questo scenario, le sezioni che seguono presentano aspetti di metodo e risultati preliminari di una ricerca che ha coinvolto le imprese alberghiere del contesto nazionale. L'Italia vanta il primato a livello europeo per capacità ricettiva alberghiera in termini di numerosità di imprese (circa 33.000 hotel), numero di camere (1,1 milioni di camere) e posti letto (2,3 milioni) (dati anno 2024) (Fonte: Rana, 2025). Le indicazioni riguardo alle scelte che hanno guidato la ricerca sul campo, la definizione dello strumento di rilevazione e il processo di analisi dei dati sono illustrate nel paragrafo che segue. La sezione 3 descrive alcuni dei principali risultati preliminari sino ad ora emersi. Attenzione è posta sia a strategie ed azioni rivolte a stakeholder interni all'impresa alberghiera (dipendenti), sia a stakeholder esterni (clienti, fornitori e comunità locale).

Nel paragrafo conclusivo, infine, si mettono in luce gli aspetti di originalità della ricerca e si delineano gli step di analisi successivi che si prevede di seguire, al fine di identificare possibili profili di imprese alberghiere che si differenziano per strategie adottate in tema di sostenibilità e inclusione.

2. Metodo della ricerca

2.1. Fuochi di ricerca e strumento di rilevazione

La ricerca analizza le scelte strategiche adottate dalle imprese alberghiere che rientrano nella dimensione della sostenibilità sociale e dell'inclusione con riferimento al contesto italiano. La popolazione di riferimento è rappresentata dalle imprese alberghiere associate a Federalberghi che, complessivamente, sono oltre ventimila, ossia oltre il 60% di tutte le imprese alberghiere a livello nazionale[4].

La ricerca sul campo si è avvalsa di una survey che ha previsto la somministrazione di un questionario online nel periodo aprile - ottobre 2025 a tutte le imprese alberghiere associate a Federalberghi. Complessivamente sono stati raccolti 1.119 questionari, di cui 624 compilati in ogni parte e ritenuti validi ai fini dell'analisi.

Per la definizione delle domande si è condotto uno scouting della letteratura scientifica che ha affrontato i temi della sostenibilità sociale e dell'inclusione con riferimento al settore dell'hospitality e della ricettività alberghiera. Dall'analisi sono emersi specifici topic che hanno messo in luce una declinazione delle tematiche oggetto della ricerca riferite alle diseguaglianze economiche, alle diseguaglianze di genere, alla diversa confessione religiosa e all'etnia di riferimento. Le domande sono state definite considerando quattro principali categorie di stakeholder: dipendenti, clienti, fornitori e comunità locale. La ricerca ha indagato fattori distintivi delle singole categorie di stakeholder e ha permesso altresì di ricostruire scelte strategiche e/o azioni implementate (o in previsione) da parte dell'hotel, finalizzate al raggiungimento di obiettivi di sostenibilità sociale e inclusione. Le principali dimensioni osservate dalla ricerca possono essere sintetizzate come segue:

- Con riferimento ai dipendenti, si è analizzata la presenza di attività di formazione ed iniziative volte ad accrescerne le competenze in tema di inclusività e l'adozione di incentivi per fidelizzare e motivare il personale.
- Con riferimento ai target di clientela si è osservata la presenza o programmazione di azioni e iniziative differenziate in ragione del Paese di provenienza, della composizione del nucleo turistico, dell'età, del genere e dell'orientamento religioso.
- Con riferimento ai fornitori si è rilevata la presenza di relazioni con gli stakeholder locali e l'utilizzo di prodotti a km zero.
- Con riferimento alla comunità locale si è indagata la presenza di collaborazioni con scuole, università, associazioni ed enti del terzo settore presenti sul territorio, così come il coinvolgimento in partnership con strutture locali e/o in attività sociali con la popolazione locale e in sponsorizzazioni di iniziative territoriali.

Per ciascuna categoria di stakeholder si è altresì rilevato se nelle attività di pianificazione e programmazione delle imprese alberghiere vi siano piani di sviluppo o azioni orientate ad accrescere le conoscenze e le competenze in tema di sostenibilità sociale e inclusione.

[4] Federalberghi è la principale organizzazione imprenditoriale del settore turistico-ricettivo in Italia. Essa rappresenta le istanze e gli interessi degli albergatori nei confronti delle istituzioni e delle organizzazioni politiche, economiche e sindacali. Aderiscono a Federalberghi oltre ventimila imprese su un totale di circa 32.000, attraverso 128 associazioni territoriali (www.federalberghi.it).

2.2. Analisi statistica dei dati

L'analisi statistica dei dati raccolti si è focalizzata sullo studio dell'associazione tra le risposte fornite alle varie domande, sotto domande e gruppi di domande, con l'obiettivo di indagare le relazioni sussistenti tra le varie dimensioni dell'inclusività e della sostenibilità sociale e le loro manifestazioni.

Le analisi svolte e in progress sono descritte brevemente di seguito, richiamandone lo scopo ed illustrandone le scelte che ne giustificano l'applicazione.

Preliminarmente è stata svolta un'analisi descrittiva del campione dei rispondenti (n = 624) rispetto alle principali caratteristiche delle strutture e alla loro distribuzione geografica, mettendole in relazione con la popolazione di riferimento (imprese alberghiere associate a Federalberghi), al fine di fornire una panoramica circa la rappresentatività del campione raccolto.

In seguito, l'analisi delle distribuzioni di frequenza delle risposte fornite ad ogni domanda o item ha permesso di dare una rappresentazione sintetica (in forma tabulare e grafica) delle distribuzioni univariate delle risposte nel campione.

L'analisi di associazione tra item e domande (fase di analisi in progress) si basa principalmente su tre tipologie di analisi, che richiamiamo di seguito.

Un'analisi preliminare di associazione è stata svolta per ogni gruppo di item appartenenti alla medesima domanda e, in alcuni casi specifici, tra item di domande differenti (ne è un esempio l'analisi riguardante rispettivamente le politiche di inclusività verso i dipendenti e le politiche di gestione del personale) sfruttando indicatori di associazione bivariata per variabili qualitative ordinali. Nello specifico, sono state calcolate la gamma di Goodman e Kruskal (Goodman, Kruskal 1954; Agresti, 2013) e la tau di Kendall (1938). Entrambi gli indicatori, assumendo valori compresi tra -1 (perfetta associazione negativa) e 1 (perfetta associazione positiva), consentono di mettere in evidenza le relazioni tra tutte le coppie di item confrontate, misurandone il segno e l'intensità (in entrambi i casi, il valore 0 indica l'assenza di associazione). Inoltre, l'analisi delle matrici di associazione permette di identificare eventuali gruppi di item particolarmente omogenei e metterli in relazione gli uni con gli altri.

La seconda famiglia di strumenti utilizzati per analizzare l'associazione tra item e tra gruppi di item è l'analisi delle corrispondenze multiple (multiple correspondence analysis - MCA) nel primo caso e l'analisi gerarchica dei fattori (hierarchical multiple factor analysis - HMFA) nel secondo. In entrambi i casi l'obiettivo dell'analisi è stato quello di ridurre la dimensionalità dei dati, fornendo una rappresentazione sintetica delle varie dimensioni della sostenibilità sociale e dell'inclusività e se e in che modo tali dimensioni siano in relazione. Dal punto di vista metodologico, la scelta è ricaduta su questo tipo di modelli sia per la loro natura eminentemente esplorativa, sia per la debolezza delle assunzioni che richiedono per essere applicati, sia a causa del rapporto sfavorevole tra il numero di variabili esaminate e il numero di osservazioni disponibili.

L'ultimo aspetto menzionato, relativo al rapporto tra variabili analizzate e osservazioni disponibili, ha reso necessario ricorrere all'analisi di regressione per studiare l'associazione tra le dimensioni della sostenibilità sociale dell'inclusività e le caratteristiche delle strutture alberghiere. Questo tipo di analisi, infatti, per essere condotta esclusivamente tramite HMFA avrebbe richiesto un numero di osservazioni di gran lunga superiore a quello disponibile. Per questo motivo, sono state utilizzate le componenti principali risultanti dalle MCA e dalle HMFA come variabili esplicative o come variabili dipendenti in alcuni modelli di regressione.

Le regressioni stimate consentono di indagare se e in che misura le dimensioni della sostenibilità sociale e dell'inclusività sono in relazione tra loro e con le caratteristiche delle strutture. L'analisi dei residui delle regressioni è poi utilizzata per individuare tendenze e peculiarità geografiche.

3. Risultati preliminari della ricerca

L'analisi preliminare dei dati raccolti attraverso la survey ha evidenziato attività ed iniziative che coinvolgono le imprese alberghiere in Italia con riferimento alla sostenibilità sociale e all'inclusione. I rispondenti sono prevalentemente titolari delle strutture (57%) e manager o direttori/direttrici dell'hotel (23%). Gli hotel appartengono per lo più alle categorie 3 stelle/3 stelle superior (49%) e 4 stelle/4 stelle superior (32%). Di seguito si presenta una sintesi delle principali evidenze emerse finora.

Con riferimento ai dipendenti, la maggior parte dei rispondenti (oltre l'80%) si avvale di personale sia in giovane età (sotto i 35 anni), sia in età matura (oltre i 55 anni) e nella quasi totalità delle imprese osservate vi è la presenza di dipendenti donne. Oltre il 66% degli hotel dichiara la presenza di dipendenti con disparate tradizioni culturali. Inferiore al 10%, invece, gli hotel che dichiarano la presenza di dipendenti con disabilità motorie e/o sensoriali (ad esempio: non vedenti, non udenti, ecc.) o con disabilità intellettive e/o psichiche (ad esempio: disturbi dello spettro autistico, ecc.). L'analisi delle azioni e dei piani di sviluppo adottati dalle imprese mette in evidenza, per la maggior parte delle imprese, la presenza di iniziative volte a: *a)* valorizzare gli anni di esperienza maturati dai/dalle dipendenti nel settore (81,9%); *b)* favorire la conciliazione tra vita privata e vita lavorativa dei/delle dipendenti (80%); *c)* tutelare la genitorialità dei/delle dipendenti (66,8%). Circa il 60% dichiara di monitorare i livelli di retribuzione delle dipendenti donne e dei dipendenti uomini e circa il 47% prevede turni di riposo differenziati per esigenze religiose o culturali.

Di poco inferiori al 40% sono gli hotel che promuovono piani di sviluppo dei talenti per i/le giovani dipendenti. In linea con la minore presenza di dipendenti con disabilità, si riducono le imprese che prevedono piani di sviluppo delle competenze e della carriera dei dipendenti con disabilità motorie e/o sensoriali (13,8%) o con disabilità intellettive e/o psichiche (circa 10%).

Con riferimento ai clienti, la ricerca mette in luce una differenziazione dei target serviti dalle imprese alberghiere, sia rispetto all'età anagrafica, sia rispetto al nucleo turistico, all'orientamento sessuale e alle tradizioni culturali. La maggior parte degli hotel accoglie quotidianamente clienti anziani, mentre i target di bambini, di donne che viaggiano da sole e di ospiti appartenenti alla comunità LGBTQIA+ (lesbiche, gay, bisessuali, trans, queer, intersessuali,...) sono presenti mensilmente. Anche la presenza di clienti con disabilità motorie e/o sensoriali o con disabilità intellettive e/o psichiche è meno abituale. Nella pianificazione dell'attività ricettiva, la maggior parte delle imprese alberghiere dichiara di aver considerato il tema dell'inclusione per i clienti senior, per le donne che viaggiano da sole, per i clienti bambini e per i clienti di disparate tradizioni culturali. Anche per gli altri segmenti viene indicata attenzione, sebbene rispetto ai clienti con disabilità le risposte denotino una pianificazione meno diffusa.

Con riferimento ai fornitori la maggior parte degli hotel acquista prodotti locali (58% vi ricorre spesso e il 14% sempre) e si avvale di stakeholder attenti alle pratiche etiche e solidali (48,9% spesso e 16% sempre).

Con riferimento alla comunità locale, infine, circa l'80% delle imprese alberghiere dichiara di collaborare con le scuole per tirocini e stage, sebbene circa il 37% lo faccia occasionalmente. Minore invece la collaborazione con le università, rispetto alle quali circa la metà dichiara di non collaborare mai. Le partnership con altre strutture del territorio (negozi, musei, stabilimenti, …) e la sponsorizzazione di iniziative sportive e/o culturali legate alla valorizzazione del territorio non coinvolgono diffusamente gli hotel. La maggior parte delle strutture non collabora mai con associazioni e/o enti del terzo settore per l'impiego.

4. Considerazioni conclusive

La ricerca presenta elementi di originalità rispetto al tema affrontato e al contesto territoriale considerato, inserendosi all'interno di un dibattito scientifico rispetto al quale si riscontra un marcato gap conoscitivo.

Da una fase preliminare di analisi emerge che le imprese alberghiere manifestano interesse e coinvolgimento in azioni e scelte strategiche orientate alla sostenibilità sociale e all'inclusione, ma queste si manifestano con intensità diversa in ragione della categoria di stakeholder osservata e della complessità dell'azione considerata. Gli ulteriori step di analisi, attualmente in progress, (cfr sezione 2.2) permetteranno di approfondire quanto sino ad ora emerso. Si potrà verificare, ad esempio, se vi siano profili di imprese alberghiere che dimostrano comportamenti virtuosi con riferimento a tutte le categorie di stakeholder - sia in termini di azioni, sia rispetto alle attività di pianificazione - o se invece prevalgano azioni saltuarie, non riconducibili a scelte strategiche deliberate per il raggiungimento di obiettivi di sostenibilità.

La ricerca permetterà di verificare eventuali associazioni tra variabili e specifiche dimensioni della sostenibilità che consentiranno di delineare profili di hotel che si differenziano per attitudini e attenzione rivolte alle scelte di sostenibilità sociale e di inclusione. Tale analisi permetterà altresì di identificare buone pratiche nell'approccio strategico orientato ad obiettivi di sostenibilità sociale e di inclusione per le imprese alberghiere. Output di particolare rilievo per le scelte strategiche di queste imprese, stante le sfide attuali che interessano il settore del turismo e dell'ospitalità.

Parole chiave: Impresa alberghiera; sostenibilità sociale; inclusione

Ringraziamenti

La ricerca coinvolge il Dipartimento di Economia e Management (DEM) dell'Università degli Studi di Trento. Si ringraziano le ricercatrici dott.ssa Letizia Caporusso e dott.ssa Anna Ress dell'Università degli Studi di Trento per la collaborazione nelle attività di ricerca ed elaborazione del questionario. La ricerca è stata ideata, finanziata, supervisionata e gestita da Federalberghi (Federazione delle Associazioni Italiane Alberghi e Turismo) e ASAT (Associazione Albergatori ed Imprese Turistiche della Provincia di Trento). Gli autori ringraziano il Dott. Angelo Giuseppe Candido (Vicedirettore Federalberghi), la Dott.ssa Anna Chiara Olini (Centro Studi Federalberghi), il Dott. Davide Cardella (Direttore Generale ASAT) e la Dott.ssa Monica Basile (Responsabile dell'Ufficio Marketing e ricerche ASAT).

L'impegno delle aziende turistiche verso l'SDG 10: Un'analisi esplorativa

Benedetta Valeria Cannizzaro[1], Loredana Picciotto[2], Marcantonio Ruisi[3]

1. Introduzione

Gli obiettivi di sviluppo sostenibile (Sustainable Development Goals - SDGs) dell'Agenda 2030 (United Nations, 2015) stimolano la riflessione e l'azione in aree di importanza critica per l'umanità ed il pianeta, ponendo sfide complesse alle quali governi, collettività e ambiente imprenditoriale sono chiamati a dare risposta. Attraverso gli SDGs, le Nazioni Unite promuovono espressamente temi di significativa rilevanza sociale come l'uguaglianza di genere, il lavoro dignitoso per tutti e la riduzione delle disuguaglianze. Tra questi, la presente ricerca si focalizza sull'SDG 10 relativo alla "riduzione delle disuguaglianze all'interno di e fra le Nazioni", un tema di importanza cruciale considerato uno dei problemi più urgenti della società (Kuhn, 2020). Le disuguaglianze di reddito, di accesso alle risorse ed alle opportunità rappresentano un ostacolo significativo allo sviluppo sostenibile e alla pace, aumentando la povertà globale e avvilendo lo spirito di realizzazione e autostima delle persone. Per tale motivo l'Agenda 2030, attraverso l'SDG 10, ha posto tale tema al centro dell'attenzione globale. Sono stati previsti obiettivi e target specifici miranti a ridurre le diseguaglianze economiche, a promuovere l'inclusione sociale e garantire pari opportunità, tra i diversi Paesi ed al loro interno nelle diverse comunità del mondo.

Nel settore turistico l'obiettivo della riduzione delle diseguaglianze assume particolare rilevanza data la natura labour-intensive del comparto ed il suo impatto sulle comunità locali.

È importante avere altresì consapevolezza del delicato ruolo riconoscibile al settore. Esso può contribuire alla riduzione delle diseguaglianze (Buhalis et al., 2023), fungendo da catalizzatore attraverso molteplici opportunità economiche e di inclusione sociale, ma può anche amplificare le disparità, specie nella misura in cui le comunità locali ospitanti non traggano adeguati benefici dalle attività economiche e dai flussi turistici.

Tra i diversi attori della società, le aziende, specie di grandi dimensioni, sono particolarmente sensibilizzate ad adottare delle pratiche sostenibili ed a rendicontare i progressi compiuti nel raggiungimento degli SDGs (United Nations, 2015, SDG 12.6). Con riferimento all'SDG 10, l'UN Global Compact Network Italia auspica che le aziende offrano condizioni lavorative dignitose attraverso tutta la catena del valore, soprattutto per i gruppi svantaggiati. Più in generale, l'organismo italiano del Global Compact delle Nazioni Unite raccomanda una serie differenziata di possibili azioni e politiche aziendali per il conseguimento di tale obiettivo.

Alla luce di ciò, ed in risposta alle attese di stakeholder e società civile, un crescente numero di aziende contempla nelle proprie strategie gli obiettivi dell'Agenda 2030 ed ha implementato negli ultimi anni la rendicontazione SDGs (KPMG, 2018, 2020; PwC, 2019; Erin et al., 2022; Gunawan et al., 2020; Pizzi et al., 2020; Rosati e Faria, 2019; Tsalis et al., 2020), comprese le aziende del settore turistico (Costa et al., 2022; Damiano e Picciotto, 2025a; Di Vaio et al., 2022;

[2] Ricercatrice, ECON-06/A, Università degli Studi di Palermo, loredana.picciotto@unipa.it – corresponding author

[3] Professore ordinario, ECON-06/A, Università degli Studi di Palermo; marcantonio.ruisi@unipa.it

Ferrero-Ferrero et al., 2024; Galant et al. 2024). Tuttavia, data la novità e la complessità della tematica, le conoscenze sono ancora limitate e la letteratura in materia è al suo stadio iniziale (Calabrese et al. 2021; Mio et al., 2020; Rosati e Faria, 2019; Tsalis et al, 2020). Alcuni studiosi hanno sottolineato l'importanza di condurre ulteriori analisi empiriche, anche nel settore turistico, sul reporting SDGs per comprendere meglio il processo di implementazione degli SDGs e le modalità di reporting (Avrampou et al., 2019; Buhalis, 2023; Medrado e Jackson, 2016; Mio et al., 2020; Serra-Cantallops et al., 2018; Franzoni e Avellino, 2019; Guix et al., 2018; Koseoglu et al. 2021). Si auspica, in particolare, una maggiore ricerca sul reporting SDGs, sia quale strumento di rendicontazione esterna agli stakeholder sia quale supporto decisionale agli attori aziendali nell'attività di governo (Mio et al., 2020).

In questa prospettiva, riconoscendo l'importanza critica dell'SDG 10 ed i limitati progressi finora conseguiti nel mondo (Halkos e Gkampoura, 2021; The Sustainable Development Goals Report, 2025), si ritiene che la rendicontazione sul tema rappresenti un fondamentale processo strategico per orientare le politiche aziendali, monitorare l'efficacia delle iniziative intraprese e dimostrare l'impegno in tale ambito agli stakeholder. Per tale motivo, la presente ricerca si propone di analizzare l'evoluzione temporale dell'impegno dichiarato dalle aziende del settore turistico verso l'SDG 10, al fine di comprendere se e come tali aziende stiano contribuendo al raggiungimento di tale obiettivo. In letteratura si riscontra una prevalenza di studi sulla disclosure SDGs complessiva delle imprese turistiche (Costa et al., 2022; Damiano e Picciotto, 2025a; Di Vaio et al., 2022; Dube, 2020; Galant et al. 2024), ma si sottolinea la necessità di studiare il loro ruolo anche nel conseguimento di singoli SDGs (Dube, 2020). Questo studio esplorativo si propone di colmare, almeno in parte, questo gap analizzando, attraverso l'utilizzo di dati estratti dal database Refinitiv Eikon, l'impegno dichiarato dalle aziende turistiche verso l'SDG 10 dall'introduzione dell'Agenda 2030, con riferimento a quattro distinte dimensioni di analisi: (1) la percentuale di aziende che dichiarano un impegno formale verso l'SDG 10; (2) l'evoluzione temporale di tale impegno; (3) le eventuali caratteristiche distintive per sottosettori turistici; (4) le differenze geografiche nell'adozione dell'obiettivo.

2. Quadro teorico di riferimento

L'avvicinamento alla fase finale dell'Agenda 2030 acuisce l'esigenza di un impegno fattivo ed accresce l'importanza di conseguire dei progressi verso gli SDGs, rendendo ormai critiche la misurazione e la rendicontazione delle performance di sostenibilità delle imprese.

Da diverso tempo le imprese hanno iniziato a rendicontare agli stakeholder, attraverso appositi report, la propria capacità di essere responsabili e di operare in modo sostenibile. Secondo la definizione del World Business Council for Sustainable Development (2002), il reporting di sostenibilità aziendale si riferisce ai report pubblici pubblicati dalle imprese al fine di fornire agli stakeholder interni ed esterni un quadro della posizione e delle attività aziendali sulle dimensioni economica, ambientale e sociale. Pertanto, tramite i report di sostenibilità le aziende descrivono il proprio contributo allo sviluppo sostenibile, comunicando pubblicamente azioni e iniziative intraprese, performance conseguite, impatto ambientale, sociale ed economico (Hahn e Kühnen, 2013; Baldarelli et al., 2017; Girella et al., 2019; Di Vaio et al., 2022).

Il reporting sugli SDGs si configura quale specifica pratica del reporting di sostenibilità e fa riferimento al processo tramite cui le aziende riportano i loro risultati relativi al raggiungimento degli SDGs (Bebbington e Unerman, 2018, 2020). Esso rappresenta un'evoluzione del reporting di sostenibilità manifestatasi nel contesto dell'Agenda 2030, che negli ultimi anni è stato oggetto di analisi da parte di diversi studiosi (Bebbington e Unerman, 2018; Calabrese et al., 2021; Damiano e Di Maria, 2024; Di Vaio e al., 2022; Erin et al., 2022; Gunawan et al. 2020; Mio et al., 2020; Pizzi et al., 2020; Rosati e Faria, 2019; Sicoli et al., 2024; Tsalis et al., 2020). Con il loro autorevole contributo, Bebbington e Unerman (2018) hanno dischiuso la strada ad un'agenda

di ricerca che studiasse l'inclusione degli obiettivi di sviluppo sostenibile nel reporting di sostenibilità delle organizzazioni aziendali.

Gli SDGs costituiscono un insieme di obiettivi interconnessi, tuttavia, la loro natura volontaria consente alle imprese di focalizzarsi su determinate problematiche ritenute prioritarie, allineando la propria strategia verso obiettivi specifici o maggiormente pertinenti con il core business (Ike et al., 2019; Gunawan et al., 2020; Van Zanten e Van Tulder, 2018). Un focus su specifici obiettivi dell'Agenda 2030 caratterizza spesso anche la rendicontazione, come emerge da recenti indagini su un rilevante numero di aziende nel mondo (KPMG, 2020; European Private Sector SDG Stocktake, 2024). In particolare, dall'analisi della KPMG (2020), condotta su 5.200 aziende di oltre 50 paesi, risulta che l'80% di esse pubblica il Report di sostenibilità. Tuttavia, emerge come il reporting sugli SDG sia spesso sbilanciato e scollegato dagli obiettivi aziendali, poiché la rendicontazione sugli SDG si concentra quasi esclusivamente sui contributi positivi delle aziende al raggiungimento degli obiettivi e manca la trasparenza dei loro impatti negativi. Inoltre, la ricerca rivela un maggiore impegno da parte delle aziende per gli obiettivi relativi al lavoro dignitoso e alla crescita economica (SDG 8), alle azioni per il clima (SDG 13) e alla produzione e il consumo responsabili (SDG 12). Un focus specifico delle politiche aziendali e della rendicontazione SDG si riscontra analogamente in un recente studio pubblicato dalle reti europee dell'UN Global Compact (European Private Sector SDG Stocktake, 2024). Dallo studio emerge che le aziende europee esaminate (oltre 1.400) hanno compiuto passi significativi nell'allineamento dei loro obiettivi. In particolare, dimostrano una conoscenza approfondita dei 17 SDGs ed un buon grado di integrazione nella strategia aziendale. Tuttavia, si riscontrano principalmente azioni a favore della parità di genere (SDG 5), del lavoro dignitoso (SDG 8) e del contrasto al cambiamento climatico (SDG 13), mentre risulta più limitato l'intervento in altri settori chiave. Inoltre, emerge ancora un divario tra strategia e misurazione della performance; molte aziende continuano a mostrare difficoltà nel tradurre gli obiettivi di sviluppo sostenibile in azioni concrete e misurabili. Anche altri studi hanno rilevato una certa difficoltà delle aziende a rendicontare efficacemente come le proprie attività si allineino e contribuiscano al raggiungimento degli SDGs (Costa et al., 2022; PwC, 2019).

Con specifico riferimento al settore turistico, alcune analisi mostrano un effettivo impegno delle imprese turistiche e dell'ospitalità a raggiungere e rendicontare gli SDGs (Damiano e Picciotto, 2025a, 2025b; Papagiannakis et al. 2024), altre sottolineano, invece, come la rendicontazione dovrebbe essere migliorata riconoscendo il contributo delle attività ad un numero maggiore di SDGs, tra cui proprio l'SDG 10 (Galan et al., 2024). Nonostante la rilevanza di questo tema, le conoscenze relative alle modalità con cui le imprese turistiche stanno effettivamente integrando l'SDG 10 nelle loro strategie di sostenibilità sembrano ancora limitate.

Dagli studi emerge, dunque, un quadro complesso ed in evoluzione, meritevole di ulteriori approfondimenti scientifici, anche alla luce della significativa valenza del reporting di sostenibilità messa in evidenza da alcuni studiosi. In letteratura si è posto, in particolare, l'accento su come la reportistica di sostenibilità, oltre a favorire una comunicazione trasparente verso gli stakeholder, possa anche influire sul pensiero e le scelte dei decisori aziendali, riorientando progressivamente le loro politiche verso pratiche sostenibili (Adams, 2017; Busco et al., 2018). Altri studiosi hanno poi osservato che le pratiche di rendicontazione nel settore turistico non sono state ancora analizzate in modo adeguato e necessitano di più approfondite analisi (Buhalis et al., 2023; Franzoni e Avellino, 2019; Gonçalves e Gaio, 2023, Guix et al., 2018; Koseoglu et al., 2021; Medrado e Jackson, 2016; Mio et al., 2020; Serra-Cantallops et al., 2018). Il focus sul reporting SDG costituisce una delle direttrici di ricerca proposte (Buhalis et al., 2023; Franzoni e Avellino, 2019; Mio et al., 2020) e caratterizza il presente studio limitando l'analisi, come anche auspicato (Dube, 2020), ad un singolo obiettivo di sviluppo sostenibile (SDG 10).

3. Metodologia

3.1. Campione

Il campione di analisi è costituito da 280 aziende quotate del settore turistico presenti nel database Refinitiv Eikon. Tali aziende appartengono a quattro sottosettori della classificazione TRBC (Thomson Reuters Business Classification) e si distribuiscono come segue:

- Restaurants & Bars: 86 aziende (30,7%)
- Leisure & Recreation: 72 aziende (25,7%)
- Casinos & Gaming: 64 aziende (22,9%)
- Hotels, Motels & Cruise Lines: 58 aziende (20,7%).

Le aziende del campione sono distribuite in 48 paesi, con una significativa concentrazione in alcune aree geografiche: Stati Uniti (31,4% del campione totale), Regno Unito (8,9%), India (6,1%), Giappone (5,4%) e Australia (5%). Tale distribuzione riflette la struttura del mercato turistico globale, caratterizzato da una forte presenza di operatori nei paesi economicamente avanzati, pur con una crescente rappresentanza di mercati emergenti.

3.2. Metodo di ricerca

L'analisi dell'impegno delle aziende del settore turistico verso l'SDG 10 si basa su un approccio quantitativo esplorativo (Creswell e Creswell, 2018), che mira a mappare sistematicamente la diffusione delle dichiarazioni formali di impegno verso la riduzione delle disuguaglianze nel periodo 2015-2023. La metodologia adottata consente di esaminare l'evoluzione temporale del fenomeno e di identificare differenze tra sottosettori e aree geografiche. L'analisi è stata condotta in R (R Core Team, 2021).

Nello specifico, l'analisi di questo contributo si articola in tre dimensioni complementari:

- Evoluzione temporale: calcolo della percentuale di aziende con impegno dichiarato per ciascun anno del periodo 2015-2023.
- Analisi per sottosettore: confronto delle percentuali di impegno tra i quattro sottosettori TRBC nell'anno 2023, integrato con l'analisi dell'evoluzione temporale per ciascun sottosettore nel periodo 2019-2023.
- Analisi geografica: esame delle differenze nelle percentuali di impegno tra i principali paesi rappresentati nel campione (con almeno 5 aziende), calcolando anche gli scostamenti rispetto alla media del settore.

Per il calcolo delle percentuali di impegno, sono state considerate esclusivamente le aziende per cui è disponibile l'informazione per l'anno specifico, escludendo i valori mancanti. Questo approccio ha consentito di evitare distorsioni legate alla crescita progressiva della copertura del database nel tempo.

3.3. Variabili

Il database Refinitiv Eikon, da cui sono estrapolati tutti i dati utilizzati per questo studio esplorativo, raccoglie sistematicamente informazioni autodichiarate dalle aziende in merito al loro impegno verso i 17 Obiettivi di Sviluppo Sostenibile. Per ciascuna azienda e per ogni anno del periodo 2015-2023, il database registra la presenza (Y) o l'assenza (N) di una dichiarazione formale di impegno verso l'SDG 10. È fondamentale sottolineare che l'analisi si concentra sulla presenza di dichiarazioni formali di impegno verso l'SDG 10, senza valutare l'effettiva implementazione di azioni concrete o la misurazione dei risultati ottenuti. La dichiarazione di impegno rappresenta pertanto un indicatore dell'allineamento strategico dell'azienda con l'obiettivo di riduzione delle disuguaglianze, ma non necessariamente una misura della performance effettiva in tale ambito. Sono state, inoltre, raccolte le informazioni relative al sottosettore di appartenenza e al paese in cui le aziende hanno sede legale.

4. Analisi

L'analisi dei dati rivela dinamiche complesse e articolate nell'evoluzione dell'impegno delle aziende turistiche verso l'SDG 10, caratterizzate da una partenza tardiva, un'accelerazione significativa e la persistenza di divari sostanziali tra sottosettori e aree geografiche.

4.1. Evoluzione temporale dell'impegno

L'evoluzione temporale dell'impegno verso l'SDG 10 nel settore turistico presenta quattro fasi distinte (Figura 1). La prima fase (2015-2018) è caratterizzata da un'assenza totale di dichiarazioni formali di impegno (0%). Nel 2019 si registra un primo balzo significativo, con il 12,30% delle aziende (23 su 187) che dichiara un impegno formale verso l'SDG 10. Questo punto di svolta coincide con una crescente pressione da parte degli stakeholder e l'intensificazione del dibattito pubblico sulle disuguaglianze a livello globale. La terza fase (2020-2021) rappresenta il periodo di maggiore accelerazione, con un incremento complessivo di 10,00 punti percentuali in soli due anni (da 15,96% a 25,96%). È plausibile ipotizzare che la pandemia di COVID-19, che ha evidenziato in modo drammatico le disuguaglianze esistenti in tutti i settori e quindi anche in quello turistico, abbia contribuito ad accrescere la consapevolezza delle aziende riguardo all'importanza di questo obiettivo. L'ultima fase (2022-2023) mostra un consolidamento del trend positivo, con una crescita più moderata ma costante (+4,15 punti percentuali nel 2022, +6,25 nel 2023), raggiungendo il 36,36% nell'anno più recente. La crescita media annua nel periodo 2019-2023 si attesta a 6,02 punti percentuali, un ritmo significativo ma non sufficiente per colmare rapidamente il gap persistente. Nonostante i progressi, la maggioranza delle aziende (63,64%) non dichiara ancora alcun impegno formale verso l'SDG 10 al 2023, evidenziando un ampio margine di miglioramento e la necessità di ulteriori azioni per promuovere l'adozione di questo obiettivo nel settore.

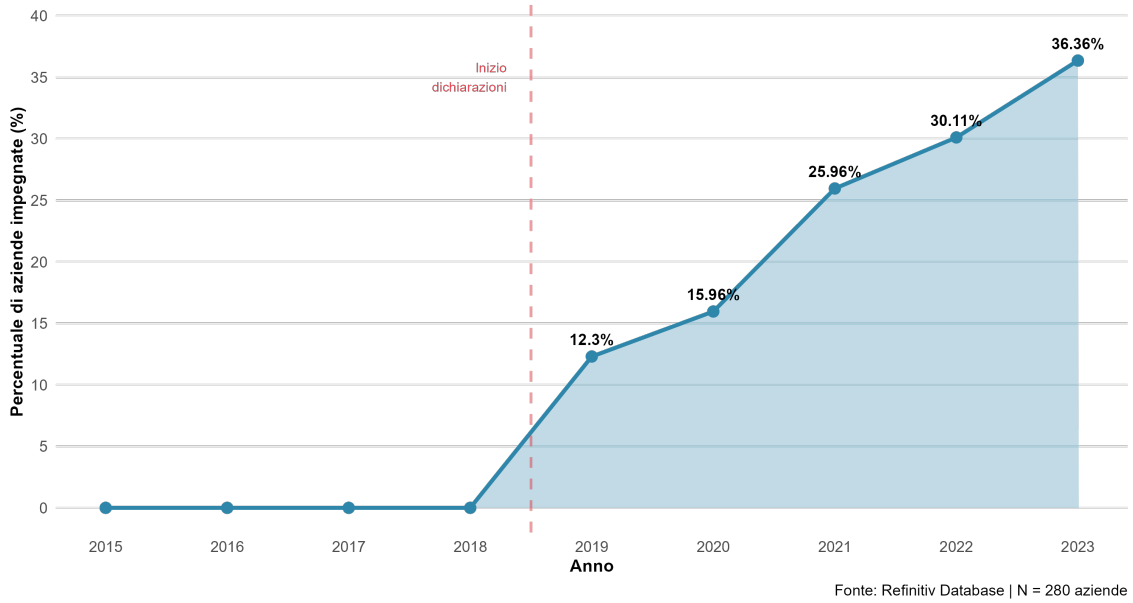

Figura 1. Evoluzione dell'impegno verso l'SDG 10 nel periodo 2015-2023.

4.2. Differenze per sottosettore turistico

L'analisi per sottosettore rivela differenze sostanziali nelle percentuali di impegno, suggerendo l'influenza di fattori specifici legati alle caratteristiche operative e alla visibilità pubblica dei diversi segmenti del settore turistico. In riferimento all'anno 2023, i sottosettori

Hotels, Motels & Cruise Lines (45,61%, 26 aziende su 57) e Casinos & Gaming (45%, 27 su 60) si posizionano come leader, con percentuali di impegno superiori di circa 9 punti percentuali rispetto alla media ponderata di settore (36,36%). Questi risultati possono essere ricondotti alla maggiore esposizione mediatica e reputazionale di tali attività, che le rende più sensibili alle pressioni degli stakeholder in materia di responsabilità sociale.

L'analisi dell'evoluzione temporale per sottosettore (2019-2023) mostra traiettorie differenziate (Figura 2). Il settore Hotels, Motels & Cruise Lines ha mantenuto una posizione di leadership lungo tutto il periodo, partendo dal 25% nel 2019. Il settore Casinos & Gaming ha, invece, registrato la crescita più marcata, passando dal 12% nel 2019 al 45% nel 2023, con un incremento complessivo di 33 punti percentuali che gli ha permesso di raggiungere il livello dei leader. Il settore Leisure & Recreation, pur mostrando una crescita assoluta dal 4,88% al 23,9%, mantiene un distacco significativo rispetto agli altri comparti.

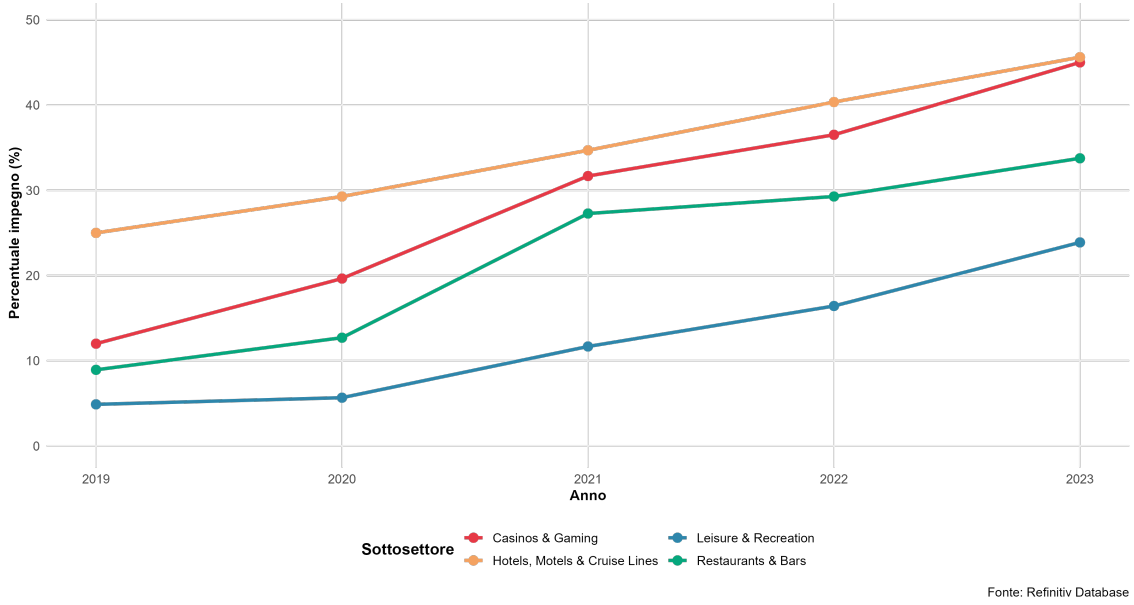

Figura 2. Evoluzione dell'impegno verso l'SDG 10 per sottosettore (2019-2023)

4.3. Differenze geografiche nell'adozione dell'obiettivo

L'analisi geografica, condotta sui paesi con almeno 5 aziende nel campione, rivela informazioni interessanti che sfidano alcune aspettative intuitive sulla relazione tra sviluppo economico, dimensione del mercato e impegno verso l'SDG 10 (Figura 3).

Nel 2023, la Malaysia emerge come leader mondiale con il 63,64% di aziende impegnate (7 su 11), seguita da Giappone (60%, 9 su 15) e Francia (60%, 3 su 5). Questi paesi mostrano percentuali di impegno superiori di oltre 20 punti percentuali rispetto alla media di settore, suggerendo la possibile influenza di framework regolatori più stringenti, di una cultura aziendale più orientata alla sostenibilità oppure di specifiche pressioni da parte degli stakeholder locali.

Particolarmente rilevante è il "paradosso geografico" rappresentato dagli Stati Uniti e dall'India. Nonostante costituiscano rispettivamente il 31,4% e il 6,1% del campione totale, questi paesi mostrano percentuali di impegno significativamente inferiori alla media: USA con 23,68% (18 su 76 aziende, -12,68 punti percentuali rispetto alla media) e India con 23,53% (4 su 17, -12,83 punti percentuali). Questo dato è controintuitivo considerando la rilevanza economica di questi mercati e suggerisce che la dimensione del mercato o il livello di sviluppo economico non sono predittori affidabili dell'impegno verso l'SDG 10.

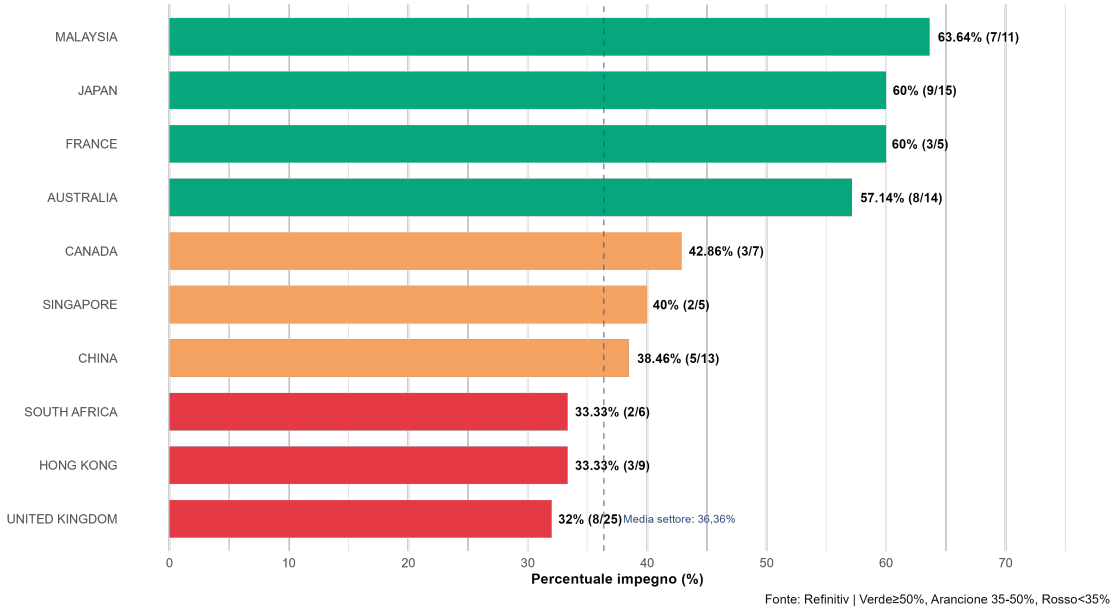

Figura 3. Top 10 paesi per impegno verso l'SDG 10 (2023)

5. Discussione e implicazioni

I risultati dell'analisi esplorativa offrono importanti spunti di riflessione sia sul piano teorico che su quello delle implicazioni pratiche per diversi gruppi di stakeholder.

Il gap di maturazione osservato nella prima fase (2015-2018) è riflesso della complessità del processo di integrazione degli SDGs nelle strategie aziendali, a prescindere dal settore di appartenenza. La mancata presenza di dichiarazioni formali in questa prima fase non deve essere interpretata necessariamente come disinteresse da parte delle aziende nel manifestare il proprio impegno alle questioni di interesse globale, quanto piuttosto come il tempo necessario per sviluppare framework di rendicontazione, definire KPI appropriati e allineare le strutture organizzative interne. Già a partire dal 2019 si assiste ad un sempre più crescente impegno da parte delle aziende a comunicare ai propri stakeholder le iniziative e le pratiche per il raggiungimento degli Obiettivi dell'Agenda 2030. Questo risultato si allinea con studi precedenti come García-Sánchez et al. (2024) che, utilizzando anch'essi aziende presenti in Refinitiv Eikon, hanno osservato un'evoluzione nelle azioni e nelle iniziative che le aziende stanno mettendo in moto al fine di contribuire al benessere delle persone, al pianeta e alla pace nel mondo. Il periodo 2020-2021 ha visto un'accelerazione improvvisa nella rendicontazione dell'SDG 10, sebbene ci siano differenze evidenti sia a livello settoriale che a livello geografico. Del resto, anche studi precedenti (si veda a tal proposito Monteiro et al., 2023) hanno messo in evidenza come il periodo 2020-2021 sia caratterizzato dalla presenza di forti variazioni nella rendicontazione dell'impegno verso gli SDG a livello regionale e nazionale.

Come anticipato all'inizio di questa sezione, questo studio ha implicazioni per vari gruppi di stakeholder, in primo luogo per i policy maker. La natura autodichiarata dei dati evidenzia la necessità di meccanismi di verifica indipendente. L'introduzione, ad esempio, di audit obbligatori sulle dichiarazioni relative agli SDGs potrebbero non solo aumentare l'accountability delle aziende, ma anche ridurre il rischio di greenwashing. In secondo luogo, i risultati dell'analisi delineano opportunità per le aziende. Esse, infatti, possono trarre vantaggi dall'analisi dei leader settoriali e geografici identificando pratiche trasferibili. Le imprese dei settori Hotels, Motels & Cruise Lines e Casinos & Gaming, così come quelle operanti in Malaysia, Giappone e Francia, rappresentano potenziali benchmark per lo sviluppo di strategie efficaci. Infine, l'analisi fornisce

elementi rilevanti per gli investitori e gli analisti ESG. Lo studio mostra una crescente adozione dell'SDG 10 suggerendo, quindi, che l'impegno verso la riduzione delle disuguaglianze potrebbe diventare un fattore sempre più centrale nella valutazione della sostenibilità (sociale) delle aziende turistiche. Di conseguenza, gli investitori dovrebbero monitorare con attenzione l'evoluzione delle posizioni aziendali rispetto all'SDG 10 come parte della loro analisi rischio.

6. Conclusioni, limiti e sviluppi futuri

Lo studio qui proposto ha avuto l'obiettivo di esplorare il graduale impegno delle aziende del settore turistico nella rendicontazione dell'SDG 10 utilizzando aziende quotate presenti all'interno del database Refinitiv Eikon nel periodo 2015-2023. Tuttavia, lo studio presenta alcuni limiti che devono essere tenuti in considerazione e che possono servire come punti di partenza per ricerche future.

In primo luogo, l'analisi si focalizza sulla presenza di dichiarazioni formali di impegno e non valuta l'effettiva implementazione di azioni concrete o la misurazione dei risultati ottenuti. Di conseguenza, studi futuri dovrebbero integrare l'analisi delle autodichiarazioni con metriche di performance reali quali, ad esempio, i gap retribuitivi o gli investimenti in programmi di inclusione sociale.

In secondo luogo, il campione utilizzato è limitato ad aziende quotate. Le PMI del settore turistico, che costituiscono la maggior parte delle imprese, potrebbero comportarsi in maniera differente. Ricerche future dovrebbero, quindi, analizzare le differenze anche in termini di dimensione settoriale.

Infine, la natura esplorativa e descrittiva dello studio non consente di identificare relazioni casuali tra le variabili osservate. Analisi econometriche sofisticate potrebbero investigare i reali motivi che spingono le aziende ad adottare l'SDG 10. Inoltre, tali analisi potrebbero essere integrate con casi studio e interviste al fine di indagare con maggiore profondità le motivazioni delle aziende e le sfide e le barriere incontrate nell'implementazione.

Parole chiave: SDG 10; report di sostenibilità; disuguaglianze; sviluppo sostenibile; aziende turistiche

La misurazione della performance ESG e le sue relazioni con il sistema di controllo di gestione e la rendicontazione di sostenibilità. Il caso di Hilton Worldwide

Loredana Picciotto[1]

1. Introduzione

L'Agenda 2030 promulgata dalle Nazioni Unite (United Nations, 2015), declinando i 17 obiettivi di sviluppo sostenibile (SDGs), ha tracciato le fondamentali direttrici lungo le quali tutti gli attori della società sono chiamati ad impegnarsi per il benessere comune e per un futuro più responsabile e sostenibile. Questi obiettivi, articolati in 169 target, sono fortemente interconnessi ed affrontano temi critici per la salvaguardia del pianeta, il benessere delle persone e la crescita economica inclusiva (tra gli altri, il cambiamento climatico, la protezione dell'ambiente naturale, il contrasto alla povertà, la salute e la sicurezza, le diseguaglianze, ecc.). Al turismo viene riconosciuto un ruolo rilevante e catalizzatore nel raggiungimento degli SDGs (Buhalis et al., 2023; Scheyvens e Cheer, 2022; UNWTO, 2017), soprattutto in alcuni ambiti chiave individuati dall'UNWTO (2017) in occasione del International Year of Sustainable Tourism for Development del 2017 per orientare l'industria turistica verso l'Agenda 2030 e le sue ambiziose sfide.

Un ruolo fondamentale nel perseguimento degli SDGs viene riconosciuto al settore privato, in relazione alla varietà degli ambiti di azione e delle risorse coinvolte (Scheyvens et al., 2016; Calabrese et al., 2021). L'Agenda 2030 attribuisce, inoltre, una chiara responsabilità alle imprese, in particolare grandi aziende e multinazionali, invitandole espressamente ad adottare pratiche sostenibili ed integrare le relative informazioni nella loro rendicontazione (United Nations, 2015, SDG 12.6).

Parallelamente, si assiste da tempo ad una crescente attenzione da parte di investitori, stakeholder e società civile per i comportamenti assunti dalle imprese e gli impatti della loro attività (Steurer, 2005). Attenzione che investe anche il settore turistico (De Grosbois, 2012; Jones et al., 2014; Uyar et al., 2021), caratterizzato da esternalità e significativi impatti economici, ambientali e sociali (Agarwal, 2002; Van Wijk e Persoon, 2006).

Tra le imprese del settore vi è ormai una diffusa consapevolezza dell'importanza di un'idonea strategia che contempli espressamente le questioni della sostenibilità (Holcomb et al., 2007; Khatter et al., 2019; Medrado e Jackson, 2016), atteso che un governo responsabile richiede l'impegnativo allineamento di fattori economici, ambientali e sociali (Jones et al., 2014). Considerando che il settore del turismo dipende in larga misura dalle risorse naturali e dal capitale umano, è altresì fondamentale per una gestione responsabile e sostenibile adottare delle pratiche ESG (Environmental, Social and Governance) (Back, 2024). Il riferimento è alle tre fondamentali dimensioni che qualificano l'impegno e l'impatto di un'azienda in termini di sostenibilità.

Le informazioni su questi profili sono divenute sempre più importanti negli ultimi anni, dal momento che investitori e stakeholder richiedono un'adeguata trasparenza sulle performance aziendali non finanziarie. Si comprende, dunque, come in tale contesto abbia acquisito crescente rilevanza nel governo delle aziende la misurazione della performance ESG, testimoniata anche da una particolare attenzione negli studi accademici nell'ultimo ventennio (Dauerer, 2025). È stato

[1] Ricercatrice, ECON-06/A, Università degli Studi di Palermo; loredana.picciotto@unipa.it – corresponding author

osservato come il presidio e il monitoraggio delle performance di sostenibilità necessitano di un solido quadro di riferimento che, in primo luogo, colleghi la gestione degli aspetti ambientali e sociali con la strategia e la sfera competitiva e, in secondo luogo, integri le informazioni ambientali e sociali con le informazioni economiche e competitive, e con il reporting di sostenibilità (Schaltegger e Wagner, 2006).

La letteratura in materia si è recentemente soffermata sulle relazioni tra la misurazione delle performance di sostenibilità, i sistemi di controllo di gestione ed il reporting di sostenibilità (Beusch et al., 2022; Chiucchi et al., 2025; De Villiers et al., 2016; Herremans e Nazari, 2016; Lozano et al., 2016; Maas et al., 2016; Schaltegger e Wagner, 2006; Traxler et al., 2020), evidenziando i vantaggi e l'importanza di ricercare un'integrazione tra tali elementi ai fini di un'efficace gestione strategica della sostenibilità e la conseguente rendicontazione dei progressi compiuti. In relazione alla complessa e delicata interazione tra questi elementi, si auspicano ulteriori analisi in merito che evidenzino, tra gli altri aspetti, le modalità tramite cui viene ricercata detta integrazione (Chiucchi et al., 2025; Schaltegger e Wagner, 2006; Traxler et al, 2020), anche ricorrendo a dei casi studio (De Villiers et al., 2016).

In questa prospettiva, la presente ricerca intende analizzare il sistema di misurazione della performance ESG di un'azienda leader nel settore dell'ospitalità con l'obiettivo di far luce sulle sue relazioni con il sistema di controllo di gestione e la rendicontazione esterna di sostenibilità, e di comprendere se e come venga ricercata l'integrazione tra tali elementi per l'efficace implementazione della strategia di sostenibilità. Essa si propone di contribuire alla letteratura sulla misurazione della performance ESG offrendo degli spunti di riflessione su come venga gestito tale processo in relazione ad altri (di controllo e di reporting) interrelati, ai fini di un'efficace integrazione della sostenibilità nella gestione delle aziende alberghiere. Considerato che un'azienda leader può avere un ruolo di grande rilievo nello sviluppo di modelli di business sostenibili (Buhalis et al., 2023; Khatter et al., 2019), la ricerca potrebbe altresì fornire validi spunti manageriali per il monitoraggio e il raggiungimento degli SDGs.

2. Il quadro teorico di riferimento

Un sistema di misurazione delle performance di sostenibilità è preposto alla raccolta, all'analisi, al monitoraggio ed alla comunicazione delle informazioni sulle performance di sostenibilità (Maas et al, 2016). Detto sistema integra misurazioni ambientali e sociali ai tradizionali indicatori economico-finanziari e di competitività (Epstein e Roy, 2001), supportando i processi di pianificazione, implementazione e controllo di una strategia di sostenibilità ed offrendo una visione olistica della performance. L'acronimo ESG indica i criteri di sostenibilità, ambientale, sociale e di qualità di governo delle aziende che consentono di apprezzarne il valore generato, gli impatti dell'attività e, in ultima analisi, il loro contributo allo sviluppo sostenibile.

Nello specifico, la componente "environmental" riguarda le politiche e le performance di un'azienda in termini di impatto ambientale, come le emissioni di gas serra, la gestione dei rifiuti, l'uso delle risorse naturali e la conservazione della biodiversità. La componente "social" riguarda le relazioni dell'azienda con i dipendenti e la comunità, includendo questioni come le condizioni di lavoro, la salute e la sicurezza, i diritti umani e le relazioni con la comunità locale. La componente "governance" riguarda la struttura e la qualità di governo, abbracciando temi come i diritti degli azionisti, la remunerazione dei dirigenti, il rispetto dell'etica e la trasparenza.

La misurazione ESG assolve un ruolo critico nel governo aziendale e nei processi di rendicontazione esterna di pratiche sostenibili. In ordine al primo profilo, tale misurazione supporta e guida le decisioni manageriali per l'implementazione della strategia aziendale di sostenibilità (Maas et al., 2016); inoltre, in virtù dei suoi legami con i sistemi di controllo di gestione (Chiucchi et al., 2025; Malmi and Brown, 2008), essa orienta il comportamento dei dipendenti verso gli obiettivi di sostenibilità, favorendo un progressivo allineamento dell'organizzazione alla strategia perseguita. Integrando la misurazione ESG, i sistemi di

controllo di gestione possono, dunque, guidare l'organizzazione verso il raggiungimento di detti obiettivi (Beusch et al., 2022; Chiucchi et al., 2025; Crutzen e Herzig, 2013; Maas et al., 2016; Malmi e Brown, 2008). In ordine al secondo profilo, la misurazione della performance ESG ha un ruolo determinante nella rendicontazione esterna di sostenibilità, consentendo, attraverso metriche ed indicatori, di predisporre e comunicare, su base volontaria o obbligatoria, informazioni su pratiche, iniziative e performance di sostenibilità con appositi report destinati agli stakeholder esterni (Baldarelli et al., 2017, Rosati e Faria, 2019). Pertanto, la misurazione ESG svolge un ruolo fondamentale nel dare forma alla rendicontazione sulla sostenibilità, fornendo dati quantificabili e misurabili che migliorano la trasparenza e informano gli stakeholder.

Si comprende, dunque, come la misurazione ESG sia essenziale per la gestione e la disclosure delle pratiche sostenibili e degli impatti dell'attività aziendale sull'ambiente e sulla società (Nielsen, 2023), con implicazioni rilevanti sia per i sistemi di controllo di gestione sia per il reporting di sostenibilità. L'importanza di questi due elementi nel contesto della misurazione della performance ESG emerge anche nell'ambito dei due distinti approcci alla misurazione della sostenibilità evidenziati da alcuni studiosi (Burritt e Schaltegger, 2010; Chiucchi et al., 2025; Schaltegger e Wagner, 2006). Il primo approccio («outside-in») pone l'accento sulla rendicontazione esterna quale determinante della misurazione della performance ESG, il secondo approccio («inside-out») riconduce la scelta di misurare la performance ESG alla necessità di supportare le decisioni manageriali e guidare l'azione di un governo improntato a principi di responsabilità sociale e sviluppo sostenibile.

Di recente, un filone della letteratura in materia ha esaminato le relazioni tra la misurazione delle performance di sostenibilità, i sistemi di controllo di gestione ed il reporting di sostenibilità (Beusch et al., 2022; Chiucchi et al., 2025; De Villiers et al., 2016; Herremans e Nazari, 2016; Lozano et al., 2016; Maas et al., 2016; Schaltegger e Wagner, 2006; Traxler et al., 2020), evidenziando una complessa interazione che plasma la strategia di sostenibilità e le pratiche di misurazione (Chiucchi et al., 2025); sottolineando l'importanza di un approccio «integrato» per l'efficace implementazione della strategia di sostenibilità (De Villiers et al., 2016; Maas et al., 2016); e auspicando una più profonda comprensione di come la misurazione della performance ESG e le sue caratteristiche interagiscano con i sistemi di controllo di gestione ed il reporting di sostenibilità (Chiucchi et al., 2025; Traxler et al, 2020). Si sottolinea come le organizzazioni possano trarre vantaggio dall'integrazione del sistema di controllo di gestione e del reporting di sostenibilità nell'ambito di framework di misurazione della performance che contemplino la dimensione della sostenibilità, orientando l'attenzione del management e favorendo un'interiorizzazione delle misure di sostenibilità da parte dei dipendenti (Schaltegger e Wagner, 2006). Ciò consente, infatti, di comprendere meglio la sostenibilità nelle sue concrete declinazioni e di renderla maggiormente operativa, favorendo una più efficace attività di reporting. Al riguardo, i report di sostenibilità sono stati spesso criticati proprio per la loro mancata integrazione nelle attività di gestione quotidiana (Gray, 2010).

3. Metodologia

L'obiettivo dello studio verrà perseguito adottando una metodologia di ricerca qualitativa, coniugando l'analisi della letteratura specificatamente focalizzata sulle relazioni tra misurazione della performance, sistema di controllo di gestione e rendicontazione di sostenibilità con la presentazione di un caso studio rappresentativo (Creswell et al., 2007; Yin, 2009), idoneo a illustrare in via strumentale tale tema (Stake, 1995) ed a far emergere l'importanza di un approccio integrato per l'efficace implementazione di una strategia di sostenibilità.

In particolare, verrà esaminato il sistema di misurazione della performance ESG di Hilton Worldwide, azienda leader nel settore dell'ospitalità da tempo impegnata a monitorare e ridurre l'impatto ambientale e sociale dei suoi hotel in tutto il mondo (Hilton, 2018). Il caso è ritenuto d'interesse poiché l'azienda ha sviluppato una strategia ESG allineata con l'Agenda 2030,

supportata dal sistema di misurazione della performance «Lightstay», per cui ha conseguito – anche per l'ESG reporting – specifici riconoscimenti (Hilton 2023, 2024). Come emerge da un precedente studio (Damiano e Picciotto, 2026), Hiton si distingue tra i grandi operatori alberghieri per la sua rilevante e continuativa esperienza nel reporting di sostenibilità, abbracciando l'intero periodo che va dall'introduzione degli SDGs ad oggi.

L'analisi si soffermerà sulle caratteristiche di progettazione e sulle modalità d'impiego del sistema di misurazione della performance ESG di Hilton, due dimensioni del sistema di misurazione della performance ritenute rilevanti in letteratura per l'efficacia di governo (Flamholtz, 2002; Merchant e Riccaboni, 2001). L'ipotesi di fondo è che il focus su dette dimensioni possa consentire di far luce sulle relazioni tra misurazione della performance, sistema di controllo di gestione e rendicontazione di sostenibilità, facendo emergere come può essere ricercata e assicurata l'integrazione tra tali elementi. A tal fine, si è privilegiato il metodo dello studio di caso, considerato particolarmente appropriato quando si desidera investigare in profondità un fenomeno contemporaneo nel contesto reale in cui esso accade (Yin, 2009).

Il caso verrà sviluppato attraverso la raccolta di dati di natura primaria e secondaria (Eisenhardt, 1989). In particolare, una prima fase della ricerca si basa sulla raccolta e l'analisi di contenuto manuale di dati secondari (documenti e report aziendali, dati e informazioni disponibili sul sito web istituzionale) ed è finalizzata a indagare le caratteristiche distintive del sistema di misurazione della performance ESG di Hilton, in termini sia di progettazione sia di impiego (dimensioni delle performance di sostenibilità monitorate, natura e tipologia di indicatori di performance impiegati, tipologie di dati e report generati, modalità di supporto all'attività decisionale, di controllo gestionale e di reporting esterno).

Una seconda fase della ricerca è incentrata sulla raccolta e l'analisi di dati primari attraverso delle interviste semi-strutturate ad attori chiave. Questi dati, oltre a essere utili alla validazione e all'approfondimento dei dati secondari, sono considerati strumentali alla chiarificazione delle relazioni tra misurazione della performance ESG, sistemi di controllo di gestione e reporting di sostenibilità.

4. Risultati

Nella presente sezione vengono presentati distintamente i primi risultati emersi dall'analisi dei dati secondari, condotta in una prima fase della ricerca, ed i risultati attesi della seconda fase della ricerca relativi all'analisi dei dati primari che saranno in futuro raccolti.

4.1. Risultati preliminari della prima fase di ricerca

La Hilton Worldwide è tra le più grandi catene alberghiere al mondo con oltre 7.500 hotel presenti in 126 paesi. Essa ha adottato una strategia ambientale, sociale e di governance (ESG) allineata con l'Agenda 2030 e finalizzata a conseguire gli obiettivi del suo programma di responsabilità aziendale «Travel with Purpose». Incentrato su tre specifici ambiti di impegno ed intervento («persone», «hotel» e «comunità»), tale programma mira a ridurre in modo significativo l'impatto ambientale degli hotel ed a raddoppiare l'investimento nell'impatto sociale entro il 2030 (Travel with Purpose, 2024 Report). Nel 2022 l'azienda ha elaborato un nuovo quadro strategico ESG, rafforzando gli obiettivi ESG ed aggiornando i sotto-obiettivi all'interno di ciascun pilastro, esplicitando le priorità, i programmi e le pratiche che guideranno lo sviluppo futuro e che vengono misurate, monitorate e rendicontate.

In particolare, la strategia di Hilton è supportata dal suo sistema di misurazione della performance ESG, denominato «Lightstay», un sistema proprietario personalizzato progettato per monitorare le prestazioni ambientali e sociali di tutti gli hotel Hilton presenti nel mondo, ed i

progressi compiuti verso gli obiettivi per il 2030[2]. Nella fattispecie si tratta di una piattaforma tecnologica sviluppata per la misurazione delle prestazioni ESG del portafoglio globale di Hilton (proprietà gestite e in franchising), idonea a monitorare, analizzare e rendicontare il loro impatto ambientale e sociale nelle comunità in cui operano. In particolare, il sistema Lightstay presenta le seguenti caratteristiche indicate nella tabella 1:

- *Monitoraggio dell'impatto ambientale*: LightStay monitora i consumi energetici, idrici e i rifiuti prodotti usando variabili come le condizioni meteorologiche e l'occupazione delle camere su base mensile degli hotel, così come prevede i consumi futuri. Inoltre, monitora le emissioni di carbonio ed i progetti di efficienza. Ciò permette un *benchmarking* delle prestazioni tra gli hotel.
- *Monitoraggio dell'impatto sociale*: Lightstay rende disponibili dati specifici inerenti i fondi di soccorso distribuiti in caso di calamità naturali, le attività e le ore di volontariato nella comunità, le donazioni e le sovvenzioni assegnate dalla Hilton Global Foundation, la formazione sui diritti umani erogata, i rifugiati assistiti, l'impegno con partner locali per specifici progetti perseguiti, le informazioni sul programma di diversità dei fornitori adottato (ad esempio, numero di aziende di proprietà di donne, di minoranze, ecc.).
- *Monitoraggio della crescita professionale*: Lightstay rende disponibili dati e informazioni sui programmi di formazione del personale. Monitora le opportunità di carriera e di sviluppo professionale offerte ai dipendenti e alle comunità locali. Inoltre, rende disponibili informazioni su fiere del lavoro, workshop e seminari organizzati.
- *Disponibilità di dati utili*: Lightstay analizza e prevede i consumi delle utenze e i relativi costi, avvisando i team degli hotel quando vengono identificati dei picchi. Il sistema genera avvisi mensili per valori di consumo incompleti o fuori intervallo.
- *Disponibilità di indici di rischio per località*: LightStay mappa tutti gli hotel Hilton rispetto ad una serie di indici di rischio esterno (ambientali e comunitari locali) con un aggiornamento annuale, inclusi i rischi per calamità, climatici, idrici, biodiversità e violazione dei diritti umani.
- *Reporting ai clienti*: Lightstay consente di segnalare ai clienti le emissioni di Scope 3 da riunioni ed eventi ospitati negli hotel Hilton. Fornisce ai clienti dei report ambientali personalizzati sulle emissioni per notte in camera nell'ambito del programma «Meet with Purpose».
- *Condivisione di best practice*: Lightstay monitora le pratiche di sostenibilità operativa, di progettazione e costruzione degli hotel, consentendo la condivisione di *best practice*.
- *Coinvolgimento del personale*: Lightstay consente di connettersi con i *team* degli hotel per fornire indicazioni e report di conformità, formazione sul sistema, report personalizzati e riconoscimenti.

Tabella 1. Le caratteristiche del sistema «Lightstay»

Il sistema Lightstay rende disponibile un ricco set di dati, informazioni e indicatori di performance ESG, di natura quantitativa e qualitativa[3], che consente di misurare gli impatti

[2] Il sistema LightStay è allineato ai criteri elaborati dal *Global Sustainable Tourism Council* (GSTC) per il turismo e le pratiche di viaggio sostenibili.

[3] La completezza e l'accuratezza di dati e processi aziendali sono garantiti da DEKRA Certification Inc, che fornisce una revisione esterna indipendente sulle informazioni relative ai programmi ambientali, sociali e di governance (ESG) di Hilton. A partire dal 2008, ha fornito i servizi di validazione per il programma

sull'ambiente e sulla società degli hotel Hilton in tutto il mondo, così come di apprezzare l'impegno, i contributi ed i progressi raggiunti verso un modello di sviluppo sostenibile perseguito con la strategia «Travel with Purpose» (per i quali si rinvia dettagliatamente al report 2024).

Il patrimonio di dati e informazioni che confluisce in un unico sistema permette a Hilton di operare in modo più efficiente, di supportare decisioni consapevoli e di generare un impatto ambientale e sociale positivo. Dall'adozione di LightStay (avvenuta nel 2009), le proprietà Hilton hanno ridotto significativamente le emissioni di carbonio e contribuito attivamente al supporto delle comunità locali, risparmiando oltre 1 miliardo di dollari in costi di utenza[4].

Le modalità d'impiego del sistema Lightstay saranno approfondite nella futura fase della ricerca, tuttavia, dall'analisi condotta emergono alcuni elementi riguardanti il ruolo assegnato al sistema dal top management e dette modalità d'uso.

Il top management della Hilton riconosce al sistema Lightstay una rilevanza critica nei processi decionali ed operativi aziendali, nonchè ai fini della rendicontazione interna ed esterna, prevedendo la sua implementazione in tutti gli hotel Hilton come specifica forma di controllo. L'impiego di Lightstay è ritenuto essenziale, informando ogni hotel degli obiettivi specifici da perseguire e delle priorità di impatto sociale cui dedicare attenzione, motivo per cui esso si configura quale requisito standard per tutto il portafoglio globale. Tutti i nuovi hotel devono completare un corso di formazione «LightStay» online tramite la Hilton University entro tre mesi dall'apertura, Sono, inoltre, disponibili dei corsi avanzati e delle guide pratiche, così come un team di supporto LightStay che gestisce le relazioni con gli hotel nell'operatività quotidiana.

Per quanto concerne le modalità d'impiego, il sistema Lightstay supporta la pianificazione di budget e tutti gli hotel devono stabilire degli obiettivi di riduzione annuale, nonchè impegnarsi in dei progetti di miglioramento. Nell'ambito di un sistema generale di reportistica, Lightstay rende disponibili ai team degli hotel anche informazioni su aree prioritarie chiave della destinazione, permettendo un focus specifico e personalizzato nel monitoraggio e nel supporto dell'attività.

A sua volta, come standard di marchio globale, tutti gli hotel gestiti e in franchising devono utilizzare Lightstay per fornire i propri dati di impatto ambientale e sociale a Hilton. È, dunque, contemplata la responsabilizzazione dei team degli hotel nel concreto impiego del sistema. Nella piattaforma vengono immesse le caratteristiche e le certificazioni di sostenibilità di tutte le strutture e gli hotel devono inserire una serie di dati su base mensile, relativi a: consumi energetici e idrici da tutte le fonti; smaltimento dei rifiuti; eventi di volontariato; donazioni. L'immissione accurata dei dati da parte degli hotel è garantita da alcune specifiche funzionalità tecniche del sistema Lightstay (conversioni globali per l'inserimento di valori in valuta locale, profili della proprietà da compilare come standard del marchio, utilizzo del protocollo internazionale per il calcolo dei gas serra, avvisi mensili per l'inserimento dei dati delle utenze).

Il sistema Lightstay è progettato in modo da rilasciare cruscotti di indicatori in tempo reale ed aggiornamenti mensili, informando così regolarmente gli hotel sulle loro prestazioni ESG. I dati sono accessibili ai dipendenti ed alle parti interessate, come gli ospiti, permettendo di riconoscere gli sforzi dell'azienda, in linea con la sua visione di promuovere l'inclusività e la sostenibilità (Hilton, 2018). Utilizzando LightStay, tutti i membri dell'organizzazione dispongono di un ricco set di dati ed informazioni a supporto delle decisioni e dell'attività operativa quotidiana, così come hanno modo di seguire ed esaminare i progressi compiuti verso il

Lightstay, e dal 2010 ha fornito i servizi di certificazione ISO 9001 (gestione della qualità), 14001 (gestione ambientale) e 50001 (gestione energetica).

[4] Più precisamente, l'azienda specifica una riduzione delle emissioni di carbonio equivalenti alla rimozione di 390.350 auto dalla strada ed un supporto alle comunità locali con 6.273.934 ore di volontariato. https://stories.hilton.com/hilton-history/lightstay-a-decade-of-managing-our-environmental-and-social-impact

raggiungimento degli obiettivi condivisi della strategia «Travel with Purpose», con le conseguenti implicazioni in chiave di consapevolezza e coinvolgimento nella sua realizzazione. Inoltre, il sistema fornisce informazioni su best practice e benchmark, permettendo un'analisi comparativa tra hotel in un'ottica di miglioramento dell'efficienza e della sostenibilità dei processi aziendali.

LightStay consente poi ad ogni hotel di predisporre per gli ospiti dei report personalizzati con informazioni sull'impatto ambientale di soggiorni, meeting ed eventi, così che i clienti possano, a loro volta, fare scelte consapevoli ed allinearsi alla strategia di sostenibilità perseguita da Hilton. La possibilità di generare report ambientali personalizzati discende dall'integrazione della piattaforma Lightstay con il programma «Meet with Purpose», dedicato all'organizzazione di riunioni ed eventi dei clienti nelle strutture Hilton[5]. Questa integrazione deriva dall'impegno di Hilton a rafforzare il proprio modello di business implementando svariati programmi e soluzioni tecnologiche idonei a limitare il consumo di risorse ed il proprio impatto ambientale, valorizzando collaborazioni come quella con ei3, partner tecnologico nella gestione e nel miglioramento continuo delle funzionalità di Lightstay. Un altro programma integrato nella piattaforma è «Hotel Kitchen Toolkit», volto a fornire agli hotel una guida e delle tecniche per la riduzione degli sprechi alimentari in ogni fase del processo produttivo[6]. L'operatività di tale programma e il processo decisionale sono supportati dal monitoraggio dei dati tramite la piattaforma LightStay. Anche in virtù di questa integrazione, si favorisce una concreta integrazione dei criteri di sostenibilità della gestione nei processi aziendali.

In generale, l'idea di fondo che informa l'impiego del sistema Lightstay è che attraverso il monitoraggio dei principali elementi ambientali e sociali, gli hotel possono ottimizzare le loro operazioni, ridurre i costi ed allinearsi agli obiettivi aziendali, offrendo, al contempo, un'esperienza più sostenibile per gli ospiti e generando valore per i proprietari.

Il sistema Lightstay inizialmente è stato implementato per supportare la strategia di responsabilità sociale di Hilton ed era incentrato sulla misurazione degli impatti ambientali delle attività alberghiere (Zientara et al., 2020). Nel tempo si è gradualmente evoluto per rispondere alle più complesse esigenze di monitoraggio e rendicontazione della performance ESG. Oggi rappresenta anche una piattaforma di comunicazione ed è alla base di un reporting standardizzato sulla sostenibilità, garantendo agli stakeholder interni ed esterni l'aggiornamento sulle performance di Hilton. In particolare, il monitoraggio di dati e informazioni in LightStay consente, a livello di general management, di esaminare le prestazioni ESG ai fini dell'azione di governo e di predisporre la Relazione annuale sulla strategia ESG per il Consiglio di amministrazione. Al contempo, Lightstay permette di predisporre il report di sostenibilità, che fornisce un aggiornamento annuale sulla strategia e le performance del programma «Travel with Purpose». Esso esplicita le aree prioritarie di intervento, le attività e le iniziative, gli indicatori di performance ESG, con un espresso richiamo agli SDGs dell'Agenda 2030. Questi ultimi sono ampiamente integrati nel core business aziendale attraverso varie e numerose iniziative descritte nella reportistica di sostenibilità (Damiano e Picciotto, 2025). Il report è redatto in conformità agli standard della Global Reporting Initiative (GRI) e integra le raccomandazioni del Sustainability Accounting Standards Board (SASB) e della Taskforce on Climate-related Financial Disclosures (TCFD).

Oltre al report di sostenibilità, Hilton comunica esternamente la propria strategia, il programma «Travel with Purpose» ed i progressi realizzati verso gli obiettivi 2030, sul proprio sito web istituzionale con una sezione dedicata.

[5] Utilizzando i dati raccolti dalla piattaforma Lightstay, Hilton ha sviluppato il Meeting Impact Calculator per calcolare l'impatto ambientale di riunioni ed eventi. Sulla base dei dati di consumo di ogni hotel, viene creato un report personalizzato che descrive in dettaglio le stime di carbonio, energia, acqua e rifiuti.

[6] Il programma si propone di: prevenire la perdita e lo spreco di cibo attraverso una pianificazione ponderata del menu; recuperare cibo sano per le donazioni; incanalare gli scarti alimentari verso altri usi.

Come si evince dal seguente passaggio, la possibilità di operare una rendicontazione esterna trasparente viene considerata un fattore fondamentale nella relazione con gli stakeholder ai fini di un loro coinvolgimento nelle questioni materiali più rilevanti, nonché di collaborazione per la ricerca attiva di soluzioni.

"We use LightStay, our award-winning ESG performance measurement platform, to measure our hotels' impacts in the communities in which they operate. We believe that transparent external reporting allows us to better engage our stakeholders on the most material issues impacting our business and collaborate on solutions to address them." (Hilton 2022 ESG Report, p. 53).

4.2. Risultati attesi della seconda fase di ricerca

Come prima accennato, i risultati attesi della seconda fase della ricerca permetteranno di chiarire le relazioni tra misurazione della performance ESG, sistemi di controllo di gestione e reporting di sostenibilità, favorendo una maggiore comprensione: i. dei fattori chiave per un'efficace integrazione tra tali elementi (posto che dai risultati preliminari sembra riscontrarsi l'approccio «integrato» auspicato in letteratura); ii. di eventuali criticità d'impiego del sistema di misurazione della performance ESG che devono essere attentamente presiedute e governate per l'efficace implementazione della strategia di sostenibilità.

5. Contributo potenziale

Lo studio presenta dei limiti, primo fra tutti la non generalizzabilità dei risultati connessa al metodo del caso studio singolo impiegato. Esso consente, tuttavia, un'analisi approfondita dei caratteri di un sistema di misurazione della performance ESG di un'azienda leader di settore, soffermandosi sui profili qualificanti un approccio integrato per la gestione strategica della sostenibilità che valorizza i legami tra misurazione della performance, sistema di controllo di gestione e rendicontazione di sostenibilità. In tal senso, il contributo potrebbe essere ritenuto d'interesse in relazione al ruolo di attore chiave riconoscibile ad aziende leader del settore turistico in virtù dell'influenza esercitabile nella comunità economica e imprenditoriale. I risultati dell'analisi possono far luce su aspetti critici ed innovativi riscontrabili nel sistema di misurazione della performance ESG della Hilton che potrebbero essere utili nella riflessione scientifica e nella sfera manageriale.

Più in generale, lo studio può contribuire alla letteratura sui sistemi di misurazione della performance della sostenibilità e le loro relazioni con il sistema di controllo di gestione ed il reporting di sostenibilità, specie con riferimento alle modalità tramite cui viene ricercata una concreta integrazione tra tali elementi ai fini di una gestione strategica della sostenibilità ed una trasparente comunicazione agli stakeholder dell'impegno profuso. Inoltre, in ottica manageriale, potrebbe offrire degli spunti per altre realtà del settore turistico impegnate nel raggiungimento e nella rendicontazione degli SDGs.

Parole chiave: Misurazione della performance ESG; controllo di gestione; report di sostenibilità; sviluppo sostenibile; imprese turistiche

The sustainability report of tourism companies: an analysis of online travel agencies

Giusy Guzzo[1], Maria Assunta Baldini[2], Giovanni Bronzetti[3], Miriam Clara Vitello[4]

1. Introduction

The role of companies within society, combined with their ethical implications, has sparked growing interest from the academic community and the business world (Harrison & Freeman, 1999). The identification of competitive advantages is a strategic priority for organisations, as it leads to the achievement of their primary goal: the creation of value in a market characterised by intense competition among businesses. According to Porter and Kramer (2006), such benefits are not limited to economic aspects, but also include social and environmental dimensions, which play an increasingly important role in the definition of current business strategies. Businesses are called upon to make public their own initiatives and practices that have a direct impact on society. In this context, there has been a growing interest among external stakeholders in companies providing clear evidence of the sustainability of their own activities under the environmental, social, and governance (ESG) profile. Similarly, there is a growing need within organisations to integrate sustainability goals with traditional economic and financial goals in order to ensure a more balanced and responsible management approach (Bachiorri, 2017). The literature is primarily concerned with the analysis of the factors that motivate the dissemination of such activities, the contents communicated, the modes of communication used, and the effects that these have on image and business performance (Benoit-Moreau & Parguel, 2011). In terms of communication modes, Rikhardsson and Holm (2006) demonstrate that the lack of shared standards is one of the most significant criticisms in the study of the phenomenon. In fact, the lack of uniform criteria limits the ability to effectively use the information disclosed in decision-making processes. In the field of sustainability accounting studies, numerous theoretical and normative proposals have been advanced to promote the standardisation and transparency of social and environmental performance practices, to discipline the performance of non-financial performance, including social, environmental, and sustainability reports developed on the basis of international standards, such as those proposed by the Global Reporting Initiative (GRI) and the Sustainability Accounting Standards Board (SASB). Within this field of research, sustainability reporting by companies operating in the hotel and tourism sector plays a particularly significant role, as these organisations are highly exposed to growing environmental instability and rapid climate change.

The tourism industry is a major global industry, but the impact of social and environmental practices on the companies that operate remains a research area that has received insufficient attention from academic literature (De Grosbois, 2012). The purpose of this study is to go deeper into the topic of measuring business sustainability in the tourism industry, with a focus on online travel agencies (OTA). In fact, these latter have gradually gained a central position in the digital

intermediation system between companies that provide transport and lodging services and end users, consolidating a competitive advantage over traditional operators in the sector. The major online travel agencies (OTA) — Booking.com, Airbnb, and Expedia — have demonstrated a growing interest in sustainability issues, with a particular emphasis on environmental issues, albeit employing various strategies. Booking has developed the Travel Sustainable program, which allows users to identify resource structures that use practices with low environmental and social impact (Gonzalez et al., 2025). Airbnb, on the other hand, has implemented a host-centric approach, providing recommendations for reducing energy consumption, efficient waste management, the use of environmentally friendly cleaning products, and the promotion of sustainable mobility (Arzoumanidi et al., 2022). Expedia has included an eco-compatibility criterion to its own rating system, allowing users to express their opinions on the sustainability practices of structures (Gonzalez et al., 2025). Based on the preceding considerations, the current study examines the environmental, social, and governance initiatives implemented by the major OTAs mentioned above, as well as the channels through which such initiatives are presented in the respective sustainability reports. The analysis is carried out using a qualitative approach, based on a documentary study of the previous reports of Booking.com, Airbnb, and Expedia. The investigation is carried out both in a diachronic perspective — taking the period 2022-2024 into account — and in a sychronic perspective, by comparing the various informative areas of the three reports and evaluating the qualitative and quantitative characteristics of the data in them.

This work is structured as follows. Section 2 examines the relevant literature and develops the study hypotheses. Section 3 describes the data, the study, and the methodology used. Section 4 presents the results, while Section 5 presents our conclusions and identifies some points for future research.

2. Literature review

2.1. Sustainability, transparency and institutional drivers in tourism

Sustainability has received increasing attention from the academic literature in the tourism industry, which has demonstrated its strategic importance not only in terms of environmental protection and social responsibility, but also as a factor determining long-term competitiveness and value creation (Streimikiene et al., 2020). Numerosi studi sottolineano, in particular, come le imprese turistiche operano in un contesto caratterizzato da una forte esposizione agli stakeholder e da una crescente sensibilità pubblica verso le tematiche ambientali, sociali e di governance (Environmental, Social, and Governance - ESG); elementi, questi, contribuiscono ad accrescere la rilevanza della sostenibilità come strumento di trasparenza e responsabilità.

According to Hahn and Kühnen's (2013) research, sustainability reporting practices are influenced by a variety of factors, including institutional factors, stakeholder pressures, competitive dynamics, and specific company characteristics. In particular, the authors demonstrate how regulation, even of a supranational nature, and the adoption of international guidelines promote the diffusion of standardised performance frameworks, whereas investor, consumer, and other stakeholder expectations highlight the role of disclosure as a tool for transparency and legitimacy. In this perspective, sustainability disclosure serves a crucial role not only as an informational but also as a symbolic function, establishing itself as a communication and legitimacy system aimed at bolstering corporate reputation and reducing informational imbalance. However, numerous contributions demonstrate that sustainable tourism practices continue to be characterised by a high degree of heterogeneity, and that these differences in performance limit the comparability of company disclosures in time and space.

In the tourism industry, literature (UNWTO, 2004; Vučetić, 2017; Streimikiene et al., 2021) has invested in the concept of sustainable development, emphasising multiple definitions that converge on key elements such as economic growth compatible with environmental protection, carbon emission reduction, and efficient use. According to the World Tourism Organization

(UNWTO, 2004), measuring the level of sustainable development necessitates the adoption of a structured set of indicators capable of representing the various interconnected dimensions of sustainability. The most significant dimensions are generally identified as environmental, economic, and social (Vučetić, 2017, p 318).

In particular, the environmental dimension receives the most criticism and, as a result, attention, because the tourism industry exerts significant pressure on natural resources, emissions of greenhouse gases, and local ecosystems, directly influencing the environmental quality of destinations and, indirectly, their competitiveness over time (Streimikiene et al. Environmental indicators, in particular, allow for the assessment of the impact of tourism activities and, at the same time, the support of continuous improvement processes, thereby contributing to the preservation and improvement of the quality of natural resources (Kiss, 2015).

These indicators play a vital role in the "measuring" of sustainability, both for internal performance monitoring and for stakeholder reporting (Tang et al., 2023; Zhang et al., 2025). Despite the fact that the literature has demonstrated how, among the various tools for measuring sustainability in tourism, environmental indicators are the most widely used, the effective integration of these indicators in decision-making processes and performance practices remains heterogeneous, particularly in relation to the type of industry operator and the model. The growing emphasis on measuring and standardising such impacts explains the adoption of performance frameworks such as GRI Standards capable of structuring and making environmental information produced by tourism businesses comparable (Guix et al., 2024; Rüger & Maertens, 2023). In terms of economic dimension, it refers to the ability of tourism businesses to provide long-term economic value, ensuring profitability for those who hold the title and contributing to local development. The literature emphasises that economic sustainability is not limited to profit generation, but also includes equitable value distribution across the value chain, support for local suppliers, and job creation (AA.VV., 2025; Bachiorri, 2017; Khaghaany et al., 2019).

Economic performance measurement using structured indicators allows for the monitoring of profits, investments, tax contributions, and expenditures on the local economy, allowing for comparative analysis of companies and time periods.

Finally, the social dimension takes into account the effects of tourism on individuals and communities, including working conditions, human rights, social equity, inclusiveness, and cultural value (Bachiorri, 2017; Jones & Comfort, 2018). Social sustainability entails active participation of host communities, the promotion of responsible workplace practices, and the protection of cultural heritage. Social performance measurement using structured standards, such as GRI 400, allows for the transparent documentation of the social impacts of tourism businesses and the comparison of operator performance (Guix et al., 2024; Zhang et al., 2025).

2.2. ESG, standardisation and the limits of disclosure in tourism

This theoretical framework links the three traditional dimensions of sustainability to the need for standardised and comparable reporting frameworks to achieve the best sustainability assessment for individual companies over time and across companies.

As is well known, theory and legislation recommend the use of sustainability reporting tools, such as social, environmental, and sustainability reports based on frameworks and standards developed by international and European bodies, to standardise, or at least harmonise, and compare sustainability disclosures by companies, particularly tourism companies.

The Integrated Reporting Framework (IR), Global Reporting Initiative Standards (GRI), European Sustainability Reporting Standards (ESR), and International Financial Reporting Standards for Sustainability Disclosure are examples.

Due to the diversity of the proposed models, the literature has also examined the changes caused by sustainability reporting in the accounting and corporate professions and relevant professional jurisdictions (Lai A., Stazzecchini R., 2021), as well as the differences between the

various frameworks, particularly those of the GRI and the ISSB and/or SASB, to identify the future dire Recent studies have shown that generalist reporting models may not capture the specific characteristics of tourism companies, suggesting the need for more tailored approaches. Ye Jin et al. demonstrate how the lack of sector-specific standards might affect the quality and usefulness of provided ESG information, emphasising the necessity for empirical investigations of tourism firms' usage of current frameworks.

Due to their multi-stakeholder focus, the GRI Standards are one of the most frequently utilised and internationally accepted sustainability reporting standards. To meet stakeholders' increased need for information, these standards were created in the late 1990s to give corporations a structured and shared instrument to disclose their economic, environmental, and social performance transparently and comparably. They enable customisable sustainability disclosures across relevant dimensions and reporting on direct and indirect value chain impacts by adopting a stakeholder-oriented perspective.

The GRI Framework has evolved to improve clarity, internal consistency, and alignment with sustainability legislation and conceptual advances. Revisions to the standards' numbering and classification scheme eliminated the distinction between the GRI 100, 200, 300, and 400 series. The GRI 100 series standards have been reorganised and combined into the Universal Standards, renamed GRI 1 (Foundation), GRI 2 (General Disclosures), and GRI 3 (Material Topics). Due to their modular and flexible nature, the GRI Standards are ideal for comparative and longitudinal evaluations of framework adoption and macro-category coverage.

2.3. Online Travel Agencies and the transformation of the tourism sector

Intermediaries between hotels, bed and breakfasts, cruise operators, and other tourism service providers and consumers play a key role in the tourism business.

Online travel agencies (OTAs) are becoming increasingly important in the global tourism sector and impacting market dynamics. They balance supply and demand, minimise consumer search costs, and standardise tourism offers while haggling with established providers (Garcia et al., 2022). The OTA business model's high digitisation and absence of direct infrastructure control make environmental and social implications difficult to quantify. OTAs' indirect effects on the tourism supply chain include supplier selection, sustainable or unsustainable practices promotion, and price policies. This unique feature makes OTAs a good case study for sustainability practices because their ESG development is primarily a multiplier effect along the value chain (Garcia et al., 2022).

OTAs adopting standardised reporting standards is a huge opportunity, according to this interpretation. Structured reporting allows stakeholders to receive transparency and accountability and monitor ESG performance across the supply chain, but the literature shows that practices vary widely. Thus, empirical examination of OTAs provides a unique viewpoint on how digital enterprises might include sustainability into their business model without direct touch with natural resources or tourism infrastructure.

2.4. Research questions

As stated above, although OTAs are recognised as playing a key role in promoting sustainability and setting new ESG standards within the sector, the literature on sustainability and ESG disclosure practices in tourism has not yet systematically and comparatively analysed OTA reporting models and practices and, more specifically, the evolution of reporting over time and the relative level of coverage of the various economic, environmental and social dimensions. In light of this gap, taking into account that the most widely used reporting model in industry practice is the GRI Framework and assuming that the OTAs that have demonstrated the greatest sensitivity

towards sustainability are Booking.com, Expedia Group and Airbnb, this study aims to answer the following Research Questions:

- RQ1: To what extent do OTAs adopt GRI standards in their sustainability reports?
- RQ2: Which categories of GRI standards (Universal, Economic, Environmental, Social) are most frequently reported by OTAs?
- RQ3: How does the reporting of GRI standards by Booking.com, Expedia Group and Airbnb vary over time (2022–2024)?

With regard to the first question, the aim of the study is to assess the level of compliance of the sustainability reports of the three OTAs under consideration with GRI standards and the differences that emerge between them in the adoption of these standards.

With regard to the second question, the aim of the study is to analyse the differences between the OTAs under consideration in the application of GRI standards in relation to specific areas of sustainability within their reports.

With regard to the third question, the research objective is to study, through a longitudinal analysis, the evolution over time of the adoption of GRI standards in the sustainability reports of the OTAs under consideration, in order to highlight any trends, changes in the level of compliance, and the degree of maturity of reporting, including from a comparative perspective between the various companies analysed.

In order to answer the research questions formulated, this study adopts a qualitative approach based on a documentary analysis of the sustainability reports published by the selected OTAs. In particular, the analysis focuses on the sustainability reports of Booking.com, Expedia Group and Airbnb for the period 2022–2024, examining their level of compliance with GRI standards through the construction of specific analysis matrices.

3. Research method

3.1. Sample

The methodology adopted follows a comparative multi-case study supplemented by a quantitative analysis of the documents. The sample comprises Airbnb, Expedia and Booking.com, selected as the leading OTAs in Italy, renowned for the variety of accommodation and packages they offer, and united by their status as listed companies with uniform reporting obligations – a condition that ensures a high degree of comparability of information. The data are drawn from public documents: Sustainability Reports for Booking.com, Global Impact Report for Expedia, and Sustainability and Community Update for Airbnb. These documents are available on the investor relations websites of the respective online travel agencies. The selection of the sample is based on their market significance and the availability of comparable financial and non-financial data.

The authors manually collected the data from the aforementioned documents using the GRI classification system. As the selected companies only have data available for the years 2022–2024, this time frame was chosen.

3.2. Research analysis method

A methodological design inspired by the qualitative content analysis model developed by Philipp Mayring (2015) was adopted, comprising seven stages. However, in view of the specific objectives of this research, not all the stages envisaged in the original model were applied in full. The methodological framework was therefore adapted, involving a partial reorganisation and simplification of the operational stages.

The categorical system was then defined, identifying main categories and subcategories derived from the relevant literature. During this phase, guidelines for data coding were developed,

drawn up in line with the Global Reporting Initiative (GRI) framework, to form the operational basis of the analysis.

Subsequently, the research activity focused on the examination of the empirical material and the interpretation of the results, which were analysed and discussed in relation to the research questions, with the aim of providing analytical evidence consistent with the objectives of this study.

4. Analysis of the results

This section presents the results of the empirical analysis in relation to the three research questions underpinning this study. In accordance with GRI criteria, a deductive categorisation approach is used to classify the content of the publications across the three dimensions of sustainability and their various subcategories. As mentioned, for Booking.com, Sustainability Reports covering the 2022–2024 period were examined. For Expedia, however, the analysis focused on the Global Impact Reports covering the same timeframe. Finally, with regard to Airbnb, the documents entitled Sustainability and Community Update were analysed.

With regard to the variables relating to the presence of a materiality analysis and the adoption of GRI standards, a binary approach was used to construct the tables, assigning a value of 0 in the case of absence and a value of 1 in the case of presence.

Table 1 provides a summary of the documents analysed, indicating for each one the number of pages, the presence of a materiality analysis and the adoption of GRI standards.

MATERIALITY ASSESSMENT	0	0	0	1	1	1	1	1	1
GRI STANDARDS	1	1	1	1	1	1	1	1	1

Table 1. Characteristics of the analyzed sustainability reports

Building on this preliminary framework, the analysis proceeds with a systematic examination of the GRI standards adopted by the main OTAs covered in the study.

The analysis is structured according to the macro-area model set out in the GRI Standards, distinguishing between reportable GRI Universal Standards (GRI 2 and GRI 3) and thematic standards relating to the economic (GRI 200 – Economic), environmental (GRI 300 – Environmental) and social (GRI 400 – Social) dimensions.

The construction of the compliance matrices is based on the GRI Content Indexes, formally reported in the sustainability reports of Booking.com and Expedia Group. Conversely, for Airbnb, which does not have a structured GRI Content Index, the analysis is conducted by referring to the

environmental information disclosed by the company, with particular attention to the data on greenhouse gas emissions contained in the section “Corporate GHG Emissions by Scope”. These disclosures have therefore been mapped to the environmental macro-area (GRI 300 – Environmental), enabling a consistent comparison at thematic level, even in the absence of explicit adoption of the GRI standards by the company.

Specific compliance matrices were also developed for each OTA analysed for the examination of the GRI Universal Standards.

These tables enable an analysis, for each company, of the evolution of GRI standard adoption, with particular reference to the disclosures required by GRI 2 (General Disclosures) and GRI 3 (Material Topics) during the period under review.

In order to provide an adequate assessment, the authors have grouped the matrices into a single table that encompasses the GRI Universal Standards and the three OTAs under analysis (Table 2).

Table 2. GRI- General disclosure compliance matrix

Analysis of the compliance matrices reveals significant differences between the leading OTAs. Expedia Group stands out as the most consistent in its adoption of the GRI Universal Standards, with compliance rates of 75% in 2022, 72% in 2023 and 66% in 2024. Booking.com maintains a good level of compliance, albeit with more limited use of certain disclosures, recording a consistent 66% over the three-year period under review. For Airbnb, as the GRI Index is not included in the reports analysed, compliance stands at 0%, highlighting a marked disparity compared to other OTAs.

With regard to environmental standards, these are of particular significance, as the environmental impact is predominantly indirect and stems primarily from activities within the value chain. In this regard, a compliance matrix has been drawn up (Table 3), which shows, for the sample analysed, which standards from the GRI 300 series have been adopted and which have not.

Table 3. GRI 300- Environmental compliance matrix

The results show that the three OTAs analysed adopt environmental standards to a limited extent. Booking.com has a compliance rate of 13%, which remained constant throughout the three-year period. Expedia Group recorded a rate of 28% in 2022, which fell to 19% in 2023 and 2024; Finally, Airbnb shows an unchanged adoption rate of 16% throughout the period analysed.

Finally, social standards (GRI 400) are examined. Analysis of the results reveals significant differences in adoption levels and social disclosure among the companies considered, which are highlighted in Table 4 below.

Table 4. GRI- Social compliance matrix

As highlighted by the following summary charts, Expedia Group takes a more systematic approach to reporting, whilst Booking.com and Airbnb show significantly lower or zero levels of compliance across various categories of standards.

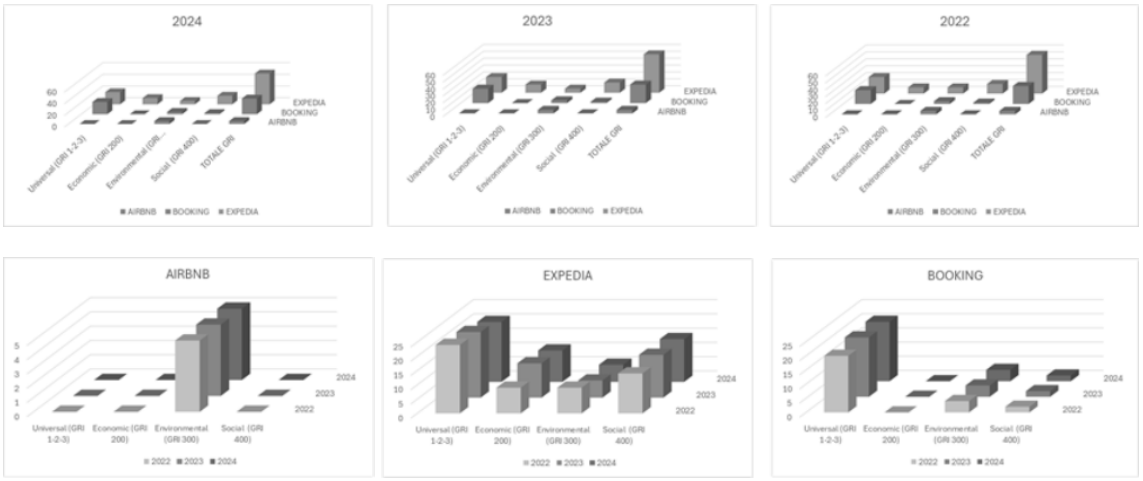

Figure 1. GRI adoption among the analysed OTAs (2022-2024)

The analysis of the sustainability reports published by Booking.com, Expedia Group and Airbnb between 2022 and 2024 reveals a picture characterised by significant variation in the ESG reporting practices adopted by the leading OTAs. The results show that the adoption of GRI standards is neither uniform in scope nor depth, confirming the sector's difficulties in producing fully comparable and consistent disclosures across the various dimensions of sustainability. Expedia Group emerges as the operator with the highest level of formal alignment with the GRI framework, being the only OTA in the sample to systematically report on all categories of standards (Universal, Economic, Environmental and Social).

In contrast, Booking.com focuses its reporting predominantly on universal standards, highlighting a substantial lack of disclosure relating to economic, environmental and social standards. This suggests a reporting approach geared more towards organisational and governance aspects, rather than the structured measurement of ESG impacts.

As regards Airbnb, the analysis shows that the company has not formally adopted the GRI framework. However, the company provides some environmental information, particularly regarding greenhouse gas emissions, which are categorised under the environmental macro-area to allow for a thematic comparison with other OTAs.

5. Conclusion

This study used an analytical framework to evaluate Booking.com, Expedia Group, and Airbnb's sustainability reports to find similarities and differences.

Based on the literature on tourism company sustainability, particularly OTAs, the research questions examined the three selected agencies' financial statements' GRI compliance, the categories of standards most frequently reported in them, and any changes in individual reporting dimensions over time. As noted in the results section, the empirical investigation found some variability in company reporting and a focus on the environment. These results have several

limitations, but they allow us to make some final conclusions and suggest future research. The small sample size of three companies and the short financial statement observation period of three years are major limitations of this study. This limits the capacity to generalise the data and analyse the sample firms' sustainability actions' long-term evolutionary dynamics. The study is primarily descriptive, summarising OTA sustainability reports.

Due to these constraints, future studies could increase the number of operators and reference time span to acquire more robust and generalisable evidence. More normative research could help define an OTA sustainability reporting methodology. This study's theoretical implications pertain to how the results help OTAs comprehend reporting procedures and design more structured ESG disclosure strategies.

In the absence of tourism-specific standards, the academic debate should also focus on dedicated reporting models for tourism companies to improve the completeness, transparency, and comparability of the information in their sustainability reports, especially OTAs, in response to growing pressure from legislators, institutions, and stakeholders. In this sense, an ad hoc GRI standard for the tourism sector might help enterprises disclose their environmental, economic, and social impacts more consistently, enabling valid comparisons between operators and eras. A standard for ESG information in digital tourism would improve openness, accountability, and legitimacy of the business.

Keywords: Sustainability report; travel agency; GRI; environmental; social; governance

Local businesses' perception of the overtourism induced by social media influencers in lesser-known destinations: Empirical evidence from Italy and Vietnam

Alessandro Bigi[1], Michelle Bonera[2], Ha Vi Le[3]

1. Introduction

Along with the development of social media has been the boom of the tourism industry in recent years (Song & Wondirad, 2023). One aspect that significantly contributes to this growth is influencer marketing (Kamarulzaman et al., 2025), particularly its role in the rapid development of tourism in previously less-visited destinations. Besides the benefits, the tourism attracted by influencer marketing in these locations also has a significant negative impact on stakeholders (Koens et al., 2018). The research on how relevant stakeholders, such as the local residents (Almeida-García et al., 2016; Đurkin Badurina & Soldić Frleta, 2021; Halim et al., 2022) and visitors (Krajickova et al., 2022), react to this phenomenon has gained increasing importance recently (Zhang et al., 2019); however, there has not been much research done to clarify the impact of overtourism on the local entrepreneurs' perception.

Therefore, this study was conducted with the aim of studying the impact of tourism caused by influencer marketing on the awareness of local businesses in little-known tourist destinations, with empirical research in two countries: Vietnam and Italy. Italy is described as a tourism destination with many mature components, particularly with many tourism sectors at theirs stagnation and rejuvenation phases (Bernini et al., 2020), while Vietnam reflects an emerging tourism context (Le, 2020) with rapid, social-media-driven growth (Sinh Duc Hoang et al., 2024). Comparing these contexts allows exploration of how tourism maturity shapes business reaction towards influencer-driven tourism pressure. Although two countries differ significantly in geographical features, the analysis is conducted at a destination level. Country context is used to interpret institutional difference, rather than as a unit of comparison.

Through this article, the researchers aim to analyze and compare the impact of this phenomenon on the perception of local businesses between different less-visited destinations of two countries with different levels of tourism maturity through a thematic analysis, with semi-structured interviews with time frame from 2025-2026; thereby providing implications for local authorities and local businesses, contributing to a more sustainable development of the tourism industry in lesser-known locations.

2. Conceptual background and literature review

The rapid development of social media has been accompanied by a significant boom in the tourism industry in recent years (Song & Wondirad, 2023). Among the key drivers of this growth are social media influencers (SMI), whose profound impact on tourism stems from their ability to shape consumer behavior and evoke emotional responses that increase travel intentions

[3] Università degli Studi di Brescia; h.le002@studenti.unibs.it

(Kamarulzaman et al., 2025). Influencer marketing (IM) has an impact on nearly every stage of the customer journey. With the pre-purchase phase, travel content from influencers triggers followers' desire to travel by cultivating emotional connections (Wu et al., 2024). Besides, benign envy, which results from upward social comparison during exposure to travel content, is also considered a driver of willingness to travel (Asdecker, 2022). During the purchase stage, customers' decision to travel to a specific destination is significantly influenced by the credible suggestion of social media influencers. Finally, customers' trust in SMI has been proven to positively impact their satisfaction with the travel experience. To be specific, following an SMI's recommendation can make consumers feel comfortable with their purchasing decision and feel they made a wise choice (Kamarulzaman et al., 2025). At a strategy level, destination management organizations use influencer marketing as a non-intentional marketing approach to boost the popularity of the destination (Kamarulzaman et al., 2025; Wu et al., 2024).

However, social media, including influencer marketing, is also identified as a driver for overtourism. To be specific, social media influencers and their viral content rapidly increase destination popularity, leading to excessive visitation and a concentration of tourist flow in specific areas (hot spots) which exceed the carrying capacity of the locations (Song & Wondirad, 2023).

Overtourism is formally defined by the UNWTO as the impact of tourism on a destination, or parts thereof, that excessively influences the perceived quality of life of citizens and/or the quality of visitors' experiences in a negative way (Koens et al., 2018). Milano et al. (2018) defined overtourism as the excessive growth of visitors to tourist destinations, which leads to overcrowding.

When overtourism occurs, it generates several negative externalities, namely physical overcrowding, socio-cultural and economic deterioration, environmental degradation, and loss of authenticity (Song & Wondirad, 2023). The effect of overtourism induced by IM doesn't stop at popular destinations but also affects lesser-known locations. The rapid, unintentional popularity triggered by social media in lesser-visited destinations results in severe infrastructural strain, environmental degradation, a disconnect between virtual image and physical reality, and precarious economic stability (Wengel et al., 2022; Yang et al., 2025)

Loverio et al. (2022) found that increased stakeholder cooperation can mitigate negative problems brought by mass tourists by enabling the creation of multifaceted, long-term solutions that public or private entities could not achieve alone. The effectiveness stems from comprehensive engagement. Edward Koh et al. (2019) proposed a BRAVE framework integrating businesses, residents, authorities, visitors, and environmentalists to tackle overtourism collaboratively Therefore, it is important to understand the impact of overtourism on stakeholders' perception in less-visited destinations. Prior studies mostly focus on visitors' or the overall local communities' perception. In terms of visitors' perception, overtourism in less-visited destinations is viewed negatively with several impacts: damage to the visual of the destination, over commercialization leading to higher prices, and overcrowding. Their overall assessment is characterized by different socio-demographic variables: origin and intention to visit, age, and gender (Krajickova et al., 2022). On the other hand, the response of local communities is reported differently. In lesser-known regions, particularly those in the early or moderate stages of tourism growth, overall resident perception may remain net positive. Residents generally believed the economic and social benefits outweighed the negative impacts. However, even in these relatively positive cases, underlying negative impacts related to traffic, pollution, or price inflation were still acknowledged. (Almeida-García et al., 2016)

Yet, prior research has largely overlooked the impact of overtourism induced by social media influencers on the local businesses' perception. There have been recent calls for further search on the data of other relevant stakeholders, other than visitors or overall local communities, especially tourism businesses that might see tourism growth differently from local residents (Kuščer & Mihalič, 2019; Krajickova et al., 2022) Additionally, despite extensive attention to a particular

destination, limited focus has been given to cross-country research with different cultures, economic and political situations (Peters et al., 2018; Gaunette Sinclair-Maragh, 2016). Besides, according to Moteab Alsaloum et al. (2024), "a more thorough analysis for future studies should be considered by using qualitative analysis to gain a deeper understanding of the residents' perceptions and attitudes towards tourism development."

Synthesizing the above streams of literature reveals three key gaps:

First, the absence of research on local business perceptions of overtourism, even though this group is directly affected and may hold perspectives distinct from residents and visitors.

Second, there is a lack of cross-country comparative evidence, especially across destinations that differ significantly in tourism competitiveness and development stage.

Third, despite much attention given to quantitative research, a critical gap exists in understanding the local businesses' perception at a deeper and explanatory level using a qualitative method.

Addressing these gaps, this study was conducted with the aim of studying the impact of tourism caused by social media influencers on the perception of local businesses in little-known tourist destinations, with empirical research from in-depth interviews with business owners in two countries: Vietnam and Italy.

3. Theoretical Framework

3.1. Justification for country and destination selection

Country-level rationale

According to Lundberg (2015), a country's degree of tourism development significantly affects how its stakeholders perceive tourism. While there are stable differences in how residents perceive cultural and natural preservation, their reaction toward economic benefits differs dramatically with the change in tourism development. To be specific, negative impact perceptions may be higher with lower levels of tourism development.

Therefore, we expect the level of tourism competitiveness will affect how the local businesses in different countries react to overtourism. Two countries, Vietnam and Italy, were chosen using the Shift-Share Analysis Indicators proposed by Dogru et al. (2020). This methodology uses basic economic figures (Tourist arrivals, Tourism receipts, and Per-tourist-Dollar) to determine a country's competitive standing objectively. Italy's higher statistics indicate a more mature and highly competitive tourism industry compared to Vietnam. Observing the same phenomenon in two countries with different degrees of competitiveness might bring value to the research.

Destination-level rationale

A list of candidate destinations was first compiled by the authors through a collection process of different news and reports regarding tourism in Vietnam and Italy. Destinations are publicly identified as lesser-known destinations, which gain popularity after the endorsement of IM. The locations shortlisted process also concerns the relative similarity in geographical dimensions and positions to eliminate the influence of confounding variables

To theoretically justify the classification of "lesser-known destination", the study adopt the definition of Kareem et al. (2025), which describes lesser-known destinations (LKDs) as "locations, attractions, or regions that receive fewer visitors compared to mainstream tourist sites. This status is typically a result of their off-the-beaten-path nature, emerging status in the tourism sector, or a lack of significant marketing efforts."

To confirm the chosen destinations, meet the definition requirement, we analyse data based on the indicators used in a research by Đurkin Badurina and Soldić Frleta (2021). In this study,

the author identified the term “less-visited”, or “lesser-known”, in comparison with a highly visited destination. Both of the destinations are characterized by similar geographical position, number of inhabitants, and infrastructural structure; however, the difference lies in the number of visitors and overnights, which represent the tourism intensity. Therefore, we will collect secondary data about the number of visitors and overnight beds, comparing them with highly visited destinations, to conclude whether they qualify as lesser-known destinations

These destinations will undergo a further screening step through secondary data on visitors number. Specifically, we observe the changes in the number of tourists before and after the time when the post was posted on the TikTok platform to confirm that the overtourism phenomenon induced by social marketing happened in these destinations. This approach follows the methodology of Wengel et al. (2022). In their study, the overtourism induced by IM phenomenon was quantified by comparing visitor counts before and after viral social media exposure.

3.2. Social Exchange Theory (SET)

This study is grounded in the Social Exchange Theory (SET) (Ap, 1992), which posits that residents evaluate tourism based on a cost-benefit analysis. At its core, SET claims that when the exchange of resources is balanced or higher in favour of the residents, tourism impacts are perceived positively. On the other hand, the influence is viewed negatively when the exchange of resources is low (Ap, 1992). The construct has evolved from its initial conceptualization toward a broader understanding encompassing the community comparison (Gursoy & Rutherford, 2004). The study suggested that there are five main factors influencing the community reactions towards tourism: community attachment, community concern, use of tourism resources, ecocentric attitudes, and the state of the local economy. Also, it indicates that the local economy acts as a mediating role in the influence of these factors. To be specific, the higher the perceived importance of local economic development, the more likely the residents are to support tourism, while they are less concerned about social costs. A modern application with moderating variables has been analysed in more recent research according to Nunkoo and Ramkissoon (2011). The authors suggest that the perceived benefits/costs of tourism are influenced by trust in tourism institutions, power to influence tourism, and neighborhood conditions.

In recent studies, the SET is widely adopted to evaluate the perception of local residents towards the impact of tourism, with the assumption that tourism development’s economic benefits offset its environmental and socio-cultural costs (Peters et al., 2018). Prior studies consistently showed that residents’ perception is largely shaped by an evaluation of cost and benefit in terms of economic and socio-cultural impacts (Peters et al., 2018; Pekerşen & Kaplan, 2022; Halim et al., 2022), compared to less-weighted environmental impacts (Halim et al., 2022).

Other frameworks, such as Stimulus-overload theory (González-Reverté, 2021), or Identity theory (Sinclair-Maragh, 2017), focus on understanding negative emotional response due to overtourism saturation, or explaining why residents with different demographic characteristics support/oppose overtourism. But they do not provide a mechanism to analyse cost-benefit evaluation. In contrast, SET aligns directly with the objective of this research, of examining how perceived impacts shape stakeholders’ attitudes.

While previous studies applied SET to evaluate the general residents’ perception of tourism, this work advances the theory by contextualizing it in the perspective of a specific stakeholder - the local businesses - in the context of lesser-known destinations, which gain overnight popularity due to IM. The use of SET in this study enables a more comprehensive explanation of how local entrepreneurs perceived overtourism. Local entrepreneurs are likely to support tourism development if they perceive the benefits—such as increased income, job growth, and business visibility—as outweighing the costs (overcrowding, loss of authenticity, infrastructure pressure). This definition is particularly suitable for evaluating local entrepreneurs’ perception towards overtourism because it explains why entrepreneurs in the same destination may have very

different perceptions of the same phenomenon. It is important to note that their perception of tourism's impact depends on their sustainability orientation—defined by their awareness of environmental degradation and their commitment to long-term resource preservation (Akhtar et al., 2022). It adapts a cost-benefit analysis with key measurements, including: perceived economic impacts, perceived socio-cultural impacts, perceived environmental impacts, to evaluate the outcome - the local business's support/opposition for tourism resulting from IM, with three distinct research questions:

RQ1: How do local entrepreneurs perceive the economic benefits of influencer-driven tourism, and how do these perceptions influence their support for tourism growth?

RQ2: How do local entrepreneurs perceive social, cultural, and environmental costs of influencer-driven tourism, and how do these perceptions influence their support or opposition?

RQ3: How do local entrepreneurs' perceptions of overtourism differ between a highly competitive (Italy) and an emerging tourism market (Vietnam), and what contextual factors shape their responses?

4. Research method

To address the research aim, a qualitative design will be used based on an interpretative, inductive thematic coding process. To ensure an holistic representation of the tourism ecosystem, primary data will be collected through semi-structured interviews using a purposive sampling Tourism business owners and managers in Italy and Vietnam's lesser-known tourist spots will be interviewed. The sample is stratified according to the UNWTO Tourism Satellite Account (TSA) framework to guarantee coverage across the entire tourism value chain. Participants are recruited from the following "tourism-characteristic" industries: accommodation, food and beverage, transport, travel services, cultural and recreational services, retail (Douglas, 2010), The sample size will in line with the principle of theoretical saturation, meaning that data collection continues until no new themes or insights emerge from additional interviews (Glaser & Strauss, 1967).

A flexible interview guide, built around the three research questions, will include open-ended prompts on perceived economic benefits, social–cultural and environmental costs, and contextual conditions in Italy and Vietnam. The guide will ensure coverage of these core topics while allowing the interviewer to pursue unanticipated issues raised by participants, generating rich narratives that can be inductively coded through thematic analysis. This will help us get detailed, contextualized accounts of how influencer-driven overtourism affected their businesses and the areas around them. Interview transcripts will be analysed using Leximancer, a Bayesian, machine-learning-based content analysis software (www.leximancer.com). Leximancer automatically extracts concepts from patterns of word co-occurrence and groups them into higher-order themes without predefined coding categories, thereby reducing researcher subjectivity (Smith & Humphreys, 2006; Bigi et al., 2021). The software performs both conceptual (thematic) and relational (semantic) analysis, generating concept maps that visually display how salient concepts cluster and interrelate across the corpus and between the Italian and Vietnamese cases (Smith & Humphreys, 2006; Bigi et al., 2016). First, a combined analysis will identify the overall concepts and themes structure. Then, separate runs by country will allow comparison of: (a) the salience of shared concepts (e.g. economic benefits, crowding, cultural change), (b) country-specific concepts and themes, and (c) differences in how concepts co-occur and cluster in the concept maps across the two contexts.

5. Expected outcome

We expect to see a high awareness of local businesses of the phenomenon. There will be a mixed perception of this phenomenon, with the anticipation that Italy, a country with higher

tourism maturity and competitiveness, will generally react more positively towards overtourism caused by influencers than Vietnam

In terms of economic expectations, the authors predict that the businesses will foresee a higher revenue when tourists arrive. However, the instability and dependency on viral fame are also concerns. The economic impacts are expected to be the main factor determining the business owners' support/opposition of tourism in lesser-known destinations.

With socio-cultural and environmental impacts, while it is considered a major cost in the evaluation of residents' attitudes, we expect a lower impact of this construct in the business's perception due to the differences in interests between the two stakeholders. Nevertheless, the local entrepreneurs are expected to see a threat in loss of authenticity, overcrowding, and environmental pressures when influencer-driven tourists flock in.

Finally, in this study, we expect to find out about how businesses will adopt their business strategy in response to the situation, whether they are more likely to collaborate with influencers to further expand the effect, or to avoid them.

6. Expected contributions

The Social Exchange Theory (SET) serves as the foundational lens for this analysis because it directly addresses how stakeholders evaluate tourism based on a cost-benefit trade-off. SET is best suited to local businesses because it explains their support or opposition through perceived economic gains (e.g., revenue, visibility) versus costs (e.g., overcrowding, infrastructure strain), even though it is usually applied to residents. By placing existing theory within the unique perspective of entrepreneurs in lesser-known locations affected by influencer-driven overtourism, this framework advances existing theory and enables a nuanced understanding of how various impacts shape business strategies and attitudes.

This study contributes to the growing body of research on local businesses' perceptions by offering new insights into how overtourism, caused by social media, shapes the responses of key stakeholders in little-known destinations. The findings are expected to enrich theoretical understanding and provide practical guidelines for policymakers to achieve more sustainable growth in tourism.

Regarding the research's theoretical contribution, findings from this study help expand overtourism theory, SET in particular, by adding the perspective of a new stakeholder - the local businesses. A cross-country analysis might introduce new insights about destination development in emerging vs mature tourism economies, with a focus on lesser-known destinations. Besides, a qualitative analysis is expected to reveal nuances that prior quantitative studies failed to capture, by introducing a new voice from an undermined stakeholder perspective.

Concerning practical contributions, due to the importance of local businesses to the destination developments, understanding their attitudes might help tourism practitioners and policymakers to design a more sustainable destination strategy with a clear guide for businesses on how to respond to influencer-driven demand. Besides, the collaboration of the destination entrepreneur and the content influencers can potentially open a new future for the destination tourism development, which should be carefully considered and mediated by the authority. The authority must understand and manage the local readiness towards the phenomenon in small destinations before overoturism further escalates.

Keywords: Influencer marketing; overtourism; social media; local businesses; lesser-known destinations

Operational Transparency in Closed-Loop Supply Chains: Activating Consumers as Suppliers

Benedetta Baldi[1], Ivan Russo[2], Ilenia Confente[3]

1. Introduction

The textile and clothing industry ranks among the most environmentally damaging sectors, contributing significantly to water pollution, land degradation, and carbon emissions (European Parliament, 2024). In response, policymakers have intensified efforts to address these environmental challenges, introducing strategies to reduce waste, extend garment lifecycles, and promote textile recycling while also urging companies to cut their carbon emissions and environmental footprint (Ellen MacArthur Foundation, 2024). This shift necessitates fundamental changes to the supply chain, aligning with the principles of the circular economy, such as "closing the loop" (Hazen et al., 2021). A closed-loop supply chain emphasizes retrieving products from consumers and recovering their remaining value (Guide & Van Wassenhove, 2009), with the goal of reducing natural resource extraction, waste, and emissions.

In the closed-loop supply chain for the textiles and clothing industry, consumers play a pivotal role by initiating the reverse flow of goods necessary for product recovery and closed-loop processes. End-of-use garments move from consumers to retailers, positioning consumers as key actors in reverse logistics processes (Denizel & Schumm, 2023; Vadakkepatt et al., 2021). Essentially, consumers act as suppliers within the closed-loop supply chain, determining the fate of discarded products. Therefore, engaging consumers is crucial for the success of closed-loop systems; yet retailers face the challenge of determining the best way to connect with them. The logistics and supply chain management literature provides evidence that transparency is a powerful tool for shaping consumer behavior, with a primary focus on forward supply chain contexts (e.g., Duan & Aloysius, 2019; Mollenkopf et al., 2022; Peinkofer & Jin, 2023).

2. Purpose and background of the research

This study aims to investigate how operational transparency within closed-loop supply chain contexts fosters active consumer participation in initiating reverse logistics and closed-loop supply chain processes. Specifically, the study aims to answer the following research question: How does operational transparency in closed-loop supply chains influence consumers' intention to participate in take-back initiatives?

The research is grounded in the consumer-centric supply chain management, which positions consumers as key and active supply chain actors (Baldi et al., 2024; Esper et al., 2020), and operational transparency literature (Budler et al., 2024). The transparency literature has long been characterized by a lack of a clear definition, which limits both scholars and practitioners from fully understanding its role in supply chains (Mollenkopf et al., 2022; Montecchi et al., 2021). However, recent efforts have moved toward a more consistent definition (Bell et al., 2016; Budler

[1] Postdoctoral Researcher, ECON-07/A, University of Verona; benedetta.baldi@univr.it – corresponding author

[2] Full Professor, ECON-06/A, University of Verona; ivan.russo@univr.it

[3] Associate Professor, ECON-06/A, University of Verona; ilenia.confente@univr.it

et al., 2024). This study adopts the definition by Budler et al. (2024), who describe operational transparency as organizations' ability to proactively engage in communication with stakeholders to create visibility and traceability within upstream and downstream supply chain operations. More specifically, visibility refers to the ability of organizations to see across (or into) their SC, and traceability refers to the ability to access any or all information relating to the products, and to follow the movement of products through specified stage(s) such as production, processing, and distribution. Much of the transparency literature has focused on the upstream and forward operationalization of the concept, leaving the adaptation of the concept to reverse and closed-loop processes underexplored. A closed-loop supply chain focuses on reclaiming products from consumers to recover added value, aiming to minimize resource consumption and waste (Hazen et al., 2021). To develop a closed-loop supply chain, companies can choose from several product recovery options as alternatives to waste disposal, including remanufacturing, repair, refurbishing, recycling, or reuse (Geissdoerfer et al., 2020). The critical element enabling the reverse product flows related to any of these recovery processes is the collection of end-of-use products from consumers. Therefore, consumers play a pivotal role in initiating reverse flows. The end-of-use products brought back to stores re-enter the closed-loop supply chain and undergo one of the recovery options, where they may be recycled into new products, repurposed, or sold in secondhand markets (Denizel & Schumm, 2023). Among the various product recovery options in closed-loop supply chains, recycling plays a pivotal role, and it is the focus of this study. Recycling involves extracting valuable components from returned products and converting them into raw materials for reprocessing (Ellen MacArthur Foundation, 2021). Recycling involves disassembling products to the material level, which are then reprocessed into new inputs for manufacturing (Denizel & Schumm, 2023). While recycling is often viewed as a last-resort option in a circular economy—because embedded energy and value are lost in the process—it is crucial for reducing natural resource extraction by incorporating recycled materials into new production cycles (Ellen MacArthur Foundation, 2021; Raz & Souza, 2018). This minimizes waste by transforming discarded items into valuable inputs for new production (Dwivedi et al., 2023).

The signaling theory (Connelly et al., 2011; Spence, 1973, 2002) serves as the theoretical lens for the investigation. According to the signaling theory, signals help reduce information asymmetry between two parties—in this case, the retailer (signaler) and consumers (receiver)—in a market where one party (the consumer) has limited information for decision-making, while the other (the retailer) is fully informed. To bridge this gap and mitigate the information asymmetry, the informed party sends signals that the less informed party can use to guide its decisions (Stiglitz, 2002). In this study, operational transparency related to closed-loop supply chain processes serves as a signal sent by retailers to reduce information asymmetry and influence consumer involvement in closed-loop processes. Transparency in forward supply chains has been shown in the literature to positively influence consumers' behaviors, such as increased purchase intention, favorable attitudes toward the firm, and a higher willingness to pay (e.g., Duan & Aloysius, 2019; Mollenkopf et al., 2022; Peinkofer & Jin, 2023). Therefore, we hypothesize that operational transparency in closed-loop supply chains has a positive influence on consumers' intention to participate in take-back programs.

H1. Retailers' operational transparency has a positive influence on consumers' intention to participate in take-back programs.

According to signaling theory, consumers evaluate signals by considering the perceived costs associated with producing them. Signals that are more costly to imitate are generally viewed as more credible and therefore exert a stronger influence on consumer judgments (Connelly et al., 2011). Within the context of closed-loop supply chains, operational transparency functions as such a costly signal, as it demands extensive investments and coordination across supply chain partners (Budler et al., 2024; Morgan et al., 2023). We propose that when retailers disclose their operational information related to closed-loop initiatives, consumers interpret this transparency as a signal that enhances perceptions of the retailer's credibility. Retailer credibility plays a vital

role in consumer decision-making (Nilsson et al., 2004; Dawar & Parker, 1994), as credible retailers are more likely to be trusted, and their disclosed information is more readily accepted and used by consumers.

H2. Exposure to operational transparency positively influences consumers' perceived credibility of the retailer.

Self-efficacy originates in the psychological literature (Bandura, 1977) and refers to individuals' beliefs in their ability to perform the actions necessary to achieve desired outcomes. These beliefs influence both the initiation and persistence of behavior: individuals with strong self-efficacy are more likely to attempt challenging tasks and to continue striving in the face of difficulties. In the context of this study, the disclosure of operational transparency information serves as a form of textual persuasion that can shape consumers' self-efficacy regarding participation in closed-loop initiatives. However, the effectiveness of such persuasion depends on the credibility of its source. Here, the retailer represents the source of the disclosed information, and the retailer's credibility determines the extent to which consumers accept and internalize the information. When the retailer is perceived as trustworthy, knowledgeable, and reliable, consumers are more likely to incorporate operational transparency information into their beliefs and feel more capable of engaging in closed-loop behaviors, thus acting as suppliers. Therefore, we hypothesize that consumers' perceived credibility of the retailer positively influences self-efficacy. Additionally, the relationship between operational transparency and consumers' intention to participate in take-back programs is sequentially and positively mediated by retailer credibility and self-efficacy.

H3. Consumers' perceived credibility of the retailer positively influences consumers' perceived self-efficacy.

H4. Perceived credibility of the retailer and perceived self-efficacy sequentially and positively mediate the relationship between operational transparency and consumers' intention to participate in take-back programs.

3. Methodology

In line with recent logistics and supply chain management research on consumer behavior (Jin et al., 2022; Masorgo et al., 2023; Peinkofer et al., 2022), between-subjects scenario-based survey experiments with U.S. consumer participants are used to test the causal relationships proposed in the hypotheses (Rungtusanatham et al., 2011). The methodology provides a valuable opportunity to investigate consumers' decision-making (Eckerd & Bendoly, 2011; Knemeyer & Naylor, 2011). It is particularly suitable to isolate effects that are difficult to observe in noisy environments (Rungtusanatham et al., 2014). Moreover, in scenario-based experiments, varying versions of a scenario communicate information about different levels of the manipulated variable to participants (Rungtusanatham et al., 2011). Before the main experiment, pretests were conducted to ensure scenario realism and to conduct manipulation checks (Bachrach & Bendoly, 2011). Experiments were developed via Qualtrics, and participants were recruited through Prolific Academic.

We conducted three main experiments to test the hypothesized relationship. Study 1 served to test the direct relationship between operational transparency and intention to participate in the take-back program (H1). Study 2 tested the direct effect of operational transparency on perceived retailer credibility (H2). Study 3 tested the relationship between retailer credibility and self-efficacy (H3) and the sequential mediation model (H4).

4. Results

Study 1 involved 100 U.S. consumer respondents (53% female; M_age = 46.6) who participated in a single-factor (operational transparency: yes vs. no) between-subjects

experimental design. We tested H1 using a one-way ANOVA. Results confirm the positive and direct effect of operational transparency on consumers' intention to participate in take-back programs ($F = 7.30$; $p < 0.01$). Study 2 involved 200 U.S. consumer respondents (54.5% female; M_age = 43.5), who participated in a single-factor (operational transparency: yes vs. no) between-subjects experimental design. We tested H2 using a one-way ANOVA, which confirmed the positive and direct effect of operational transparency on perceived retailer credibility $F = 10.23$; $p < 0.01$). Study 3 involved 401 U.S. consumers (53.6% female; M age = 44.6), who participated in a single-factor (operational transparency: yes vs. no) between-subjects experimental design. We tested H3 and H4 following the recommendations of Rungtusanatham et al. (2014) for mediation analysis using bootstrapping. We conducted the analysis with the PROCESS macro for SPSS (Hayes, 2012). This method, based on ordinary least-squares regression, estimates mediation effects with sufficient statistical power through bootstrap confidence intervals (Hayes, 2018). We run a PROCESS model 6 using 95% bias-corrected bootstrapping with 5000 samples. The model includes operational transparency as the independent variable, the intention to participate in the take-back program as the dependent variable, and retailer credibility and self-efficacy as sequential mediators. The model results reveal a significant and positive impact of perceived retailer credibility on self-efficacy (beta coefficient = 0.51; $p < 0.01$), as well as a positive and significant sequential mediation (total indirect effect = 0.44; SE = 0.12; CI [0.219, 0.678]). Therefore, all four hypotheses are fully supported.

4. Theoretical and managerial contributions

This study offers theoretical and managerial contributions. First, it complements the operational transparency literature by disclosing information about the reverse logistics processes, thus adding to the literature that has primarily focused on upstream and forward processes. Second, it contributes to the operational transparency literature by shedding light on the key mechanisms, namely retailer credibility and self-efficacy, which lead operational transparency to affect consumers' participation as suppliers in closed-loop initiatives. Third, this study advances the consumer-centric supply chain management literature by redefining consumers as suppliers within supply chain processes, thereby closing the loop. The findings offer managers actionable insights into the strategic value of operational transparency investments and their potential effectiveness in driving consumer engagement. The design of closed-loop supply chains anchored in operational transparency logic requires considerable investments and strategic choices at the company level. To be strategically effective, such investments must yield a return for companies by positively influencing and changing consumers' intentions and behaviors. The findings of this study provide guidance for retailers on how to accomplish this. Effective disclosure not only enhances consumer engagement but also plays a crucial role in building relationships with consumers, fostering the retailer's credibility, and improving consumers' self-efficacy in their personal actions.

Managing tensions towards supply chain emissions reduction: managerial cognition and organizational factors

Chiara Sguizzardi[1], Ivan Russo[2], Ilenia Confente[3]

1. Introduction

Climate change is widely regarded as one of the most pressing issues of our time, as evidenced by the increasing frequency of extreme weather events, droughts, biodiversity loss, and substantial global costs associated with infrastructure damage. Greenhouse gas (GHG) emissions, with carbon dioxide being the most common, are a primary contributor. Policymakers worldwide, along with advocacy groups like the United Nations Sustainable Development Goals and the Science Based Targets initiative, are actively working to reduce emissions and the effects of climate change (IPCC, 2023; Wieland & Creutzig, 2025). However, recent news indicates that the world is on a "catastrophic pathway" to 2.7 degrees of heating by the end of the century, with slow progress in implementation plans and in aligning near-term emissions trajectories with net-zero targets (Kaplan, 2023; UNEP, 2024).

Organizations are commonly presented as the best agents to respond to the issue of climate change, and measures to cut emissions are taking center stage within companies' environmental, social, and governance (ESG) strategies even amidst national climate policy shifts (Ellram & Tate, 2025; Velázquez Martínez et al., 2025). However, many of these corporations have also been the most significant contributors to escalating carbon emissions. Together with industry and manufacturing, sectors such as power and energy, and transportation represent over 50% of global GHG emissions (Ritchie et al., 2020; UNEP, 2024). Such sectors characterize most companies' supply chains; thus, relevant progress in tackling climate change cannot overlook the environmental impact generated outside of one focal firm.

Supply chains represent a central intervention point for solving the climate crisis, as the majority of emissions are generated here. A leading carbon disclosure system's report showed that an organization's upstream supply chain emissions were on average 26 times higher than its own emissions (CDP, 2024), while Apple reports that nearly 100% of its 2023 emissions were generated outside of Scope 1, direct emissions (Apple, 2024; Wieland & Creutzig, 2025). On average, Scope 3 emissions (defined by the GHG Protocol as indirect emissions from suppliers, transportation, product use, and all other parts of the supply chain) form up to 80% of overall emissions for most companies (McKinsey, 2024; Ellram & Tate, 2025).

Literature on supply chain Scope 3 emissions has highlighted the need to invest and innovate across multiple sectors (Zhang et al., 2024). However, the inherent challenges (e.g., unreliable data and scarce transparency, trade-offs around sustainable procurement, cost of investing in energy-efficiency and renewable resources) generate tensions among pressures to reduce the environmental impact, without compromising firm growth. We argue that these tensions may contribute to the observed low alignment of most companies' emissions pathways with the Paris targets (Cenci et al., 2023). In this study, we examine the management of such tensions by juxtaposing two levels of analysis. Specifically, we explore how organizational-level elements

[1] Researcher, ECON-06/A, University of Verona; chiara.sguizzardi@univr.it – corresponding author

[2] Full Professor, ECON-06/A, Università of Verona; ivan.russo@univr.it

[3] Associate Professor, ECON-06/A, Università of Verona; ilenia.confente@univr.it

and individual-level cognitive factors enable management of tensions, in the context of implementing a series of initiatives to decarbonize a firm's supply chain.

In understanding supply chain emissions reduction, paradox theory provides a valuable theoretical lens by investigating how organizations navigate the paradoxical tensions (Poole & Van de Ven, 1989; Smith & Lewis, 2011; Lewis & Smith, 2022) that manifest along the implementation of multiple initiatives. Previous studies investigated managerial cognitive framings, suggesting that a paradoxical framing enables decision-makers to cultivate the ability to embrace and engage contradictions (Hahn et al., 2014; Xiao et al., 2019). The extant literature, however, indicates that paradoxical framing alone does not necessarily lead to the most desirable outcome in sustainability contexts. This study addresses this gap by examining how managerial cognitive framings, paired with organizational factors, influence paradoxical tensions' perception and management during the path towards supply chain emissions reduction. We conduct a single case study (Ketokivi & Choi, 2014; Yin, 2014) of a best-in-class organization in the cosmetics and beauty industry. Building on interviews and secondary data, we conduct an analysis with a point of departure in paradox theory.

2. Conceptual background

2.1. Management of supply chain GHG emissions

Management of supply chain GHG emissions has climbed up the environmental sustainability discourse, becoming a top issue both within corporate agendas and within management academic literature. Such an increase in attention is due to increasingly frequent consequences of climate change with severe economic impacts on business activities, as well as alarming reports from climate experts (Ellram & Tate, 2025; Wieland & Creutzig, 2025). Firms are increasingly pressured to reduce GHG emissions (hereinafter referred to solely as "emissions") both by legislators and by consumers and customers. Specifically, businesses are expected to take responsibility not only for their direct emissions but also for the more complex and dispersed Scope 3 emissions arising across their supply chains (De Stefano & Montes-Sancho, 2024).

Empirical research on supply chain emissions has investigated drivers and enablers for firms to reduce Scope 3 emissions (De Stefano & Montes-Sancho, 2024; Ellram et al., 2022; Villena & Dhanorkar, 2020). On the other side, literature has shed light on barriers and common challenges (Vieira et al., 2024; Schramm & Lehner, 2024; Zhang et al., 2024). Despite the contributions made by previous studies to understand the role of supply chain management (SCM) in addressing the climate crisis, the topic has only recently started to gain traction within the discipline (Hettler & Graf-Vlachy, 2024; Wieland & Creutzig, 2025), and extant studies mainly focus on specific, narrow practices (Ellram & Tate, 2025). Given the interdependence of emissions sources, achieving emissions reduction objectives requires a combination of organizational commitment, initiatives, and investments covering vast areas of a company's internal organization and its supply chain. Against this backdrop, research shortcomings and gaps persist regarding a broader perspective on firms' approaches to managing emissions across their supply chains.

Looking at corporate action, data shows that many companies still struggle to take effective action in reducing their environmental impact across their supply chains and that the majority of emissions pathways are still misaligned with the targets set by the Paris Agreement on Climate Change (Wieland & Creutzig, 2025; Cenci et al., 2023). The lack of progress suggests that companies face substantial tensions in reconciling emissions reduction programs with other - often competing - performance demands (Cichosz et al., 2025; Wright & Nyberg, 2017) and signals limited capacity for firms to manage the emerging paradoxes in practice.

2.2. Paradox theory and coping with paradoxical tensions

Paradox as theory research explores how paradoxes are organizationally conceived of and responded to, and finds that how paradoxes are navigated has significant implications for organizational performance (Smith & Lewis, 2011). A crucial aspect of paradox theory lies in its articulation of paradoxical tensions - elements that, while individually logical, present contradictions when considered collectively (Smith & Lewis, 2011). These paradoxical tensions typically manifest as two contradictory poles, or objectives, that organizations must manage simultaneously. Previous research has identified four predominant types of paradoxical tensions: performing; belonging; organizing; and learning (Lewis & Smith, 2022). Secondly, paradox theory offers insights into management responses to tensions, either by fostering a virtuous circle of valuing both poles of a tension ("both-and" approaches), or by inducing a vicious circle that privileges only one such pole ("either-or" approaches) (Schad et al., 2016; Smith & Lewis, 2011). Such responses are influenced by managerial cognitive framings, defined as how managers interpret stakeholders' pressures and make sense of the ubiquitous tensions in sustainability (Hahn et al., 2014; Smith & Lewis, 2011; Xiao et al., 2019).

Existing studies within SCM literature on paradoxes have largely focused on identifying and describing paradoxes that arise in specific case examples (Dahlmann et al., 2023). However, to bring actual progress to the issue of reducing supply chain emissions and tackling climate change, it is necessary to take a step forward and understand how to navigate or manage such paradoxical tensions.

Attempting to achieve sustainability goals in supply chains involves multiple tensions (Montabon et al., 2016). While the adoption of the paradox perspective to managing sustainability challenges is a "relative newcomer" to SCM research (Carter et al., 2020), this theoretical lens has significantly grown in the last decade in the corporate sustainability field (Hahn et al., 2014) as well as in management and organization studies (Smith & Lewis, 2011). Previous studies integrated paradox theory in the investigation of managerial cognitive frames, proposing the existence of a business case frame and a paradoxical frame (Hahn et al., 2018). In SCM literature, research into managerial cognitive processes is still rare.

Further empirical research suggests that a paradoxical framing alone does not always produce the most desirable outcome in sustainability contexts. Rather, several researchers have emphasized that we need to pay more attention to organizational and supply chain contexts (Benkert, 2021; Wright & Nyberg, 2017; Xiao et al., 2019), specifically to contextual factors that may influence individual-level managers' cognitive frames and, in turn, decision-making in tension management (Benkert, 2021; Grewatsch & Kleindienst, 2018). There remains a significant gap in our understanding of what factors characterize firms that are effective in addressing sustainability-related tensions and that are, in turn, making meaningful progress in reducing supply chain GHG emissions. Therefore, in this study we address organizational factors that may influence the tensions that managers perceive, and how they elaborate on them in light of individual-level managerial cognitive frames. We argue that these factors shape management responses to the paradoxical tensions in a firm seeking to reduce its supply chain emissions.

3. Methodology

Our research approach is qualitative, as we aim at gaining further understanding into the interplay of organizational factors (e.g. organizational culture, leadership behaviors, decision-making guidelines) (Benkert, 2021; Grewatsch & Kleindienst, 2018) and managerial cognition factors (Hahn et al., 2014; Preuss & Fearne, 2022; Xiao et al., 2019) that characterize an organization that is successful in managing emissions-related tensions throughout its supply chain. The need for rich empirical evidence and theoretical explanation, as well as the invitation to provide actionable managerial guidance, suggested an exploratory approach for our research.

The research design was based on the recommendations of Yin (2014) and Ketokivi & Choi (2014) and closely followed previous research in logistics and SCM literature (e.g. Ellram et al.,

2022). We conduct a case study for theory elaboration (in our case, paradox theory) to enhance its explanatory power and applicability (in our case, paradoxical tensions and management responses in the context of supply chain emissions reduction). In line with previous literature (Benkert, 2021; Xiao et al., 2019), we juxtapose two levels of analysis, namely the organizational level and the individual level, as this allows exploring how factors pertaining to the organizational context and to individuals' cognition interplay for an effective reduction of supply chain emissions. We have collected 9 interviews throughout different functions (namely, board members, sustainability, logistics, procurement, R&D) at an Italian company in the beauty and cosmetics industry.

3.1. Research context

A company working in the beauty and cosmetics industry was chosen as the context of this study. The reason for this case selection was twofold: first, the company represents a best-in-class organization in terms of measuring supply chain emissions and reporting, as well as implementing initiatives by partnering and collaborating with actors throughout its supply chain. The selection responds to calls for research that engages with best-in-class organizations to understand what effective practice is (Ellram & Tate, 2025). The second motive for case selection regards the industry, which represents significant opportunities for emissions reduction due to the presence of a huge variety and types of raw materials - which frequently include chemicals, microplastics, and are characterized by complex extraction processes (Cubas et al., 2022) -, the pervasive presence of packaging, as well as intensive logistics and transportation processes related to procurement and distribution phases.

The selected organization is responsible for the formulation, production, distribution, and sales of skincare and haircare products. For anonymity, the case will be referred to as *Cosmetics*. *Cosmetics* is a multinational group headquartered in Italy, with eight international affiliates; it employs over 1.000 people globally, half of which are in Italy, where formulation and production processes are based.

3.2. Data collection

To gather data from field, we used semi-structured interviews and field observations, paired them with public information from websites, annual reports, and sustainability reports, as well as internal documents, presentations, and e-mails. Participants involved in the research are identified based on theoretical sampling guidelines, in conjunction with snowball effect techniques (Bryman & Bell, 2022). The interview protocol invites managers within different functions (namely, top management team member, sustainability, logistics, and R&D functions) in the organization, to grasp how individuals perceive, recognize and make sense of paradoxical tensions – also in light of how they perceive the organizational context - and how, in turn, they respond, manage or navigate potential contradictions related to reducing the environmental impact of the overall organization while reconciling their functions' objectives.

Participants were selected based on a set of criteria: key involvement in their firm's sustainability initiatives, sufficient knowledge of logistics and SCM issues, and representation of different roles and levels of responsibility within the company's organizational structure. Lastly, in a few cases, the initial interviews made it clear that we needed additional data; therefore, additional respondents were invited for further interviews. Details regarding key informants are provided in Table 1. A total of 9 semi-structured interviews – lasting between 45 and 90 minutes - have been collected, electronically recorded with participants' permission, and transcribed. Most interviews are collected online, and, for interviews collected on site, the facility tour became part of the data collection effort. Finally, to complement available information, we combine these primary sources of evidence with notes taken during the meetings and additional secondary data.

This design allowed the researcher to capitalize on triangulation, combining different types of data from multiple sources (Pagell & Wu, 2009).

#	Interviewee's role	Function	Experience	Years in the firm
1.	Procurement and Purchasing Director	Procurement and purchasing	27	10
2.	Procurement and Purchasing Manager	Procurement and purchasing	10	7
3.	Corporate Packaging Research Development and Innovation Manager	R&D	20	18
4.	LCA and Product Sustainability Specialist	R&D	9	9
5.	Sustainability Operations Project Specialist	Sustainability	5	2
6.	Sustainability Advocacy Specialist	Sustainability	3	3
7.	Internal Logistics Manager	Logistics	32	29
8.	Head of Logistics, Inventory, Traceability, Sales Operations Processes	Logistics	12	11
9.	External Consultant and Board Member	Board	36	21

Table 1. Interview participants' overview

The interview protocol consisted of two parts: one explored the interviewees' role within the organization, individual-level values, and the priority they assigned to environmental issues in respect to other business issues, and whether they perceived tensions and how they reacted to these. The second part involved organizational-level questions about actions the organization had taken to reduce supply chain emissions, leadership behaviors and decision-making guidelines, and the perception of tensions emerging among different functions in the firm or actors in the supply chain. Finally, each interviewee was asked to think of one shift in practices or strategies that could speed up their process towards the net-zero goal. A more detailed version of the interview guide is provided in Appendix A. To guide the number of interviews included in this study, we followed two criteria: first, we aimed to include relevant informants; secondly, we stopped data collection as we were not gaining additional insights (i.e., theoretical saturation).

3.3. Data analysis

All interviews were initially conducted in Italian, because the study was conducted in Italy; therefore, after the transcription process, the interview transcripts were translated into English. A colleague who is fluent in both Italian and English then double-checked the correctness. During data analysis, we followed the steps suggested by Gioia et al. (2013): the analysis phase started with first-order coding of meaningful concepts from each interview and was facilitated by the software NVivo. Examples of quotes are displayed in the next section, accompanied by the interviewee's role and interview number in parentheses. Second-order themes were then derived by connecting various first-order themes. Lastly, the researchers looked for patterns across interviews to group themes into broader aggregate categories.

4. Findings

In the following section, we present an account of organizational factors that characterize organizations that are effective in reducing their supply chain emissions and how such factors influence managers' perception of sustainability-related tensions. Then, we describe how managerial cognitive frames shape managers' responses to paradoxical tensions surrounding supply chain emissions reduction goals.

4.1. Organizational culture, leadership behaviors, and decision-making guidelines

Across all interviews, sustainability emerged as a foundational element of the case-company's organizational culture. Interviewees repeatedly described sustainability as "part of who we are" and as a shared identity that guides everyday decisions. This cultural orientation was seen as the outcome of a long process of internal socialization, which first started with the development of an ethics chart for the firm and was later substantiated with the decision to apply for the B Corp certification. Such certification was obtained in 2016 and renewed in 2023.

Leadership behavior was widely recognized as a critical driver of the company's sustainability trajectory. Respondents highlighted the consistent and visible commitment of the top management team, both in how corporate leaders linked sustainability to the firm's long-term strategy and in how they took part in periodic meetings with different functions regarding the topic. In 2023, the company launched its long-term development strategy based on four pillars: decarbonization, circular economy, biodiversity, and water. Cosmetics, however, also aims at reaching half a billion euros in revenue within the next five years. As noted by an interviewee, the goals of reducing supply chain emissions and of growing steadily generate tensions. Leadership, therefore, plays a dual role: on one side, it sets growing directions and, on the other, it embodies sustainability through daily behaviors and periodic statements.

Cosmetics has also codified sustainability principles into formal decision-making guidelines and measuring tools, transforming commitments into measurable processes. Procurement and R&D for product and packaging provide the clearest examples of this institutionalization. Managers described a structured approach in which sustainability is systematically evaluated through predefined criteria and quantitative metrics.

4.2. Managerial cognition and responses to paradoxical tensions

Across the interviews, managers at *Cosmetics* displayed different approaches through which they made sense of sustainability and the tensions surrounding supply chain emissions reduction. While all respondents recognized value in the company's sustainability orientation, they differed in which tensions they perceived and how, as well as in the way they acted upon them.

A first group of managers displayed a more pragmatic orientation towards sustainability, emphasizing win-win conditions of cost efficiency and environmental impact reduction, or highlighting situations where they adopted an "either-or" approach, dismissing sustainability indicators in favor of cost KPIs or service level KPIs. These individuals perceive sustainability as strategically valuable but economically contingent; they legitimize it as long as it remains aligned with financial and operational performance. Examples of this framing can be found in the Procurement and Purchasing team as well as in the Supply Chain & Logistics function. We interpret this as an "either–or" response to paradoxical tensions, shaped by situational flexibility. Similarly, the logistics function faces tensions between environmental impact and costs, service level, as well as technological and infrastructure availability. To balance tensions between service level, costs, and environmental impact, also in light of available solutions and infrastructure, dedicated deliveries in the area surrounding the company's headquarters have been implemented. A few initiatives, on the other hand, are not progressing due to a lack of agreement between logistics and commercial functions: to expand the area of deliveries performed with electric vehicles, a renegotiation of service KPIs would be needed, as the autonomy of these vehicles

would not guarantee the current service level. At this point, commercial departments have not decided yet whether to penalize the service lever; therefore, this type of emissions reduction initiative in the logistics field remains hard to scale in broader geographical areas. Beyond transport and route optimization, both logistics professionals framed sustainability as an issue requiring visibility across the entire supply chain. The logistics department remains grounded in efficiency and process optimization, and among interviewees, it appears to be the function that experiences tensions among competing demands the most.

A second group of managers viewed sustainability goals and business performance as interdependent elements of the same system. These interviewees could rationalize the competing demands they were exposed to in their different roles, and frame the multiple sides of a paradox as mutually reinforcing and inherently complex. In this cognitive, unintentional process, managers frequently mentioned the support of the large adoption of technical and scientific tools and metrics, as well as their backgrounds. This orientation was mostly visible among R&D and Sustainability professionals, who frequently described sustainability as an analytical problem that required understanding multiple, interconnected variables.

Most managers in this group also described personal values as deeply aligned with the firm's mission. A strong identification reinforced their resilience toward contradictions, as sustainability and the reduction of environmental impact are not simply a task but an expression of personal and professional coherence.

To sum up preliminary findings, Table 2 highlights organizational-level elements and individual-level cognitive factors that shape management responses to paradoxical tensions and reports some exemplary quotes.

Factors contributing to management responses to paradoxical tensions		**Exemplary quotes**
Organizational-level factors	Strong leadership commitment to sustainability issues	Our leadership has always made it clear that we are a company with a purpose - not to be the best in the world, but to be the best for the world. (#3) The meaning of the company is its missions, to create a good life for all through beauty, ethics and sustainability. The product and everything else are tools. (#9)
	Adequate allocation of resources	In the majority of situations, Cosmetics prefers a supplier that is more expensive but more sustainable. (#2) As a company, we have a target of reducing by 55% our emissions by 2030. To do so, we support other functions with our technical and normative knowledge in defining what initiatives they can undertake and we accompany them in the implementation. (#5)
	Decision-making guidelines based on objective measurement	We have a platform that allows us to measure our suppliers' sustainability. This criterion weights 20% of our evaluation and it is balanced with reliability and quality. Other conditions being equal, we always prefer the supplier with the highest sustainability score, or the B Corp supplier over non certified one. (#2) We have published a sustainability strategy based on decarbonization, circularity, biodiversity and water. We have set objective targets that guide our investments and growth strategy. (#9)
Managerial cognition	Paradoxical cognition allows framing paradoxical tensions as poles to be integrated	I realized sustainability has to be based on functionality and data. You can't make something ultra-light and fantastic if it breaks and becomes waste. (#3) I explain to suppliers that this [implement initiatives to reduce emissions, track progress and report] is a journey

	rather than conflicting values	they have to do […] because it brings value to their firm. (#2)
	Paradoxical cognition in intra-organizational tensions management	At the beginning, it was my opinion against someone else's; now, with numbers and evidence, discussions are much more constructive and colleagues from other functions […] understand our point more easily. (#3)
	Paradoxical cognition and supply chain positive spillover	When I need to transfer to our suppliers the concept of having a good impact on the environment, I do not struggle at all. Assimilating this way of thinking helped me so much in my professional and personal growth; it is something I deeply feel and believe in, and it seems so obvious to share it with suppliers. (#1) In our last meeting, I asked to our main transport provider to have an electric truck on the route they cover for us daily. They have realized that we are activating all sorts of [more sustainable] alternative suppliers and solutions and finally they agreed to further investigate this idea. (#8)

Table 2. Factors enabling tensions management

5. Discussion

This study aims to explore how managers within different functions, as key actors in firm and supply chain sustainability (Preuss & Fearne, 2022), perceive, make sense of, and respond to tensions between indicators of cost, service, quality, and environmental impact in their daily operations. Moreover, as suggested by earlier investigations (Benkert, 2021; Xiao et al., 2019), organizational factors, were also investigated to clarify whether and how organizational elements influenced individual managers' perception of such tensions. By combining insights from paradox theory with qualitative data tackling two levels of analysis, initial findings show that managers do not simply react to competing demands by attaining either cost, performance, or sustainability; rather, they interpret and frame competing demands in light of organizational orientation and manage emerging tensions accordingly. A paradox perspective allows for a greater understanding of how tensions, which can hardly be removed in the sustainability context, can be managed to integrate supply chain emissions reduction goals with other – more traditional - business aims.

6. Limitations and future research

This research presents some limitations. First, the study assesses a single organization that is a leader in setting sustainability targets and implementing related strategies. Thus, due to a limited number of interviews, results may not be generalizable to other industry settings. Secondly, this research does not directly assess upstream suppliers' perspectives on the issue of supply chain emissions reduction, which represents a significant limitation in the analysis of Scope 3 emissions.

Keywords: Sustainable supply chain management; decarbonization; paradox theory; cognitive frames; organizational frames; case research

L'effetto di Lean Production e Industria 4.0 sulle performance operative d'impresa: evidenze da uno studio sul campo

Valeria Belvedere[1], Alberto Grando[2], Viviana D'Angelo[3], Andrea Chiarini[4]

1. Introduzione

Per migliorare costantemente le prestazioni operative di tempo, costo, qualità e flessibilità, le imprese industriali nel tempo hanno sperimentato numerose soluzioni organizzative e tecnologiche in grado di incidere favorevolmente sulle performance produttive e logistiche (Abdelilah, El Korchi, and Balambo 2018; Shekarian, Reza Nooraie, and Parast 2020). Uno dei paradigmi organizzativi più celebri e diffusi è rappresentato dalla Lean Production (LP), le cui origini risalgono alle prime esperienze maturate in Giappone presso Toyota a partire dagli anni '50 del secolo scorso (Womack, Jones, and Roos 1990). La LP ha trovato ampio consenso e diffusione in quanto consente di eliminare (o quanto meno ridurre) i cosiddetti "sprechi" dei processi di produzione, ovvero quelle inefficienze che limitano l'efficacia e l'efficienza delle operations aziendali (Shah and Ward 2003).

Più di recente nuove tecnologie, note come Industria 4.0 (I4.0) (Kagermann, Wahlster, and Helbig 2013), hanno cominciato a diffondersi nell'industria determinando lo sviluppo di sistemi cyberfisici che connettono oggetti, impianti e operatori, offrendo significativi benefici operativi (Zangiacomi et al., 2020). Alcuni recenti contributi hanno ipotizzato che nei contesti produttivi lean le soluzioni I4.0 possano essere adottate in modo più efficacie grazie alla migliore organizzazione e linearità dei processi produttivi (Rossini et al. 2019; Tortorella and Fettermann 2018). Ciò porta a ritenere che l'adozione congiunta di questi due paradigmi possa ulteriormente potenziare i benefici legati all'uso delle nuove tecnologie (Rosin et al. 2020; Rossini et al. 2022; Chiarini and Kumar 2021).

Tuttavia, nonostante l'apparente coerenza di fondo tra LP e I4.0, la loro implementazione congiunta potrebbe in realtà generare esiti sfavorevoli (Agostini and Filippini 2019; Azadegan et al. 2013). Infatti, la LP è fortemente orientata alla valorizzazione del personale di fabbrica, al contrario I4.0 promuove l'automazione (De Treville and Antonakis 2006; Pun, Chin, and Gill 2001). Alcuni contributi hanno, infatti, dimostrato che l'effetto sinergico tra LP e I4.0 si riscontra solo a fronte di specifiche condizioni (Bhatia and Kumar 2022; Jang, Chung, and Son 2022; Saxby, Cano-Kourouklis, and Viza 2020) o riguarda solo alcune specifiche dimensioni prestazionali (Ding, Ferràs Hernández, and Agell Janè. Nùria 2023; Pozzi, Rossi, and Secchi 2023; De Giovanni, Belvedere, and Grando 2024).

2. Obiettivi e metodologia

Questo studio intende approfondire la relazione tra LP e I4.0, allo scopo di comprendere: 1) se e in che misura LP e I4.0 influiscono sulle prestazioni produttive; 2) se l'interazione tra i due paradigmi determina effetti sfavorevoli sulle prestazioni produttive.

L'indagine empirica è stata condotta attraverso una survey su un campione di stabilimenti localizzati in Italia (Forza, 2002), identificati attraverso gruppi tematici sui temi LP e I4.0 attivi su LinkedIn o presso centri di ricerca. Complessivamente sono stati inviati a partecipare all'indagine circa 700 stabilimenti e sono stati raccolti 189 questionari utilizzabili, con un tasso di risposta del 27%.

Il questionario è stato sviluppato partendo dal lavoro di Tortorella e Fettermann (2018). Il costrutto "Lean Production" è stato misurato attraverso 41 affermazioni valutabili in scala di Likert da 1 a 5 e relative alle pratiche più diffuse della LP, come proposto da Shah and Ward (2007). Il costrutto "Industria 4.0" è stato quantificato attraverso 9 item proposti da Tortorella and Fettermann (2018), che riguardano le principali soluzioni I4.0, ovvero: Internet of Things (IoT), Cloud Computing, Cybersecurity, Big Data and Analytics, Simulazioni, Integrazione orizzontale e verticale, Additive Manufacturing (3D Printing), Advanced Manufacturing Solutions e Realtà Aumentata.

Il costrutto "Prestazione operativa" è stato misurato attraverso 7 item relativi alle principali prestazioni delle operations, ovvero: produttività, servizio logistico, scorte, sicurezza, qualità, flessibilità, sostenibilità. I primi cinque item sono basati su Tortorella and Fettermann (2018); gli ultimi due sono stati aggiunti in ragione della recente rilevanza di queste dimensioni prestazionali.

Sono state, inoltre, utilizzate le seguenti variabili di controllo: dimensione aziendale, durata di implementazione di LP (maggiore o minore di due anni), natura del processo produttivo (ripetitivo/non ripetitivo; discreto o continuo), localizzazione degli stabilimenti dell'azienda (solo in Italia o anche all'estero), localizzazione dell'headquarter (Italia o estero).

I dati raccolti sono stati analizzati attraverso una regressione gerarchica su otto diverse variabili dipendenti (Hair et al. 2014). Nella prima, la variabile dipendente è "Prestazione operativa". Le altre riguardano ciascun singolo attributo prestazionale identificato nel questionario. Il Modello 1 considera esclusivamente le variabili di controllo, ovvero:

- Dimensione aziendale ("Dimensione", dove 1 è <50 dipendenti; 2 è 50-250 dipendenti; 3 è >250 dipendenti);
- Durata di implementazione di LP ("LPexp", dove 1 è > 2 anni; 0 è < 2 anni);
- Localizzazione degli stabilimenti ("PlantLoc", dove 1 indica stabilimenti in Italia e all'estero, 0 solo in Italia);
- Localizzazione dell'headquarter ("HQLoc", dove 1 indica HQ all'estero, 0 indica HQ in Italia);
- Produzione ripetitiva/non ripetitiva ("RepPP", dove 1 indica ripetitiva, 0 non ripetitiva);
- Produzione discreta/continua ("ConPP", dove 1 indica continua, 0 indica discreta).

Nel Modello 2 si aggiungono i seguenti predittori:

- Implementazione di Lean production ("LP")
- Grado di adozione di Industria 4.0 ("TEC")

Il Modello 3 aggiunge anche l'effetto di interazione:

- Interazione tra LP e TEC (LP*TEC)

3. Risultati

Tabella 2b. Regressione sulle singole dimensioni prestazionali

Come si può notare nella Tabella 1, la regressione su "Prestazione operativa" evidenzia che la lunghezza di implementazione di LP è l'unica variabile di controllo statisticamente significativa in tutti i Modelli. Inoltre, concentrando l'analisi sui Modelli 2 e 3, LP dimostra di essere un driver rilevante, caratterizzato da coefficienti di regressioni positivi. Al contrario TEC e LP*TEC non sono significativi.

Tuttavia, osservando i risultati delle regressioni nelle Tabelle 2a e 2b, relativi alle singole dimensioni prestazionali delle operations, si osservano evidenze interessanti. È confermato il ruolo significativo della lunghezza di implementazione di LP nell'influenzare molte delle prestazioni operative. Al contrario, le altre variabili di controllo hanno un rilievo molto più circoscritto. Inoltre, LP si conferma essere un predittore statisticamente significativo per tutti i profili prestazionali, mentre TEC è rilevante per 5 su 7 almeno in un Modello. In tutti i casi, i coefficienti di regressioni sono positivi, dimostrando un effetto favorevole di LP e TEC sulle prestazioni operative. Infine, l'interazione tra LP e TEC è statisticamente significativa solo per Qualità, dove assume valore negativo.

Considerando la rilevanza della lunghezza di implementazione di LP nello spiegare il fenomeno in esame, è stata condotta anche una regressione sul sottocampione di stabilimenti che adottano LP da oltre due anni (116 osservazioni), utilizzando esclusivamente LP e TEC come variabili indipendenti.

	Prestaz. operativa	**Produttività**	**Servizio logistico**	**Scorte**	**Sicurezza**	**Qualità**	**Flessibilità**	**Sostenibilità**
TEC	**2,470****	**1,294****	**,870***	,080	**1,029***	**1,159****	**,949***	,136
LP	**3,533*****	**,746****	**,763****	,471	**,680****	**,970****	**,770****	,240
LP*TEC	**-2,296****	**-1,522****	-,970	-,273	-1,180	**-1,600****	-1,131	-,171
R-squared	,242***	,094**	,212***	,105***	,107***	,121***	,148***	,030ns

** significativo al 10%; ** 5%; *** 1%*

Tabella 3. Regressione sulle singole dimensioni prestazionali per stabilimenti con implementazione di LP maggiore di 2 anni

Come si vede nella Tabella 3, tutte le regressioni hanno un R quadro significativo, con l'unica eccezione di Sostenibilità. Inoltre, LP e TEC sono predittori significativi non solo per Prestazione operativa, ma anche per tutte le singole dimensioni prestazionali, con l'eccezione di Scorte e Sostenibilità. Tuttavia, per Prestazione operativa, Produttività e Qualità l'interazione tra LP e TEC è significativa e negativa, dimostrando che l'intensificarsi di LP determina una minore efficacia di TEC.

Per approfondire la comprensione di questa evidenza, è stata condotta un'analisi su due sottocampioni di stabilimenti, uno con implementazione di LP sopra la media (HLP), l'altro con implementazione di LP sotto la media (LLP). I risultati sono rappresentati in Figura 1, dove Prestazione operativa è messa in relazione a TEC per ciascuno dei due sotto campioni.

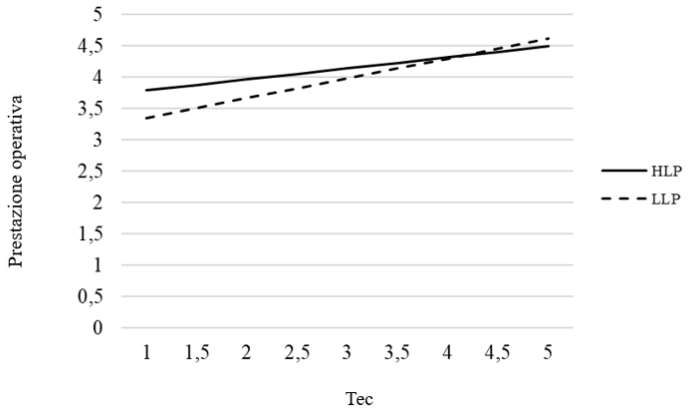

Figura 1. Relazione tra Prestazione operativa e TEC

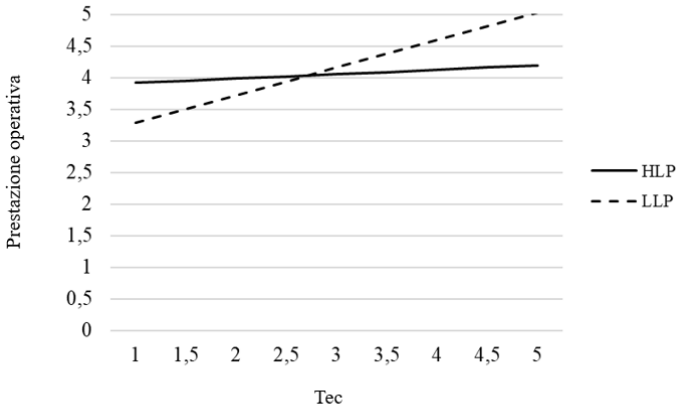

Figura 2. Relazione tra Prestazione operativa e TEC (LP > 2 anni)

Nella Figura 1, per elevati livelli di TEC gli stabilimenti del gruppo LLP beneficiano di una prestazione superiore.

La stessa analisi è stata replicata sui soli stabilimenti caratterizzati da una lunghezza di implementazione di LP superiore a due anni. La Figura 2 descrive le evidenze.

Come si può notare, il fenomeno già descritto nella Figura 1 è ancora più accentuato nella Figura 2. Infatti, la differenza di inclinazione delle due rette è chiaramente maggiore nella Figura 2. Inoltre, il punto di intersezione tra le due rette si colloca su un valore più basso di TEC rispetto alla Figura 1, evidenziando che l'interazione con LP può ridurre l'efficacia di I4.0 persino a fronte di un moderato sforzo di adozione delle nuove tecnologie.

4. Conclusioni

Questo paper, che rappresenta nello stato attuale un work in progress, contribuisce al dibattito sulla relazione tra I4.0 e LP. I risultati dimostrano che sia LP sia I4.0 possono contribuire a migliorare le prestazioni operative. Tuttavia, si dimostra anche che, in contesti caratterizzati da una lunga ed intesa adozione di LP, l'efficacia di I4.0 risulta attenuata. Queste evidenze offrono un contributo nuovo agli studi accademici su questo fenomeno e, nella prospettiva del management, evidenziano un elemento di criticità su cui è necessario soffermarsi prima di varare programmi di adozione di I4.0 in stabilimenti lean.

Selezione Strategica Dei Fornitori e Mitigazione del Rischio Mafioso: L'Innovazione dei Processi Aziendali Mediata dall'Intelligenza Artificiale

Marco Salemi[1], Rodolfo Damiano[2], Salvatore Cincimino[3]

1. Introduzione

L'avvento dell'Intelligenza Artificiale (IA) e, più in generale, della moderna trasformazione digitale ha alimentato un crescente interesse scientifico nei confronti del Business Process Management (BPM) (Cronemyr et al., 2025; Moreira & Dallavalle, 2025; Szelągowski & Berniak-Woźny, 2024). Crescente enfasi è stata conseguentemente attribuita alla Business Process Technology (BPT), intesa come l'infrastruttura tecnologica attraverso cui le organizzazioni integrano decisioni data-driven di natura predittiva e automatizzata nei propri processi operativi (Draheim, 2010; Iden et al., 2025; Van Looy, 2021). Alla luce della marcata volatilità, incertezza e vulnerabilità che connotano l'odierno ambiente d'impresa (Cavusgil et al., 2020; Manuj & Mentzer, 2008; Simangunsong et al., 2012), l'architettura strategica della BPT può configurarsi come un abilitatore cruciale di capacità organizzative avanzate per l'identificazione e la gestione dei rischi aziendali (Slagmulder & Devoldere, 2018; Muehlen & Ho, 2005; Röglinger et al., 2022; Thabet et al., 2021). Fra i processi più rilevanti che la BPT può supportare, la selezione dei fornitori riveste un ruolo decisivo nel garantire la continuità operativa, la reputazione e la redditività delle imprese (Kull et al., 2014; Wagner & Bode, 2008; Wissuwa et al., 2022; Riedl et al., 2013; Roehrich et al., 2014; Zhang et al., 2024). Studi recenti hanno evidenziato come le tecnologie basate sull'IA possano accrescere efficienza, agilità, capacità di gestione del rischio e resilienza delle catene di fornitura (Lu et al., 2025; Modgil et al., 2022; Singh et al., 2024; Yang et al., 2023; Uren & Edwards, 2023). Tuttavia, queste tecnologie pongono sfide rilevanti per gli utilizzatori umani, sia per la loro intrinseca complessità e la conseguente carenza di competenze specifiche (Cannas et al., 2024; Dey et al., 2024), sia per la natura opaca e difficilmente intelligibile dei risultati prodotti (Brintrup et al., 2024; Sadeghi et al., 2024), oltre che per le preoccupazioni concernenti la gestione dei dati sensibili, la cybersicurezza e i profili collaterali di rischio (Cheung et al., 2021; Nozari et al., 2022). In questo alveo di riflessione, lo studio indirizza lo sguardo verso un'area di criticità dai riflessi globali che, anche a fronte della sua pervasività, riscuote una sempre più marcata, per quanto recente, attenzione in dottrina manageriale: l'infiltrazione della criminalità organizzata (CO) nell'economia legale tramite le strutture societarie legali (Cincimino et al., 2024; 2025). Questo fenomeno rappresenta una minaccia di elevato profilo per le imprese legittime (IL) e pone una sfida complessa all'integrità dei protocolli di selezione dei fornitori (Marelli et al., 2020; Savona & Berlusconi, 2015; Savona & Riccardi, 2015; 2018). L'instaurazione di relazioni d'affari con controparti criminali determina infatti l'esposizione a rischi multidimensionali che possono generare derive distorsive e profondi nocumenti economico-sociali, fino a pregiudicare la stessa continuità aziendale (Champeyrache, 2014; 2018). Alla luce di tali sfide, congiuntamente ai progressi

[1] Dottorando di ricerca, ECON-06/A, Università degli Studi di Palermo; marco.salemi01@unipa.it – corresponding author

[2] Ricercatore, ECON-06/A, Università degli Studi di Palermo; rodolfo.damiano@unipa.it

[3] Professore associato, ECON-06/A, Università degli Studi di Palermo; salvatore.cincimino@unipa.it

tecnologici che accompagnano l'integrazione dell'IA nei processi aziendali (Abbasi et al., 2025; Baryannis et al., 2019; Jackson et al., 2024; Sharma et al., 2022), il presente lavoro pone il seguente interrogativo di ricerca: come percepiscono i supply chain manager l'integrazione dell'IA nei processi decisionali finalizzati alla mitigazione del rischio di instaurare relazioni commerciali con controparti criminali?

Al fine di rispondere a tale interrogativo, lo studio ha preliminarmente individuato, nell'ambito del mercato dei servizi rivolti alle imprese, una soluzione tecnologica di recente sviluppo basata sull'IA che, per quanto a conoscenza degli autori, presenta caratteri di marcata originalità nel panorama degli strumenti commercialmente disponibili a supporto della prevenzione aziendale del rischio di instaurare relazioni con controparti criminali. In coerenza con tale scelta empirica, lo studio adotterà un disegno di ricerca esplorativo fondato su uno studio di casi multipli (Eisenhardt, 1989; Eisenhardt & Graebner, 2007). Questo approccio consentirà di comprendere le ragioni e le modalità attraverso cui la tecnologia innovativa è stata implementata nei processi aziendali di selezione e monitoraggio dei fornitori in molteplici realtà aziendali, nonché di analizzare come essa venga percepita dai componenti delle unità organizzative deputate alla supply chain security all'atto della sua integrazione nelle ordinarie routine decisionali aziendali.

La fase propedeutica all'indagine sul campo ha previsto un'intervista semi-strutturata in profondità allo sviluppatore e fondatore dello strumento tecnologico. Nel presente contributo congressuale sono specificamente trattati gli esiti di tale intervista, che, sottoposti a un'analisi tematica riflessiva (Braun & Clarke, 2019; 2021), hanno permesso di decodificare la genesi, le finalità e l'architettura analitica della tecnologia. L'elaborazione preliminare delle evidenze raccolte attraverso l'intervista ha permesso di enucleare quattro pilastri concettuali destinati a orientare il futuro protocollo di ricerca: la proiezione etica dello strumento tecnologico quale "anticorpo sociale" contro l'illegalità, un'innovativa "chirurgia" di precisione volta a minimizzare gli errori, il potenziamento cognitivo del decision-making umano in antitesi alla sostituzione algoritmica e, infine, la creazione di un forte "scudo di rete" a tutela della continuità operativa aziendale. Il prosieguo dell'indagine si sostanzierà nella conduzione di focus group (Greenbaum, 1998; Krueger, 1997a; 1997b; 2014) presso imprese che hanno adottato la soluzione tecnologica individuata, eterogenee per dimensione e comparto economico, al fine di vagliare la tenuta della visione teleologica del fondatore alla prova delle prassi operative e intercettare eventuali disallineamenti nel rapporto uomo-macchina. Lo studio intende così accertare se l'integrazione della BPT agisca quale leva per la ricalibrazione della percezione manageriale del rischio, identificando al contempo le determinanti di una corretta postura proattiva e data-driven nei processi decisionali osservati. Sotto il profilo dottrinale, il contributo si snoda lungo una triplice direttrice volta ad ampliare il paradigma della BPT, estendere la letteratura sulla supplier selection e corroborare gli studi sulla resilienza delle IL alle infiltrazioni della CO nelle catene di fornitura globali. L'indagine offre anche importanti implicazioni operative, evidenziando l'efficacia della due diligence algoritmica nel convertire rischi opachi in variabili governabili, elevando la selezione dei fornitori a leva reputazionale dinamica e virtuosa.

2. Letteratura di Riferimento

2.1. Gestione dei processi aziendali, tecnologia e avanzamento dell'IA

La dottrina contemporanea ravvisa nella sinergica orchestrazione tra fattore umano e risorse tecnologiche innovative il fondamento per garantire l'efficienza di lungo periodo dei processi aziendali (Bresciani et al., 2025; Iden et al., 2025; Moreira & Dallavalle, 2025; Szelągowski & Berniak-Woźny, 2024). Al di là del mero affinamento operativo, la letteratura mostra come il BPM sia in grado di riorientare le organizzazioni riconfigurandone le posture da reattive ad anticipatorie e proattive, nelle quali la visibilità informativa in tempo reale e il supporto decisionale algoritmico contribuiscono congiuntamente a irrobustire la continuità operativa e il

rinnovamento strategico (Klun & Trkman, 2018; Zelt et al., 2018). In tale riconfigurazione, la BPT si presenta simultaneamente come esito e come abilitatore della trasformazione digitale del BPM, inscrivendosi in una relazione simbiotica e sinergica nella quale il BPM definisce la visione strategica dei processi e i canoni metodologici di eccellenza, mentre la BPT fornisce le infrastrutture tecnologiche attraverso cui tali principi vengono concretizzati, scalati e sostenuti in contesti organizzativi complessi (Draheim, 2010; Grover & Kettinger, 1995; Kirchmer, 2017; Vom Brocke & Mendling, 2018). Nel configurarsi come disciplina olistica (Dumas et al., 2018), il BPM ha elevato la tecnologia da fattore ausiliario a pilastro costitutivo del successo aziendale (Beverungen et al., 2020; Kerpedzhiev et al., 2021). La corrente dottrinale sul BPM indica che l'efficacia operativa possa essere ottenuta per mezzo della capacità delle tecnologie informative di innervare l'intero ciclo di vita dei processi aziendali, dall'ideazione sino al miglioramento continuo (Rahimi et al., 2016; Trkman, 2010; Ozkan et al., 2024; Weinzierl et al., 2024). L'avvento dell'IA ha ulteriormente catalizzato il passaggio verso flussi di lavoro cognitivi e predittivi capaci di innescare all'interno delle imprese cicli autonomi di ottimizzazione (Abbasi et al., 2025; Dumas et al., 2023; Caruso et al., 2023; Dwivedi et al., 2021), con implicazioni profonde nei processi decisionali multi-criteriali, come la selezione dei fornitori (Alikhani et al., 2019; Bak, 2018; De Boer et al., 2001; De Assis Santos & Marques, 2022; Chai et al., 2013; Kilubi, 2016a; 2016b; Sodhi et al., 2012), così da garantire un posizionamento competitivo dinamico e prospero nei mercati attuali (Chai & Krause, 2006; Cousins & Spekman, 2003; Li et al., 2006).

2.2. La tecnologia nei processi di selezione dei fornitori

La letteratura manageriale contemporanea conferisce ai processi di selezione dei fornitori la valenza di imperativi strategici, riconoscendone l'incidenza determinante sulla sostenibilità organizzativa di lungo periodo (Araz & Ozkarahan, 2007; Borges de Araújo et al., 2015; Dekker et al., 2013). Le più recenti traiettorie d'indagine scientifica postulano l'adozione di architetture decisionali ibride e multicriterio, capaci di sintetizzare dimensioni prestazionali eterogenee quali la qualità, la reattività operativa, la solidità patrimoniale e, con crescente enfasi, la gestione del rischio[4] (Abdulla & Baryannis, 2024; Chai et al., 2013). In tale prospettiva, si consolida la consapevolezza che la stima dell'affidabilità dei fornitori derivi da un processo sistemico fondato sulla necessaria convergenza di metriche quantitative e qualitative eterogenee (Ho et al., 2010; 2015). L'affinamento dei paradigmi valutativi ha generato la possibilità di valutare le capacità di resilienza dei partner (Hosseini & Barker, 2016; Rajesh & Ravi, 2015), promuovendo lo sviluppo di quadri decisionali olistici idonei a governare la complessità selettiva insita negli scenari dinamici e transnazionali (Harland et al., 2003; Manuj & Mentzer, 2008). Questa evoluzione, rafforzata dai recenti shock delle supply chain e dalla crescente consapevolezza delle loro

[4] Superando il paradigma dell'ottimizzazione dei costi, l'attuale dottrina privilegia l'analisi di proxy operative — quali tassi di difettosità, varianza nei lead time, vincoli capacitivi e flessibilità di volume — per inferire la resilienza strutturale del partner (Hallikas et al., 2005; Hosseini & Barker, 2016; Yoon et al., 2018). A tale quadro quantitativo si integrano valutazioni qualitative sull'assetto manageriale e sulla capacità tecnologica, quali indicatori di reattività e potenziale innovativo (Wu & Barnes, 2011), unitamente a parametri di stabilità finanziaria e compliance normativa ponderati algoritmicamente per preservare la continuità aziendale (Kull & Talluri, 2008). In siffatto scenario, l'esame delle metriche storiche abilita stime predittive cruciali per la mitigazione proattiva di minacce operative e reputazionali (Bruno et al., 2012; Cheng et al., 2020; Choudhary et al., 2023; Gernert et al., 2023; Islam et al., 2021; Ma & Li, 2024; Wu, 2009). Parallelamente, l'avanzamento interdisciplinare attesta l'efficacia di tecniche statistiche applicate a fonti testuali eterogenee — dai bilanci di esercizio ai social media — nella prevenzione di frodi e dissesti finanziari (Akhtar et al., 2023; Jim et al., 2024; Kosasih et al., 2024; Li et al., 2023a; 2023b; Lokanan & Maddhesia, 2025; Sadeek & Hanaoka, 2023).

vulnerabilità (Craighead et al., 2007), ha spinto le imprese a includere la resilienza e il profilo di rischio dei fornitori tra i criteri centrali della propria cultura aziendale (Gebhardt et al., 2022; Hosseini et al., 2019; Schoenherr et al., 2023; Wissuwa et al., 2022). In questo contesto, una BPT all'avanguardia può fungere da architettura di sintesi per flussi informativi variegati, permettendo di raggiungere capacità gestionali superiori (Acitelli et al., 2025; Caputo et al., 2019; Fettke & Di Francescomarino, 2025; Kang & Bhawna, 2025). La letteratura recente evidenzia, infatti, come i benefici derivanti dai processi di digitalizzazione (Perano et al., 2023), trovino un fondamentale e ulteriore potenziamento nell'integrazione di tecnologie basate sull'IA (Baryannis et al., 2019; Kagalwala et al., 2025). L'innesto di tali soluzioni agisce quale catalizzatore per l'efficienza decisionale e la reattività aziendale (Spreitzenbarth et al., 2024), favorendo una migliore gestione olistica dell'intero ciclo di vita dei partner commerciali (Chai & Ngai, 2015; Ganesh & Kalpana, 2022; Helo & Hao, 2022; Gunasekaran et al., 2017; Toorajipour et al., 2021; Zamani et al., 2023). Tuttavia, emergono dilemmi etici profondi nell'utilizzo dell'IA concernenti trasparenza, equità e responsabilità delle decisioni autonome, oltre al rischio di un'eccessiva dipendenza umana da sistemi che restano suscettibili di errore (Hendriksen, 2023).

Persistono, inoltre, preoccupazioni sostanziali riguardo all'opacità algoritmica, alla possibile amplificazione di bias discriminatori e all'eccessiva dipendenza tecnologica (Bauer & Gill, 2024; Berente et al., 2021; Fernández-Loría et al., 2022; Richey et al., 2023; Wang et al., 2023). La letteratura documenta altresì il rischio che pregiudizi cognitivi umani preesistenti vengano codificati e amplificati dai modelli di calcolo, perpetuando iniquità sistemiche nei processi di selezione (Hu et al., 2025). Ne deriva l'urgenza di ricercare un adeguato bilanciamento che eviti l'erosione del capitale umano e delle capacità distintive (Raisch & Krakowski, 2021). Al fine di garantire relazioni d'affari affidabili e durature (Lau et al., 2018; Luo et al., 2009; Kannan & Tan, 2002; Garfamy, 2009; Sarkis & Talluri, 2002; Spekman, 1988; Taherdoost & Brard, 2019), si delinea la necessità di concettualizzare una stretta simbiosi tra BPM e BPT, dove la corretta interazione tra uomo e macchina diviene il fattore chiave abilitante per il potenziamento della gestione dei processi aziendali (Cannas et al., 2024; Guida et al., 2023; Liang et al., 2024).

3. Metodologia

3.1. Contesto di ricerca e selezione del campione

Nell'attuale scenario globalizzato, la CO trascende i confini dei mercati illeciti per configurarsi come una minaccia sistemica che compromette l'integrità delle istituzioni socio-economiche e le dinamiche del commercio internazionale (Savona et al., 2016; United Nations Office on Drugs and Crime, 2024; World Economic Forum, 2024). Sebbene i mercati illegali costituiscano la fonte primaria di reddito della CO, la strategia prevalente si fonda sul reinvestimento sistematico dei proventi nell'economia legale tramite veicoli societari legali (Bianchi et al., 2022; Mirenda et al., 2022). L'integrazione di imprese controllate dalla CO nella filiera economica risponde a una triplice finalità: il riciclaggio dei proventi illeciti, la costruzione di relazioni stabili con attori economici e istituzionali e, in misura determinante, l'amplificazione dei profitti e del potere, nonché del controllo territoriale e di settori economici strategici (Barone & Narciso, 2015; Catino, 2019; Chircop et al., 2023; Slutzky & Zeume, 2024). L'opacità delle operazioni è garantita dall'impiego di prestanomi di fiducia e dalla costituzione di intricate architetture proprietarie multilivello, così da favorire il radicamento della CO nei mercati transazionali legittimi[5] (Buckley et al., 2024; Compin, 2008; Pacini et al., 2019). In siffatto scenario, le IL fronteggiano una marcata esposizione al rischio di instaurare inconsapevolmente

[5] Stime recenti evidenziano che l'86% delle reti europee più pericolose utilizza strutture legali per le proprie attività (Europol, 2024; 2025). Nel contesto italiano, i gruppi di CO controllano circa il 2% delle imprese registrate (Arellano-Bover et al., 2024).

relazioni con imprese infiltrate dalla CO (Marelli et al., 2020; Parbonetti, 2021; Savona & Berlusconi, 2015; Transcrime, 2013). Le ripercussioni sistemiche per le IL si esplicano attraverso una duplice dimensione d'impatto. Sul versante esogeno, l'intervento delle forze dell'ordine può determinare l'improvvisa interruzione della catena di fornitura (Calamunci, 2022; Ferrante et al., 2021; Operti, 2018). Sul piano endogeno, le imprese controllate dalla CO palesano una strutturale inaffidabilità e orizzonti opportunistici che sfociano spesso in instabilità interne e inadempienze contrattuali (Arlacchi, 2007; Champeyrache, 2014; 2018; La Rosa & Paternostro, 2015). A fronte delle criticità emerse, e fatta salva l'eccezione di un ristretto novero di working paper incentrati su modelli quantitativi di identificazione di proxy criminali nelle aziende (Ambrosini et al., 2024; Cariello et al., 2024), la letteratura ad oggi offre esigui contributi volti ad investigare qualitativamente le strategie aziendali tese a prevenire l'interazione con le controparti criminali lungo le catene di fornitura (Cincimino et al., 2024). Per colmare tale lacuna, la presente indagine si avvale della mediazione istituzionale del Centro di Ricerca su Impresa, Mafia ed Economia dell'Università di Padova, il cui ruolo di gatekeeper ha garantito l'accesso privilegiato al dominio empirico (Yin, 2016).

Il fulcro dell'indagine risiede nell'analisi di un'innovativa tecnologia recentemente sviluppata, concepita per supportare le IL nella decodifica di pattern riconducibili a sodalizi criminali. Sotto il profilo procedurale, l'architettura della ricerca si svolge in due fasi sequenziali interconnesse. In via preliminare, la mediazione del gatekeeper ha consentito la conduzione di un'intervista élite in profondità al fondatore e CEO della società sviluppatrice della soluzione tecnologica (durata: 120 minuti), finalizzata a chiarire la teleologia dell'innovazione e le aspettative implementative (Harvey, 2011; Solarino & Aguinis, 2021). Le risultanze tassonomiche scaturite dal processo di codifica di tale intervista preliminare hanno orientato l'architettura del disegno di ricerca di prossima attuazione, strutturato come studio di casi multipli (Eisenhardt, 1989; Eisenhardt & Graebner, 2007), guidando altresì la definizione del protocollo per le successive interviste semi-strutturate (Edwards & Holland, 2013; Qu & Dumay, 2011) tramite l'approccio focus group (Greenbaum, 1998; Krueger, 1997a; 1997b; 2014). L'iter investigativo prevederà il coinvolgimento diretto delle imprese utilizzatrici di tale innovazione nei processi di selezione delle partnership commerciali mediante un contatto già avviato con la totalità della popolazione di riferimento costituita da circa 15 aziende, eterogenee per settori economici e dimensioni. La fase di raccolta dati in via di calendarizzazione si sostanzierà in interviste della durata prevista di 60 – 120 minuti rivolte a figure chiave, quali analisti e security officer, al fine di far emergere i processi di sense-making manageriale e di cogliere il nesso tra le aspettative iniziali del provider e l'esperienza operativa degli user (Alam, 2021; Yin, 2018). Il rigore metodologico sarà preservato da strategie di validità di costrutto e affidabilità che includono la tracciabilità della catena di evidenze e la triangolazione dei dati mediante l'analisi di fonti secondarie disponibili online quali siti istituzionali e documenti aziendali per ricostruire la storia delle imprese e le strategie di compliance integrando e corroborando tali informazioni con le narrazioni che emergeranno dalle interviste (Denzin & Lincoln, 2011; Gibbert et al., 2008).

3.2. Processo di codifica

L'analisi si incardina nel paradigma interpretativo-costruttivista avvalendosi di una strategia di analisi tematica riflessiva (Braun & Clarke, 2019). Conseguentemente, i temi finali rappresentano costruzioni logiche derivate da una codifica analitica all'interno della quale l'attività di ogni ricercatore è stata concepita come un processo di *sense-making* attivo e indipendente (Braun & Clarke, 2021).

Figura 1. I 6 Step dell'Analisi Tematica Riflessiva

La Figura 1 illustra il processo di codifica designato, ponendo una forte enfasi sull'approccio abduttivo-iterativo che abbraccia cicli iterativi di combinazione sistematica tra evidenze empiriche e apparato teorico di riferimento (Dubois & Gadde, 2002; Gibbs, 2007; Timmermans & Tavory, 2012). Supportata dall'ausilio del *software* NVivo 15, ogni intervista condotta sarà sempre seguita dalla fase di trascrizione e di anonimizzazione al fine di rendere tracciabili i passaggi logici e, al contempo, mitigare i *bias* idiosincratici, favorendo così il confronto collegiale sistematico (Flick, 2013; 2018). Inoltre, la riproducibilità sarà garantita mediante un *audit trail* rigoroso e la stesura di una descrizione densa del contesto che permetta giudizi informati sulla trasferibilità dei risultati (Tracy, 2024).

4. Temi emergenti prodromici al design di ricerca

La selezione dell'impresa erogatrice della soluzione tecnologica scaturisce dalla sua natura pionieristica, tale da configurarla quale unicum nel panorama dei servizi di prevenzione aziendale. Le evidenze offerte dal fondatore in merito all'architettura tecnica in esame hanno permesso di decodificare la genesi valoriale e la teleologia operativa della piattaforma tecnologica.

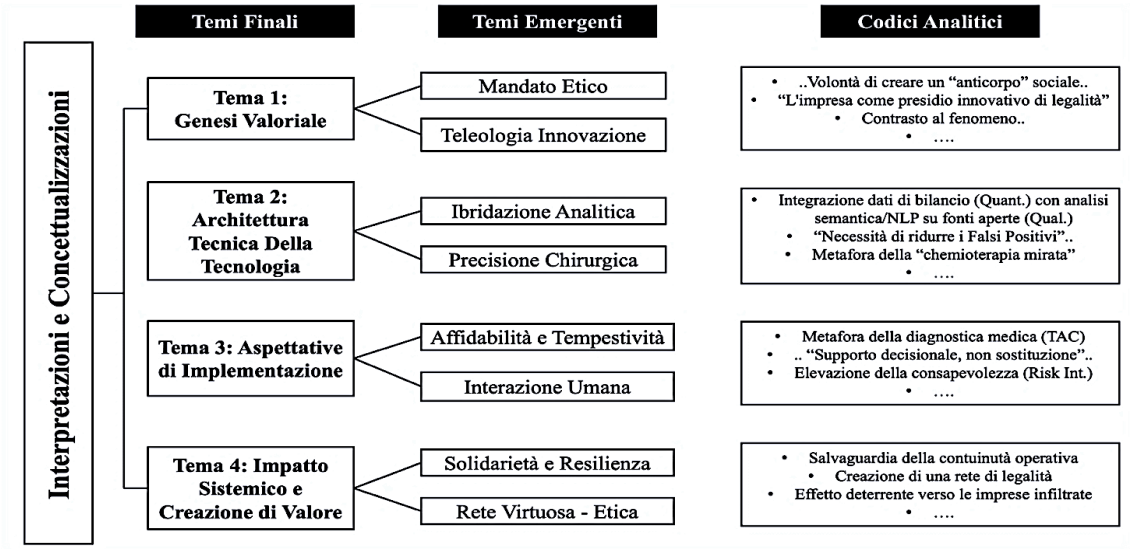

Figura 2. Esiti dell'analisi tematica riflessiva derivante dall'intervista al fondatore e CEO dell'impresa erogatrice della tecnologia (Eseguita il 27/11/25 presso la sede legale della stessa)

L'analisi tematica riflessiva ha fatto emergere una concezione dello strumento che trascende il mero adempimento di compliance per configurarsi come un vero e proprio anticorpo sistemico a salvaguardia dell'impresa. Dalle evidenze raccolte si delinea la volontà di istituire un ecosistema di legalità in cui l'algoritmo non si limita a fungere da barriera difensiva, bensì agisce come catalizzatore di sviluppo economico, nonché di resilienza e affidabilità della catena di approvvigionamento dell'impresa lecita. Sotto il profilo funzionale la tecnologia viene descritta come un supporto decisionale avanzato che, volendo operare in analogia con la diagnostica medica di precisione, integra l'analisi quantitativa di metriche finanziarie e la profilazione qualitativa basata su fonti aperte per offrire al decisore umano un risk intelligence predittivo capace di minimizzare i falsi positivi e salvaguardare la continuità operativa.

In questo contesto, emerge con chiarezza il tema della "centralità aumentata" dell'operatore umano, laddove l'IA non mira alla sostituzione delle prerogative manageriali, ma al loro potenziamento cognitivo, fornendo un quadro informativo depurato da rumore di fondo e bias cognitivi che abilita scelte consapevoli e tempestive in scenari di incertezza. In sintesi, il primo nucleo tematico emerso dal processo di coding ancora la teleologia dell'innovazione tecnologica in un mandato etico, elevando lo strumento a presidio di legalità e anticorpo sociale contro la pervasività criminale. Parallelamente, l'architettura tecnica sostanzia un'ibridazione analitica di "precisione chirurgica" che fondendo metriche quantitative e semantiche, minimizza i falsi positivi evocando, per usare una metafora medica, una "chemioterapia" mirata. Sul fronte delle aspettative di implementazione, si delinea una tecnologia che non vicaria bensì potenzia la capacità umana di decision-making, affinando la risk intelligence decisionale in analogia con la diagnostica medica evoluta. Infine, la prospettiva dell'impatto sistemico tratteggia una rete virtuosa di solidarietà e di resilienza, ove la tutela della continuità operativa si trasfigura in potente deterrente verso le infiltrazioni illecite.

5. Risultati aspettati e prime conclusioni

È ragionevole ipotizzare che le imprese utilizzatrici percepiscano lo strumento come una protesi cognitiva essenziale, capace di trasformare l'incertezza radicale legata al rischio criminale in un rischio calcolabile e governabile. Più che una mera automazione del giudizio, dalle prossime interviste alle aziende utilizzatrici ci si attende di riscontrare una dialettica simbiotica: da un lato l'algoritmo che agisce come filtro ermeneutico, riducendo il rumore informativo, dall'altro il manager che evolve il proprio ruolo da semplice selettore a garante etico ed esegeta del dato, riservandosi l'ultima istanza valutativa sulle segnalazioni di anomalia. I potenziali contributi teorici derivanti dal presente studio si possono articolare lungo tre direttrici. In primo luogo, lo studio mira ad ampliare il filone emergente sulla BPT, chiarendone il ruolo non solo come abilitatore operativo, ma come architettura fondamentale che rafforza il giudizio umano in contesti decisionali complessi e ad alto rischio. In secondo luogo, lo studio intende estendere la letteratura sulla selezione strategica dei fornitori, introducendo e ancorando empiricamente una dimensione di rischio cruciale, finora trascurata, relativa alla mitigazione delle interazioni con imprese legali infiltrate dalla CO, elevando il rischio di integrità a criterio di primo ordine e formalizzando una proxy che lo collega alla resilienza e al capitale reputazionale all'interno del portafoglio complessivo dei rischi di supply chain. Ne discende, in ultima istanza la possibilità di orientare lo sviluppo futuro di cornici di gestione del rischio di supply chain più olistiche, che incorporino sistematicamente tale proxy ai fini della mitigazione della contaminazione da CO. In terzo luogo, il lavoro ambisce a contribuire all'evoluzione della letteratura manageriale sull'infiltrazione della CO nell'economia legale attraverso le imprese, in particolare nel dominio degli studi dedicati alle strategie poste in essere dalle imprese legittime per contrastare le

controparti criminali. Sul piano pratico, le implicazioni appaiono sostanziali. Per i manager, la ricerca mette in luce il valore tangibile degli strumenti di due diligence supportati dall'IA nel presidio dell'integrità aziendale e nella tutela della continuità operativa, trasformando rischi opachi in variabili governabili. Per i professionisti, lo studio offre una cornice metodologica e operativa per l'evoluzione delle attività di consulenza, consentendo di integrare assessment tecnologici avanzati nei processi di valutazione del rischio di controparte e di rafforzare la qualità dei servizi di due diligence offerti alle imprese, con particolare riferimento alla prevenzione dell'infiltrazione criminale nelle catene di fornitura. Per i decisori pubblici, l'indagine evidenzia la necessità di promuovere ecosistemi istituzionali favorevoli all'adozione di tali tecnologie, anche attraverso standard o incentivi, al fine di rafforzare in modo strutturale la tenuta dell'economia legale.

Parole Chiave: Criminalità organizzata; innovazione tecnologica predittiva; salvaguardia dell'integrità commerciale; rete virtuosa di legalità

Digital technologies for sc transparency: a review from a circular supply chain perspective

Sara Savy[1], Nadia Di Paola[2], Roberto Vona[3]

1. Framing the research

The increasing complexity and geographical diversification of modern supply chains (SC) have led to a critical emergence of demand from consumers and companies alike to make the SC more transparent, specifically by tracking the provenance and production conditions of purchased and distributed products (Busse et al., 2017; Wilhelm et al., 2016). This higher attention has been intensified by various social and environmental crises, including recent pandemics (such as COVID-19), the frequent incidence of diseases, food scandals, and pervasive product waste, all of which have illuminated the severe opacity inherent in contemporary supply chains.

Indeed, the exponential growth of supply chains to a transnational level, often involving numerous actors located in developing countries, has resulted in immense complexity and vast geographical distances. This inherent structure results in a systemic lack of visibility beyond direct, tier-one suppliers (Boström et al., 2012; Busse et al., 2016), exacerbating information distortion and inaccuracies among SC actors (Gurtu & Johny, 2019).

This situation has created an imperative need for SC transformation, demanding that they become more transparent, sustainable, and responsible (Closs et al., 2011), thereby enabling companies and suppliers to reliably trace social and environmental breaches (Pagell & Wu, 2009).

In this context supply chains transparency (SCT) has emerged as a pivotal capability allowing the disclosing of detailed and accurate information with key stakeholder about operations and products history, such as their origin, sourcing, manufacturing processes, costs, and logistics, while also incorporating stakeholder feedback for supply chain improvement (Bai & Sarkis, 2020, Carter & Easton, 2011; Carter & Rogers, 2008).

SCT is thus viewed as a key enabler for obtaining a new, more collaborative, resilient, and sustainable supply chain network.

To better understand the academic debate on SCT, a clarification of its key concepts is necessary. While terms such as visibility, traceability, disclosure, information sharing, and openness are often used as near-synonyms, they hold a crucial functional distinction. Transparency is the strategic outcome. Specifically, visibility and traceability are depicted as the antecedents of transparency (Montecchi et al., 2021). Visibility is characterized as a potential outcome of information sharing activities (Barratt & Oke, 2007), while information sharing itself is the active process of information exchange.

In contrast, openness and disclosure are better defined not only as components of transparency but also as crucial factors influencing its implementation. Specifically, transparency guides the organization toward establishing the appropriate level of disclosure. Furthermore, openness reflects a broader organizational orientation to promote a climate of proactive disclosure (Cadden et al., 2013). However, viewed as an inclination or willingness to make information available, openness is also defined as an important antecedent of SCT (Budler, 2024).

[1] Dottoranda di ricerca, ECON-07/A, University of Naples Federico II; sara.savy@unina.it – corresponding author

[2] Professoressa ordinaria, ECON-07/A, University of Naples Federico II; nadia.dipaola@unina.it

[3] Professore ordinario, ECON-07/A, University of Naples Federico II; roberto.vona@unina.it

Maintaining clarity regarding the functional roles of these interrelated concepts is essential when investigating the strategic impact of SCT.

The current imperative to focus on Supply Chain Transparency (SCT) is primarily warranted by the emergence of technological requirements essential to support it (van Hoek, 2019). New and emerging technologies appear to offer significant promise to improve both the level and quality of transparency, enabling large volumes of data to be rapidly and efficiently gathered, transferred, integrated, and processed (McGrath et al., 2021). As stated by Budler et al. (2024) technology plays a central role in ensuring effective transparency by overcoming inherent limitations, particularly the common lack of information access beyond first-tier suppliers in multi-level supply chains (Bai & Sarkis, 2020).

Digital technologies provide the means for data capture, analysis, and monitoring while new data collection and sharing technologies, such as barcodes, QR codes, GPS software, and mobile phone sensors (Adams et al., 2014; Wang & Wei, 2007), enhance accessibility to customer and supplier information (Kim & Kankanhalli, 2009).

Technology solutions such as RFID, blockchain (BC) and the Internet of Things (IoT) have been examined to understand how they support the tracking of goods throughout supply chains. Traceability, which is the ability to follow an item across multiple supplier layers by generating an information trail, is a prerequisite for visibility. (Khan et al., 2022). Transparency results when visibility is achieved: all parties can see the product's status, location, and history, which in turn boosts confidence in its safety and quality. Budler (2024) confirms that exploring the connection between antecedents and technologies is essential to understanding how to harness technology to support efforts aimed at increasing transparency in SCs.

Sustainability has provoked a multitude of discussions in the SCM literature (Seuring & Müller, 2008; Morali & Searcy, 2013). However, global consumption patterns remain dangerously unsustainable.

As stated by Hazen et al. (2017 p.461) "the world's population cannot sustain this level of consumption without changing the way products are sourced, produced, delivered, reclaimed and regenerated". The circular economy (CE**)** has been recognized as having great potential to help organizations achieve a breakthrough in sustainability performance and is currently stands as an essential paradigm for global development.

This urgency is underscored by the Circularity Gap Report (2025) which highlights a deteriorating situation: the global circularity metric continues its decline, driven primarily by the massive inflow of virgin materials that outpaces the volume of secondary, recovered resources. This trend is quantified by a recent fall in the circularity metric, decreasing from 7.2% to 6.9% as of the latest analysis. It is illustrative of the magnitude of this challenge to note that if we were to successfully recycle all materials currently categorized as potentially circular but unutilized, the Global Circularity Metric could realistically rise to approximately 25% (Circle Economy, 2025). Furthermore, data reveal a major gap between the global waste collection rate (82%) and the subsequent recycling rate (27% in 2021), unequivocally pointing to profound inefficiencies within existing systems.

This situation highlights the critical need to rethink current systems, through the lenses of circular economy which offers a pathway to improve well-being while safeguarding natural environments and ecosystems through the continuous rethinking and optimizing of resource utilization.

In the context of SCM and circular economy has been formally defined as circular supply chain management (CSCM) (Genovese et al., 2017; Nasir et al., 2017). Rigorous definitions of this concept abound.

For example, Batista et al. (2018) described the CSCM as a management approach that necessitates the deliberate coordination of all supply flows, both forward and reverse, through the integration of an entire business ecosystem.

A supplementary definition focuses on the integration of circular thinking directly into the management of the supply chain. The guiding principle for this approach is the zero-waste vision (Farooque et al., 2019). The circular supply chain in designed to restore and regenerate resourced which is realized through system-wide innovation spanning both business models and all supply chain functions, from the initial product/service design phase through to end-of-life and waste management. Crucially, this definition also emphasizes the key importance of collaboration across all stakeholders throughout a product/service lifecycle, including parts/product manufacturers, service providers, consumers, and users.

However, the successful implementation of CSC models requires unprecedented levels of information visibility across complex, multi-tier supply networks. In doing so supply chain transparency (SCT), has been identified as a potential catalyst for circular transitions. By making material flows, product lifecycles, and environmental impacts visible to stakeholders, SCT theoretically enables the coordination, trust, and decision-making capabilities necessary for circular business models.

Supply chain transparency is theorized as a necessary information infrastructure that enables circular economy strategies by making product lifecycles, material origins, and return flows visible to actors across the supply chain. Recent integrative frameworks explicitly position Supply Chain Transparency as the central mediating mechanism between digital technologies (AI, blockchain, IoT) and circular supply chain performance (Xing et al., 2025).

Digital technologies generate and capture supply chain data allowing SCs transparency. This information infrastructure enables circular practices. This framework highlights that digital technologies alone are insufficient; their value for circularity is realized through the transparency capabilities they create.

2. Purpose of the paper

Despite the extensive existing research on SCT's role in enabling crucial outcomes such as collaboration, resilience, and sustainability (Al- Khatib, 2025; Di Paola et al., 2023; Santharm & Ramanathan, 2022; Rejeb et al, 2021) the precise role of SCT in achieving a circular SC is still in its nascent era. This work-in-progress paper aims to address this lack of academic literature. The purpose is to systematically summarize the previously published documents on this connection to better understand the role of digital technologies in enabling transparency and, consequently, how transparency helps firms to achieve circularity. Moreover, the final output intends to be the construction of a framework linking technologies, transparency dimensions and circular economy practices.

3. Methodology

The objective of this literature review is to critically analyze and systematize the role of SC Transparency, enable by digital technologies, as a crucial determinant and transmission mechanism for the adoption and success of Circular Supply Chain models.

For this reason, the following research questions was proposed to guide the review:

RQ1: What are the dominant research trends and key thematic clusters that characterize the literature at the nexus of Supply Chain Transparency (SCT) and Circularity, and how has the conceptual focus of this relationship evolved over time?

To follow the objective of this review, it was employed the 10-step methodology (Table 1) for a Bibliometric-Systematic Literature Review (B-SLR), as described by Marzi et al. (2025). This specific review type is instrumental in addressing the research problem by uncovering underexplored areas where further research is needed and simultaneously aids in constructing conceptual models and theoretical frameworks (Marzi et al., 2025).

The combination of a bibliometric (quantitative) analysis and a systematic qualitative analysis is uniquely suited to mitigate the potential biases inherent in adopting either methodology separately. Specifically, the qualitative analysis of the Systematic Literature Review (SLR) is susceptible to interpretive bias (MacCoun 1998; Tranfield et al. 2003). This interpretive bias is effectively mitigated using quantitative (bibliometric) methods, which, according to Zupic & Čater (2015) serve as a complement to, rather than a substitute for, traditional review methods (Donthu et al. 2021). By offering a rigorous quantitative base, the bibliometric analysis allows scholars to apply their creativity to move existing knowledge forward.

The 10 steps process suggested by Marzi et al., (2025) are outlined below (Table 1).

B-SLR STEPS	**Application to SC Transparency and circular supply chain**
Step 1: Research Question and Boundaries of The Study	Topic: Transparency and circular supply chain
Step 2: Search Query Definition	The query was defined through a trial-and-error process led by previous literature
Step 3: Database Selection	Database: Web of Science Search date: 2025-12-01 Search in: title, abstract and keywords
Step 4: Data Screening and Data Cross-Checks	Inclusion/exclusion criteria Document type: peer reviewed articles Language: English Subject area: Business economics Raw dataset (n=131)
Step 5: Data Cleaning and Export	The manual selection following the boundaries of the selected topic and the inclusion/exclusion criteria
Step 6: Bibliometric Approach	Co-citation analysis (Bibliometrix) Co-occurrence analysis (Bibliometrix) Keywords co-occurrence (Bibliometrix)
Step 7: Clusters' Topic Identification	Bibliometrix Graphical representation of the results
Step 8: Sample Ordering and Selection	All documents will be included for SLR
Step 9: Systematic Literature Review	Holistic analysis of the dataset Specific analysis of the documents in the clusters
Step 10: Developing A Theoretical Contribution	Conceptual framework and research agenda

Table 2. Based on Marzi et al. (2025)

In Step 2, the search query was defined. The terms included in the query were established by referencing previous literature reviews and through a trial-and-error process which resulted in the most appropriate query. This rigorous process permitted to minimize thematic deviation and ensure a sharp focus on the core research theme. The final query resulted in three parts: the first component focused on Supply Chain Transparency (SCT), which serves as the primary construct of this review. This part was deliberately constrained to the core construct of transparency, leading to the explicit exclusion of antecedent concepts such as visibility and traceability (Schäfer, 2022) to maintain a rigorous thematic focus, thereby avoiding potential conceptual deviation from the central objective of the analysis.

The second component delimited the research scope by centering the query on the Circular Supply Chain (CSC) and its foundational pillars (Govindan & Hasanagic, 2018)

The third element addressed Smart Technologies (e.g., Blockchain, IoT). The inclusion of this part was crucial, as the ultimate aim of the review is to articulate the role of these digital technologies in enabling transparency and, consequently, how they can be effectively leveraged to achieve broader circularity goals.

To select the database for the analysis, the recommendation of Donthu et al. (2021) was followed: selecting a single database to avoid redundant actions and mitigate potential human errors.

The database selected (in Step 3) for the review was the Web of Science (WoS), powered by Clarivate Analytics. WoS was chosen due to its selective indexing criteria, high-impact journals, and guaranteed access to essential research in the fields of innovation and sustainability (Asubiaro et al., 2024; Budler et al. 2024).

The title, abstract, and keyword search query were run on WOS, and a raw database of 764 documents was extracted.

This preliminary result was obtained without applying any filter. Subsequently, three inclusion and exclusion criteria were set to determine the final sample: research area to focus on the field of interest, document type to include only peer-reviewed papers, and language to avoid interpretative biases. The application of these criteria yielded a final sample of 131 document.

The review process followed the guidelines of the Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) framework (Figure 1) to ensure replicability and methodological rigor of the study (Donthu et al. 2021)

After converting the raw dataset into a suitable format for the bibliometric tool bibliometrix (an R package developed by Aria & Cuccurullo, 2017), the sample was screened. This screening was conducted based on abstract reading and full-text reading, where necessary, to refine the results and ensure relevance. This process led to the final sample of 112 documents that fully align with the defined thematic scope and the established inclusion and exclusion criteria.

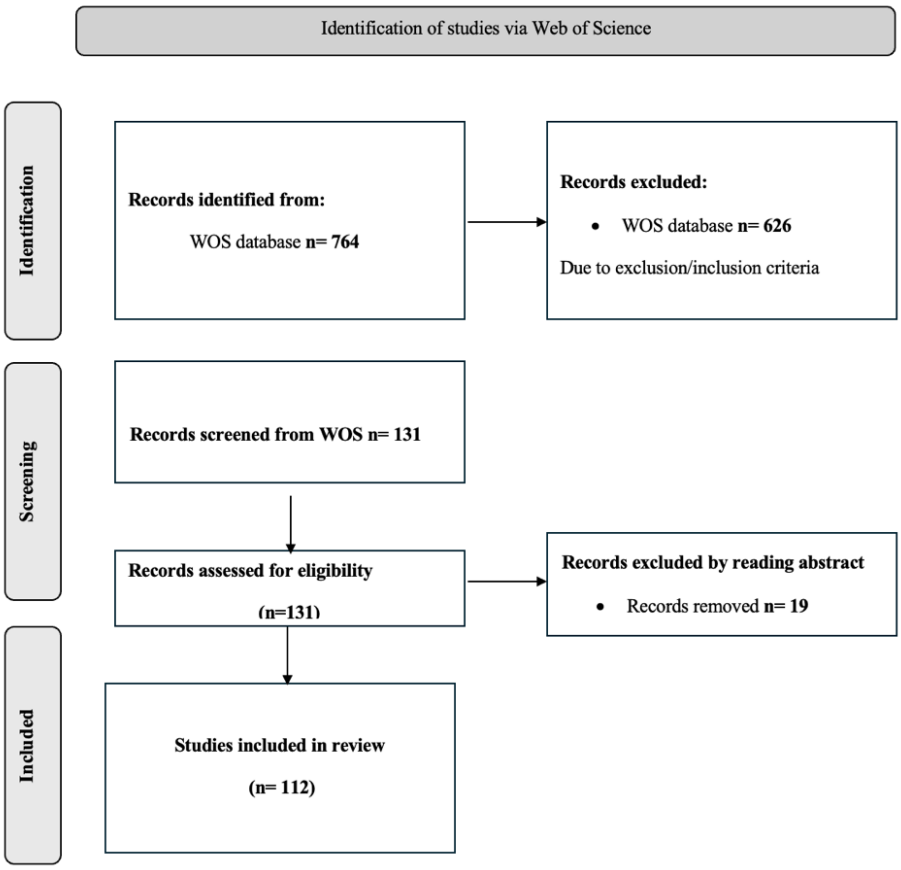

Figure 2. PRISMA Framework

4. Results

A descriptive analysis of the collected corpus was performed to detail the main characteristics of the sample. Covering the period from 2016 to 2025, the literature in this area is demonstrably young, with only 12 documents published between 2016 and 2021 (9 of which appeared in 2021) and 100 published between 2022 and 2025.

The field exhibits a high degree of dynamism, evidenced by a substantial Annual Growth Rate of 44.81%. As Figure 2 illustrates, annual scientific production follows a pronounced positive trend, peaking in 2022 with 26 documents and continuing its growth trajectory into 2025 with 28 papers. This high growth rate and the relatively young age of the documents confirm that the research area covered by the collection is undergoing significant and rapid development.

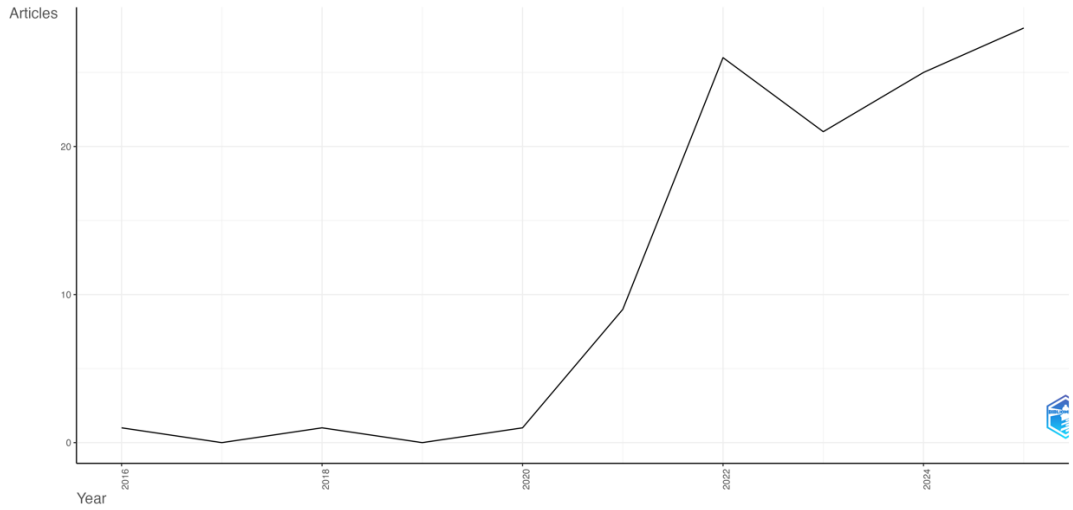

Figure 3. Annual Scientific Production, Authors elaboration (developed with Biblioshiny)

To visualize the most important themes within the field, a thematic analysis was conducted using Bibliometrix. The resulting graphic representation (Figure 3) utilizes a quadrant scheme, which categorizes topics into four distinct groups: motor themes (core and well-developed), basic themes (foundational themes that can grow more), niche themes (specialized and isolated), and emerging/declining themes (new or fading research areas).

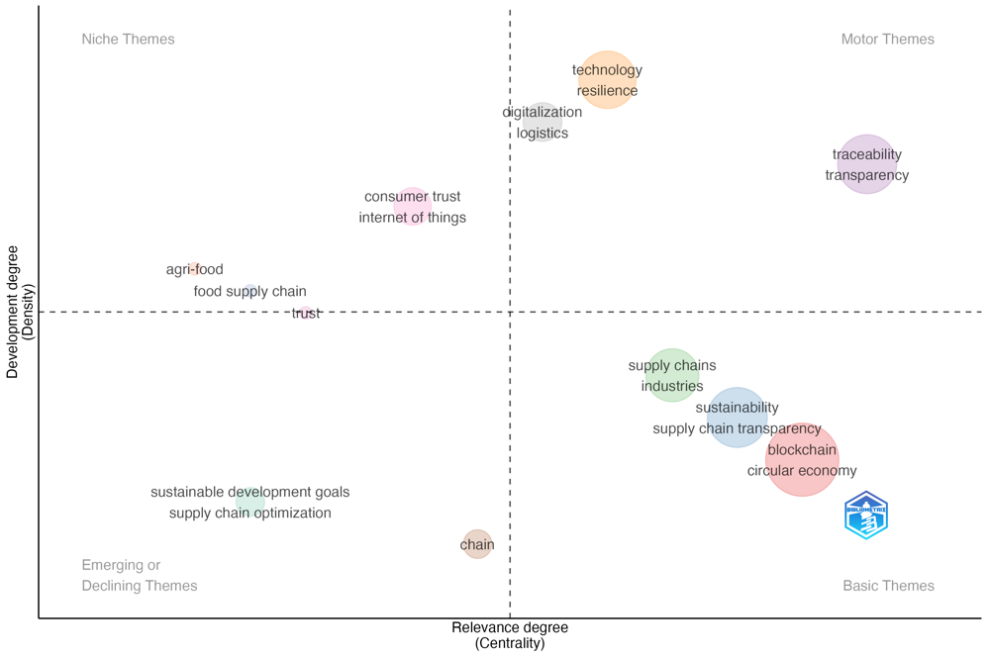

Figure 4. Thematic analysis, Authors elaboration (developed with Biblioshiny)

The preliminary analysis clearly identifies technology, digitalization, and the constructs of traceability and transparency as established motor themes. This prevalence highlights the growing importance and maturity of research dedicated to the digital transformation of supply chain capabilities.

This thematic dominance is rooted in a fundamental paradigm shift within the field. While traditional supply chains primarily focused on production and delivery, the advancements towards

Industry 4.0 and the digital era necessitate the prioritization of sustainability, data security, and privacy alongside economic efficiency (Huang et al., 2023). This requires a holistic technological approach encompassing environmental and social considerations throughout the entire product life cycle. Digital technologies such as Blockchain, QR codes, and RFID tags are recognized as central enablers of this transition, enhancing both traceability and transparency.

Within the basic themes' quadrant, concepts such as Supply Chain, Sustainability and Blockchain (BC) are observed. Their positioning indicates their status as a foundational and highly relevant topic, although its potential for further growth and evolution within this specific context is recognized.

Blockchain (BC) is identified as a central, predominant theme, representing the most studied technology in this field, particularly in connection with the Circular Economy (CE). Academic literature widely agrees that the transition toward a circular economy is increasingly dependent on smart technological integration. (Bergendahl, Sarkis, and Timko, 2018).

Due to its intrinsic characteristics, such as enhanced transparency, decentralization, peer-to-peer data synchronization, smart contracting capabilities, and data immutability, BC provides numerous benefits that are foundational to support the circular transformation of supply chains (Khan et al., 2022; Kouhizadeh et al.,2019).

Furthermore, Khan et al. (2021) asserts that adopting BCT may also help organizations improve efficiency and reduce costs through resource regeneration promising long-run returns and contribute significantly to social, economic, and environmental sustainability (Khan et al., 2021).

Niche themes, situated in the upper-left quadrant, indicating low centrality but high density. Themes like trust, consumer trust, agri-food, food SC, are positioned in this quadrant. This suggests that these themes are specialized area with strong internal connections but less influence on the broader field. The Food Supply Chain (FSC) represents one of the areas with the highest research density concerning the application of tracking technologies. This high concentration is due to the intrinsic complexities and unique challenges of the sector, which make it particularly receptive to these technological solutions. The inherent need for robust solutions addressing issues such as product perishability, safety, provenance verification, and susceptibility to fraud drives the intensive study and early application of technologies like Blockchain and IoT within the FSC, positioning it as a leading domain for traceability research (Ali et al., 2021).

The second important niche theme identified is centered on trust and consumer trust. This theme is intrinsically linked to Blockchain Technology (BCT), which fundamentally shifts reliance from trust in human parties to trust in the underlying technology itself.

Academic literature highlights BCT's role in resolving issues stemming from a lack of transparency and trust by securely sharing verifiable data. Specifically, the technology helps mitigate market acceptance challenges associated with remanufactured products, a crucial component of the Circular Economy, which are often perceived by consumers as lacking reliability; thus, BCT can significantly improve circular manufacturing through remanufacturing initiatives (Govindan, 2022). Consequently, trust emerges as a critical design factor for developing circular blockchain platforms within supply chains. This necessity contrasts with the pre-BCT environment, where processes such as recycling, remanufacturing, and redistribution were highly constrained, typically relying upon centralized control mechanisms, fragmented individual local databases, the prerequisite involvement of trusted third parties, and the subsequent formation of trusted dyadic relationships among supply chain partners (Centobelli et al., 2022).

The cluster focused on Sustainable Development Goals (SDGs) is situated in the lower-left quadrant of the thematic map, categorizing it as an emergent theme. This positioning suggests that the direct linkage between SDGs and the core research field is not yet fully integrated or established as a dominant area of study.

For example, Tsolakis et al. (2021) conceptualize transparency as a necessary enabling mechanism to achieve specific SDGs by leveraging Blockchain technology to overcome information asymmetry. The authors argue that SDGs present a key opportunity for the redesign of supply chains. Digital technologies, such as Blockchain, are instrumental in attaining SDGs related to livelihoods, food security, and the environment. This is achieved precisely because these technologies allow for the real-time identification of issues and the implementation of interventions by ensuring data authentication, verifiability, and confidentiality.

From this preliminary analysis of the literature was identified the prominent role of traceability as a key mechanism leads to transparency defined as a mediator in the association between emerging technologies and transparency (Khan et al., 2022). This consideration stimulating a focused, vertical analysis on this antecedent before proceeding to a broader investigation of overall transparency.

To better understand the function of transparency in enabling circular supply chains, this study deliberately chose to examine its primary antecedent: traceability. Through this in-depth study of traceability, we gain clearer insights into the essential role of digital technologies in enabling this capability and its contribution to achieve broader transparency.

Analysis of the papers within our sample focusing on traceability reveals several key research themes. Blockchain clearly emerges as the central technology; it is not only the most frequently used tracking solution but is generally defined as the principal technology for enabling a transparent supply chain. Beyond transparency, it can also be seen as a pivotal enabler of circularity. Implementing Blockchain solutions simplifies energy supply procedures and reduces request volatility, allowing production to occur in real-time based on market demand. This functionality directly enables the optimization and conservation of natural resources, contributing substantially to circular economy goals (Centobelli et al., 2022).

Furthermore, a strong focus on the food and pharmaceutical sectors was observed, alongside an under-exploration of other central sectors where the recycling or regeneration of products is notoriously difficult. The analysis also highlights that product traceability has a direct impact on consumer trust when purchasing sustainable, recycled, or upcycled products. This finding is central to our research, as it demonstrates how enhanced transparency can potentially impact consumer choice, subsequently influencing the willingness of firms to adopt circular practices. The literature extensively covers the barriers to implementing tracking technologies, which is not surprising given that technologies purposed for this require substantial initial investment and are subject to various challenges, including technology acceptance and integration issues. A significant emerging theme identified is the use of tools such as Digital Product Passports (DPP), which, although still underexplored, is recognized as a promising approach, particularly for mapping downstream activities and product lifecycle journeys.

The analysis highlights a significant research gap: most documents concentrate their efforts on pre-production and in-production traceability, neglecting the critical phase of downstream traceability. Downstream traceability specifically addresses the product's end-of-life journey, when the product reaches the final consumer and subsequent recovery is managed. Traceability across the entire supply chain remains largely deficient, which is particularly problematic in sectors where resource waste occurs at multiple stages throughout the chain, such as the food and fashion industries. This deficiency severely hinders the implementation of effective circular strategies.

5. Research limitations

This systematic literature review is subject to several methodological limitations that must be acknowledged.

Firstly, a key limitation concerns the selection of sources, as the choice of database (Web of Science) and the stringent inclusion/exclusion criteria may have inherently influenced the

completeness of the final analysis. Furthermore, the exclusion of "gray literature," while enhancing the study's replicability and rigor (Adams et al., 2017), simultaneously restricts the diversity and flexibility of the findings derived from the corpus.

Secondly, a significant limitation stems from the decision to narrow the search query's focus to "transparency" alone, deliberately excluding closely related concepts such as "traceability" and "visibility," despite their frequent recurrence in the research domain. While the explicit objective of this decision was to narrow the analysis to achieve a deeper understanding of the distinct role of transparency, this specificity may nonetheless have restricted the selection of relevant papers included in the final review.

6. Managerial implications

The findings of this literature review would offer significant managerial implications for practitioners across multiple levels of the supply chain. Recognizing the inherent value of digital technologies in achieving sustainability goals, this review wants to provide an implementation roadmap for circular supply chain processes viewed through the critical lens of Supply Chain Transparency (SCT).

This review intends to offer clear, actionable guidelines for the efficient creation and enhancement of transparency capability. This guidance allows practitioners to fully understand the strategic deployment of smart technologies and their specific, measurable impact on enabling and sustaining a robust Circular Supply Chain (CSC).

Based on the preliminary findings of this review, firms aiming to transition toward circularity must implement advanced tracking systems capable of monitoring resource utilization and identifying waste throughout the Supply Chain (SC). More crucially, such systems must be able to "shadow" the product from its origin to its end-of-life, a phase that remains indispensable for the effective management of recycling, reuse, and remanufacturing practices.

This analysis reveals that most existing studies focus their efforts on pre-production and in-production traceability, often neglecting the critical downstream phase. This imbalance highlights an ongoing gap in the attempt to fully trace global supply chains, which frequently renders the successful implementation of circular economy principles ineffective.

However, a key insight emerging from this preliminary evidence is that while data tracking provides the necessary foundation for circularity, the strategic sharing of this information represents the true turning point for the actualization of circular SCs. Beyond the mere collection of data, inter-organizational transparency may act as a catalyst for enhanced collaboration. Indeed, these technologies facilitate the real-time identification of inefficiencies and the implementation of corrective interventions by ensuring data authentication, verifiability, and confidentiality.

Consequently, practitioners should explore emerging tools such as the Digital Product Passport (DPP). Although still underexplored in current literature, the DPP is recognized as a promising approach for mapping downstream activities and capturing the entirety of the product lifecycle journey, thereby bridging the gap between production and sustainable end-of-life management.

7. Originality of the paper

The distinct originality of this study lies in its ability to overcome the current fragmentation in the literature by proposing a systematic synthesis that directly connects SC transparency to circular economy practices. Unlike existing reviews, this work systematically investigates the relationship between the enabling technologies for transparency (such as Blockchain) and the actual implementation and impact on the circular supply chain. This integrated approach allows us to fully comprehend the scope and influence of these adoptions on circular practices, thereby addressing a significant gap in academic research.

Keywords: Supply chain; transparency; circular economy; circular supply chain; digital technologies

Blockchain e AI nelle PMI del Food & Beverage: Effetti su Redditività e Customer Experience

Jacopo Balestracci[1], Niccolò Lombardi[2]

1. Introduzione

Il settore alimentare e delle bevande è tra i più significanti in Europa: contribuisce in modo sostanziale al PIL, all'occupazione e alla bilancia commerciale, ed è riconosciuto come uno dei settori manifatturieri più importanti dell'Europa centrale (e, più in generale, dell'UE). Da sempre ha rivestito un ruolo chiave nella crescita sostenibile a lungo termine, dando stabilità economica in un contesto di incertezza globale (Łukiewska & Juchniewicz, 2021; Gazzola et al., 2024). Le analisi di competitività mostrano come il settore abbia mantenuto nel tempo elevati livelli di produttività, redditività e quote di esportazione (Notta et al., 2012). Il settore ha inoltredimostrato resilienza durante le crisi economiche, come la crisi finanziaria del 2007- 2011, periodo in cui ha superato gli indici di mercato più ampi in termini di rendimenti e stabilità (Tanda, 2018; Konstantinidis et al., 2019).

I piccoli produttori (PMI) del settore food and beverage svolgono un ruolo significativo nello sviluppo socioeconomico, seppur la loro performance finanziaria vari da paese a paese (Gardijan & Lukač, 2020). Tale significatività è confermata dalla struttura del mercato europeo: a fronte di poche ma grandi aziende (con una quota superiore all'1%), se ne trovano innumerevoli di dimensioni medio-piccole (Belyaeva et al., 2020). L'attenzione verso le PMI del settore deve quindi essere massima, in quanto il loro apporto è fondamentale e sempre più importante, riscontrando una sempre maggioreintegrazione al loro interno di modelli di business orientati alla sostenibilità (anche se in misura minore rispetto alle imprese occidentali più grandi) (Belyaeva et al., 2020). Questo può non stupire, in quanto una caratteristica delle PMI è la capacità di sviluppare cambiamenti interni mostrando maggiore adattabilità organizzativa a svariati tipi di innovazioni digitali forti, nonostante la scarsità di risorse da investire (Chan et al., 2018). In tale contesto, dunque, strumenti come la blockchain e l'intelligenza artificiale possono offrire determinanti vantaggi competitivi.

2. Blockchain

La blockchain è una tecnologia di registro digitale distribuito e decentralizzato che consente di registrare e verificare transazioni in modo sicuro e trasparente senza la necessità di un'autorità centrale. Funziona come un registro pubblico condiviso, dove ogni blocco contiene un insieme di transazioni, è collegato al blocco precedente tramite crittografia e non può essere modificato una volta aggiunto, garantendo così immutabilitàe tracciabilità (Niranjanamurthy et al., 2018). Questa struttura distribuita è mantenuta da una rete di nodi che validano le transazioni attraverso meccanismi di consenso peer-to-peer, rendendo la blockchain resistente a manomissioni e frodi (Yaga et al., 2018). Il primo utilizzo fu di supporto alle sole criptovalute (come Bitcoin), ma la blockchain col tempo e il suo sviluppo ha trovato implementazione in molti settori, quali finanza, sanità e servizi governativi, che si aggiungono al tema centrale di questo progetto: la gestione

[1] Dottorando di ricerca, ECON-06/A, Università di Pisa; jacopo.balestracci@unipi.it – corresponding author

[2] Dottorando di ricerca, ECON-06/A, Università di Pisa; niccolo.lombardi@phd.unipi.it

della supply chain. Il motivo è semplice, anche se non banale: le aziende e i mercati sfruttano le sue caratteristiche di sicurezza, trasparenza e decentralizzazione (Krichen et al., 2022).

Queste caratteristiche sono essenziali lungo tutta la filiera e la catena di approvvigionamento del settore agroalimentare; la blockchain ne migliora la tracciabilità, la trasparenza e la sicurezza alimentare, grazie a dei registri digitali e immutabili condivisi tra gli operatori. Ciò ha come conseguenza una riduzione dell'incertezza tra i partecipanti della filiera, che permette di aumentare l'affidabilità dei dati e contribuire a prevenire frodi e, cosa importantissima, contaminazioni alimentari. Laddove al contrario ci fossero problemi, difetti o prodotti non sicuri, tale tecnologia consente l'identificazionee la rimozionerapida degli stessi (Li et al., 2021; Feng et al., 2020). Il risvolto operativo è anche verso quelle imprese della filiera ritenute "emarginate", permettendo di promuovere il commercio equo, con migliori opportunità per quest'ultime di integrazione nel mercato globale (Kshetri, 2023).

3. Intelligenza artificiale

Fra le più importanti, dirompenti, ed epocali innovazioni applicabili all'azienda (e non solo) possiamo citare anche l'intelligenza artificiale (AI). Con volontà di sintesi si potrebbe definire come l'insieme di tecniche, metodi e sistemi informatici progettati per simulare, estendere o automatizzare capacità cognitive tipiche dell'intelligenza umana, quali l'apprendimento, il ragionamento, la percezione e la capacità decisionale (Russell & Norvig, 2021). L'AI è molto utile alle aziende perché migliora l'ef ficienza operativa, automatizza e ottimizza i compiti ripetitivi, efficientando allo stesso tempo l'uso delle risorse, e conseguentemente riducendo i costi operativi (Solano et al., 2024). Le risorse in surplus possono dunque essereriallocate, aumentando la risposta dell'impresa a cambiamenti di mercato grazie ad una struttura organizzativa più snella, specie in mercati con una forte competizione interna (Li et al., 2023). L'AI potrebbe essere applicata a tutti i livelli aziendali e a tutte le funzioni ed unità organizzative; ciò consentirebbe decisioni più rapide e accurate grazie all'analisi avanzata dei dati, favorendo innovazione continua e vasta personalizzazione dei servizi, elementi chiave per la soddisfazione del cliente (Yaşar, 2024). L'effetto cardineè che le aziende AI oriented possono arrivare a migliorarele performance sia a livello organizzativo che di processo, ottenendo vantaggi competitivi sostanziali (Wamba-Taguimdje et al., 2020).

4. Research problem

4.1. RQ1: Blockchain e redditività

Numerosi studi evidenziano che, a determinatecondizioni, l'adozione della tecnologia blockchain nelle catene di approvvigionamento del settore food & beverage abbia molteplici effetti positivi (Tabella 1). Analisi di casi e approcci di modellizzazione dimostrano che la blockchain può ottimizzare i profitti, in particolare nei beni deperibili e in condizioni di incertezza e fluttuazione della domanda (Stranieri et al., 2021; Keskin et al., 2024; Vern et al., 2024; Vu et al., 2024; Li et al., 2021; Yang et al., 2021; Wamba et al., 2020). I miglioramenti apportati potrebbero palesarsi anche verso l'esterno, aumentando la fiducia di consumatori e clienti, giustificando strategie di prezzo premium, accrescendo di conseguenza i ricavi (Rogerson & Parry, 2020).

L'implementazione delle nuove tecnologie a fronte di questi vantaggi pone anche alcune sfide: le aziende difatti dovranno fronteggiare la complessità della messa a punto della tecnologica (manca una standardizzazione e generalizzazione della stessa) e le problematiche di accettazione nella governance (Katsikouli et al., 2020; Rogerson & Parry, 2020; Apeh & Nwulu, 2025). L'entità dei guadagni in termini di redditività dipende infatti da fattori come i costi di implementazione, la struttura della supply chain e il coinvolgimento degli stakeholder (Liu et al., 2022; Deqing et al., 2024; Thoukidides et al., 2025; Wu et al., 2021). Costi elevati ed avversione

al rischio dei partner dellasupply chain possono annullarei benefici finanziari, soprattutto quando le preoccupazioni dei consumatori sulla sicurezza alimentare non sono rilevanti.

Asserzione	Descrizione	Fonti
L'adozione della blockchain aumenta la redditività nelle imprese del settore alimentare e delle bevande	Numerosi studi empirici e di modellizzazione mostrano incrementi di profitto grazie a una maggiore efficienza e tracciabilità	Stranieri et al., 2021; Keskin et al., 2024; Vern et al., 2024; Vu et al., 2024; Li et al., 2021; Yang et al., 2021; Wamba et al., 2020
La blockchain migliora le performance della supply chain e il vantaggio competitivo	Forte consenso su una migliore trasparenza, tracciabilità ed efficienza operativa	Stranieri et al., 2021; Vern et al., 2024; Vu et al., 2024; Li et al., 2021; Wamba et al., 2020; Rogerson & Parry, 2020
L'incremento di redditività dipende dai costi di implementazione e dal contesto	Alcuni studi mostrano che costi elevati o un'inadeguata applicazione possono annullare i benefici, specialmente per le PMI	Liu et al., 2022; Deqing et al., 2024; Katsikouli et al., 2020; Thoukidides et al., 2025; Wu et al., 2021

Tabella 1. Blockchain e redditività

Poche ricerche hanno studiato le specifiche sfide affrontate dalle PMI in tale contesto; da tale gap deriva la prima domanda di ricerca:

RQ1. Attraverso quali meccanismi l'adozione della blockchain influenza la performance economica delle PMI del settore alimentare e delle bevande?

4.2. RQ2: Integrazione blockchain e intelligenza artificiale

Integrare blockchain e AI può consentire di superare i limiti delle singole tecnologie, seppur (anche in tal caso) con alcune sfide aperte (Tabella 2). Tale combinazione migliora la qualità dei dati, la resilienza delle supply chain, la prevenzione delle frodi e la personalizzazione dei servizi (Kumar et al., 2022; Tsolakis et al., 2022; Khan et al., 2023; Patel et al., 2023).

I settori che traggono maggior beneficio dall'integrazione sono supply chain, produzione, audit o i settori della finanza o sanità. Un esempio di applicazione potrebbe essere il supporto ai sistemi di packaging intelligenti per combattere le frodi alimentari (Yang et al., 2024). Specificatamente nella supply chain, la combinazione di AI e blockchain migliora la tracciabilità delle singole materie e lavorazioni, la previsione della domanda e la sostenibilità (Charles et al., 2023). In ambito finanziario invece, la sinergia aumenta la sicurezza delle transazioni e la capacità di rilevare frodi (Kumar et al., 2022). Ulteriori studi empirici e casi reali mostrano che l'adozione congiunta porta inoltre a incrementi misurabili di efficienza, riduzione dei costi, miglioramento della qualità dei prodotti e della customer satisfaction (Wang et al., 2022).

Permangono sfide legate alla scalabilità (è stata riscontrata difficoltà nel farla funzionare su larga scala in maniera generalizzata), ovvia complessità tecnica, elevati costi di implementazione, carenza di competenze tecniche e specifiche (Crocco et al., 2025; Patel et al., 2023).

Asserzione	Descrizione	Fonti
L'integrazione di blockchain e AI genera sinergie superiori	Numerosi studi empirici e review mostrano benefici	Kumar et al., 2022; Tsolakis et al., 2022; Khan et al., 2023; Patel et al., 2023

rispetto all'adozione isolata per la profittabilità aziendale	misurabili in efficienza, sicurezza e innovazione	
L'integrazione migliora la resilienza e la sostenibilità delle supply chain	Evidenze empiriche in supply chain agricole e industriali mostrano aumenti di produttività e riduzione cost	Tsolakis et al., 2022; Khan et al., 2023; Charles et al., 2023
Le barriere tecniche e regolatorie limitano l'adozione su larga scala	Studi segnalano ostacoli di scalabilità, costi e competenze	Charles et al., 2023; Patel etal., 2023
Mancano studi longitudinali e cross-settoriali sull'impatto a lungo termine	La maggior parte degli studi è concettuale o su casi pilota, con pochi dati su effetti di lungo periodo	Charles et al., 2023; Crocco et al., 2025
L'adozione isolata di AI o blockchain offre benefici limitati rispetto all'integrazione	Studi comparativi mostrano che i limiti delle singole tecnologie vengono superati solo tramite integrazione	Kumar et al., 2022; Tsolakis et al., 2022; Khan et al., 2023

Tabella 2. Sinergie tra blockchain e AI

La customer experience (CX) agisce come mediatore e amplificatore tra integrazione tecnologica e profittabilità. Nel banking digitale, gli attributi tecnologici (qualità del servizio digitale, usabilità, velocità, personalizzazione, innovazione percepita) migliorano la CX; la CX aumenta soddisfazione e loyalty, che a loro volta si collegano ai risultati finanziari (Mbama et al., 2018; Mbama & Ezepue, 2018). Ma anche nelle PMI fintech l'adozione di tecnologie digitali migliora valore percepito, supporto e velocità del servizio, che potenziano CX e generano intenzioni di fedeltà, considerate driver di ricavi futuri (Barbu et al., 2021). Mancano però studi empirici che isolano il contributo della customer experience ai profitti sulle PMI del settore alimentare e delle bevande.

RQ2. In che misura l'uso combinato di blockchain e AI migliora la profittabilità attraverso la customer experience nelle PMI del settore alimentare e delle bevande?

5. Metodologia

Il disegno metodologico adottato per questa ricerca si fonda su un approccio di tipo "multiple case study" (Yin, 2018), integrato successivamente dall'applicazione del metodo Delphi (Okoli & Pawlowski, 2004; Linstone & Turoff, 1975).

La componente di multiple case study riguarderà in un primo momento l'analisi di alcune aziende del settore agrifood che hanno integrato soluzioni di intelligenza artificiale e blockchain nella propria supply chain, per poi espandersi eventualmente a settori affini per una verifica di robustezza. Le informazioni ottenute dai casi saranno poi utilizzate per alimentare il panel Delphi, così da validare e/o generalizzare i risultati. I casi oggetto di analisi saranno molto probabilmente selezionati secondo una logica di purposive sampling, privilegiando imprese che abbiano già introdotto o pianifichino l'introduzione delle tecnologie sotto esame e che siano classificate come piccole e medie imprese (PMI) in base ai criteri europei.

Il metodo Delphi è emerso da una prima analisi preliminare dove furono considerate anche altre metodologie qualitative, come discussioni di gruppo o focus group, con l'intento di non volerle concepire solo come semplici "forme allargate di intervista" (Fon tana & Frey, 1994; Goldman, 1962; Hartman, 2004; Mayan, 2009). Difatti, la specificità del tema di ricerca e l'elevato livello professionale e decisionale dei partecipanti che formeranno il "campione di studio" hanno reso preferibile escludere quest'ultime metodologie, poiché rischierebbero di produrre semplici interviste multi-vocali piuttosto che un confronto realmente esperto e

indipendente. Il metodo Delphi si configura come la soluzione ideale per questa impostazione, poiché consente di superare il doppio social desirability bias, evitando le dinamiche di influenza o di soggezione reciproca che possono emergere nei confronti diretti tra partecipanti di alto profilo. Inoltre, riduce drasticamente anche il rischio di litigi o affermazioni forzate delle proprie idee.

A ciò si aggiunge la possibilità di svolgerlo in modo indipendente ed asincrono, eliminando la necessità di incontri in presenza sincrona e favorendo una partecipazione più riflessiva, approfondita ed incondizionata. Il metodo in aggiunta consente di integrare la modalità di ricerca qualitativa con una successiva quantitativa, offrendo la possibilità di esplorare percezioni ed esperienze soggettive, ma anche di analizzare le convergenze e le priorità che emergono nei diversi round di consultazione. Un ulteriore valore aggiunto risiede nel beneficio immediato per i partecipanti, i quali possono accedere alle risposte e alle esperienze condivise dagli altri informant, arricchendo così la propria prospettiva e favorendo un apprendimento reciproco all'interno del processo di indagine. Queste caratteristiche rendono il Delphi particolarmente adatto a studi in cui il tema richiede la raccolta di valutazioni complesse, specifiche e multidisciplinari, facendo emergere insight che non verrebbero fuori utilizzando altre modalità (Morgan, 1998). Il campione previsto comprenderà esperti del settore agrifood che abbiano, o abbiano avuto, un ruolo attivo nella transizione od implementazione delle nuove tecnologie all'interno della propria organizzazione, garantendo l'anonimato dei partecipanti (a meno che tutti non accettino l'opposto all'atto del reclutamento) e selezionati in modo dagarantire omogeneità rispetto all'esperienza nel campo oggetto di studio, assicurando che non vi siano relazioni dirette o conoscenze tra loro, almeno a nostro sapere (Powell et al., 2003). Il numero complessivo dei partecipanti sarà compreso tra 8 e 10, con un possibile overrecruiting del 20% a tutela dei partecipanti in caso di defezioni non preannunciate di alcuni di essi.

Il modello Delphi seguirà un protocollo strutturato e articolato in più fasi (Hasson, Keeney & McKenna, 2008) (tabella 3), con la possibilità di estendersi fino a tre round, garantendone almeno due. Si inizierà definendo la domanda di ricerca e predisponen do la comunicazione da inviareai partecipanti. Successivamente, nel primo round, verrà ipoteticamente inviata una mail contenente una o due domande aperte relative al tema di indagine, accompagnata dall'indicazione dei tempi massimi per la restituzione delle risposte. Le informazioni raccolte saranno poi analizzate e sintetizzate, al fine di individuare le principali aree di convergenza e gli elementi di interesse emersi, così che nel secondo round tali risultati verranno condivisi con tutti i partecipanti, che potranno esprimere valutazioni, priorità o ulteriori riflessioni sui temi più rilevanti emersi. Tale fase permetterà di affinare progressivamente il livello di consenso e di approfondire i punti di disaccordo. Laddove il processo sarà più complesso o necessiterà di maggiore elaborazione, potremmo prevedereun ulteriore round di validazione volto a consolidare i risultati e a garantire la robustezza del consenso raggiunto. Infine, si procederà con l'analisi conclusiva e con la valutazione complessiva del grado di accordo tra gli esperti, così da identificare le convergenze, le divergenze e le possibili linee guida per la ricerca futura.

FASE	DESCRIZIONE
1	Definizione della domanda di ricerca e predisposizione delle mail da inviare
2	Round 1 – Invio ai partecipanti di una mail contenente una o due domande aperte relative al tema di ricerca, con indicazione di tempi massimi di restituzione delle risposte
3	Analisi e sintesi delle risposte del primo round
4	Round 2 – Condivisione dei risultati sintetizzati del primo round, rendendoli poi pubblici a tutti i partecipanti e rilanciando eventuali topic di interesse di ricerca venuti fuori. Richiesta ai partecipanti di esprimere valutazioni o priorità sugli aspetti più rilevanti
5	Feedback controllato e iterazioni successive, con eventuale terzo round di validazione

6	Analisi finale e valutazione del consenso, utile a identificare convergenze, divergenze e possibili linee guida future

Tabella 3. Protocollo Delphi

6. Risultati attesi

L'indagine consentirà di valutare se, e con quale sforzo economico ed umano, anche le imprese che non hanno ancora integrato innovazioni di intelligenza artificiale e blockchain nella propria supply chain possano trarre un vantaggio dall'adozione di tali tecnologie. L'analisi qualitativa, successivamente ed eventualmente supportata da una quantitativa, permetterà di comprendere se la convenienza percepita ed "effettivamente goduta" superi i costi di implementazione e in quali condizioni organizzative ed economiche tale scelta risulti vantaggiosa.

La ricerca vorrebbe inoltre verificare se l'integrazione di AI e blockchain possa generare un miglioramento misurabile nella relazione cliente–fornitore lungo tutta la catena di fornitura (dalla materia prima al consumatore finale). L'adozione di soluzioni innovative può infatti incrementare la tracciabilità, la tempestività e l'affidabilità delle informazioni, elementi che la letteratura riconosce come determinanti nella costruzione della fiducia. Si prevede che i risultati attesi possano offrire un contributo teorico e applicativo nel comprendere l'impatto dell'integrazione tra AI e blockchain sulla profittabilità e sulla gestione delle relazioni nelle supply chain, fornendo alle imprese indicazioni utili per sviluppare strategie tecnologiche più innovative, sostenibili e consapevoli.

The support of incubators and accelerators in value creation during startups' internationalization

Chiara Luisa Cantù[1], Lala Hu[2], Mirko Olivieri[3]

1. Introduction

New ventures are increasingly expanding beyond their national markets, aiming for global reach as a means of survival and competitiveness in today's dynamic business environment (Mintz and Lilien, 2024; Mondal and Sinha, 2025). This growing trend toward internationalization is driven by startups' need to access larger markets, diversify risks, and leverage global innovation ecosystems. However, entering international markets presents considerable challenges (Cantù et al., 2025), including navigating unfamiliar regulatory landscapes, managing cultural differences, and establishing business relationships with foreign stakeholders despite limited brand recognition and market presence. These obstacles often require startups to acquire new capabilities and resources that are difficult to secure independently.

In this context, entrepreneurial support organizations (ESOs), such as incubators and accelerators, have emerged as vital intermediaries that facilitate startups' access to international markets and networks (Marval, 2025). By offering tailored support programs, mentorship, and critical resources, these organizations play an essential role in helping new ventures overcome barriers to internationalization (Dourado Freire et al., 2023; Runfola and Monteverde, 2023). Their interventions often include providing strategic guidance, technical and financial assistance, and fostering network connections, all aimed at accelerating the global expansion of startups.

As highlighted by Bergman and McMullen (2022), ESOs represent an interesting research avenue for advancing studies on entrepreneurial support and support organizing. Thus, the aim of this study is to investigate how incubators and accelerators activate knowledge creation in the internationalization process of startups. Specifically, the research explores the types of resources and services these actors provide and how they tailor their support to address the challenges faced by startups in foreign markets. To achieve these objectives, a qualitative research approach was adopted by conducting 13 semi-structured interviews with entrepreneurs and professionals operating within accelerators, incubators, startups participating in their programs, and other actors. This methodology enables an in-depth exploration of the lived experiences and perspectives of key stakeholders involved in startup internationalization, providing rich insights into the practical mechanisms through which incubators and accelerators facilitate global growth.

Through this approach, the study aims to fill a gap in the existing literature by offering an understanding of how accelerators and incubators support startups to create value during internationalization.

2. Literature review

The academic debate on the internationalization of startups highlights a positive role of accelerators and incubators (e.g., Deyanova et al., 2022; Wu et al., 2025). For example, scholars argue that accelerators and incubators equip startups with relevant competencies, such as effective use of social media for marketing (Hussain and Barman, 2025). In addition, their programs often help startups identify and secure funding opportunities to strengthen their financial capabilities (Paoloni and Modaffari, 2022) and play a key role in forging business connections with global suppliers, partners, and institutions. Indeed, ESOs create international linkages between entrepreneurial ecosystems (Marval, 2025). According to Grilli and Marzano (2023), startups affiliated with university-based accelerators are more likely to engage in R&D collaborations, whereas those in public accelerators tend to form commercial partnerships. Pinto and Rua (2023) recently highlighted that the networking and knowledge sharing improve the understanding of target markets, thus supporting more credible and successful international market entry by connecting entrepreneurs with investors and international stakeholders. In this regard, the recent study by Raeisy et al. (2025) demonstrated that network integration represents a critical success factor, arguing that startups in incubators and accelerators achieve stronger outcomes when embedded in networks which enhance knowledge exchange, resource access, and ecosystem connectivity.

In particular, accelerator hubs offer strong infrastructural backing to innovative ventures (Fuad et al., 2024), and foster exchange of information between international partners, which helps build trust (Schepis, 2021). Furthermore, accelerators may intensify competition among early-stage ventures, stimulating performance improvements (Moritz et al., 2021). In this vein, Costa et al. (2024) suggest that to effectively support global expansion, accelerators and incubators should cultivate an internationalization mindset among participating startups. Literature in international entrepreneurship emphasizes that adopting global business models enhances organizational performance and contributes to the sustainable growth of local economies (Henn et al., 2022).

Although accelerators and incubators share several similarities, they also have distinct characteristics. Accelerators typically operate through time-bound programs designed to support the entrepreneurial journey of startups. They offer resources such as seed funding, co-working spaces, and access to networks, along with educational and mentorship initiatives that often culminate in a demo or graduation event (Cohen et al., 2019). Corporate accelerators, which are sponsored by established firms, follow a similar model but tailor support based on company-specific goals and resources (Del Sarto et al., 2024; Kohaler, 2016).

Conversely, incubators are defined more broadly as shared office spaces that offer strategic support, continuous monitoring, and business assistance with the goal of nurturing startups while minimizing the risk of failure (Hackett and Dilts, 2004). These facilities provide value through network access and are frequently located within innovation hubs or science parks that promote R&D collaborations (Bibeau et al., 2024). Incubation is widely recognized as a model for facilitating new venture development (Bruneel et al., 2012), enhancing startup performance (Hou et al., 2022). Accordingly, Braun and Souranta (2025) highlighted that incubatees are better able to innovate their business models because incubators create a supportive environment which helps entrepreneurs overcome key challenges. Over time, incubators have gained prominence for delivering specialized services that accelerate time-to-market and enable integration into networks of technological and commercial actors (Hausberg and Korreck, 2020).

A key feature common to both accelerators and incubators is their emphasis on networking. These organizations cultivate various relationships across business and non-business domains (Pauwels et al., 2016), which is especially critical in internationalization processes. The ability to share resources and initiate joint activities across national and international settings facilitates innovation and market entry. Access to external networks is fundamental, as it supports complex problem-solving, reduces costs and development time, and accelerates the commercialization and dissemination of innovations (Aarikka-Stenroos et al., 2017).

3. Research aim and methodology

While the internationalization of startups has received considerable attention in the previous literature (e.g., Costa et al., 2024; Forsberg and Hulsink, 2024; Schepis, 2021), the specific role played by accelerators and incubators in this process remains underexplored (Pinto and Rua, 2023). To address this gap, the present study aims to investigate the following research questions:

RQ1. How do accelerators and incubators support startups to create value during internationalization?

Thus, the aim of this ongoing study is to explore how incubators and accelerators support startups to create value during internationalization. Given the exploratory nature of the research, a qualitative approach was chosen (Yin, 1994), relying on semi-structured interviews with professionals from both accelerators and incubators, startups that have participated in acceleration or incubation programs and other actors (Creswell and Creswell, 2018).

The data collection phase began in 2022 and is still ongoing. A total of 13 interviews has been collected with various key informants, including senior managers, managing partners, heads of incubation and open innovation, and other professionals with direct experience in guiding startups through internationalization. Specifically, the current sample includes six startups, three incubators, one accelerator, a national trade agency, and a venture capital firm.

The interviews followed a semi-structured protocol developed by the researchers, based on a comprehensive review of the literature on startup internationalization. While the main themes of the interview guide remained consistent, the questions were adapted to align with the professional roles of the interviewees. For example, startup key informants were first invited to outline their professional backgrounds, then to describe how their companies were supported in expanding internationally, highlighting the involvement of key stakeholders such as suppliers, institutions, and investors. They were also asked to elaborate on the evolution of these relationships. Professionals working within incubators and accelerators were asked to explain how their organizations contribute to the internationalization of new ventures, focusing in particular on the structure and content of the programs they offer to entrepreneurs. All key informants were encouraged to provide concrete examples and share specific stories or experiences from their organizations. At the end of each interview, participants were invited to share any additional insights or relevant information that had not emerged during the earlier stages of the conversation.

Interviews were conducted through Microsoft Teams and lasted approximately one hour. With the informed consent of the participants, all interviews were recorded and subsequently transcribed verbatim to ensure accuracy and facilitate in-depth analysis.

The transcribed interviews serve as the primary source of data for the study and are supplemented by additional material shared by key informants, including company presentations, internal reports, press releases, and articles from relevant industry publications. The analytical process is being carried out using a coding strategy informed by principles of grounded theory. Specifically, the researchers are employing open, axial, and selective coding to enable constant comparison across cases (Corbin and Strauss, 1990). As the analysis progresses, recurring themes and patterns are emerging and are being interpreted in light of a priori framework informed by the existing body of literature on international entrepreneurship and startup support ecosystems.

4. Preliminary results

The preliminary findings of this study underscore the key role that incubators and accelerators play for supporting startups to create value during internationalization. The analysis has revealed three key areas: (1) characteristics of the support programs for startups, (2) the main resources provided to startups during internationalization, and (3) the development of

international business relationships. The findings also highlight several important distinctions between the roles incubators and accelerators play in the internationalization process.

4.1. Characteristics of the support programs for startups

Both accelerators and incubators offer support programs for startups. However, one of the most notable differences lies in the duration and scope of the programs offered to startups. Accelerator programs are typically short-term and intensive, designed to help startups rapidly scale or transition to their next growth milestone, such as securing a new round of investment or entering a foreign market. These programs generally follow a structured timeline and culminate in a demo day or investor pitch event.

Incubators tend to offer long-term support, often spanning several years, and sometimes extending beyond the initial incubation period through affiliated institutions such as innovation hubs or science parks. This extended timeline allows incubators to adapt their services to the evolving needs of startups, with a stronger emphasis on sustained growth and capacity building. Incubators commonly provide tutorship services focused on business plan development, as well as mentorship opportunities facilitated through collaborations with large corporations and SMEs within the innovation ecosystem.

4.2. Main resources provided to startups during internationalization

Startups participating in either type of program generally report an enhanced capacity to expand into international markets. However, the nature of the support provided varies. Accelerators typically offer access to a curated network of international mentors, investors, and local stakeholders in target markets. Additionally, many accelerators provide startups with seed funding or equity-based investment as part of their value proposition. They also offer practical guidance, such as insights into international customer behavior and market entry strategies and equip entrepreneurs with technical and managerial skills through structured training modules.

In contrast, incubators provide more personalized consultancy services that help startups prepare for the complexities of international expansion. These include support for understanding local market dynamics, navigating foreign regulatory environments, and adapting business models to global scalability. The findings suggest that incubators play a critical role in helping early-stage ventures overcome cultural, legal, and operational barriers. Their long-term engagement enables them to guide startups through the foundational phases of growth and support their integration into relevant business networks.

4.3. The development of international business relationships

Both incubators and accelerators facilitate valuable opportunities for startups to expand their networks beyond domestic borders. They do so by granting access to international events, pitch competitions, and matchmaking initiatives with potential investors, customers, and strategic partners. These activities improve the visibility and credibility of startups in global markets and foster trust-based relationships that are essential for international growth.

In sum, while both incubators and accelerators act as enablers of knowledge creation in startup internationalization, their approaches differ in intensity, duration, and service orientation. Accelerators emphasize rapid scaling through high-intensity programming and investment readiness, whereas incubators offer long-term developmental support tailored to the evolving needs of startups. However, both contribute meaningfully to improving the access of startups to international markets by providing resources, knowledge, and relational capital.

5. Discussions and conclusions

The findings of this study highlight that ESOs play a fundamental role in supporting startups to create value throughout the internationalization process. Consistent with previous research (Costa et al., 2024; Hussain and Barman, 2025; Marval, 2025), these support organizations facilitate the development of strategic relationships with international stakeholders and activate a broad range of resources: both tangible, such as infrastructure and technical support, and intangible, such as expert knowledge, access to global networks, and the reinforcement of trust. These elements are instrumental in helping startups shape their internationalization strategies and overcome key barriers to entering foreign markets.

However, the study also reveals important distinctions in the way accelerators and incubators operate in this context. Accelerators tend to focus on short-term, high-intensity support that accelerates connections with investors, international mentors, and market entry opportunities. Their programs are often geared toward preparing startups for rapid growth, investment readiness, and immediate international expansion. On the contrary, incubators focus on long-term engagement, nurturing sustained business relationships, and supporting the gradual development of core entrepreneurial capabilities. This includes assistance in areas such as business model refinement, regulatory compliance, and cultural adaptation, capabilities that are essential for building a foundation for future international growth.

Importantly, the results also indicate that both types of organizations provide tailored support based on the specific innovation profile and development stage of the startups they host. In line with Donaldson et al. (2025), this individualized approach encompasses customized training modules, targeted mentorship, and carefully curated networking opportunities. Such tailored support is crucial for enabling startups to transition into scaleups, particularly as they navigate the complexities of internationalization.

In general, this study reinforces the idea that incubators and accelerators serve as intermediaries and enablers to create value in the global innovation ecosystem. By mobilizing both internal resources and external networks, these actors improve the international readiness of startups and contribute to the diffusion of innovation across borders. Their complementary roles, i.e., accelerators driving speed and access, incubators fostering depth and resilience, highlight the multifaceted nature of entrepreneurial support in global markets.

Generally, this study contributes both to academic debate and provides managerial implications. Indeed, although the academic literature has increasingly addressed the internationalization of startups in recent years (e.g., Kuster and Rezende, 2022; Olivieri and Testa, 2024), the specific role of accelerators and incubators in facilitating new ventures' access to international markets remains underexplored. This study contributes to filling this gap by shedding light on how these support organizations actively intervene in the internationalization processes of startups.

In particular, the findings offer an original perspective on the role of incubators and accelerators within the broader field of startup internationalization focusing on value creation. The analysis reveals that both types of organizations are instrumental in enabling startups to establish relationships with international stakeholders and in mobilizing key tangible and intangible resources. However, their modes of intervention differ substantially. Accelerators tend to emphasize short-term engagement aimed at rapidly building investors and mentoring relationships to facilitate rapid market entry. On the contrary, incubators focus on cultivating long-term business relationships and strengthening the entrepreneurial capabilities necessary for sustainable international growth. Indeed, as demonstrated by Bandera and Thomas (2017), startups that collaborate with more than one type of partner have a higher survival rate, and incubators play a key role in this regard.

Moreover, this study offers several important implications for professionals and policy makers involved in the startup ecosystem.

First, the findings highlight the proactive and multifaceted role that ESOs play in activating knowledge for the internationalization of startups. These organizations provide critical capabilities that help startups shape their strategies and overcome the various barriers to entering foreign markets. Both incubators and accelerators provide a combination of tangible resources, such as physical infrastructure and technical support, and intangible assets, including specialized knowledge, access to extensive business networks, and the reinforcement of trust. This dual support system is essential for startups to successfully navigate the complexities of international expansion.

Second, consistent with the insights of Donaldson et al. (2025), our research confirms the importance of tailoring support to the specific innovation level and development stage of each startup. Customized training, mentorship, and networking opportunities are crucial components of effective incubation and acceleration programs. In line with Catanzaro et al. (2020), it is suggested that export support services should be adapted to early internationalizing startups. Furthermore, to maximize their impact, these programs should be ideally co-designed and implemented in collaboration with policymakers.

More generally, ESOs enable knowledge creation in startup internationalization more effectively if they are integrated within a broader ecosystem that includes institutions, local partners, venture capitalists, and other stakeholders (Noronha and Pillai, 2025). Over time, as startups gain experience and establish direct relationships within international markets, their reliance on incubators and accelerators may decrease (Gao et al., 2021). This progression underscores the importance of dynamic support models that evolve alongside the growing maturity and market engagement of startups.

In summary, these findings suggest that startup internationalization requires coordinated efforts among multiple actors in the ecosystem, supported by flexible and tailored incubation and acceleration programs designed to meet the evolving needs of startups.

Connettere per innovare: le reti di relazioni nella transizione verso modelli di business circolari

Matteo Dominidiato[1], Annalisa Tunisini[2]

1. Introduzione

Negli ultimi anni, il dibattito scientifico relativo ai modelli di business circolari ha conosciuto un incremento sostanziale (Geissdoerfer et al., 2018; Huemer & Flygansvær, 2025).

La letteratura ha focalizzato l'analisi sui cambiamenti interni alle imprese, esaminando come la transizione circolare influenzi le strutture organizzative, i processi intraorganizzativi e le capacità di innovazione (Broccardo et al., 2025; Ranta et al., 2018). Tuttavia, si è sviluppato anche un crescente interesse verso la dimensione interorganizzativa in contesti di mercato, considerando la collaborazione con fornitori, clienti e altri attori, con i quali vengono condivise risorse, conoscenze e competenze (Athaide et al., 2018; Barletta et al., 2024; Pedersen et al., 2023; Stål et al., 2023).

In particolare, l'evoluzione verso modelli di business circolari implica un ripensamento complessivo delle modalità attraverso cui le imprese si relazionano tra di esse. La transizione non si esaurisce nella ridefinizione delle attività produttive o nella sostituzione di risorse materiali, ma comporta una trasformazione dei processi relazionali che sostengono la cooperazione tra gli attori del network (Urbinati et al., 2017). In tal senso, il raggiungimento della circolarità può essere interpretato come un processo che ridefinisce il modo in cui le imprese interagiscono, condividono informazioni e sviluppano innovazioni congiunte (Rizos et al., 2016).

Questa prospettiva mette in luce come il passaggio da un modello di business lineare a uno circolare non sia un semplice mutamento tecnologico, bensì un cambiamento più complesso che richiede nuove forme di coordinamento, fiducia e reciprocità che tradizionalmente contraddistinguono le relazione di business (Bocken et al., 2016). Le relazioni interorganizzative sembrano diventare, quindi, un elemento costitutivo della circolarità, poiché consentono la gestione congiunta di risorse, la progettazione di soluzioni comuni e la co-creazione di valore lungo l'intera filiera (Aarikka-Stenroos et al., 2022; Stumpf et al., 2021). Comprendere tali trasformazioni significa, dunque, osservare come le imprese adattino il proprio modello di business non solo al proprio interno, ma anche nella configurazione delle loro relazioni esterne.

La ricerca, infatti, vuole evidenziare come nel dibattito sui modelli di business circolari sia necessario spostarsi da una prospettiva interna all'impresa verso una visione più ampia, che include le relazioni interorganizzative e i processi di scambio tra attori. La transizione alla circolarità appare, infatti, come un fenomeno complesso e multilivello, in cui la riconfigurazione dei modelli di business si intreccia con la trasformazione delle relazioni e delle interdipendenze che definiscono la struttura dei network.

Tale prospettiva consente di superare una lettura che guarda principalmente alle attività intraorganizzative rispetto ai processi di transizione, ponendo attenzione ai meccanismi di collaborazione, adattamento e co-creazione che sostengono il raggiungimento di un modello di business circolare.

[1] Ricercatore, ECON-07/A, Università Cattolica del Sacro Cuore; matteo.dominidiato@gmail.com – corresponding author

[2] Professoressa ordinaria, ECON-07/A, Università Cattolica del Sacro Cuore; annalisa.tunisini@unicatt.it

Sul piano teorico, il lavoro propone di considerare la circolarità non soltanto come un esito di innovazione tecnologica o di strategia d'impresa, ma come un processo relazionale che prende forma attraverso interazioni reiterate tra attori interdipendenti. In questa prospettiva, le relazioni interorganizzative diventano una componente costitutiva del modello di business, non un semplice contorno operativo.

2. Quadro teorico

In questo quadro, diversi contributi della letteratura hanno cercato di classificare le imprese in base al grado di integrazione della circolarità nei propri modelli di business, individuando traiettorie evolutive che riflettono diversi livelli di maturità organizzativa e relazionale (Bocken & Konietzko, 2022; Djelic & Quack, 2007; Foroozanfar et al., 2022; Salmi & Kaipia, 2022).

Infatti, la recente letteratura scientifica distingue tre principali categorie di imprese nel processo di transizione verso la circolarità (Salmi & Kaipia, 2022). Le Linear Incumbent sono aziende storicamente ancorate a modelli di business lineari, che basano la propria competitività sull'efficienza produttiva e sull'ottimizzazione dei costi; la loro evoluzione verso la circolarità risulta spesso ostacolata da "dipendenze di percorso" (Djelic & Quack, 2007), legate a routine operative. Le Circular Incumbent, d'altra parte, corrispondono a imprese che hanno avviato processi di riconfigurazione dei propri modelli di business, integrando elementi di eco-innovazione, riuso o riciclo nei flussi produttivi. Infine, le Born Circular sono imprese nate direttamente su principi di economia circolare: spesso piccole realtà o start-up che sperimentano nuovi paradigmi organizzativi, relazionali e tecnologici, facendo della sostenibilità la propria proposizione di valore distintiva.

Accanto a questa classificazione in letteratura sull'innovazione dei modelli di business per la sostenibilità si trova una ulteriore distinzione tra due principali approcci evolutivi. Il primo, definito accomodativo, si basa su interventi graduali e incrementali che mirano a migliorare l'efficienza dei processi interni, ridurre gli sprechi o integrare pratiche ambientali senza modificare in modo sostanziale la logica complessiva del modello di business (Schaltegger et al., 2012). In questo caso, la sostenibilità viene incorporata come estensione o adattamento delle attività esistenti, senza alterare la struttura fondamentale delle attività intraorganizzative (Makkonen & Johnston, 2014; Melander & Tell, 2019).

Il secondo approccio, definito proattivo, implica invece una riconfigurazione più profonda del modello di business. Le imprese che adottano questa strategia tendono a rivedere il proprio core business alla luce di obiettivi ambientali e sociali, integrando la sostenibilità come parte integrante della proposta di valore, delle relazioni con gli attori e delle logiche di profitto. Si tratta di un cambiamento che non riguarda solo i processi, ma anche l'identità e la missione dell'impresa.

Massa et al. (2017) propongono una distinzione analoga tra due modalità di trasformazione del modello di business: la riprogettazione completa, che comporta la creazione di una nuova architettura di attività e risorse in linea con i principi della sostenibilità e della circolarità, e la riconfigurazione di elementi esistenti, in cui l'impresa conserva la struttura di base ma introduce progressivamente nuovi elementi, come pratiche di riuso, riciclo o collaborazione interorganizzativa (Melander & Tell, 2019).

Queste prospettive contribuiscono a chiarire le diverse traiettorie evolutive verso la circolarità, ma restano in larga parte centrate sulle trasformazioni interne all'impresa. Tali classificazioni infatti si concentrano principalmente sull'analisi delle dimensioni interne ai modelli di business, come la capacità organizzativa, le strategie di innovazione e la gestione delle risorse, senza approfondire i cambiamenti che si verificano a livello dei processi interorganizzativi (Melander & Tell, 2019).

Le dinamiche interorganizzative offrono invece una chiave interpretativa utile per analizzare come la circolarità emerga dalle interazioni tra attori interdipendenti e dai processi di adattamento

reciproco che legano imprese, fornitori e clienti (Håkansson & Snehota, 1989). Secondo questo aspetto, il modello di business non è concepito come un sistema chiuso, ma piuttosto come un insieme di relazioni che subiscono trasformazioni nel tempo in funzione dei flussi materiali, informativi e di conoscenza che attraversano la rete (Håkansson et al., 2009). Infatti, le modalità attraverso cui le imprese sviluppano la transizione verso modelli di business circolari variano sensibilmente in relazione alla loro dimensione e struttura organizzativa. Le grandi imprese tendono a gestire la circolarità attraverso risorse dedicate, competenze specializzate e meccanismi formali di coordinamento, che consentono di pianificare e monitorare in modo sistematico le trasformazioni dei propri modelli di business. Al contrario, le PMI, spesso caratterizzate da strutture più flessibili ma da risorse limitate, attivano percorsi di innovazione circolare principalmente attraverso le relazioni (Luthra et al., 2022; Rizos et al., 2016). La collaborazione con altri attori diventa lo strumento attraverso cui accedere a conoscenze, competenze tecniche e opportunità di sperimentazione che non potrebbero essere sviluppate internamente.

Per questo, lo sviluppo di un modello circolare non può essere interpretato come il risultato di strategie isolate, ma come l'esito di processi relazionali fondati su interazioni, adattamenti e scambi tra attori interdipendenti che sono determinanti per il successo dello stesso modello di business (Håkansson & Waluszewski, 2007).

La circolarità emerge quindi all'interno dei network, dove imprese, fornitori, clienti e partner tecnologici co-evolvono e ridefiniscono nel tempo le proprie relazioni.

In tale prospettiva, la ricerca intende indagare come i processi di trasformazione verso modelli di business circolari influenzino – e, al contempo, siano influenzati da – le dinamiche organizzative e le relazioni inter-organizzative nei network locali delle PMI.

3. Obiettivi della ricerca

Questo studio, nel tentativo di riflettere sulle dinamiche interorganizzative, vuole far luce sul rapporto tra il processo aziendale rivolto allo sviluppo di un modello di business più orientato alla circolarità e la gestione delle relazioni interorganizzative. Queste ultime, oggetto di particolare attenzione dello studio, possono costituire per le PMI non solo un'opportunità per avviare la transizione verso modelli di business circolari, ma anche uno spazio in cui tale trasformazione finisce per ridefinire la natura stessa delle relazioni inter-organizzative. Le PMI, caratterizzate da capacità strategiche e risorse limitate, tendono storicamente a valorizzare le reti relazionali come leva per colmare tali vincoli; in questo quadro, le interazioni con fornitori, clienti e partner strategici assumono un ruolo cruciale.

La collaborazione inter-organizzativa, già riconosciuta come motore di innovazione, può infatti alimentare un circolo virtuoso in cui lo scambio continuo di conoscenze, competenze e risorse sostiene la transizione verso la circolarità. Contemporaneamente, il processo di trasformazione circolare può generare nuove esigenze, nuovi standard e nuove pratiche che rivedono le modalità di cooperazione tra gli attori, modificando le aspettative reciproche, la natura degli scambi e le forme di coordinamento.

Le relazioni inter-organizzative non si limitano, infatti, al mero trasferimento di beni o servizi legati a una transazione economica: esse costituiscono piattaforme complesse di interazione, in cui circolano informazioni, capacità tecniche e visioni strategiche. In questo ambiente dinamico, la transizione circolare e l'evoluzione delle relazioni nelle reti locali si alimentano reciprocamente, contribuendo a definire nuovi percorsi di sviluppo per le PMI.

4. Metodologia

Per studiare questo fenomeno, la ricerca adotta un approccio qualitativo che permette di esplorare in profondità le dimensioni relazionali inter-organizzative alla base dello sviluppo di modelli di business circolari nelle piccole e medie imprese. Tale approccio consente di cogliere

non solo la struttura formale delle relazioni, ma anche le dinamiche meno visibili che emergono nei processi di collaborazione: le logiche di scambio, i meccanismi di fiducia, le interdipendenze operative, le pratiche condivise e le percezioni degli attori coinvolti. Attraverso interviste approfondite, analisi comparativa dei casi e ricostruzione narrativa dei percorsi di transizione, il metodo qualitativo rende possibile comprendere come le relazioni influenzino la trasformazione verso la circolarità. Al contempo, consente di osservare come tale trasformazione riorienti e ridefinisca le relazioni stesse (Eisenreich et al., 2021; Runfola et al., 2017). Tale scelta metodologica si fonda sulla natura esplorativa dell'indagine, che mira a comprendere come la transizione verso modelli di business circolari emerga dalle interazioni tra attori oltre che da strategie formalizzate rivolte ai processi intraorganizzativi. Coerentemente con tale impostazione, le interviste in profondità rappresentano lo strumento più adeguato per raccogliere evidenze empiriche dirette, consentendo di indagare i significati, le percezioni e le pratiche attraverso cui le imprese interpretano e costruiscono relazioni orientate alla sostenibilità (Eisenhardt & Graebner, 2007).

Le interviste sono state condotte con PMI appartenenti ai settori del tessile e della pelletteria, ambiti in cui i legami interorganizzativi assumono un ruolo centrale nei processi di innovazione e cooperazione. La ricerca segue l'approccio del systematic combining (Dubois & Gadde, 2014), che valorizza la connessione dinamica tra teoria ed evidenza empirica. In questo modello, il processo di analisi non si sviluppa in modo lineare ma attraverso un continuo movimento tra quadro teorico, dati raccolti e concettualizzazione emergente. Tale logica consente di affinare progressivamente i concetti interpretativi, costruendo un dialogo costante tra letteratura e osservazione empirica.

Attraverso questa impostazione, la ricerca non si limita a verificare ipotesi predefinite, ma mira a far emergere nuove interpretazioni su come la transizione verso modelli di business circolari prenda forma nelle relazioni tra attori e, al contempo, le trasformi. In questo modo offre un contributo concettuale ed empirico alla comprensione dei processi di innovazione sostenibile nelle PMI.

5. Contesto empirico

Il settore tessile e della pelletteria costituisce un contesto empirico particolarmente rilevante per indagare le dinamiche relazionali che caratterizzano la transizione verso modelli di business circolari. Si tratta di comparti storici del made in Italy, definiti da una forte frammentazione produttiva e da una prevalenza di piccole e medie imprese. Le aziende operano lungo filiere articolate, in cui i processi di progettazione, lavorazione e distribuzione sono distribuiti tra una molteplicità di attori, generando un elevato grado di interdipendenza. La numerosità e la stabilità delle relazioni tra imprese rendono questi settori un terreno privilegiato per osservare come cooperazione e scambio di conoscenze possano sostenere la transizione verso pratiche più sostenibili e circolari.

L'interesse verso questi contesti deriva dal fatto che essi rappresentano una sintesi tra continuità e innovazione. Pur basandosi in gran parte su modelli di business tradizionali, centrati su processi lineari e su logiche di efficienza produttiva, molte imprese stanno progressivamente sperimentando pratiche di recupero, riuso e rigenerazione dei materiali. Allo stesso tempo, la densità relazionale tipica di questi comparti costituisce una risorsa distintiva: le relazioni di lungo periodo, fondate su fiducia e conoscenza reciproca, favoriscono la condivisione di risorse, competenze e soluzioni tecniche.

Per le PMI, tali relazioni non rappresentano soltanto un mezzo per garantire stabilità operativa, ma anche una leva strategica di innovazione. La prossimità relazionale e la capacità di cooperare con altri attori diventano infatti elementi centrali per sviluppare configurazioni di rete orientate alla circolarità. In questo senso, il tessile e la pelletteria offrono un luogo privilegiato

per comprendere come la sostenibilità e l'innovazione emergano non da processi isolati, ma dal continuo intreccio di relazioni che definisce l'identità stessa di questi sistemi produttivi.

6. Risultati preliminari e discussione

Dall'analisi dei dati emerge come l'interesse per l'ottimizzazione dei processi, il riciclo degli scarti e le soluzioni di eco-design si sia sviluppato all'interno di un sistema di relazioni consolidate con fornitori tecnologici, laboratori territoriali e aziende del distretto. Queste collaborazioni attivano processi inter-organizzativi di sperimentazione congiunta e di scambio di conoscenze che risultano propedeutici all'adozione di pratiche circolari e alla loro integrazione nei processi aziendali.

Parallelamente, il graduale orientamento verso la circolarità ha portato l'azienda a rivedere alcune componenti del proprio modello di business, introducendo nuove attività, nuovi processi e modalità produttive più integrate che richiedono un coordinamento più intenso e strutturato con la rete di partner. L'adozione di pratiche di eco-design e il riciclo sistematico degli scarti, ad esempio, richiedono la creazione di flussi informativi continui con fornitori specializzati, la definizione congiunta di specifiche tecniche e l'avvio di sperimentazioni condivise su materiali e processi. Allo stesso modo, le esigenze di efficientamento richiedono una maggiore sincronizzazione con i terzisti, i laboratori e gli attori distrettuali, rendendo i processi inter-organizzativi parte integrante del funzionamento del nuovo modello operativo.

In questo modo, la trasformazione verso modelli di business circolari non solo è abilitata dalle relazioni esistenti, ma contribuisce a sua volta a ridefinirle: i partner sono maggiormente coinvolti nelle fasi di progettazione e di revisione dei processi, gli ambiti di collaborazione si ampliano e i meccanismi di coordinamento diventano più stabili e ricorrenti. Le relazioni, inizialmente funzionali alla sperimentazione, si consolidano dunque come elementi strutturali del modello di business rinnovato, rafforzando i legami esistenti e generando nuove forme di cooperazione. Il caso mostra quindi un circolo virtuoso in cui i processi inter-organizzativi sostengono la transizione circolare e, al contempo, la transizione modifica tali processi e favorisce l'innovazione del modello di business, confermando la natura bidirezionale delineata dalla domanda di ricerca.

7. Conclusioni

La ricerca, dunque, sebbene in una sua fase preliminare, tenta di individuare diverse configurazioni relazionali che caratterizzano le PMI nella loro transizione verso modelli di business circolari. Ci si attende di poter distinguere tra imprese che utilizzano le relazioni prevalentemente come meccanismi di supporto operativo e quelle che le trasformano in leve strategiche di innovazione e rigenerazione delle risorse. L'analisi delle interazioni e delle pratiche collaborative consentirà di elaborare una classificazione interpretativa delle modalità con cui le imprese fanno leva sulle relazioni interorganizzative per sostenere la circolarità. I risultati attesi mirano quindi a far emergere un quadro di lettura capace di spiegare come la rete di relazioni possa costituire, per le PMI, una fonte di resilienza e apprendimento collettivo, favorendo percorsi di transizione sostenibile più coerenti con le loro specificità strutturali.

Digital Platforms for Value Chain Collaboration in the Smart Building Sector: an explorative case study

Elisa Martina Martinelli[1]

1. Introduction and theoretical background

In the current fast changing and highly competitive business environment, companies are compelled to manage increasing complexity driven by the demand for more sustainable and innovative solutions. This dynamic global context, characterized by increasingly interconnected and demand-driven supply chains and growing customer expectations, necessitates the evolution of traditional sectors.

The construction and building sector is currently undergoing transformation to address these challenges (Ghansah, 2024), and to effectively manage these critical social-economic and environmental challenges, modern buildings are undergoing a continual evolution. They are increasingly engineered to simultaneously minimize their ecological footprint and enhance occupant quality of life, leveraging new technologies to optimize resource efficiency and ensure robust waste management across the entire building lifecycle. This evolution is driven mainly by the diffusion and adoption of technologies such as Artificial intelligence (AI), Internet of Things (IoT), and advanced data analytics tools (European Commission, 2025a). The smart building concept, defined as a structure capable of "sensing, interpreting, communicating, and actively responding" to changing conditions (European Commission, 2025b), identifies a building embedded with solutions that utilize data-driven and needs-based technologies, often leveraging real-time data from various sensors and user inputs to optimize resources according to specific demands (Farzaneh et al., 2021). These technologically-equipped buildings require integrated digital platforms to manage multiple assets in real time, monitoring performance and ensuring building functionality, comfort, and sustainability. The smart building concept has gained increasing attention in academia and industry due to its capability to improve efficiency and intelligently support life, particularly in facility management. Consistent with the European Commission (2025b) conceptualization, this research focuses on the smart building's critical role during the facility management stage in a business-to-business (B2B) environment. This stage necessitates the deliberate integration of people, places, and processes to optimize the built environment. In particular, the strategic objective of an owner of a building is to satisfy the demand side: supporting the productivity of the business customer elevating their occupant experience. It is through a proper facility management system that the necessary functionality, efficiency, comfort, safety, and sustainability of the built environment are ultimately ensured (Ghansah, 2024). Considering the socio-economic and sustainability issues, the evolution of technology and the global trends, the potential application of the Digital Twin (DT) concept in the construction and building sector has attracted increasing interest from researchers and practitioners (Ghansah and Lu, 2023). Despite the vast potential of DT for smart buildings, significant challenges emerge during the decision to implement these technologies specifically at the facility management stage, primarily due to the conceptual novelty of this integration (Holopainen et al., 2024).

[1] Research fellow, ECON-07/A, Università Cattolica del Sacro Cuore di Milano; elisamartina.martinelli@unicatt.it – corresponding author

In the contemporary business landscape, characterized by rapid shifts and intense competition, organizations are increasingly forced to navigate complexities driven by the urgent demand for sustainable and innovative solutions. This global environment is defined by interconnected, demand-driven supply chains and heightened customer expectations, making the evolution of traditional sectors a necessity rather than an option. Among these, the construction and building sector is currently undergoing a significant transformation to address these modern challenges. This evolution is vital for both socio-economic and environmental reasons. On one hand, the building stock of a nation is a cornerstone of its socio-economic development (Arun et al., 2025; Chatzikonstantinidis et al., 2025). On the other hand, this sector is a major contributor to the global climate crisis, as it accounts for approximately 32% of the world's energy consumption and 34% of global CO2 emissions (UN Environment Programme, 2025).

To manage these social and environmental pressures, modern buildings are evolving to minimize ecological footprints while enhancing occupant quality of life. This shift is primarily propelled by the adoption of advanced technologies such as Artificial Intelligence (AI), the Internet of Things (IoT), and sophisticated data analytics (European Commission, 2025a). A smart building is thus defined as a structure capable of sensing, interpreting, and responding to changing conditions, utilizing data-driven technologies to optimize resources according to specific demands (European Commission, 2025b). These buildings require integrated digital platforms to manage assets in real time, ensuring functionality, comfort, and sustainability.

The smart building market is experiencing substantial growth, valued at 117.4 billion USD in 2024 and projected to reach 548.5 billion USD by 2032 2032 (Fortune Business Insights, 2025). Within this market, the facility management stage is particularly critical, especially in business-to-business (B2B) environments. This stage involves the deliberate integration of people, places, and processes to optimize the environment for productivity and occupant experience. Consequently, the application of the Digital Twin (DT) concept has gained significant traction. Originating in the early 2000s, the DT creates a connection between virtual and real spaces through continuous data flow (Grieves, 2005).

Despite its potential for efficient fault detection and carbon emission reduction, incorporating DT at the facility management stage presents challenges due to its conceptual novelty. Current research is limited, often because of the high complexity of modeling the underlying physics and a historical tendency to view smart buildings through a purely operational lens (Bujari et al., 2021; Ghansah, 2024; Holopainen et al., 2024; Seghezzi et al., 2021).

Integrating DT into facility management establishes a powerful virtual platform for real-time analysis and operational execution (Sepasgozar et al., 2020). It functions as a optimization management system that consolidates data from disparate sources into a Single Pane of Glass (SPOG), creating a single source of truth for all building systems (IBM, 2025). Key systems providing information for this DT include Building Information Modeling (BIM), which manages 3D models and life cycle data (Villani et al., 2025), and the Building Management System (BMS), which monitors core functions like heating and security (Ahmad and Alshurideh, 2025a). The emergence of IoT-enabled BMS marks a turning point, allowing buildings to monitor environmental parameters and occupancy to reduce energy usage (Taboada-Orozco et al., 2024). The further integration of AI leads to AIoT-enabled BMS, facilitating predictive maintenance and strategic coordination among diverse stakeholders (Poyyamozhi et al., 2024). This technological transition fosters a customer-oriented strategy where DT provides real-time feedback to align stakeholders and satisfy the business customer (Chatzikonstantinidis et al., 2025).

Given the current context, the existing body of literature, and the identified lack of extensive research, this study primarily aims to investigate how emerging digital platforms are transforming the smart building industry. Specifically, the research explores how these platforms facilitate the use of DTs to foster collaboration among various value chain participants while promoting a customer-centric strategic integration paradigm specifically tailored to the business client and the actual users of the building.

2. Methodology

The research is currently in an initial exploratory phase of a larger ongoing project. It utilizes a qualitative approach grounded in a single case study design. This methodological choice is justified by the suitability of qualitative methods for exploratory inquiries in specialized, dynamic industries like the smart building sector (Ellram, 1996; Yin, 2013). A deep analysis of a single successful case allows for uncovering complex organizational and collaborative dynamics that quantitative instruments might miss (Gustafsson, 2017; Yin, 2009). This approach provides theoretical depth by examining a contemporary phenomenon within its real-world context where the boundaries between technology and organization are often blurred (Yin, 2013).

The subject of this study is Company Alpha, a firm founded in 2000 in Rome that operates as a global platform-based entity across four continents. Alpha was chosen because it represents a best practice in implementing platform-based strategies to address sustainability and value chain integration. The company focuses on an experience-first approach to create sentient built environments by leveraging data as a critical asset. Its core technology is a proprietary modular digital platform designed for the development and management of space-centric applications. Alpha's influence is notable in the national facility management market, and its growth is fueled by an aggressive mergers and acquisitions strategy, such as its 2025 acquisitions of a Spanish solution provider and an open innovation firm.

To analyze Alpha’s strategic transition, the study employs the ORBIT innovation framework (Ahmad and Alshurideh, 2025b; Narang and Devaiah, 2014). This framework consists of five phases: Opportunity Scanning, Research & Development, Building Collaborative Ecosystems, Implementation, and Tracking Performance. Data collection involved a triangulation of primary and secondary sources. Secondary data included a review of corporate reports, market analyses, and official websites to establish strategic positioning. Primary data were gathered through two semi-structured interviews conducted face-to-face in November 2025. One interview was held with the Managing Director to understand the internal R&D process and strategic vision, while the second was with a Company Consultant to gain an outside-in perspective on ecosystem development and stakeholder collaboration.

3. Preliminary considerations and future developments

The preliminary findings from the case of Company Alpha demonstrate the pivotal role of digital platforms in reshaping the smart building sector through DT-enabled collaboration. Analysis through the ORBIT framework shows that Alpha moved beyond conventional DT by identifying energy inefficiency and spatial rigidity as critical shortcomings in traditional models. A specific opportunity was recognized in the rise of smart working, where organizations required building providers to guarantee accessible workspaces for employees near their homes. Consequently, Alpha implemented its digital platform as a technological core that connects service supply from contractors and engineers with corporate demand from business clients.

In the R&D phase, Alpha designed its platform as a Platform-as-a-Service (PaaS) to optimize interactions between physical assets and occupants. By integrating BIM processes, the platform allows for a holistic visualization of the building and data-driven decision-making in real-time. Furthermore, the platform utilizes AIoT-enabled BMS to aggregate data from various sensors, applying machine learning for predictive maintenance and dynamic climate control based on actual occupancy. This enables the building to function as an extended collaborative community ecosystem where the platform acts as a market mediator between demand and supply. The open architecture ensures interoperability, allowing all stakeholders to co-create value by contributing information and tracking transactions.

During implementation, Alpha focused on creating a self-improving solution based on business customer needs. The platform integrates data in a single sharing environment, making the building more transparent and improving occupant comfort. This method decentralizes control, allowing for rapid intervention in maintenance and real-time updates to the information contained in the DT. Finally, in the tracking performance phase, value is measured through outcomes such as energy savings and employee well-being rather than just square footage. These insights are then used to identify new opportunities, starting the iterative loop of innovation again.

By examining a novel solution that surpasses conventional methods in smart building facility management, this preliminary study addresses specific voids in the existing literature. Although DTs offer significant potential, there is a marked deficiency in research regarding their application during the facility management phase (Bujari et al., 2021; Ghansah, 2024; Holopainen et al., 2024; Seghezzi et al., 2021). This lack of academic inquiry is largely due to the novelty of the concept and the technical difficulties associated with modeling complex physical processes within new digital platforms (Pašek and Sojková, 2018). Moreover, current scholarship is mostly limited to engineering perspectives, failing to provide strategic insights from a supply chain management standpoint or to explore the value chain through a customer-focused marketing lens.

Managerially, the case shows how, by leveraging new technologies (e.g., AIoT-enabled BMS), it is possible to develop solutions that valorize and enrich the value chain, orienting it towards customer-centric strategies. This has allowed Alpha to position itself not only as a strategic intermediary between B2B supply and demand, revolutionizing the facility management process, but also to include another strategic actor in the value chain: the business customer and, in particular, the final user of the smart building (specifically, its employees). This new technological platform has allowed, in fact, the creation of an extended collaborative community ecosystems in which the user is not only the focus of the value chain, but also actively contributes to the improvement and development of the platform in the management and efficiency of the smart building, thereby maximizing their satisfaction.

Despite providing valuable exploratory insights into the platform-based integration of the construction value chain, the principal limitation of the present research resides in its current preliminary stage of investigation and the use of a singular case study design. While a single case offers theoretical depth, it inherently restricts the generalizability of the findings across the wider building sector. The initial results, therefore, serve primarily as an exploratory foundation for further analysis and investigations. Future research efforts will address this limitation through a structured progression towards generalization. Specifically, the next phase of investigation should embrace a multiple case study approach, allowing for cross-case comparison and pattern identification regarding collaborative platform implementation across different firm sizes and geographical contexts. Furthermore, subsequent studies will incorporate a longitudinal analysis design to capture the temporal evolution of collaborative ecosystems and the long-term impacts of AIoT-enabled platforms on operational efficiency and sustainable performance. Beyond these comparative and temporal studies, a critical avenue for future research involves exploring the applicability and implementation challenges of this platform-based model across diverse sectors to assess the model's scalability and multi-industry relevance.

The Impact of Reselling Platforms on Fashion Consumer Behavior: A Cross-Country Comparative Study

Ilaria Galavotti[1], Francesca Negri[2], Giada Castagnoli[3]

1. Introduction

Fashion industry is at the intersection of commerce, culture, and creativity, and in recent decades, it has come under growing criticism of its social, environmental, and economic footprint. With fast fashion having long dominated global markets with its rapid production cycles, low prices, and rapid turnover, this strategy has come under growing pressure from emerging sustainable and circular alternatives. Of these, reselling platforms have grown at a phenomenal rate, not only representing a technological development in the fashion sector but also a very apparent revolution in consumer psychology, values, and construction of identity.

2. Brief literature review and research gaps

Studies on second-hand shopping are limited. Existing research identifies a variety of factors that influence second-hand shopping such as economic necessity and price equity. Similarly, scholars have indicated that purchasing used goods is an efficient method for reducing waste and pollution (Khurana and Tadesse, 2019; Machado et al., 2019). As an example, in the past few years, the second-hand clothing business has grown steadily as more young buyers have become interested in vintage clothing (Su et al., 2019). This is due to the fact that environmental value is the most significant predictor of views toward used apparel (Padmavathy et al., 2019). In recent years, the market for second-hand goods has undergone a significant transformation with the rise of consumer-to-consumer (C2C) online platforms. C2C online commerce refers to online transactions between two users that involve the exchange of goods. Such transactions are carried out through various online marketplaces, including popular platforms such as eBay, Etsy, or Taobao, as well as auction websites (Statista, 2022). The proliferation of these platforms has made it easier than ever for individuals to buy and sell used items directly to one another, bypassing traditional intermediaries like thrift stores or pawn shops.

In even more recent times, there has been a shift towards mobile-based shopping platforms that encourage consumers to engage in C2C transactions without having to go through traditional business channels. The fashion industry has particularly benefited from this trend, offering new opportunities for both consumers and sellers (Johan et al., 2020) and C2C e-commerce has proven popular, especially among younger generations. Thus, social shopping platforms (e.g., Vinted and Depop) enable millions of sellers and resellers to develop their own, more or less “professional”, virtual store and connect with consumers, thanks to rating, reviews and direct interactions between buyers and sellers that allow price bargaining and requesting for additional information, “social” elements far from the logic of todays’ retail or e-commerce. In addition, buying and selling

[3] Catholic University of Sacred Heart

second-hand items incorporate several elements of sustainability, both economical and environmental.

Sustainability motivations mainly indicate consumers' concern for the environment, particularly in relation to sustainability issues and beliefs (Hamari et al., 2016). Consumers who care about the environment will question the necessity and usefulness of a product before making a purchase in order to safeguard the environment and abstain from ecologically hazardous behaviour (Parguel et al., 2017). It has been proven that sustainability-inclined beliefs (Hamari et al., 2016; Kim & Yoon, 2021) positively influence attitude towards collaborative consumption. Environmentally conscious consumers are more likely to engage in sustainable clothing consumption (Diddi et al., 2019; Parguel et al., 2017; Styvén & Mariani, 2020). Parguel et al. (2017), for instance, argued that the environmental awareness of French consumers has prompted them to purchase used goods through C2C platforms such as the local Leboncoin. Consumers believe that their actions can help to reduce waste by recycling, extending product life spans, and resulting in a decrease in indulgent, unsustainable consumption (Parguel et al., 2017; Turunen & Leipämaa-Leskinen, 2015).

Economic motivations refer to consumers' price consciousness (Padmavathy et al., 2019). In early studies on thrift store purchasing, economic motivation had been emphasised extensively (Ferraro et al., 2016). Price-conscious consumers are more likely to purchase secondhand clothing (Yan et al., 2015) and are referred to as highly economically-oriented bargain hunters (Seo & Kim, 2019). According to Edbring et al. (2016), consumers who purchase second-hand goods, especially clothing, tend to avoid purchasing first-hand goods at original prices because they may be able to purchase branded goods for a lower price or higher-quality products for a lower price on the secondary goods market.

Consumption on C2C platforms shows how users have incorporated technology into their daily lives and are progressively forming a conscience about being good for the environment. Studies on consumers' purchases of used goods have been conducted (Guiot & Roux, 2010; Mohammad et al., 2021; Seo & Kim, 2019; Yan et al., 2015), but there are fewer empirical studies on consumers' online selling and reselling behaviour for particular used goods like apparel.

As the world faces growing concerns over the environmental impact of fast fashion, the importance of sustainability and ethical values is becoming increasingly prominent in consumer behaviour. The study by Park (2023) highlights that consumer behaviour on C2C online platforms for second-hand fashion products is heavily influenced also by their level of environmental consciousness. Consumers who prioritize environmental sustainability and saving tend to view second-hand trading platforms as an effective way to recycle products and purchase good quality second-hand fashion products. In contrast, consumers with low environmental consciousness tend to use the platform for hedonistic and experiential consumption.

3. Research goals and methodology

The research examines the disruptive role of reselling sites in restructuring the new fashion consumption, and more precisely their psychological, behavioral, and cultural impacts on customers. Based on the theory of conspicuous consumption, circular economy, and digitalization, the study examines how the forces of sustainability, price sensitivity, and uniqueness conflict and converge under second-hand fashion. It also examines the evolving luxury consumption dynamics, where the conventional understanding of exclusivity is being redefined by the impact of accessibility, resale, and value redefinition.

In striving to accomplish this, the study adopts a mixed theoretical and empirical approach.

A quantitative methodological approach was employed. A structured online survey was created and administered to a representative consumer sample, more precisely among Generation Z and Millennials, who are at the forefront of online fashion cultures and green consumption behaviors. Customer experience is therefore addressed through an online questionnaire used to

gather quantitative data from 181 participants across multiple countries who were largely Generation Z members, which is a technology-oriented and highly interactive consumer group when it comes to sustainability stories.

The population for this study was sampled using a non-probability convenience sampling method whereby it tried reaching those people who are of a different nature via casual and virtual settings. It was deemed appropriate to the research exploratory nature as well as to the desired population, who are those in clothes and therefore relevant to the topic of fashion and sale websites.

The survey was posted online from April 3rd to April 25th, 2025, on different platforms such as WhatsApp, Instagram, and LinkedIn, and word of mouth. These platforms gave the survey extensive and rapid coverage, and by this, the researcher was able to reach out to the respondents of different countries and backgrounds, primarily from those who are digitally enabled and fashion-oriented. The link to the survey was shared for free, with no restrictions in terms of age, gender, and nationality, and on voluntary and anonymous terms.

The single inclusion criterion employed was that the participants would have to purchase clothing, frequently or rarely.

Though convenience sampling limits statistical generalizability of findings, it facilitated the attainment of rich qualitative data set consistent with the research purposes. The researchers received 181 valid responses. Participants filled out the questionnaire voluntarily, and their information was processed according to good ethical research practice.

By segmenting adopters and non-adopters and psychographic profiling of factors such as eco-attitude, price consciousness, and desire for uniqueness, this research presents a multi-dimensional typology of contemporary consumers and adoption determinants.

The online format offered easy reach and comparability between samples, and the researcher's international academic community supported gathering answers from diverse nations and cultures. This diversity enriched the dataset and allowed observation of cross-cultural dynamics and generational trends of reselling behavior.

Six research goals were originally formulated to explore a variety of dimensions of the phenomenon. These goals were later reorganized into three more comprehensive and interconnected macro-goals in the course of analytical design. The reorganization aimed at enhancing conceptual cohesiveness, minimizing thematic duplication, and facilitating easier more integrated interpretation of results between corresponding hypotheses.

The first objective is centered on identifying the main motivations for engaging in reselling platforms and the psychological profiles of consumers. It investigates if participants are driven by pure sustainability values, economic motivations, or by seeking weird and rare products. It also investigates the role of marketing cues, generation identity, and psychographic factors such as price sensitivity and eco philosophy. Primary variables in this section are self-reported motivation scales, impulse buying behavior, and consumer segmentation using cluster analysis.

The second aim investigates whether engaging with reselling platforms produces behavior change in the long run. Specifically, it investigates whether such engagement leads to reduced consumption of fast fashion, increased circular behavior (e.g., reselling rather than disposing), and internalized and normalized second-hand fashion practice. It also investigates whether the use of platforms becomes routinized and which mechanisms such as moral licensing, where reselling legitimizes overconsumption, occur. Frequency of usage, experience years, and buying and disposal behavior indexes are at the center of this analysis.

The third objective is about the impact of second-hand settings on both the symbolic meanings and perceived value of luxury clothing. It questions if luxury products purchased through reselling sites are viewed as less valuable, if the sites make luxury democratically available or symbolically diluted, and why consumers purchase second-hand luxury products. This part also explains perceived tensions between exclusivity and access, and if various forms of platforms (e.g., peer-to-peer vs. B2C) appeal to various consumer profiles.

In addition to these three core objectives, the research employs a set of transversal factors that, while not formally codified as standalone goals, are highly significant in shaping platform usage. These are trust perceived in retailers, product authenticity anxiety, perceived ease of use of the platform, the impacts of social proof and reviews, and broader psychological second-hand consumption resistance. They describe how certain consumers, who have expressed sustainability-values aligned with reselling, do not adopt reselling behaviors. They cite underlying emotional and cultural inhibitions, i.e., hygiene concerns, fear of deception, or affection for the notion of "newness", that can act against adoption even by ideologically friendly consumers.

These goals are complemented by hypothesis sets that are statistically tested with tools such as t-tests, regression, and cluster analysis. Emphasis is placed on transversal variables such as trust, usability, and perceived authenticity that have the maximum mediating impact on consumer adoption of platforms.

Research Objective	*Associated Hypotheses*
Objective 1: To understand the psychological motivations and consumer profiles behind second-hand fashion adoption	*H1a*: Consumers who prioritize sustainability are more likely to adopt reselling platforms. *H1b*: Consumers motivated by affordability are also more prone to impulsive purchases. *H1c*: The perceived uniqueness of second-hand items increases purchase frequency. *H1d*: Some users engage in "moral licensing" by using reselling to justify unsustainable purchases. *H4a*: Younger generations are significantly more likely to use reselling platforms. *H5a*: Influencer marketing does not directly affect adoption, but is relevant for profiling specific user types. *H5b*: Promotional offers primarily impact consumers with existing price sensitivity.
Objective 2: To analyse behavioural changes in fashion consumption patterns linked to reselling platforms	*H6a*: Engagement with reselling platforms is associated with a reduction in the purchase of new clothing. *H6b*: Consumers are more likely to resell than donate or accumulate clothing after using these platforms. *H6c*: Experience with reselling platforms increases frequency of use. *H2a*: The use of reselling platforms reduces guilt related to fast fashion consumption. *H2b*: Second-hand shopping increases wardrobe turnover, fostering faster consumption cycles. *H1d (revisited)*: Reselling may enable less sustainable habits through delayed disposal justification.
Objective 3: To explore how second-hand affects the perception and symbolic value of luxury fashion	*H3a*: Luxury items purchased second-hand are perceived as having lower value compared to new luxury. *H3b*: Second-hand platforms are not perceived to significantly enhance luxury accessibility. *H3c*: Price is not the primary driver behind second-hand luxury purchases. *H4c*: Platform choice (e.g., Vinted, Depop, Vestiaire) is influenced by age and type of purchase intention.

Table 1. Research Objective and Hypotheses

By the amalgamation of behavioral, motivational, and cultural data, this study is able to give a multi-dimensional view of how second-hand fashion websites are changing consumption behaviors, brand constructs, and notions of value in a digital technology- and circular economy-driven world. The incorporation of transversal adoption barriers also suggests that behavioral change is not solely value- or incentive-dependent, but a multifaceted combination of cognitive, emotional, and experiential forces that reselling sites need to strategically manage.

4. Results

Results indicate an omnibus behavioral context. While sustainability is often invoked as an explanation of resale, uniqueness and affordability are the variables that consistently predict usage. The study further confirms that reselling website use is associated with a decline in fast fashion consumption and circular disposal behavior, which suggests a shift towards linear to circular fashion paradigms.

Nonetheless, it also identifies contradictions such as moral licensing and fast fashion rotation through which reselling can facilitate, but not contain, overconsumption. Furthermore, in the luxury fashion context, resale undermines normative values through both a democratization of access and an erosion of symbolic exclusivity, resulting in cultural friction between inclusivity and distinction.

With the integration of these findings, the thesis contributes to industry practice in addition to Academic theory. It expands the academic conversations around online consumer behavior, circularity, and sustainable fashion consumption, and provides practical guidance for the brands and platforms for whom a dynamic marketplace is challenging. Ultimately, this research shows that the future of fashion may not depend on new materials or technologies, but on a deeper cultural shift, one where ideas of value, trust, and identity are being reshaped by changing consumer attitudes.

The study ultimately affirms that fashion, far from being a superficial or ephemeral domain, serves as a powerful lens through which to observe and influence broader societal transformations.

Rethinking Diversification and Innovation in FMCG Markets: an Empirics-First Analysis

Sebastiano Grandi[1], Alessandro Iuffmann Ghezzi[2], Francesca Negri[3]

1. Introduction

Fast-moving consumer goods (FMCG) markets across Europe have undergone structural transformations driven by intensified retailer power, saturation of product categories, and the rapid growth of Private Labels (PL). Italy represents one of the most promising and dynamic Private Label markets in Europe, distinguished by rapid growth in penetration, increasing category leadership, and rising consumer trust in retailer-owned brands. The country's low retailer concentration and sophisticated category management practices have enabled PL ranges to expand beyond traditional value tiers into premium, functional, and specialised segments, strengthening retailers' strategic influence across the FMCG landscape.

Retailers have consolidated their ability to shape assortments, control visibility, and drive innovation within categories. As a result, National Brand manufacturers (NB) face mounting pressure to defend brand equity and profitability. To respond, many manufacturers have relied heavily on product diversification, SKU proliferation, and incremental innovation to sustain market presence. These strategies are often complemented by persistently high promotional pressure, even as competitive roles evolve. Yet, it remains unclear whether such approaches generate real growth, expand market boundaries, or reinforce competitive advantage.

This study adopts an empirics-first approach to reassess the effectiveness of diversification and innovation strategies in contemporary FMCG retailing. Drawing on survey data from 24 leading manufacturers and scanner data from the entire Italian FMCG market, we explore how brands diversify, how innovation is executed, how promotional behaviour evolves, and how national brands compare to Private Labels over time. Rather than testing predefined hypotheses, we allow empirical patterns to guide conceptual refinement. The combination of managerial insights and market-level performance data enables a comprehensive analysis of strategic choices and their actual outcomes. Italy's dense retailer ecosystem and strong PL penetration provide an ideal context for understanding broader dynamics in mature FMCG markets.

2. Brief Literature Review and Research Gaps

Research on brand strategy identifies diversification and innovation as central drivers of growth. Brand extensions and line variants can leverage existing brand equity (Aaker, 1990; Keller, 2003), reinforce consumer attention, and manage shelf presence (Bronnenberg & Wathieu, 1996). However, scholars also highlight risks of overextension, including cannibalisation, loss of clarity, and diminishing incremental returns. While line extensions may support short-term defence, they seldom create genuine new demand (Dekimpe et al., 1997).

[2] Assistant Professor, ECON-07/A, University of the Sacred Heart; alessandro.iuffmannghezzi@unicatt.it – corresponding author

[3] Assistant Professor, ECON-07/A, Catholic University of the Sacred Heart; francesca.negri1@unicatt.it

Parallel literature on Private Labels has shifted from viewing PL as low-cost substitutes to recognising them as structural competitors, supported by retailer endorsement, cross-category legitimacy, and growing quality parity (Gielens, 2012; Sethuraman & Gielens, 2014). Retailers' category management power allows PL to achieve leadership in categories where NB traditionally dominated, altering the competitive landscape.

Promotional strategy is another critical dimension. Promotions can stimulate purchase incidence (Neslin, 2002), yet excessive reliance may erode baseline sales and distort brand positioning (Pauwels et al., 2002). Despite this, promotional behaviour tends to show rigidity, often disconnected from changes in market structure or brand role.

Finally, innovation research acknowledges that new product performance depends on category context, retailer support, and display conditions (Ataman et al., 2010). However, most empirical studies analyse innovation at aggregated market levels, neglecting channel heterogeneity. This is a significant omission in markets where discounters, supermarkets, and premium retailers differ in shopper missions, space allocation, and innovation visibility.

Together, these works highlight the strategic complexity of FMCG markets but leave open fundamental questions about the real contribution of diversification and how brands navigate increasingly PL-dominated environments.

Despite extensive scholarship, three key gaps persist:

a**.** Limited empirical assessment of diversification outcomes: while diversification is widely promoted as a growth strategy, few studies quantify its actual contribution to portfolio renewal or sales expansion. Existing work often assumes diversification to be beneficial without testing whether it changes competitive boundaries or merely redistributes volume across variants.

b. Lack of integration between diversification, brand role, and promotional behaviour: research seldom links diversification patterns to competitive roles (leader vs. follower). Our evidence suggests that follower brands diversify disproportionately and maintain high promotional pressure even in weak competitive positions. This misalignment remains underexplored theoretically and empirically.

c. Absence of channel-sensitive innovation frameworks: innovation has rarely been studied at the channel level, despite widespread retailer heterogeneity and the centrality of retailer endorsement for innovation success. The neglect of channel-specific patterns limits understanding of how innovation performs across formats and how PL strategies reshape innovation pathways.

Taken together, these gaps reveal a structural disconnect between the strategies national brand manufacturers prioritise - diversification, innovation, and promotions - and the market dynamics unfolding in an environment increasingly shaped by Private Labels. Existing literature provides only partial insights into how these strategic levers operate under contemporary retail conditions, and it does not fully account for the asymmetries introduced by retailer-owned brands or for the limited market impact of incremental product proliferation. Moreover, prior studies rarely integrate strategic intentions with actual market outcomes, leaving unclear whether manufacturers' efforts effectively sustain competitiveness in the face of expanding PL presence. To address these limitations, this study investigates the following research question (RQ):

RQ. How effective are national brand manufacturers' diversification, innovation, and promotional strategies in sustaining competitive performance within an Italian FMCG market increasingly shaped by the rise of Private Labels?

3. Data and methodology

This study employs a mixed-method, empirics-first design (Golden et al., 2023), integrating managerial perceptions with objective market behaviour. A structured survey was conducted with 24 national brand manufacturers operating in major FMCG categories. The instrument collected information on strategic priorities, innovation intensity, diversification initiatives, promotional investments, and perceptions of category evolution.

To validate survey insights, we analysed longitudinal scanner data covering the full Italian FMCG market. These data offer granular visibility into sales dynamics, category leadership, promotional intensity, and comparative trends for NB and PL.

We follow an empirics-first logic through four stages:

- Pattern identification across survey and scanner data
- Cross-validation of managerial perceptions with observed outcomes
- Segmentation by brand role (leader vs. follower) and category type (core vs. non-core)
- Interpretive synthesis feeding conceptual refinement on diversification and innovation under retailer-driven competition

This approach enables us to uncover structural regularities that traditional hypothesis-driven studies often overlook.

4. Results

This section integrates survey evidence from 24 national brand manufacturers (NB) with scanner-based market data from the Italian FMCG sector. The results are structured around five tables derived directly from the empirical material and are presented sequentially to illustrate patterns in innovation, diversification, competitive roles, and the relative performance of NB and Private Labels (PL). Across all analyses, a consistent picture emerges: NB increasingly rely on tactical proliferation, while PL consolidate structural advantages across categories.

Innovation Intensity and the Nature of New Launches

To assess the strategic depth of NB innovation, Table 1 summarises the composition of new industrial launches in 2025. The data show that line extensions account for 53.6% of all launches, making them the dominant form of innovation. New lines under existing brands represent an additional 28.0%, whereas completely new brands make up only 10.1%, despite wide variation among companies (0-79%). A small share (8.3%) pertains to existing foreign brands introduced in Italy.

Type of Launch	**Mean % of Total Launches**	**Range Across NB Groups**
Line extensions of existing brands	53.6%	4% - 93%
New lines under existing brands	28.0%	0% - 70%
Existing foreign brands launched in Italy	8.3%	0% - 50%
Completely new brands created	10.1%	0% - 79%

Table 1. Innovation Mix of National Brand Launches, 2025

These results indicate that manufacturers prioritize incremental innovation, primarily through variants that reinforce existing brand architectures. The prevalence of line extensions, combined with the fact that some firms launched more than 100 new SKUs in a single year (Circana, 2025), shows that innovation is often used tactically to secure distribution and shelf visibility rather than to expand consumption or enter new demand spaces. This innovation model lacks strategic depth, as it reinforces existing boundaries rather than challenging or extending them.

Limited contribution of market diversification

Despite managerial emphasis on diversification beyond core categories, the actual impact of such strategies is marginal. Table 2 summarises the contribution of new categories introduced over the past three years.

Indicator	**Mean Value (NB)**	**Range Across NB Groups**
% of SKU in new categories vs. 2022	4.8%	0% - 30%
% of sales generated in new categories vs. 2022	5.3%	0% - 35%

Table 2. Contribution of New Categories to Portfolio and Sales

The data show that diversification into new categories accounts for less than 5% of both product assortment and total revenues. Even for firms more active in diversification, the revenue contribution rarely exceeds one-third. These findings demonstrate that market diversification efforts are not translating into meaningful commercial outcomes. Instead, they appear to dilute managerial attention and resource allocation while delivering limited new growth. This is consistent with the broader theme of tactical proliferation rather than strategic expansion.

Differences in category breadth and promotional intensity by brand role

Scanner data reveal significant structural differences between leaders and followers, summarised in Table 3. Leader brands operate in fewer categories - 3.2 on average - whereas follower brands operate across 6.1 categories, nearly double. This suggests that follower brands overextend their portfolios in an attempt to compensate for weaker market positions. The pattern is reinforced by promotional intensity: followers exhibit 34.5% promotional pressure, compared to 33.0% for leaders.

Brand Role	**Avg. Number of Categories (2025)**	**Value Share Trend**	**Promotional Pressure (2025)**
Leaders	3.2	Declining share in core categories (29.4% to 26.6%)	33.0%
Followers	6.1	Declining share in secondary categories (4.0% to 3.6%)	34.5%

Table 3. Category Breadth and Promotional Pressure by Brand Role

These findings indicate that promotional strategies remain rigid and undifferentiated, even when competitive positions deteriorate. Rather than tailoring promotions to market structure or brand role, NB maintain or increase promotional effort in secondary categories, where returns are typically lower. This suggests a mismatch between commercial execution and strategic positioning - and contributes to erosion of profitability.

Comparative growth trajectories of NB and PL

A central element of this study is the comparison between NB and Private Label performance. Table 4 shows the evolution of value sales between 2020 and 2025 across core and non-core categories.

Segment	**NB Growth**	**PL Growth**
Core categories	+€3.9B	+€5.1B
Non-core categories	-€1.2B	+€2.3B
Total growth	+€2.7B	+€7.4B

Table 4. Growth of NB vs. PL in Core and Non-Core Categories, 2020-2025

The results clearly show that PL outperform NB across all segments. NB achieve modest growth in core categories but decline in non-core areas, while PL exhibit strong and balanced growth in both. This pattern supports the interpretation that PL operate with a structurally transversal model, leveraging retailer control over categories to gain legitimacy and share, whereas NB struggle to sustain performance outside historical strengths.

Inversion of category leadership and price convergence

Table 5 expands on the structural shift in competitiveness by comparing leadership and price indices over time.

Metric	**2020 NB**	**2025 NB**	**2020 PL**	**2025 PL**
Number of categories with leadership	241	215	219	246
Weighted incidence of category leadership	44.6%	34.4%	55.4%	65.6%
Average Price Index	144	141	71	74

Table 5. Evolution of Category Leadership and Price Indices, 2020-2025

The inversion of leadership is striking: PL increase leadership from 219 to 246 categories, surpassing NB, whose leadership declines from 241 to 215. At the same time, price differences narrow, not because PL cut prices, but because NB reduce theirs. This strategic convergence undermines differentiation and accelerates consumer migration toward PL, which offer similar value propositions at structurally advantaged cost positions.

Summary of results

Together, the tables reveal a consistent narrative: NB strategies rely heavily on incremental innovation, tactical diversification, and uniform promotional policies that fail to account for competitive roles or structural changes in the market. Meanwhile, PL continue to strengthen their presence, leveraging retailer endorsement, transversal category coverage, and coherent price-value positioning. These dynamics collectively reshape the competitive landscape and challenge long-standing assumptions about the sources of brand growth in FMCG markets.

5. Discussion

The results reveal a structural misalignment between manufacturers' strategic intentions and market realities. First, diversification remains reactive and defensive. Followers diversify more extensively than leaders, yet diversification contributes little to growth. This indicates that diversification is often a symptom of competitive weakness rather than a pathway to leadership. Second, innovation is treated as channel-agnostic, despite clear differences in how retail formats legitimise, display, and support new products. This blind spot reduces the effectiveness of innovation and may contribute to premature failure rates. Third, retailer-driven competition reshapes strategic logic. PL's transversal presence and structural control over assortments make category breadth a natural competitive asset. NB, whose equity depends on vertical depth and differentiated value propositions, cannot imitate retailer strategies without eroding their brand rationale. Finally, promotional behaviour exhibits rigidity: even as brands lose leadership, promotional intensity remains high or increases, suggesting organisational routines rather than adaptive responses to market structure.

6. Conclusion and managerial implications

This study offers an empirically grounded reassessment of diversification, innovation, and competitive positioning in FMCG markets. The findings show that product diversification - despite being central to managerial strategy - rarely expands markets or strengthens competitiveness. Instead, manufacturers should shift attention toward market-centric diversification, identifying new consumption occasions, unmet needs, or broader demand spaces rather than accumulating incremental variants. Managers should also develop channel-sensitive innovation strategies, recognising that innovation performance varies across retail environments. Collaboration with retailers, differentiated launch programmes, and channel-specific shopper insights will be essential. Promotional investments must be aligned with brand competitive roles. Leaders and followers require distinct promotional logics; maintaining uniform intensity is inefficient and may harm long-term brand equity. Finally, manufacturers must resist strategic convergence with Private Labels. Differentiation - not imitation - is the foundation of value creation in retailer-driven markets.

7. Limitations and future research

This study is subject to several limitations that define both its scope and its opportunities for future research. First, the analysis focuses exclusively on the Italian FMCG market, a context with strong PL penetration and high retailer concentration. While Italy provides a valuable setting for observing mature retail dynamics, results may not generalise to markets with different competitive structures or PL development. Second, the study is descriptive and exploratory, consistent with the empirics-first approach. Further work should incorporate causal modelling, structural equation approaches, or quasi-experimental methods to deepen the analysis. Third, while scanner data allow channel-level breakdown, the present study has only begun to explore channel effects conceptually. Future research should operationalise channel-sensitive innovation models, examining how discount, supermarket, hypermarket, and premium channels shape

adoption and performance. Finally, the survey sample covers 24 NB manufacturers representing a substantial but incomplete share of the Italian market. Expanding the sample and integrating retailer perspectives would enrich understanding of how strategic decisions evolve along the value chain. Despite these limitations, the study offers a foundation for a broader research programme aimed at rethinking diversification, innovation, and brand strategy in an era of escalating retailer dominance and Private Label sophistication.

Keywords: FMCG; private label; diversification; innovation; brand strategy; Italy

Il monitoraggio ambientale con drone a supporto degli strumenti di gestione ambientale di processo

Stefano Duglio[1], Giuseppe Tassielli[2], Riccardo Beltramo[3]

1. Introduction

Il presente contributo illustra le attività che si stanno compiendo nell'ambito del progetto "L'uso di sistemi aeromobili a pilotaggio remoto (droni) nel monitoraggio ambientale integrato con sistemi di gestione ambientale e analisi del ciclo di vita (LCA): set-up ai fini del miglioramento del profilo ambientale di siti di discarica e impianti industriali" (Progetto di rilevanza nazionale - PRIN - 2022), con il contributo del Ministero della Educazione, Università e ricerca, Prot. 2022FPFPT5, al fine di impiegare i dati rilevati da drone per il miglioramento della gestione ambientale di processo, con riferimento ai Sistemi di Gestione Ambientali normati attraverso lo Standard Internazionale ISO 14001:2015 o il Regolamento Europeo EMAS – Eco-Management and Audit Scheme.

L'attività è attualmente in itinere e rappresenta il frutto della collaborazione tra l'Università degli Studi di Bari "Aldo Moro", quale capofila di progetto e l'Università degli Studi di Torino, e si sta concentrando in particolare sul monitoraggio delle emissioni fuggitive di gas metano (CH4) da discariche di rifiuti solidi urbani.

2. Inquadramento del contesto

Il monitoraggio ambientale svolge un ruolo centrale nella diagnosi degli impatti generati dalla gestione dei siti e degli impianti produttivi in genere, nonché nel miglioramento della comprensione dei processi di produzione in un'ottica di ottimizzazione dell'impiego delle risorse e della gestione degli aspetti ambientali significativi derivanti dai processi stessi.

Con riferimento alle discariche di rifiuti urbani, è necessario sottolineare come queste rappresentino una delle principali fonti di emissione di metano (Yong et al., 2024) e recenti studi (Mønster et al. 2019) hanno sottolineato che circa il 12% del metano generato globalmente dalle discariche sia collettato e della necessità, quindi, di dare priorità a questa operation.

Nel contesto europeo ed italiano, il collettamento di gas metano a finalità di produzione di energia elettrica e termica si pone quale vincolo normativo e rappresenta un processo significativo, sia in termini di efficienza della produzione energetica, che in termini di potenziali emissioni non controllate (fuggitive) di gas climalteranti nell'ambiente (Daugėla et al., 2020). Tuttavia, e nonostante il fatto che tutte le discariche abbiamo processi ed impianti atti a collettare il gas metano, vi possono sempre essere delle emissioni non controllate in atmosfera (Daugėla et al., 2020).

Ne consegue che il monitoraggio di tali emissioni riveste un duplice interesse per l'ente gestore di discarica di rifiuti solidi urbani: da un alto, infatti, esso si pone quale strumento per una corretta gestione ambientale e, inoltre, può fornire indicazioni utili a migliorare l'efficienza di processo, con implicazioni economiche che possono essere significative per i gestori dei siti.

[3] Professore ordinario, ECON-10/A, Università di Torino; riccardo.beltramo@unito.it

Ulteriore obiettivo del progetto, quindi, è quello di integrare le misure effettuate nei Sistemi di Gestione Ambientale (SGA) già formalizzati nei casi studio, attraverso l'adesione allo Standard ISO 14001:2015 o a Regolamento Europeo EMAS in modo che i rilievi possano contribuire al miglioramento del profilo ambientale dei siti e delle aziende.

Come noto, i Sistemi di Gestione Ambientale maggiormente implementati per la gestione ambientale di processo, ovvero lo Standard ISO 14001 ed il Regolamento EMAS, hanno la medesima struttura documentale e si differenziano sostanzialmente per un diverso livello di comunicazione con le parti interessate che vede, in EMAS, la sua principale espressione nel documento di Dichiarazione Ambientale (EMAS, 2009). Entrambi i modelli pongono un forte accento sull'importanza del monitoraggio delle variabili ambientali significative in fase di controllo (Beltramo et al., 2016) come elemento per comprendere l'andamento del profilo ambientale dell'organizzazione ed il raggiungimento degli obiettivi e traguardi ambientali.

3. Approccio metodologico

Il monitoraggio delle emissioni fuggitive di gas metano da discarica non è una operazione di facile svolgimento per diversi motivi: in primo luogo, le emissioni possono variare da discarica a discarica (Fosco et al., 2024), la distribuzione del gas non è necessariamente uniforme (Jońca et al., 2022) e l'evento può essere episodico (Yang et al., 2018), rendendo difficile intercettare e quantificare l'emissione stessa.

Allo stato attuale, quindi, nel campo della ricerca scientifica sul tema sono state testate diverse soluzioni, ognuna delle quali presenta punti di forza e di debolezza, in relazione al fatto che la misurazione delle emissioni fuggitive ha dei vincoli sia in termini spaziali che temporali. Esistono diversi metodi per rilevare le perdite di gas di discarica: piattaforme terrestri, rilevatori portatili, laboratori mobili, aeromobili con equipaggio dotati di strumenti specifici e satelliti (Yang et al., 2018; Shaw et al., 2021; Hollenbeck et al., 2021; Tassielli et al., 2024) o una loro combinazione.

Ognuna di queste metodologie contiene dei punti di debolezza: le piattaforme terrestri, attraverso l'impiego delle camere di flusso a terra, possono superare la variabile temporale, essendo in grado di operare per lunghi periodi di tempo, ma non sono in grado di coprire aree ampie (Emran et al., 2017), mente i satelliti, che possono ovviare a tale criticità, possono avere problemi in termini di risoluzione spaziale (Mønster et al., 2019) oltre a costi operativi elevati (Yang et al., 2018).

Altre tecnologie quali i rilevatori portatili, i laboratori mobili ed i velivoli con equipaggio solitamente incontrano limitazioni nella copertura di vaste aree, mentre gli elicotteri devono far fronte a costi elevati e difficoltà nel raggiungere luoghi remoti ed in aree interne.

In questo contesto, il gruppo di ricerca ha optato per impiegare i cosiddetti sistemi aeromobili a pilotaggio remoto (acronimo UAS dall'inglese Unmanned Aerial Systems), anche detti droni, in quanto presentano un notevole potenziale per migliorare radicalmente il monitoraggio ambientale, ponendosi come opportuna soluzione che può ovviare alle criticità poc'anzi esposte. Infatti, i sensori montati su UAS offrono una straordinaria opportunità per colmare il divario esistente tra le osservazioni sul campo ed il tradizionale telerilevamento aereo, fornendo dettagli spaziali elevati su aree relativamente grandi con un possibile risparmio di costi e di tempo impiegato per svolgere l'attività.

L'impiego dei droni nel monitoraggio ambientale delle emissioni fuggitive di metano dalle discariche rappresenta una significativa innovazione metodologica rispetto ai tradizionali sistemi di misura a terra. Le piattaforme a pilotaggio remoto consentono infatti di ottenere una copertura spaziale più estesa e dettagliata, garantendo una risoluzione superiore nella localizzazione delle sorgenti di emissione. Grazie alla possibilità di volare a basse quote e di seguire traiettorie programmate con elevata precisione, i droni permettono di individuare con maggiore accuratezza

le aree critiche, incluse quelle difficilmente accessibili per via delle condizioni morfologiche o della presenza di infrastrutture.

Dal punto di vista operativo, l'utilizzo dei droni comporta una notevole riduzione dei tempi di rilievo e un incremento dell'efficienza complessiva delle campagne di monitoraggio. Le operazioni possono essere condotte su ampie superfici in tempi sensibilmente inferiori rispetto ai metodi manuali, consentendo di ripetere le misurazioni con maggiore frequenza e di rilevare anche variazioni temporanee delle emissioni.

Un ulteriore vantaggio riguarda la sicurezza degli operatori, che possono effettuare le attività di controllo mantenendosi a distanza dalle aree potenzialmente pericolose, evitando così l'esposizione diretta a gas, terreni instabili o superfici irregolari tipiche dei siti di discarica.

Dal punto di vista tecnico-scientifico, l'integrazione tra sensori specifici per la rilevazione del metano – come quelli basati sulla tecnologia TDLAS (Tunable Diode Laser Absorption Spectroscopy) – e sistemi di posizionamento satellitare consente di ottenere dati accurati e georeferenziati. Tali informazioni possono essere elaborate per generare mappe di concentrazione, modelli di dispersione o rappresentazioni tridimensionali del plume, fornendo un supporto analitico di elevato dettaglio per la valutazione e la mitigazione delle emissioni.

L'uso dei droni risulta inoltre vantaggioso sotto il profilo economico: la riduzione del personale necessario, dei tempi operativi e delle attività di campionamento al suolo comporta una diminuzione complessiva dei costi di monitoraggio. Allo stesso tempo, la possibilità di identificare tempestivamente eventuali fughe di biogas contribuisce a ottimizzare i sistemi di captazione e a ridurre le perdite di metano, con benefici ambientali ed energetici.

Infine, la tracciabilità e la documentazione digitale dei dati raccolti favoriscono la conformità ai requisiti normativi e la trasparenza nei processi di controllo ambientale. Le informazioni possono essere archiviate e integrate in sistemi GIS o in piattaforme di monitoraggio continuo, consentendo un approccio più sistematico e sostenibile alla gestione della discarica.

Inoltre, l'attività di monitoraggio consente di alimentare gli archivi dati che sono a supporto della fase di controllo dei Sistemi di Gestione Ambientale, che possono essere impiegati sia a corredo della predisposizione della Analisi Ambientale Iniziale e di contesto che, in caso di adesione alle Registrazione EMAS, della Dichiarazione Ambientale.

Nell'ambito del progetto, quindi, si sta operando per integrare le informazioni raccolte tramite UAS nell'Analisi Ambientale Iniziale e nelle registrazioni del sistema di gestione ambientale, fondamentali per il calcolo degli indicatori utili a comprendere il raggiungimento degli obiettivi e dei traguardi che sono stati identificati dall'ente gestore. Inoltre, l'azione risulterà utile in sede di Audit interno, considerato che il monitoraggio degli obiettivi è fondamentale per verificare l'eventuale non raggiungimento di parte di essi, che rappresenta una importante fattispecie di non conformità di cui è necessario rilevare le cause e proporre le opportune azioni preventive e correttive che andranno poi discusse e confermate in fase di riesame del sistema. La Figura 1 riporta il diagramma di flusso delle fasi di processo nell'ambito di un Sistema di Gestione Ambientale. In particolare, si evidenzia in quali momenti possono essere integrati i dati ottenuti dalla misurazione effettuata con drone.

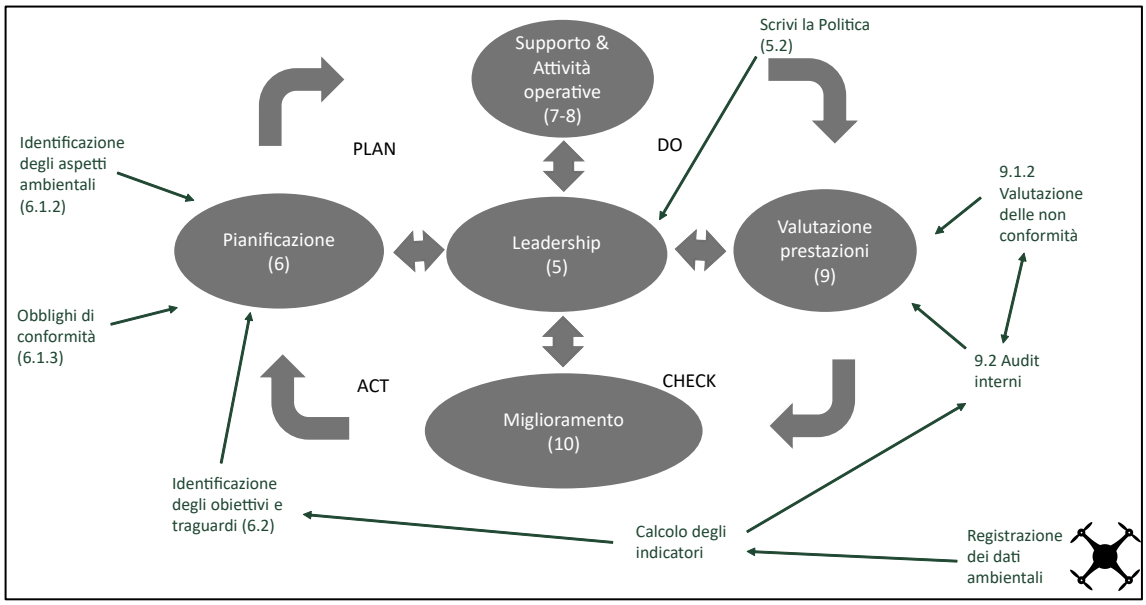

Figura 1. Monitoraggio da drone e fasi di processo di un Sistema di Gestione Ambientale

4. Fattibilità economica dell'uso di droni per il monitoraggio ambientale delle discariche

L'adozione di droni per il monitoraggio ambientale delle emissioni di biogas da discarica richiede una valutazione economica accurata, che tenga conto sia dei costi diretti sia dei benefici indiretti nel medio-lungo periodo. I costi associati a questa tecnologia possono essere suddivisi in investimenti iniziali e costi operativi ricorrenti.

Gli investimenti iniziali comprendono innanzitutto l'acquisto del drone, che per applicazioni professionali di monitoraggio ambientale presenta un costo variabile in funzione delle prestazioni, dell'autonomia di volo e della capacità di carico. A questo si aggiunge il costo dei sensori specifici per il rilevamento delle emissioni di biogas, in particolare sensori per il metano, che rappresentano spesso la voce più rilevante dell'investimento. Ulteriori costi riguardano i software di elaborazione e analisi dei dati, necessari per trasformare le misurazioni grezze in mappe emissive e report ambientali, nonché la formazione del personale e le certificazioni richieste dalla normativa vigente per il pilotaggio dei droni. La tabella 1 riporta una stima dei costi di investimento iniziali necessari per avviare un'attività di monitoraggio del biogas tramite drone.

Voce di costo	**Valore indicativo**
Drone professionale	€10.000 – >€20.000+
Sensore gas/metano dedicato	€20.000 – €30.000+
Software di analisi dati + GIS	€5.000 – €10.000 (licenze)
Formazione personale / certificazioni	€1.000 – €5.000 a operatore

Tabella 1. Investimenti iniziali

Accanto ai costi di avviamento, occorre considerare i costi operativi annuali, che includono la manutenzione del drone e dei sensori, la sostituzione delle batterie, le assicurazioni obbligatorie, l'aggiornamento dei software e la calibrazione periodica della strumentazione. A

questi si sommano i costi del personale tecnico addetto alle operazioni di volo e all'interpretazione dei dati raccolti. Complessivamente, tali costi risultano generalmente inferiori rispetto a quelli necessari per condurre monitoraggi tradizionali estesi e frequenti sul campo.

Il confronto economico con i metodi di monitoraggio tradizionali evidenzia alcuni vantaggi significativi dell'uso dei droni. Le tecniche convenzionali, basate su rilievi a terra e campionamenti puntuali, comportano un impiego intensivo di personale, tempi lunghi e una copertura spaziale limitata. Al contrario, i droni consentono di monitorare vaste superfici in tempi ridotti, riducendo il numero di ore uomo necessarie e aumentando la frequenza dei controlli. Questo porta a una maggiore efficienza operativa e a una migliore individuazione delle emissioni fuggitive di metano.

Oltre ai benefici economici diretti, l'utilizzo dei droni genera importanti benefici indiretti. La disponibilità di dati ad alta risoluzione spaziale e temporale migliora la qualità del monitoraggio ambientale e supporta una gestione più efficace della discarica. L'individuazione precoce delle perdite di biogas consente interventi correttivi tempestivi, riducendo le emissioni climalteranti e i potenziali costi associati a sanzioni o non conformità normative. Inoltre, la raccolta sistematica di dati digitali favorisce la trasparenza e il rispetto degli obblighi di rendicontazione ambientale, con ricadute positive in termini di immagine e sostenibilità.

In conclusione, dal punto di vista economico l'impiego dei droni nel monitoraggio delle emissioni di biogas da discarica risulta generalmente fattibile e vantaggioso, soprattutto per siti di medie e grandi dimensioni o per gestori che devono effettuare controlli frequenti. Sebbene l'investimento iniziale possa essere significativo, il ritorno economico può manifestarsi in un arco temporale di tre-cinque anni, grazie alla riduzione dei costi operativi, al miglioramento dell'efficienza e alla mitigazione dei rischi ambientali e normativi.

5. Risultati attesi

Il progetto è attualmente in una fase di implementazione che ha visto, allo stato attuale, l'impiego dei droni con riferimento a due casi studio, le discariche di rifiuti solidi urbani gestite dalla ASET S.p.A. di Fano in Provincia di Pesaro-Urbino ed Ecologica Sangro S.p.A., a Lanciano, in Provincia di Chieti.

La Tabella 2 riporta le informazioni principali dei casi studio pilota e dell'attività di monitoraggio effettuata.

Denominazione	**Ente Gestore**	**Località**	**Capienza**	**Numero di voli**	**Ettari coperti**
Discarica di Fano	Aset S.p.A.	Fano	50/55.000 tonnellate/anno	42	17,24
Discarica di Lanciano	Ecologica Sangro S.p.A.	Lanciano	100.000 tonnellate/anno	38	9,6

Tabella 2. Casi pilota

Il rilievo è stato condotto con l'obiettivo di effettuare misurazioni ripetute delle emissioni in differenti condizioni meteoclimatiche ed emissive, al fine di valutare la variabilità dei risultati in funzione dei parametri ambientali. A tal proposito, sono state eseguite complessivamente sei sessioni di misura nell'ambito della medesima campagna sperimentale: due nella mattinata iniziale, due nel pomeriggio e due nel mattino successivo, in modo da garantire una copertura temporale rappresentativa delle diverse condizioni atmosferiche.

In tabella è riportato il numero totale di voli effettuati sui due siti di indagine, necessari per coprire integralmente le aree di interesse e consentire la ripetizione delle misure in condizioni controllate.

Per l'acquisizione dei dati è stato impiegato un drone DJI Matrice 300 RTK, equipaggiato con un sensore per la rilevazione del metano basato su tecnologia TDLAS (Tunable Diode Laser Absorption Spectroscopy).

La metodologia di rilievo adottata si articola in due fasi operative distinte: una prima fase di detection, finalizzata all'individuazione preliminare delle fughe di metano, e una successiva fase di quantificazione, mirata alla stima del flusso emissivo. L'applicazione delle metodiche sviluppate ha richiesto la definizione di specifici parametri di volo, calibrati per garantire la ripetibilità e l'affidabilità delle misurazioni. Le caratteristiche di volo sono state impostate come segue: quota costante dal suolo pari a 10 m, velocità di traslazione del drone di 2 m/s e frequenza di acquisizione del dato pari a 10 Hz.

Contestualmente alle misurazioni delle emissioni, sono stati acquisiti i dati meteoclimatici mediante una stazione meteorologica portatile installata in prossimità del sito di rilievo. Le variabili registrate comprendono la temperatura dell'aria, la pressione atmosferica, la direzione e la velocità del vento, informazioni necessarie per la corretta interpretazione dei dati emissivi e per l'analisi delle condizioni di dispersione.

I dati raw ottenuti dalle campagne di misura necessitano di successiva elaborazione al fine di estrapolarne le informazioni utili. A tal fine sono stati testati e messi a punto vari algoritmi con differenti funzioni: rimozioni degli errori di misura del sensore, soprattutto in fase di registrazione del background di metano presente nell'ambiente; individuazione delle serie di dati contenenti effettivamente letture di metano emesso; quantificazione dei flussi corrispondenti a ciascun leak individuato.

I dati così ottenuti sono utili a definire in maniera più approfondita il quadro emissivo dei siti. Le informazioni raccolte, pertanto, possono essere impiegate in forma integrata nei rispettivi sistemi di gestione ambientale per focalizzare maggiormente la significatività degli impatti generati dalle proprie attività.

Entrambi i siti sono dotati di strumenti gestionali di processo: in particolare, ASET S.p.A. è certificata secondo lo Standard ISO 14001:2025, con ultimo rinnovo a Marzo 2024, mentre Ecologica Sangro S.p.A. è sia certificata secondo lo Standard ISO 14001:2025 che registrata in conformità al Regolamento Europeo EMAS 1221/2009 e s.m.i., con Dichiarazione Ambientale emessa in Aprile 2025.

I risultati attesi, derivanti dalle fasi attualmente in implementazione, sono di seguito riportati:

1. Creazione dell'archivio dati a corredo della predisposizione del documento di Analisi Ambientale Iniziale e di Contesto (ISO 14001 ed EMAS) e della Dichiarazione Ambientale EMAS, attraverso la integrazione delle informazioni raccolte tramite UAS nell'analisi ambientale stessa.
2. Predisposizione di metodiche di post-processing più idonee per ottenere informazioni utili alla gestione.
3. Indicazione delle modalità di integrazione dell'uso di UAS all'interno di un Sistema di Gestione Ambientale e creazione di linee guida per l'impiego dei droni a tali finalità, in particolare sulle seguenti fasi di sistema:

- Punto norma 6.1 – "Misure relative ai rischi e alle opportunità", nella macrofase Pianificazione del sistema, relativamente alla valutazione degli aspetti ambientali significativi.
- Punto norma 7.4 – "Comunicazione", nella macrofase Sostegno dove, relativamente all'ambiente EMAS, si pone l'accento sulla necessità di divulgare le informazioni ambientali in coerenza con l'allegato IV "Comunicazione in materia ambientale", che contiene le specifiche per redigere la Dichiarazione Ambientale EMAS.
- Punto norma 9.1 – "Monitoraggio, misurazione, analisi e valutazione", nella macrofase di Valutazione delle prestazioni, nella sua parte di valutazione dei sistemi di monitoraggio.

Keywords: Droni; monitoraggio ambientale; discariche di rifiuti urbani; metano; sistemi di gestione ambientale

L'innovazione circolare dei modelli di business nel contesto delle born-green startup

Antonella Pia d'Aries[1], Michele Posa[2], Ivano De Turi[3], Antonello Garzoni[4]

1. Introduction

L'attuale contesto economico, segnato dall'urgenza di promuovere nuove forme di creazione di valore sostenibile in linea con i principi della Triple Bottom Line (Elkington, 1997) (persone, pianeta e profitto) e con le linee guida dell'Unione Europea (European Commission, 2019; 2020), pone diverse sfide e opportunità rilevanti per la competitività delle imprese (Fülöp e Cifuentes-Faura, 2025). Oggi le aziende sono chiamate a ripensare l'imprenditorialità (Esau et al., 2025), l'organizzazione dei processi (Duan et al., 2024) e la gestione delle filiere (Cheng et al., 2023) per rispondere in modo virtuoso ai cambiamenti ambientali e sociali.

Ne deriva l'esigenza di un ripensamento in chiave sostenibile dell'identità aziendale (George, 2025) e del modello di business (Atkova et al., 2025), inteso come struttura logica che disciplina attività, creazione e distribuzione del valore (Climent e Haftor, 2021; Demil e Lecocq, 2010; Osterwalder e Pigneur, 2010; Teece, 2010). Questo obiettivo si confronta con un contesto profondamente trasformato da tecnologie quali intelligenza artificiale, blockchain, sensori intelligenti e deep-tech, che costituiscono risorse chiave per la competitività di lungo periodo (Xing et al., 2026) e, al contempo, abilitano il conseguimento degli Obiettivi di Sviluppo Sostenibile (Muench et al., 2022; Dal Mas et al., 2024). Ciononostante, molti modelli restano ancorati alla sola prospettiva tecnologica non pienamente integrata con la sostenibilità (Biloslavo et al., 2018), una criticità significativa alla luce dell'insostenibilità del paradigma lineare e dell'urgenza di promuovere forme più responsabili di creazione del valore (Sarja et al., 2021).

In questa prospettiva, l'innovazione del modello di business si configura come leva strategica capace di trasformare interi settori (Demil e Lecocq, 2010). Tra gli attori emergenti spiccano le born-green startup, che coniugano sostenibilità e solidità economica (Hahn et al., 2018), benché la ricerca empirica sulla loro adozione di strategie circolari resti limitata (Van Opstal e Borms, 2023). Operando spesso in nicchie favorevoli alla sperimentazione e alla definizione di nuovi paradigmi di mercato (Horne e Fichter, 2022), tali imprese devono tuttavia dimostrare capacità di consolidamento al di fuori di questi spazi. Persistono inoltre tensioni tra sostenibilità e crescita, aspetto centrale delle agende di ricerca avanzate da diversi studiosi (e.g., Filippelli et al., 2025). Il presente studio ha l'obiettivo di indagare tale quesito, esaminando come le born-green startup traducano i principi della sostenibilità in modelli di business circolari e quali fattori orientino il loro potenziale di crescita. Attraverso un single case study (Yin, 2017) su Alpha, startup italiana del food-tech, si osservano percorsi evolutivi fondati su apprendimento e adattamento continui, più che su espansione standardizzata. Le evidenze ampliano la comprensione dello sviluppo dei modelli circolari come processi relazionali e rigenerativi, evidenziando l'importanza di mantenere coerenza tra valori e crescita e il ruolo di contesti istituzionali abilitanti.

La struttura dell'articolo è la seguente: la Sezione 2 offre una revisione della letteratura sull'innovazione circolare dei modelli di business e sulla sua convergenza con il contesto delle born-green startup, con un focus sul settore food-tech. La Sezione 3 illustra la metodologia di analisi; la Sezione 4 presenta i risultati preliminari, mentre la Sezione 5 conclude discutendo le implicazioni e delineando i suggerimenti per la ricerca futura.

2. Revisione della letteratura

2.1. Innovazione dei modelli di business ed economia circolare

Un modello di business articola la logica secondo cui un'azienda crea e fornisce valore ai clienti. Delinea inoltre l'architettura di ricavi, costi e profitti associati all'impresa che fornisce tale valore (Teece, 2010), basandosi su attività, risorse e capacità realizzate internamente o in collaborazione con partner e clienti (Zott e Amit, 2010). Da una prospettiva strategica, il modello di business orienta le decisioni in contesti incerti (McGrath, 2010) e amplia la nozione di valore oltre la relazione impresa–cliente, includendo tutti gli attori coinvolti nei processi organizzativi (Haftor e Climent, 2023). L'innovazione del modello di business è quindi emersa come prospettiva centrale per la riconfigurazione dei meccanismi di creazione e cattura del valore. Pur essendo spesso associata alla modifica della proposta di valore per il cliente (Bocken et al., 2014), l'innovazione dei modelli di business va intesa come un processo continuo (Bachmann e Jodlbauer, 2023).

L'innovazione sostenibile di questi ultimi nasce al fine di integrare obiettivi economici, ambientali e sociali (Shakeel et al., 2020; Yang et al., 2017; D'Amato et al., 2017), ma nella pratica è ancora affrontata con cautela, spesso percepita dalle imprese come costo piuttosto che come leva strategica (Dhir et al., 2023). In questo contesto, il paradigma dell'economia circolare si è affermato quale risposta al modello lineare, promuovendo la massimizzazione dell'uso e del valore di prodotti, componenti e materiali (Jabbour et al., 2019). Tale approccio permette di attenuare gli effetti della scarsità di risorse e dell'aumento dei costi energetici (Van Opstal e Borms, 2023), rafforzando il legame fra imprenditorialità, innovazione e risoluzione delle sfide socio-ambientali (Lüdeke-Freund e Dembek, 2017). La crescita della ricerca sull'innovazione sostenibile ha contribuito a chiarire come tecnologie e pratiche sociali facilitino le transizioni verso la sostenibilità (Boons e Lüdeke-Freund, 2013), enfatizzando il ruolo dei modelli di business fondati sulla Triple Bottom Line (Bocken et al., 2014).

Poiché sostenibilità ed economia circolare costituiscono sfide globali, la loro operazionalizzazione attraverso i modelli di business circolari assume rilevanza strategica (Geissdoerfer et al., 2017; Kajtazi et al., 2023). Questi traducono i principi dell'economia circolare in strutture operative complesse e innovative (Jabbour et al., 2019), orientate alla rigenerazione di valore lungo il ciclo di vita dei materiali (Bocken e Konietzko, 2022). La loro diffusione dipende dalla presenza di ecosistemi imprenditoriali dinamici ed orientati alla sostenibilità (Neumeyer e Santos, 2018), in grado di favorire la sperimentazione e la crescita di nuovi modelli circolari (Tiba et al., 2021).

Tuttavia, la loro gestione richiede capacità di fronteggiare le tensioni insite nelle transizioni sostenibili (Bommel, 2018). Nelle fasi iniziali di trasformazione settoriale, le nuove imprese sostenibili si mostrano più pronte a cogliere opportunità emergenti rispetto agli operatori tradizionali (Hockerts e Wüstenhagen, 2010). Tali realtà, definite "emerging Davids" (Hockerts & Wüstenhagen, 2010), si configurano in tal modo come protagoniste di un cambiamento orientato a integrare innovazione economica, rigenerazione ambientale e valore sociale.

2.2. Economia circolare e born-green startup

L'imprenditorialità sostenibile è emersa come un ambito distintivo di ricerca che integra la creazione di valore economico, sociale ed ecologico all'interno di un orientamento unitario (La

Rocca e Dal Molin, 2024). Essa pone l'accento sulla salvaguardia della natura, delle comunità e dei sistemi di supporto alla vita, generando al contempo benefici finanziari e non finanziari per la società (Shepherd et al., 2011). Tale prospettiva si è intensificata in risposta alle crescenti pressioni ecologiche e ai limiti planetari, che al tempo stesso aprono nuove opportunità per le startup ecologiche di creare valore affrontando le sfide globali della sostenibilità (Kuckertz et al., 2019; Bonfanti et al., 2024).

Le imprese green incarnano questa evoluzione, offrendo soluzioni pratiche e innovative a problematiche di natura sociale e ambientale (Criscuolo e Menon, 2015; Esty e Winston, 2009). Tra queste, le born-green startup si distinguono come veri e propri agenti del cambiamento. Nate con la sostenibilità come missione fondativa, piuttosto che come adattamento successivo, esse si configurano come motori dell'innovazione verde e circolare (Bendig et al., 2022; Hoang e Böckel, 2024), spesso sfidando le logiche dominanti di mercato e richiedendo pertanto forti livelli di legittimazione e fiducia. La loro peculiarità risiede nell'agilità organizzativa, nell'orientamento valoriale e nell'assenza di vincoli legati a sistemi ereditati dal passato (Demirel et al., 2019), elementi che consentono loro di sperimentare modelli di business circolari di natura dirompente (Henry et al., 2020) e di porsi come precursori nei processi di transizione verso la sostenibilità. Molte di queste imprese nascono direttamente su principi circolari (Sehnem et al., 2021). In tal modo, esse propongono soluzioni radicali a problematiche quali l'inquinamento, l'esaurimento delle risorse e la tutela della salute pubblica (Tiba et al., 2021).

Il loro percorso di sviluppo segue tuttavia le fasi tipiche del ciclo di vita imprenditoriale: startup, transizione, crescita e uscita (Picken, 2017), nel corso delle quali possono emergere specifiche tensioni. La pressione a crescere rapidamente per attrarre investimenti, conquistare quote di mercato e ottenere economie di scala si scontra spesso con la necessità di preservare la coerenza e la performance sostenibile nel lungo periodo (Filippelli et al., 2025). In questo contesto, sebbene le startup siano ampiamente riconosciute come motori di innovazione, gli studi empirici dedicati alla selezione e all'implementazione di strategie circolari restano limitati ed in uno stato iniziale (Van Opstal e Borms, 2023; De Angelis, 2021).

3. Metodologia

3.1. Disegno di ricerca e strategia di campionamento

Per rispondere agli obiettivi di ricerca, lo studio adotta un campionamento per criteri (criterion sampling) per la selezione di un caso ad alta informatività (Fletcher e Plakoyiannaki, 2011; Patton, 2002). In primo luogo, ci siamo concentrati su settori caratterizzati da una forte compresenza di innovazione e sostenibilità. In secondo luogo, abbiamo cercato born-green startup che avessero conseguito risultati rilevanti in termini di performance sociali, ambientali ed economiche, così da esaminare il processo di integrazione di pratiche sostenibili nel modello di business. In terzo luogo, abbiamo dato priorità a casi che garantissero accesso a informatori con prospettive multiple, interne ed esterne all'impresa (De Massis e Kotlar, 2014). In quarto luogo, ci siamo orientati verso born-green startup basate su modelli di produzione circolari, idonee a rivelare antecedenti, barriere e fattori abilitanti di tale processo. Infine, abbiamo selezionato questo caso rivelatorio poiché, nonostante la recente fondazione (2023), Alpha, startup innovativa del settore food-tech, si è distinta grazie a un'alternativa al cioccolato priva di cacao, ottenuta tramite una tecnologia brevettata che trasforma la carruba, attraverso processi di tostatura e fermentazione, in un prodotto di alta qualità. Tale innovazione valorizza la materia prima e si allinea ai principi dell'economia circolare, promuovendo l'efficienza nell'uso delle risorse e la riduzione degli sprechi.

3.2. Raccolta dati

I dati sono stati raccolti da fonti primarie e secondarie mediante un disegno qualitativo che combina interviste semi-strutturate, osservazione diretta e analisi documentale (Strauss e Corbin, 1998). La raccolta è iniziata nella primavera 2025 ed è proseguita per diversi mesi, consentendo un coinvolgimento prolungato con i membri di Alpha e con l'ecosistema organizzativo, al fine di cogliere voci e prospettive multiple. Una sintesi operativa delle fonti e dei materiali è riportata in Tabella I.

I dati primari sono stati raccolti mediante tre round di interviste semi-strutturate con figure chiave di Alpha Food: il Co-founder, il New Product Development Manager e il Financial Manager. Le interviste hanno esplorato le componenti del modello di business (meccanismi di creazione, distribuzione e cattura del valore), il grado di integrazione dei principi di economia circolare, le barriere e i fattori abilitanti, nonché il potenziale di crescita del modello. Tutte le interviste sono state audio-registrate, trascritte verbatim e integrate con annotazioni raccolte durante visite in loco, osservazioni dirette e conversazioni informali in occasione di incontri operativi ed eventi pubblici. I dati secondari sono stati raccolti attraverso fonti documentali. Queste hanno incluso materiali online (sito web, comunicati stampa, post social), documentazione interna e risorse visive/multimediali (fotografie, video, rassegna stampa). Tali materiali sono stati analizzati per contestualizzare le evidenze primarie, ricostruire l'evoluzione storica e strategica di Alpha e triangolare le prospettive, rafforzando la validità costruttiva (Eisenhardt, 1989; De Massis e Kotlar, 2014) e supportando lo sviluppo teorico attraverso profondità contestuale e convergenza evidenziale (Rondi et al., 2024).

Tabella 1. Raccolta dati

3.2. Analisi dei dati

I dati qualitativi sono stati e saranno analizzati attraverso un processo abduttivo e iterativo (Timmermans e Tavory, 2012), muovendosi costantemente tra evidenza empirica e interpretazione teorica per sviluppare una comprensione fondata sul campo ma teoricamente informata del fenomeno. Questo approccio consente di collegare i pattern emergenti ai fondamenti concettuali dello studio, rafforzando coerenza teorica e validità interna (Yin, 2017). L'analisi è stata guidata dal framework Antecedenti–Attività–Risultati (De Massis et al., 2022) e dal Twin Transition framework (Leipziger et al. 2025), così da cogliere come antecedenti organizzativi e di contesto, scelte/attività del modello e relativi esiti interagiscono lungo il percorso di sviluppo del modello di business circolare. La prima ha riguardato la lettura estensiva e la codifica aperta (open coding) di tutte le trascrizioni delle interviste, le field notes e i materiali per mappare lo sviluppo cronologico del caso, le attività, gli attori e le interazioni chiave. Il coding descrittivo ha permesso di delineare la struttura del processo, mettendo in luce la sequenza degli eventi e i meccanismi che ne hanno orientato l'evoluzione. La seconda fase è stata incentrata

sull'approfondimento di antecedenti e meccanismi che hanno abilitato l'integrazione dei principi dell'economia circolare nel modello di business. Particolare attenzione è stata rivolta ai moderatori contestuali e ai meccanismi che collegano antecedenti e attività. La terza fase, attualmente in corso, riguarda l'analisi dei risultati, sia realizzati sia attesi, a livello organizzativo e inter-organizzativo. L'obiettivo finale è lo sviluppo di un framework concettuale robusto che colleghi le dimensioni analizzate e si innesti nella teoria sui modelli di business circolari e sulle born-green startup.

4. Risultati preliminari

4.1. Strategie di innovazione circolare: principi e modalità di adozione

Alpha integra i principi dell'economia circolare sin dalla sua fondazione come born-green startup, riconoscendo la rilevanza delle criticità ambientali, sociali ed economiche associate alla filiera tradizionale del cacao. A differenza delle imprese che adottano pratiche sostenibili in fasi successive, Alpha nasce con la sostenibilità quale pilastro non negoziabile del modello di business.

"L'economia circolare è al centro del nostro modello di business; ne è il cuore pulsante." (Co-Founder).

La filiera del cacao presenta importanti esternalità: elevati consumi idrici ed emissivi, fenomeni di deforestazione, perdita di biodiversità e diffuse criticità sociali, tra cui sfruttamento minorile, condizioni lavorative precarie e una riduzione dei redditi, con un impatto particolarmente significativo sulle donne. L'aumento dei prezzi delle materie prime intensifica tali pressioni, rendendo particolarmente attrattive alternative con caratteristiche funzionali analoghe.

"Per chi lavora grandi volumi, un cioccolato che costa la metà, con le stesse proprietà industriali e un gusto simile, è un forte incentivo." (Financial Manager)

In tale scenario, l'orientamento alla circolarità risponde a pressioni sistemiche. La natura di startup conferisce agilità e rapidità di innovazione, favorendo l'integrazione precoce di pratiche circolari nei processi produttivi, senza gli ostacoli tipici delle grandi imprese.

"Essere una startup ci ha aiutati quasi al 90%; oggi è un grande vantaggio." (NPD Manager)

Alla base del modello si colloca la valorizzazione di scarti agricoli trasformati in ingredienti ad alto valore. Il caso più emblematico è quello della carruba, tradizionalmente utilizzata per i semi destinati alla produzione di gomma di carruba, mentre la polpa viene spesso scartata o impiegata in lavorazioni marginali. L'impiego della carruba è coerente con principi di efficienza delle risorse e resilienza ecologica.

"Semplicemente non usando cacao, non italiano e con filiere molto complesse, facciamo già una scelta sostenibile." (Financial Manager).

La carruba, coltura perenne resiliente alla siccità, non richiede irrigazione né input chimici, cresce in aree aride del Mediterraneo, non implica deforestazione o perdita di fertilità del suolo. Inoltre, l'apertura dello stabilimento in Puglia favorisce il reperimento locale della carruba, di cui l'Italia è secondo produttore mondiale, e riduce i costi ambientali legati al trasporto. La strategia circolare si estende anche al fabbisogno energetico.

"Ci affidiamo all'energia solare per quasi il 100% del fabbisogno: durante l'orario di lavoro funzioniamo quasi esclusivamente con il fotovoltaico." (Co-Founder).

Ciò consente di scollegare la crescita produttiva dal consumo di risorse fossili.

Nel complesso, il caso Alpha dimostra come la CE possa essere integrata operativamente lungo l'intera catena del valore, dalla scelta delle risorse alla produzione, per generare un sistema agroalimentare più resiliente e competitivo.

4.2. Antecedenti, barriere e fattori abilitanti nello sviluppo dei modelli di business circolari

L'attuale macro-ambiente, segnato dalla crisi climatica, dalla pressione sulle filiere e dall'aumento dei prezzi del cacao, accresce la rilevanza di modelli fondati su ingredienti a basso impatto e su approvvigionamento locale. Lo sviluppo del modello di business di Alpha si confronta tuttavia con alcuni ostacoli strutturali quali la disponibilità biofisica della carruba, risorsa locale non ancora pienamente destinata all'uso alimentare. Reperire forniture certificate e tracciabili risulta pertanto complesso, così come gestire le fluttuazioni delle materie prime complementari. Sul piano operativo, la crescita del modello incontra vincoli tecnici, poiché la trasformazione della carruba in un sostituto del cacao richiede processi sofisticati (fermentazione, macinazione, incorporazione dei grassi) e continui investimenti in ricerca e sviluppo.

Persistono inoltre barriere socio-culturali. Il forte radicamento del consumo di cioccolato e la diffidenza verso ingredienti alternativi rendono lento il cambiamento delle preferenze.

"Il principale ostacolo sono sicuramente le persone, in altre parole la cultura. Siamo abituati a consumare cioccolato, quindi la prima grande difficoltà è culturale." (Co-Founder)

La concentrazione del settore dolciario, dominato da pochi attori, limita il riconoscimento commerciale e la possibilità di stringere partnership strategiche. A questo si aggiungono i vincoli finanziari tipici delle startup.

Contestualmente, esistono fattori che sostengono l'evoluzione del modello di business circolare. In primo luogo, la versatilità della carruba, coltura resiliente, a basso impatto idrico e adattabile a molteplici applicazioni alimentari, che offre un'alternativa promettente al cacao. Inoltre, l'ingresso di Alpha avviene in un contesto di crescente attenzione verso la sostenibilità. Le imprese ricercano ingredienti in grado di sostenere obiettivi ESG, in un mercato caratterizzato da competizione limitata. L'interesse di investitori orientati all'impatto rappresenta un ulteriore elemento abilitante, fornendo capitale, visibilità e mentoring strategico.

"I nostri investitori forniscono capitale, naturalmente, ma portano anche una visione strategica. Agiscono come advisor; sono persone con cui siamo in costante contatto." (Financial Manager)

Infine, le attività educative promosse dall'azienda contribuiscono a ridefinire la percezione della carruba, da risorsa marginale a ingrediente moderno e sostenibile, favorendone l'accettazione presso consumatori e operatori di filiera.

4.3. Outcome dei modelli di business circolari: persone, pianeta, profitto

Questa sezione analizza gli impatti del modello di business circolare di Alpha lungo le dimensioni ambientale, sociale ed economica.

Sul piano ambientale, la sostituzione del cacao con la carruba costituisce l'innovazione più significativa, consentendo una riduzione fino al 90% del consumo idrico e dell'80% delle emissioni di CO_2 rispetto al cioccolato convenzionale.

"Il nostro prodotto […] è molto rispettoso dell'ambiente, quasi due volte più sostenibile rispetto al cioccolato tradizionale." (NPD Manager)

La filiera corta, interamente radicata in Italia, riduce ulteriormente l'impronta dei trasporti e rafforza la resilienza produttiva. Lo stabilimento prossimale alle aree di coltivazione favorisce l'efficienza operativa, in linea con l'obiettivo di rimanere locali, migliorare la filiera e aggiungere valore. La carruba, coltura perenne resistente alla siccità, può essere impiantata su terreni marginali, contribuendo alla rigenerazione agroecologica, al sequestro del carbonio e alla preservazione della biodiversità. L'intero processo produttivo mira a minimizzare gli scarti e a ottimizzare l'uso di risorse in ottica circolare, persino il sito web aziendale è progettato per generare emissioni digitali inferiori alla media. L'intero processo produttivo minimizza gli scarti e promuove l'uso di energia e risorse in chiave circolare, persino il sito aziendale è progettato per generare emissioni digitali inferiori rispetto alla media.

Gli impatti sociali si manifestano sia sul versante dei consumi, sia su quello territoriale. Il nuovo prodotto vegetale privo dei principali allergeni e caratterizzato da ridotti contenuti di

zuccheri, risponde alle esigenze di salute pubblica legate all'aumento di intolleranze e patologie metaboliche. Le proprietà nutrizionali della carruba conferiscono all'alternativa un profilo funzionale e salutistico. In chiave complementare, la scelta di operare nel Mezzogiorno genera effetti socio-economici positivi, contribuendo alla valorizzazione del patrimonio agroalimentare mediterraneo e favorendo la riconnessione dei consumatori con l'identità territoriale.

"Il nostro obiettivo è rimanere locali, migliorare la filiera e aggiungere valore. Questo, da solo, migliora in modo significativo la nostra impronta di sostenibilità." (NPD Manager)

La dimensione economica del modello poggia sulla trasformazione di una risorsa agricola sottoutilizzata in una filiera locale stabile, capace di rivitalizzare aree rurali e generare valore diffuso.

"L'intera area del Salento potrebbe diventare un importante hub per la lavorazione della carruba, creando reddito e opportunità per gli agricoltori […]. Questo potrebbe generare nuove attività e opportunità di lavoro." (Co-Founder)

La possibilità di coltivare, trasformare e distribuire la carruba interamente in Italia riduce la dipendenza da materie prime importate e da mercati globali volatili, offrendo maggiore stabilità rispetto al cacao. Il nuovo prodotto, comparabile al cioccolato in termini di performance industriale ma a costi tendenzialmente inferiori, si configura come alternativa competitiva per le imprese di trasformazione. Questo approccio permette di trattenere valore nei territori di produzione, generando occupazione nelle fasi di coltivazione, trasformazione e sviluppo tecnologico e contribuendo alla diversificazione dell'economia agricola meridionale, rafforzandone la capacità di adattamento ai cambiamenti climatici e alle crisi delle colture tradizionali.

5. Implicazioni dello studio e conclusioni

Il presente studio punta ad offrire tre principali contributi teorici. In primo luogo, estendere la letteratura su imprenditorialità sostenibile e circolare (Esau et al., 2025; La Rocca e Dal Molin, 2024) e sulla gestione sostenibile delle filiere (Cheng et al., 2023), integrandola con il filone emergente sulle born-green startup (Bendig et al., 2022; Hoang e Böckel, 2024). In secondo luogo, contribuisce a colmare le lacune conoscitive sui meccanismi di sviluppo dei modelli di business circolari, offrendo un'analisi approfondita di antecedenti, fattori abilitanti e barriere e informando gli studiosi sui meccanismi di creazione di valore sostenibile (Filippelli et al., 2025). In terzo luogo, lo studio estende la letteratura sull'innovazione circolare dei modelli di business (Shakeel et al., 2020; Yang et al., 2017; D'Amato et al., 2017), facendo emergere pratiche e meccanismi per affrontare le tensioni intrinseche alle transizioni sostenibili (Bommel, 2018).

Sul piano manageriale, i risultati preliminari indicano l'esigenza di coniugare sostenibilità e performance mediante flessibilità progettuale, modularità dei processi, apertura all'innovazione e cooperazione con stakeholder eterogenei. Strategie comunicative efficaci e narrazioni autentiche risultano cruciali per costruire legittimità, così come una cultura organizzativa valoriale in grado di guidare le decisioni in condizioni di incertezza. Con riferimento alle implicazioni di policy, le evidenze analizzate suggeriscono la necessità di politiche pubbliche che sostengano la maturazione dei modelli di business circolari attraverso definizione di standard, strumenti di certificazione, appalti pubblici orientati alla sostenibilità, sviluppo di infrastrutture territoriali adeguate e interventi di sensibilizzazione. In questo quadro, istituzioni e imprese agiscono come co-protagonisti di una transizione sistemica in cui benefici ambientali, sociali ed economici sono interdipendenti e cumulativi.

Pur offrendo contributi rilevanti, la ricerca presenta limiti che ne circoscrivono la trasferibilità. L'adozione di un singolo caso abilita un'analisi in profondità, ma limita la generalizzabilità a settori o contesti socio-istituzionali differenti. Inoltre, l'impostazione trasversale restituisce una fotografia puntuale del processo, non catturando, tuttavia, appieno

l'evoluzione temporale. Questi limiti aprono spazi per future ricerche: studi multi-caso, approcci longitudinali e analisi comparative interregionali. Tali approfondimenti contribuirebbero ad una comprensione più solida e generalizzabile dei processi attraverso cui i modelli di business circolari si sviluppano, evolvono e generano impatti sistemici.

Parole chiave: Business model; economia circolare; startup; innovazione; sostenibilità

GRINS: progetto PNRR per una piattaforma dati a supporto della sostenibilità della filiera bovina italiana

Gianfranco Spizzirri[1], Bruno Notarnicola[2], Francesco Astuto[3], Pietro A. Renzulli[4], Rosa Di Capua[5], Maurizio De Molfetta[6], Donatello Fosco[7]

1. Introduzione

Il settore zootecnico italiano rappresenta uno dei pilastri dell'economia agroalimentare nazionale, con un ruolo strategico non solo nella produzione di carne e latte, ma anche nel mantenimento di sistemi agricoli, occupazione rurale e tradizioni territoriali. La produzione bovina, in particolare, contribuisce in modo significativo al valore aggiunto del settore agricolo e alla sicurezza alimentare del paese, ma è anche responsabile di impatti ambientali rilevanti, tra cui emissioni di gas serra, consumo di suolo, uso di acqua e produzione di reflui zootecnici (Gerber et al., 2013).

Negli ultimi anni, la crescente attenzione a temi come la mitigazione dei cambiamenti climatici, la transizione verso pratiche agricole sostenibili e l'adozione di strategie ESG (Environmental, Social, Governance) ha reso cruciale per le aziende e i policymaker disporre di dati affidabili e specifici per il contesto nazionale. Tuttavia, fino ad oggi, gran parte delle analisi ambientali per la zootecnia italiana si sono basate su database esteri, poco rappresentativi delle caratteristiche dei sistemi produttivi italiani, con razze, tipologie di allevamento e pratiche gestionali differenti (Berton et al., 2025). Questa lacuna limita la capacità delle aziende di valutare l'effettivo impatto ambientale dei propri processi e di prendere decisioni strategiche basate su evidenze scientifiche.

In questo scenario, il progetto GRINS (Growing, Resilient, INclusive and Sustainable), finanziato nell'ambito del Piano Nazionale di Ripresa e Resilienza (PNRR), mira a colmare questa lacuna sviluppando database nazionali e regionali di Life Cycle Inventory (LCI) per i principali sistemi produttivi italiani, tra cui l'allevamento dei bovini. Il progetto GRINS ha coinvolto un network di università e centri di ricerca italiani, combinando competenze scientifiche avanzate con conoscenze manageriali e applicative, il cui risultato scientifico sarà integrato nella piattaforma AMELIA, gestita dalla Fondazione GRINS, diventando così uno strumento accessibile e operativo per supportare la ricerca, le decisioni aziendali e le politiche di sostenibilità lungo l'intera filiera agroalimentare.

L'obiettivo è sviluppare una base dati completa e armonizzata, che consenta di misurare in modo accurato le emissioni, il consumo di risorse e gli impatti ambientali lungo l'intera filiera bovina, dalla coltivazione delle materie prime fino ai prodotti finali: carne, latte e derivati. Grazie

a questa infrastruttura informativa, aziende, filiere e policymaker potranno individuare leve di intervento efficaci per migliorare la sostenibilità delle produzioni, ottimizzare l'efficienza delle risorse e rispondere in modo trasparente ed efficace alle richieste dei mercati nazionali e internazionali.

L'approccio del progetto non si limita a un'analisi ambientale fine a sé stessa, ma intende supportare una gestione strategica del settore, facilitando la pianificazione di investimenti, l'implementazione di innovazioni tecnologiche, e la definizione di politiche di mitigazione delle emissioni, come quelle relative al metano enterico, oggi oggetto di attenzione a livello europeo. In questo senso, GRINS rappresenta uno strumento chiave per connettere la sostenibilità ambientale alla competitività industriale e alla governance delle filiere agroalimentari italiane, supportando anche l'ottenimento di certificazioni riconosciute come il Made Green in Italy, in grado di valorizzare la qualità ambientale dei prodotti e rafforzare il posizionamento delle imprese sui mercati nazionali ed europei.

L'obiettivo del progetto è sviluppare una base dati completa e armonizzata per la zootecnia bovina, capace di supportare analisi di impatto ambientale, strategie aziendali e politiche pubbliche. Questi dati permetteranno alle imprese di valutare gli effetti ambientali lungo l'intera filiera, dalla coltivazione delle materie prime alla produzione di carne e latte, e di individuare interventi mirati per migliorare l'efficienza delle risorse, ridurre gli impatti e valorizzare i prodotti a livello nazionale e internazionale.

2. Metodologia e approccio scientifico

Il progetto ha permesso di costruire inventari di ciclo di vita completi e coerenti per l'intera filiera bovina, fornendo dati trasparenti e riproducibili che rappresentano strumenti concreti per le decisioni strategiche di aziende e policymaker. Questi inventari non solo descrivono in dettaglio i flussi di materiali ed energia, ma offrono anche indicazioni pratiche per identificare leve di miglioramento lungo tutta la filiera, supportando la pianificazione di interventi mirati per la sostenibilità, l'efficienza produttiva e la gestione responsabile delle risorse.

Gli inventari coprono in modo integrato tutte le fasi principali della filiera bovina, dalla produzione agricola dei foraggi e dei mangimi, alla trasformazione delle materie prime, fino alle attività di allevamento e alla fase di macellazione, con l'obiettivo di rappresentare l'intero sistema produttivo e i relativi flussi di materiali, energia ed emissioni (Figura 1). In questo quadro sono state selezionate le principali razze bovine da carne (13) e da latte (5), classificandole per età e genere, che complessivamente rappresentano oltre il 95% della popolazione bovina italiana. La scelta è stata effettuata applicando criteri di rappresentatività basati sul peso delle popolazioni nazionali (cut-off dell'1%) e regionali (cut-off del 5%), così da garantire una copertura realistica delle diverse tipologie produttive presenti sul territorio (BDN, 2023).

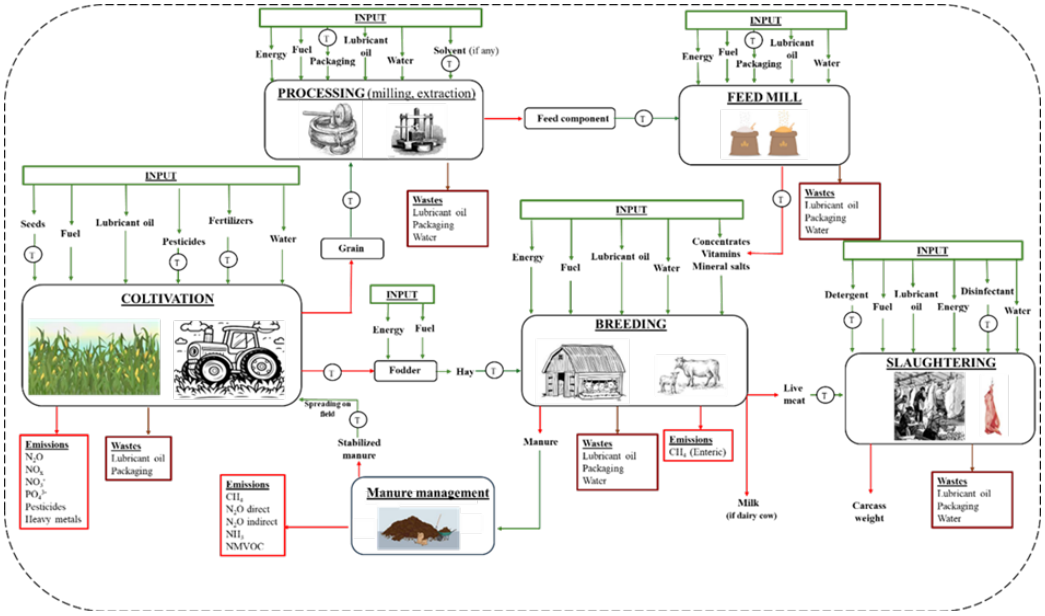

Figura 1. Confini del sistema e principali flussi della filiera bovina

In dettaglio, sono stati sviluppati:

- Produzione agricola dei foraggi e dei mangimi: 17 dataset nazionali, comprendenti colture di cereali, leguminose e foraggi, con informazioni dettagliate su input (energia, fertilizzanti, acqua, pesticidi), rese e consumi energetici, oltre alla modellizzazione dei principali output che coinvolgono emissioni in aria, acqua e suolo di fertilizzanti, fitofarmaci e metalli pesanti.
- Trasformazione delle materie prime in mangimi: 16 dataset nazionali, relativi alla lavorazione di cereali, legumi e sottoprodotti in alimenti per bovini, comprensivi di dati su energia, resa di processo e gestione dei co-prodotti.
- Allevamento: 213 dataset nazionali e 31 regionali, rappresentativi della diversità di razze, età, sesso e tipologie produttive, includendo sia la produzione di carne che di latte e co-prodotti, e considerando differenti sistemi di gestione (estensivo, semi-estensivo, semi-intensivo e intensivo).
- Macellazione: 17 dataset, comprendenti carne, sottoprodotti e flussi di scarto, con applicazione di un approccio di allocazione economica per la distribuzione degli impatti tra i diversi prodotti della filiera.

La costruzione degli inventari ha seguito rigorosi standard internazionali quali ISO 14040 e ISO 14044, assicurando trasparenza metodologica, coerenza e possibilità di riproduzione degli studi (ISO 2006a e ISO 2006b). Per garantire robustezza e rappresentatività dei dati, la costruzione degli inventari ha adottato un approccio statistico, integrando informazioni provenienti dai principali database italiani ed europei, da fonti scientifiche e letteratura tecnica, nonché da testi di settore (ISTAT, 2024; ISMEA, 2024; Ribaudo, 2017; Eurostat, 2024; Ecoinvent, 2022). Questo ha permesso di modellare in maniera accurata le diverse pratiche produttive, le caratteristiche delle razze e le condizioni regionali, fornendo un quadro realistico e dettagliato della filiera bovina italiana, utilizzabile sia per valutazioni ambientali che per supporto decisionale strategico da parte delle imprese e dei policymaker. Gli output degli inventari sono stati successivamente modellizzati utilizzando modelli internazionali riconosciuti, che hanno consentito di quantificare in modo rigoroso le principali emissioni generate lungo la filiera zootecnica (IPCC, 2019, EMEP, 2019; Notarnicola et al., 2023; Zampori e Pant, 2019). Allo stesso modo, è stato modellizzato l'intero fine vita dei materiali impiegati nelle diverse fasi produttive, garantendo una rappresentazione completa e coerente dei flussi ambientali associati al sistema analizzato (EC, 2021; CONOU, 2022).

3. Risultati e discussione

Gli inventari sviluppati sono stati utilizzati per la valutazione degli impatti ambientali della filiera bovina italiana, considerando le principali categorie di impatto previste dal metodo EF3.1, raccomandato dalla Commissione Europea, permettendo di identificare le fasi più critiche e di supportare interventi mirati per la riduzione degli impatti (EC, 2022).

L'analisi dei dati ha permesso di evidenziare come la fase di allevamento rappresenti l'anello più impattante dell'intera filiera, con il metano enterico individuato come hotspot principale. Questo risulta particolarmente rilevante nel contesto europeo, dove si stanno valutando misure di regolazione delle emissioni di metano, in cui alcuni Stati membri, come la Danimarca, hanno già introdotto tasse basate sul numero di capi, ma senza considerare le emissioni effettive dei singoli allevamenti (EC, 2024). L'approccio fornito dal progetto GRINS consente di contestualizzare gli impatti ambientali, offrendo un supporto diretto alle aziende per ottimizzare le pratiche di gestione del bestiame e ai policymaker per definire strumenti fiscali più equi ed efficaci.

L'analisi dei dati sviluppati dal progetto GRINS ha permesso di evidenziare come le diverse tipologie di allevamento e le caratteristiche delle razze influenzino significativamente gli impatti ambientali lungo la filiera bovina italiana. I sistemi estensivi, semi-estensivi, semi-intensivi e intensivi mostrano profili di emissioni e consumi di risorse molto differenziati, riflettendo le pratiche di gestione, l'alimentazione e l'accesso al pascolo.

Le razze tradizionali italiane, come Chianina, Marchigiana e Romagnola, allevate prevalentemente in sistemi semi-estensivi, beneficiano di accesso al pascolo e di stabulazione stagionale. Questo approccio favorisce la biodiversità e il mantenimento dei territori marginali, ma comporta una maggiore variabilità nei consumi alimentari e nelle emissioni di metano enterico, che emerge come hotspot ambientale in questi sistemi (Figura 2).

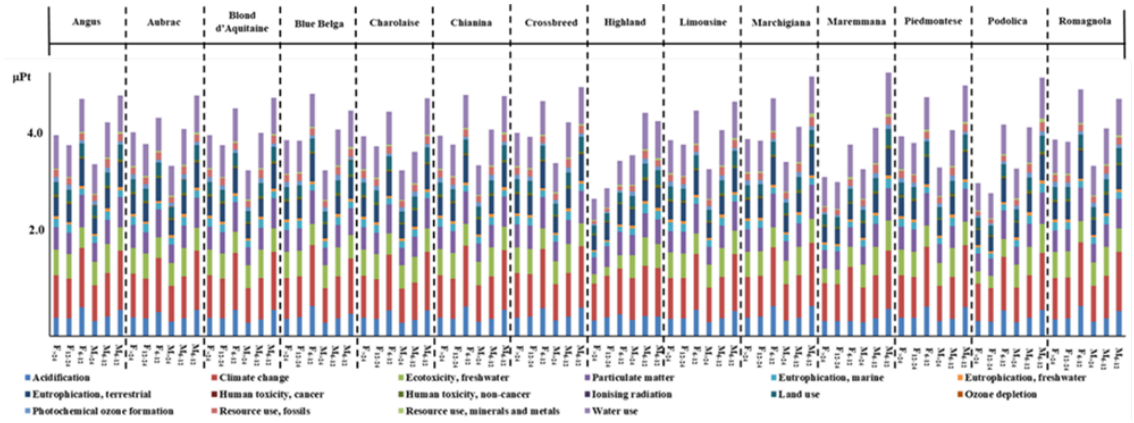

Figura 2. Analisi di impatti ambientale delle razze da carne analizzate

Al contrario, le razze importate per la produzione di carne, come Limousine e Charolaise, sono gestite principalmente in sistemi intensivi, con stabulazione permanente e razioni alimentari controllate. Questi sistemi permettono un accrescimento rapido e uniformità dei prodotti, riducendo la variabilità di produzione, ma presentano comunque impatti significativi legati all'allevamento e alla gestione delle deiezioni.

Le principali categorie di impatto ambientale identificate, considerando un cut-off del 5%, includono il cambiamento climatico, principalmente legato alle emissioni di metano biogenico derivanti dall'allevamento; l'utilizzo di risorse idrico, associato al fabbisogno idrico di colture largamente utilizzate nella preparazione della razione alimentare, come il mais; l'ecotossicità in acqua dolce, correlato all'uso di fertilizzanti e fitofarmaci; e altre categorie come acidificazione,

eutrofizzazione terrestre e particolato atmosferico, strettamente legate alle emissioni di ammoniaca e alla gestione dei reflui zootecnici.

Per quanto riguarda le razze da latte, come Frisona e Jersey, l'allevamento intensivo prevalente garantisce elevata produttività di latte e gestione controllata. L'andamento osservato risulta contrastante e perlopiù correlato con la produttività (elevata per la Frisona) e la stazza degli animali (minore per il Jersey) (Figura 3).

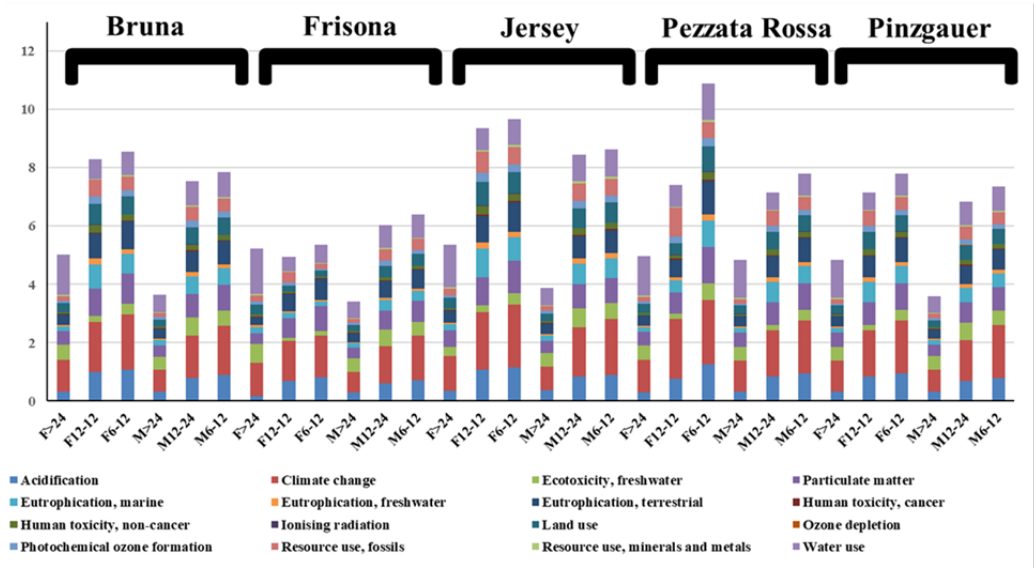

Figura 3. Analisi di impatto ambientale delle razze da latte analizzate

Le razze a doppia attitudine, come Pezzata Rossa, Pinzgauer, e Bruna, adottano sistemi semi-estensivi, combinando pascolo e stabulazione controllata, e mostrano un profilo intermedio in termini di emissioni e consumo di risorse.

Le stesse categorie di impatto, ma con diversa distribuzione, sono risultate significative anche per i bovini destinati alla produzione di latte, evidenziando come cambiamento climatico, consumo di risorse idriche, ecotossicità in acqua dolce, acidificazione, eutrofizzazione terrestre e formazione di particolato atmosferico rappresentino i principali fattori ambientali lungo l'intera filiera lattiero-casearia, con dinamiche analoghe a quelle osservate per la produzione di carne.

La diversa distribuzione delle varie categorie di impatto nel profilo ambientale dei sistemi analizzati è fondamentale per l'analisi del ciclo di vita, poiché consente di associare in maniera precisa ciascun profilo ambientali ai diversi sistemi produttivi e categorie di allevamento. I dati evidenziano come interventi mirati nell'alimentazione e nella gestione del letame possano ridurre significativamente le emissioni, offrendo alle aziende strumenti concreti per ottimizzare le pratiche di gestione e migliorare la sostenibilità complessiva. Inoltre, la disponibilità di informazioni dettagliate per le diverse razze e sistemi consente di progettare strategie di filiera più efficaci, bilanciando produttività, qualità dei prodotti e impatti ambientali, e fornisce un supporto diretto ai policymaker per definire regolazioni mirate.

Nella fase di macellazione, la categorizzazione degli animali in vitelli maschi di razze da latte, scottone, manze, vitelloni e bovini adulti permette di modellare in modo dettagliato i flussi di carne e co-prodotti, allocando correttamente i carichi ambientali. Questo livello di dettaglio è essenziale per le analisi LCA, poiché le emissioni e l'uso di risorse variano significativamente tra le varie categorie di età, genere e razza.

La disponibilità di dataset dettagliati per tutte le fasi della filiera e per ogni categoria bovina consente inoltre di comprendere le interazioni tra produzione agricola, alimentazione, gestione degli allevamenti e dei reflui zootecnici e macellazione, fornendo alle imprese uno strumento per

la pianificazione strategica, la riduzione dell'impronta ambientale e la comunicazione trasparente con il mercato. Le razze a doppia attitudine, come Pezzata Rossa, Pinzgauer, e Bruna, adottano sistemi semi-estensivi, combinando pascolo e stabulazione controllata, e mostrano un profilo intermedio in termini di emissioni e consumo di risorse.

Le stesse categorie di impatto, ma con diversa distribuzione, sono risultate significative anche per i bovini destinati alla produzione di latte, evidenziando come cambiamento climatico, consumo di risorse idriche, ecotossicità in acqua dolce, acidificazione, eutrofizzazione terrestre e formazione di particolato atmosferico rappresentino i principali fattori ambientali lungo l'intera filiera lattiero-casearia, con dinamiche analoghe a quelle osservate per la produzione di carne.

La diversa distribuzione delle varie categorie di impatto nel profilo ambientale dei sistemi analizzati è fondamentale per l'analisi del ciclo di vita, poiché consente di associare in maniera precisa ciascun profilo ambientali ai diversi sistemi produttivi e categorie di allevamento. I dati evidenziano come interventi mirati nell'alimentazione e nella gestione del letame possano ridurre significativamente le emissioni, offrendo alle aziende strumenti concreti per ottimizzare le pratiche di gestione e migliorare la sostenibilità complessiva. Inoltre, la disponibilità di informazioni dettagliate per le diverse razze e sistemi consente di progettare strategie di filiera più efficaci, bilanciando produttività, qualità dei prodotti e impatti ambientali, e fornisce un supporto diretto ai policymaker per definire regolazioni mirate.

Nella fase di macellazione, la categorizzazione degli animali in vitelli maschi di razze da latte, scottone, manze, vitelloni e bovini adulti permette di modellare in modo dettagliato i flussi di carne e co-prodotti, allocando correttamente i carichi ambientali. Questo livello di dettaglio è essenziale per le analisi LCA, poiché le emissioni e l'uso di risorse variano significativamente tra le varie categorie di età, genere e razza.

La disponibilità di dataset dettagliati per tutte le fasi della filiera e per ogni categoria bovina consente inoltre di comprendere le interazioni tra produzione agricola, alimentazione, gestione degli allevamenti e dei reflui zootecnici e macellazione, fornendo alle imprese uno strumento per la pianificazione strategica, la riduzione dell'impronta ambientale e la comunicazione trasparente con il mercato.

Nonostante i risultati significativi ottenuti dal progetto GRINS, permangono alcune limitazioni che richiedono ulteriori approfondimenti. In particolare, l'analisi delle razze meno diffuse e dei sistemi di allevamento marginali è ancora parziale, limitando la rappresentatività complessiva dei dati per alcune nicchie produttive. Inoltre, la variabilità stagionale dei sistemi produttivi e delle condizioni ambientali non è completamente catturata dai dataset attuali, così come alcune informazioni relative alla fase di macellazione, quali il consumo energetico specifico, l'utilizzo di co-prodotti e la gestione dei rifiuti, che necessitano di ulteriori dati empirici per garantire una stima più accurata degli impatti.

Gli sviluppi futuri del progetto prevedono un ampliamento dei dataset a livello regionale e temporale, con l'obiettivo di rappresentare in maniera ancora più precisa la diversità dei sistemi produttivi italiani e le dinamiche stagionali delle produzioni. Si prevede inoltre di estendere l'analisi ai processi downstream, includendo la trasformazione, il confezionamento e la distribuzione dei prodotti carne e latte, in modo da offrire una valutazione ambientale completa lungo l'intera filiera.

Parallelamente, è previsto un continuo allineamento con iniziative internazionali e standard metodologici, quali le linee guida ISO e le raccomandazioni della Commissione Europea, al fine di migliorare la coerenza, la comparabilità e l'applicabilità dei dati sia per la ricerca scientifica, sia per le decisioni strategiche delle aziende. Questa evoluzione consentirà alle imprese di utilizzare i dati per ottimizzare investimenti sostenibili, pianificare interventi mirati per la riduzione degli impatti ambientali, e rafforzare la trasparenza e la comunicazione con stakeholder, mercati e consumatori.

Infine, il miglioramento continuo della precisione e della copertura dei dati renderà gli inventari uno strumento sempre più robusto per supportare le politiche pubbliche e le strategie

aziendali nel settore zootecnico, contribuendo a favorire una produzione più sostenibile, resiliente e competitiva a livello nazionale ed europeo.

4. Conclusioni

Il progetto GRINS rappresenta un passo decisivo verso la sostenibilità della filiera bovina italiana, fornendo strumenti concreti e affidabili sia per le aziende del settore, sia per i policymaker. La piattaforma LCI sviluppata consente di misurare in maniera precisa gli impatti ambientali lungo tutta la filiera, dalla produzione delle materie prime per l'alimentazione dei bovini fino alla macellazione e alla gestione dei co-prodotti, offrendo una visione integrata e scientificamente robusta dei flussi materiali ed energetici.

Grazie ai dataset dettagliati e armonizzati, le imprese possono identificare le fasi più critiche e gli hotspot ambientali, come il metano enterico nella fase di allevamento, e pianificare interventi mirati per ridurre le emissioni e ottimizzare l'efficienza produttiva. Allo stesso tempo, i dati supportano scelte strategiche su investimenti sostenibili, gestione delle risorse naturali, razionamento e miglioramento dei sistemi di allevamento, contribuendo a creare vantaggi competitivi e a rispondere alle crescenti richieste di trasparenza e responsabilità da parte dei consumatori e dei mercati internazionali.

Dal punto di vista delle politiche pubbliche, gli inventari LCI forniscono un supporto solido per lo sviluppo di strumenti fiscali più equi ed efficaci, come eventuali tasse sulle emissioni di metano basate su dati reali e non solo sul numero di capi allevati, e per la definizione di linee guida e regolamenti orientati alla sostenibilità.

Infine, il progetto apre la strada a sviluppi futuri che integreranno dati più dettagliati a livello regionale e temporale, estendendo l'analisi ai processi downstream come trasformazione, confezionamento e distribuzione, e garantendo l'allineamento continuo con standard nazionali e internazionali.

Tra le certificazioni che le aziende possono ottenere per valorizzare il proprio impegno in termini di sostenibilità un ruolo importante a livello nazionale è occupato dalla certificazione Made Green in Italy, lo schema nazionale basato sulla metodologia PEF (Product Environmental Footprint) promosso dal Ministero dell'Ambiente. Tale certificazione, partendo da studi LCA, permette di attestare in modo trasparente le prestazioni ambientali dei prodotti lungo l'intero ciclo di vita, rafforzando la credibilità delle filiere e offrendo alle imprese un importante strumento per differenziarsi sul mercato attraverso qualità, tracciabilità e responsabilità ambientale.

In questo modo, GRINS non solo consolida la base scientifica per la valutazione ambientale della filiera bovina, ma diventa uno strumento strategico per guidare la transizione verso un settore agroalimentare più resiliente, innovativo e sostenibile, rafforzando la competitività delle aziende italiane a livello nazionale ed europeo.

Parole chiave: Life cycle assessment; filiera bovina; progetto GRINS; sostenibilità; metano enterico

Ringraziamenti

Questo studio è stato finanziato dalla European Union - NextGenerationEU, in the framework of the GRINS - Growing Resilient, INclusive and Sustainable project (GRINS PE00000018 - CUP J53C22003140001).

Circolarità per la decarbonizzazione: pratiche di transizione nelle supply chain tessili

Sara Toniolo[1], Ilenia Bravo[2], Ivan Russo[3], Raffaella Taddeo[4]

1. Introduzione

Per rispondere a un mercato globale sempre più orientato alla personalizzazione e al modello del fast fashion, il settore tessile presenta rilevanti criticità ambientali, tra cui il depauperamento delle risorse naturali e un'eccessiva produzione di rifiuti. L'implementazione dei principi dell'economia circolare, tra cui la riduzione dei consumi, il riutilizzo dei filati e la mitigazione degli impatti ambientali, è essenziale anche per garantire la sostenibilità sociale ed economica del settore.

Oggi il settore tessile è parte integrante dell'economia globale e deve adattarsi al cambiamento delle preferenze dei consumatori verso una maggiore personalizzazione e cicli di vendita sempre più brevi. L'industria dell'abbigliamento è inoltre influenzata dalla costante domanda di nuovi stili e dal rapido ricambio di design e materiali. Questa tendenza accelera il ciclo di vita del prodotto, riducendo spesso la durata utile dei capi e contribuendo a generare rifiuti tessili. Tale modello genera una produzione e un consumo eccessivi, ponendo sfide rilevanti in termini di gestione dei rifiuti e sostenibilità ambientale.

Nonostante gli sforzi di riciclo dei rifiuti tessili, molti autori concordano sul fatto che il 75% di essi finisca globalmente in discarica, mentre l'incenerimento, ampiamente utilizzato, contribuisce a rendere l'industria tessile uno dei settori a maggiore impatto ambientale, con un ruolo rilevante nell'inquinamento idrico e atmosferico (Juanga-Labayen et al., 2022; Hora et al., 2024).

In questo contesto, l'adozione di strategie di economia circolare è emersa come un approccio promettente per mitigare tali impatti, promuovendo metodi alternativi per estendere la vita utile dei capi e ridurre gli scarti (Solis et al., 2024). Questi approcci richiedono una rimodulazione pianificata delle pratiche produttive, finalizzata a ridurre gli effetti ambientali negativi, mantenere standard sociali adeguati e stimolare la crescita economica (Karim et al., 2024).

La supply chain tessile comprende diverse fasi di lavorazione, come la produzione di fibre e filati, la realizzazione dei tessuti, i trattamenti preliminari, la tintura, la stampa, il taglio e la confezione. Per raggiungere una supply chain sostenibile è necessario monitorare in modo consapevole tutti i processi di approvvigionamento, produzione, distribuzione e smaltimento. Il settore tessile si trova nella complessa posizione di dover conciliare la tradizione della moda con l'innovazione, le nuove tendenze di consumo e la necessità di decarbonizzazione. In questo contesto, la gestione dei rifiuti tessili rimane una delle sfide più pressanti.

[4] Professoressa associata, ECON-10/A, Università degli Studi "G. d'Annunzio" Chieti – Pescara; raffaella.taddeo@unich.it

Ciò implica valutare l'intero ciclo di vita del prodotto, dall'acquisizione/approvvigionamento delle materie prime allo smaltimento, adottando misure per prevenire i danni ambientali, garantire condizioni di lavoro eque e sostenere il benessere delle comunità locali (Rashid et al., 2024).

Per quanto riguarda la produzione delle fibre, metodi agricoli rigenerativi (ad esempio evitando l'uso di input chimici) e/o il riutilizzo degli scarti generati durante la lavorazione possono contribuire alla riduzione dei rifiuti. Numerosi autori hanno esplorato l'associazione tra economia circolare e tecnologie digitali basate su automazione e scambio di dati nei processi di smart manufacturing (Aslam et al., 2024). Tali tecnologie includono robotica, intelligenza artificiale, blockchain, modellazione informativa tridimensionale, piattaforme digitali/marketplace e Internet of Things (Çetin et al., 2021). Esse consentono il monitoraggio dei flussi di prodotti e componenti e forniscono dati utili a migliorare la gestione delle risorse e a rafforzare i processi decisionali nelle diverse fasi del ciclo di vita. Questo comporta il duplice vantaggio di ridurre i consumi e gli errori di produzione, migliorando al contempo l'efficienza complessiva (Rajput e Singh, 2019).

Tecniche produttive basate su tecnologie digitali, come il taglio meccanizzato e i processi di tintura e stampa digitale, che consentono un'applicazione più precisa del colore, hanno ridotto lo spreco di inchiostri, sostanze chimiche e acqua. Inoltre, l'applicazione di misure di controllo qualità è essenziale per minimizzare i difetti durante cucitura e assemblaggio, massimizzare l'utilizzo dei filati e ridurre gli sprechi di tessuto, materie prime ed energia. L'esame dei materiali e degli accessori con particolare attenzione alla riciclabilità può portare a una minore produzione di rifiuti nelle fasi di assemblaggio e finitura. Altre strategie includono la progettazione di tessuti in monomateriale o con risorse facilmente separabili, oltre alla rimozione di componenti non riciclabili come bottoni metallici e accessori complessi, facilitando così il riciclo (Hora et al., 2023).

Progettare tessuti durevoli, minimizzare la sovrapproduzione ed estendere il ciclo di vita attraverso riparazione, rigenerazione o riutilizzo contribuisce alla creazione di un'economia circolare industriale (Din et al., 2025).

Iniziative come gli scambi di abiti, i negozi dell'usato e i programmi di donazione aiutano ulteriormente a deviare i tessili dalle discariche. Nei casi in cui vengono attivati loop di circolarità, la prospettiva di ciclo di vita risulta integrata nella supply chain tessile attraverso l'impiego delle principali metodologie basate sul life cycle per identificare pratiche e strategie di miglioramento; l'uso di approcci di mappatura finalizzati a rappresentare la supply chain o i flussi di scarto; l'applicazione di approcci qualitativi fondati sul life cycle thinking per far emergere pratiche e strategie di miglioramento; l'adozione di approcci quantitativi che includono analisi di ciclo di vita come strumento di valutazione delle prestazioni ambientali (Toniolo et al., 2024a). Attraverso la condivisione di standard di eccellenza è possibile promuovere l'innovazione e accelerare la transizione verso un'economia tessile circolare (Reike et al., 2023; Hora et al., 2023). Tuttavia, questa transizione verso una produzione ecosostenibile non è priva di sfide: mancanza di risorse finanziarie, resistenza al cambiamento, infrastrutture insufficienti e complessità delle supply chain nei Paesi emergenti rappresentano le barriere più comuni all'adozione di catene sostenibili (Vishwakarma et al., 2022).

Grandi marchi della moda, come Stella McCartney, Nike, H&M, Zara e Uniqlo, hanno adottato pratiche di moda sostenibile, lanciando prodotti a basso impatto ambientale e rafforzando le loro iniziative di responsabilità sociale d'impresa, oltre che di riduzione delle emissioni (Aras-Beger et al., 2020). Il settore del tessile è infatti responsabile non solo della generazione di ingenti quantità di rifiuti e di un consumo intensivo, spesso non necessario, di risorse, ma anche di rilevanti emissioni di gas serra lungo l'intero ciclo di vita dei prodotti; si stima, infatti, che generi il 2–8% delle emissioni globali di gas a effetto serra (UNEP, 2025), contribuendo così in maniera significativa alle pressioni ambientali e climatiche associate ai modelli produttivi e di consumo contemporanei.

Le principali criticità che ostacolano una gestione realmente circolare dei rifiuti tessili appaiono oggi connesse alla chiara definizione delle responsabilità lungo la filiera, alla creazione di piattaforme operative davvero efficienti e alla capacità degli attori maggiormente coinvolti di trattare flussi materiali eterogenei (Taddeo et al., 2023).

L'adozione di un modello di economia circolare consente di ridurre la domanda di materiali vergini e l'energia necessaria per estrazione e produzione, diminuendo così le emissioni di gas serra: in tal modo l'economia circolare diventa un elemento strategico per la decarbonizzazione e la mitigazione del cambiamento climatico (European Environment Agency, 2024). Lo scopo di questo studio, tuttora Work in Progress, è analizzare come le aziende impegnate in percorsi avanzati di decarbonizzazione affrontino o integrino pratiche di circolarità nell'intera supply chain, dando una risposta alle seguenti domande di ricerca:

RQ1. Quali pratiche di circolarità vengono adottate dalle aziende del settore tessile che presentano un forte impegno verso la decarbonizzazione?

RQ2. Quali schemi emergono tra il livello di impegno per la decarbonizzazione e l'adozione di pratiche di circolarità nelle aziende del settore tessile?

2. Metodo

Questo studio propone una lettura integrata tra decarbonizzazione ed economia circolare nelle supply chain tessili, spostando l'attenzione dall'adozione isolata di singole pratiche alla loro combinazione.

La novelty risiede in (i) un campione costruito a partire da target climatici scientificamente validati (SBTi) e con copertura degli scope 1, 2 e 3, che consente di analizzare le aziende con un commitment avanzato di decarbonizzazione; (ii) una mappatura sistematica delle pratiche di circolarità secondo i circular loops nel tessile; (iii) l'identificazione di configurazioni ricorrenti di pratiche circolari e di decarbonizzazione associata a diversi livelli di decarbonizzazione, alla copertura degli scope e all'orizzonte temporale dei target.

La scelta di analizzare le pratiche di circolarità risulta coerente con l'approccio consolidato nella letteratura, che frequentemente adotta l'esame delle pratiche aziendali come lente privilegiata per comprendere come le imprese traducano i principi della circolarità in azioni concrete lungo la supply chain (Toniolo et al., 2024b).

Al fine di rispondere alle due domande di ricerca, questo studio sviluppa un'analisi basata su un ampio insieme di business case raccolti attraverso fonti secondarie (documentazione pubblica, siti istituzionali, report di sostenibilità e materiali aziendali). L'approccio metodologico è coerente con quello adottato da Das e Bocken (2024), i quali esplorano pratiche e strategie rigenerative a partire da un'analisi sistematica di documenti aziendali di natura secondaria; analogamente, si ispira alla fase iniziale del lavoro di Henry et al. (2020), in cui una prima selezione derivante dalla letteratura e una successiva focalizzazione su specifiche categorie di imprese permettono di identificare i relativi modelli di business circolari.

La presente ricerca utilizza il database delle aziende aderenti alla Science Based Target Initiative (SBTi) come base empirica per l'identificazione delle aziende con un importante commitment nei confronti della decarbonizzazione. SBTi rappresenta infatti uno dei principali framework internazionali per la definizione e la validazione scientifica degli impegni di decarbonizzazione aziendale, anche nel settore del tessile (Science Based Target and World Resources Institute, 2019). Il database raccoglie esclusivamente organizzazioni che hanno assunto obiettivi climatici allineati agli scenari dell'Accordo di Parigi, sottoposti a un processo di verifica metodologica rigoroso e trasparente (Ben Amar et al., 2024).

Di conseguenza, la presenza delle aziende nel database SBTi costituisce un indicatore affidabile del loro effettivo commitment climatico, distinguendole da iniziative volontarie o dichiarazioni non validate. Tale caratteristica rende SBTi una fonte privilegiata per studi che intendono analizzare le pratiche di sostenibilità e, in particolare, le relazioni tra decarbonizzazione

e circolarità, poiché consente di selezionare un campione di imprese che già manifestano un livello elevato di impegno nei confronti della decarbonizzazione.

3. Analisi in corso

In una prima fase, dal database "Target Dashboard"1 (in cui sono presenti in totale 13081 business case) sono stati selezionati tutti i business case che presentano un impegno dichiarato nei confronti della decarbonizzazione, selezionando attraverso i filtri disponibili le aziende appartenenti al settore "Textiles, Apparel, Footwear and Luxury Goods" ottenendo un totale di 727 casi. Questi casi sono stati ulteriormente selezionati, mantenendo nel campione soltanto le aziende che hanno presentato degli impegni di riduzione lungo la supply chain, quindi in riferimento agli Scope 1, 2, 3 dello Standard ISO 14064 o del GHG Protocol, ottenendo in questo modo il campione finale di 156 business case. Ogni caso rappresenta una azienda, che potrebbe avere più target/obiettivi. Sono state selezionate esclusivamente le aziende che presentano obiettivi di riduzione delle emissioni negli Scope 1, 2 e 3, poiché tale configurazione consente di adottare una prospettiva realmente estensiva e multilivello sulla decarbonizzazione. In particolare, l'inclusione dello Scope 3, che comprende le emissioni indirette lungo l'intera supply chain, dai fornitori a monte fino all'uso e al fine vita dei prodotti, è fondamentale per acquisire una visione orientata alla supply chain. Questa scelta metodologica è motivata dal fatto che, nel settore tessile come in molti settori manifatturieri, la quota predominante delle emissioni totali deriva proprio da processi situati al di fuori dei confini operativi diretti dell'azienda. Pertanto, considerare soltanto gli Scope 1 e 2 offrirebbe una rappresentazione parziale e non consentirebbe di cogliere le pratiche aziendali, strategie di decarbonizzazione e dinamiche di circolarità distribuite lungo la filiera. Selezionando aziende che hanno assunto impegni formali e validati su tutti e tre gli Scope, è possibile analizzare attori che manifestano non solo un forte commitment climatico, ma anche una capacità, e volontà, di intervenire su processi di approvvigionamento, produzione, logistica, utilizzo e fine vita. In questo modo, il campione risulta più coerente con l'obiettivo del presente studio, che mira a investigare come le imprese impegnate in percorsi avanzati di decarbonizzazione affrontino o integrino pratiche di circolarità nell'intera supply chain.

L'analisi qualitativa dei 156 business case selezionati sarà condotta attraverso una procedura di codifica basata su criteri derivati dalla letteratura su economia circolare, supply chain sostenibile e modelli rigenerativi (Das and Bocken, 2024; Henry et al., 2020). La codifica è applicata alle informazioni pubblicamente disponibili per ciascuna azienda (descrizione del caso, siti web, report, comunicazioni istituzionali).

I criteri individuati attualmente per la codifica riguardano sia il commitment di decarbonizzazione, come per esempio presenza di riferimenti a sostenibilità, responsabilità ambientale, riduzione degli impatti, obiettivi specifici, esistenza di target misurabili, certificazioni o adesione a standard esterni, ampiezza dell'impegno in riferimento alla supply chain; sia il commitment e le pratiche di circolarità eventualmente messe in essere dall'azienda. Sarà quindi identificata la presenza di pratiche riconducibili ai principali principi dell'economia circolare utilizzando la classificazione dei cinque circular loops, closing, narrowing, intensifying, slowing, dematerializing (Geissdoerfer et al., 2017), lungo la supply chain (Hazen et al., 2021).

4. Conclusioni

La ricerca è attualmente in corso e, nella fase finora sviluppata, il lavoro si è concentrato prevalentemente sulla definizione dell'impostazione metodologica e sulla concettualizzazione dell'intersezione tra decarbonizzazione e circolarità, nonché sulla messa a punto dei criteri per l'individuazione del campione di imprese da analizzare. I prossimi passaggi consisteranno nell'esame sistematico della documentazione pubblicamente accessibile per ciascuna azienda selezionata, al fine di ricostruire in modo approfondito le pratiche ambientali adottate lungo la

filiera. A valle della codifica, sarà realizzata una matrice dei diversi casi, evidenziando il profilo di commitment alla decarbonizzazione (includendo anche copertura degli scope 1–2–3, orizzonte temporale del target SBTi) e il portafoglio di pratiche di circolarità riconducibili ai circular loops. L'analisi delle configurazioni sarà svolta in due passaggi: prima una analisi cross-case della matrice per individuare combinazioni di pratiche che emergono; successivamente una costruzione iterativa di configurazioni ricorrenti, attraverso confronto sistematico tra casi (similarità/differenze).

Parole chiave: Circolarità; decarbonizzazione; tessili

Misurare e Comunicare la Sostenibilità del Settore Cartario Italiano: un'analisi dei Key Performance Indicators mediante il Bilancio di Sostenibilità

Maria Rosaria Sessa[1], Antonio Cesarano[2], Roberto De Luca[3], Ornella Malandrino[4]

1. Introduzione

Negli ultimi anni l'attenzione globale verso la sostenibilità ambientale e sociale è notevolmente aumentata. Questo interesse ha spinto i principali Paesi del mondo a collaborare attraverso piani d'azione comuni in ambito ESG (Environmental, Social and Governance). In questo contesto, il settore cartario assume un ruolo significativo, soprattutto in relazione agli obiettivi dell'Agenda 2030 dedicati al consumo e alla produzione responsabili (Obiettivo 12), alla lotta contro il cambiamento climatico (Obiettivo 13) e alla tutela della vita sulla terra (Obiettivo 15). Infatti, la crescente attenzione delle imprese verso la sostenibilità ambientale, sociale e di governance (ESG) sta determinando una trasformazione profonda anche dei modelli di misurazione delle performance aziendali e dei sistemi di rendicontazione. L'introduzione della Corporate Sustainability Reporting Directive (CSRD) e l'adozione dei nuovi European Sustainability Reporting Standards (ESRS) hanno ampliato gli obblighi informativi in materia di sostenibilità, imponendo alle imprese europee di integrare informazioni non finanziarie nei propri bilanci di sostenibilità e di sottoporle a verifica indipendente. Ciononostante, la normativa CSRD presenta ancora delle lacune e il framework degli ESRS è incompleto. Pertanto, le linee guida Global Reporting Directive (GRI) rappresentano ancora il punto di riferimento per la rendicontazione di sostenibilità e gli standard più utilizzati a livello globale (KPMG, 2022). Obiettivo di questo studio, che è in fase di completamento, è quello di individuare i principali temi materiali e gli indicatori GRI utilizzati dalle grandi aziende del settore cartario italiano nei loro report di sostenibilità. L'intento è comprendere quali indicatori e quali tematiche legate alla sostenibilità vengano maggiormente rendicontati. Attraverso un'analisi dei contenuti, la ricerca vuole cercare di rispondere a due domande fondamentali:

1. Quali sono gli indicatori chiave di sostenibilità più utilizzati dalle grandi aziende dell'industria della carta in Italia?
2. Quali sono i temi materiali più ricorrenti individuati nei loro report di sostenibilità?

I risultati dell'indagine potranno supportare i decisori aziendali nello stabilire le priorità nelle proprie strategie di sostenibilità in base all'impatto delle diverse questioni ESG e offrire alle imprese cartarie italiane un utile riferimento per affrontare le nuove sfide legate alla rendicontazione non finanziaria.

A seguito di questa breve introduzione, il resto dell'abstract è strutturato in tal modo: la Sezione 2 riguarda il quadro teorico di riferimento; la Sezione 3 illustra la metodologia di ricerca; la Sezione 4 presenta i risultati; la Sezione 5 fa riferimento alla discussione dei risultati; mentre le conclusioni sono riportate nella Sezione 6.

2. Background

Nel corso del tempo si è consolidata a livello globale l'idea che le imprese debbano assumersi la responsabilità degli impatti che le proprie attività generano su stakeholder e società. In questo contesto, il bilancio di sostenibilità rappresenta uno strumento essenziale per comunicare in modo trasparente le proprie performance non finanziarie ed è, pertanto, anche uno strumento di supporto al raggiungimento degli obiettivi dell'Agenda 2030. Diversi studiosi hanno indagato la relazione tra reporting di sostenibilità e raggiungimento degli obiettivi dell'Agenda 2030 (Calabrese et al., 2021; Stefanescu, 2022; Whittingham, 2023), sottolineando come, da un lato, l'Agenda abbia influenzato la struttura e il contenuto dei report di sostenibilità; mentre, dall'altro, la presenza dei report di sostenibilità in cui dover rendicontare le proprie performance di sostenibilità abbia spinto le aziende ad impegnarsi maggiormente nel raggiungimento dei target stabiliti dalla suddetta Agenda.

Diversi studi hanno approfondito il legame tra sostenibilità e industria cartaria. Jones e Comfort (2017), analizzando i report di sostenibilità delle principali aziende del settore forestale e cartario, hanno osservato che la partecipazione delle imprese alle iniziative sostenibili è spesso motivata da esigenze economiche più che da un reale impegno ambientale o sociale. Pätäri et al. (2016), attraverso un'indagine condotta su esperti del settore della carta, hanno individuato tra i principali fattori che influiscono sulla sostenibilità dell'industria europea della carta l'aumento della domanda energetica, la volatilità dei mercati dei combustibili fossili e la scarsità di risorse naturali.

Altri studi si sono concentrati su aspetti più specifici: Wang et al. (2011) hanno dimostrato che in Cina l'introduzione di normative ambientali più rigorose ha migliorato l'efficienza ecologica dell'industria cartaria, mentre Scordato et al. (2018) hanno analizzato le politiche più efficaci per conciliare sostenibilità ambientale e competitività economica nel settore svedese. In Germania, Fleiter et al. (2012) hanno sviluppato modelli per stimare il risparmio energetico ottenibile attraverso nuove tecnologie produttive, con risultati simili a quelli di Xu et al. (2013) per il contesto americano.

Alcuni autori, invece, hanno cercato di elaborare indicatori sintetici di sostenibilità per il settore. Greiner (2001) ha definito le caratteristiche che un buon indicatore dovrebbe possedere, come la capacità di supportare le decisioni e misurare il raggiungimento degli obiettivi. Seguendo questo approccio, Fortuna et al. (2011) hanno proposto un insieme di indicatori riferiti a quattro aree principali: approvvigionamento responsabile delle fibre, produzione pulita, incremento dell'uso di materiale riciclato e riduzione dei consumi di carta. Tuttavia, il loro modello resta teorico e poco confrontato con la realtà industriale.

Papafloratus et al. (2023) hanno condotto un'analisi dei contenuti sugli argomenti di materialità discussi nei bilanci di sostenibilità delle grandi aziende dell'industria chimica, al fine di arricchire la ricerca scientifica relativa ai temi materiali di sostenibilità e al contenuto dei report di sostenibilità. Per rispondere alle loro domande di ricerca, gli autori utilizzano un approccio manuale con il quale identificano 15 temi materiali principali per le aziende del settore chimico e li classificano in base al numero di volte che sono richiamati nei report di sostenibilità. Il loro approccio non tiene conto delle scale di importanza con le quali molte aziende suddividono i propri temi materiali; pertanto, non offrono un discrimine tra temi che sono segnalati come secondari e temi che sono segnalati come primari. Karagiannis et al. (2023) studiano la valutazione di materialità nel settore del trasporto marittimo attraverso l'analisi dei contenuti e l'analisi dei dati, accompagnate da un sondaggio tra gli esperti del settore marittimo. Gli autori individuano inizialmente 544 temi materiali ESG in quanto discriminano anche i temi riconducibili alla medesima categoria ma con diversa denominazione; tuttavia, alla fine individuano gli aspetti ESG più significativi per le aziende del settore marittimo: salute e sicurezza sul lavoro, emissioni atmosferiche e gestione energetica. Léon e Salesa (2023) studiano

con approccio critico i temi di materialità di aziende nel settore spagnolo delle telecomunicazioni e dai loro risultati emerge che vi possono essere incongruenze tra analisi di materialità così come viene presentata dalle aziende e l'analisi degli indicatori GRI. Pertanto, è utile approfondire entrambi in maniera separata.

Infine, Pandey e Prakash (2018) hanno elaborato un indice di sostenibilità industriale applicandolo al comparto cartario per misurare il beneficio socioeconomico generato per unità di emissioni di CO_2. Pur essendo un contributo rilevante, questo indice non copre tutte le dimensioni della sostenibilità, trascurando altri temi materiali tipici del settore.

È a partire da questo quadro di riferimento che la sezione successiva sarà dedicata alla presentazione della metodologia di ricerca, in grado di supportare l'analisi degli indicatori e dei temi materiali scelti dalle aziende cartarie italiane nelle loro rendicontazioni di sostenibilità, al fine di rispondere adeguatamente alle domande di ricerca.

3. Il disegno metodologico

Per rispondere alle domande di ricerca iniziali, è stata condotta un'analisi dei contenuti sui report di sostenibilità di 29 grandi aziende italiane del settore cartario. Tra i vari approcci alla content analysis, è stato utilizzato un metodo qualitativo, che permette una classificazione strutturata e oggettiva dei dati, concentrandosi sulla codifica dei contenuti piuttosto che su un approccio narrativo. La codifica dei dati estratti dai report è stata eseguita manualmente seguendo una metodologia rigorosa.

Per selezionare i report oggetto di analisi, sono stati applicati alcuni criteri di eleggibilità:

- Dimensione aziendale: sono state considerate solo le aziende con fatturato superiore a 50 milioni di euro, individuando un cluster iniziale di 109 imprese.
- Disponibilità del report di sostenibilità: tra queste, solo 52 aziende pubblicano un report di sostenibilità.
- Presenza di duplicazioni: per gruppi aziendali con più società, è stato considerato solo il report consolidato, riducendo il cluster a 37 aziende.
- Uso degli standard GRI aggiornati al 2021: questo criterio ha migliorato la comparabilità dei dati e ha ridotto ulteriormente il campione a 29 report.

L'analisi dei contenuti si è concentrata su due principali aspetti: analisi GRI e analisi della materialità.

3.1. Analisi GRI

Per rispondere alla prima domanda di ricerca, è stata esaminata la tabella degli indicatori GRI contenuta nei report di sostenibilità. La sezione "GRI content index" è fondamentale nei report redatti secondo gli standard GRI, poiché guida il lettore verso i punti in cui ciascun tema di sostenibilità è trattato. Dopo uno screening qualitativo preliminare, è stato escluso un report perché i GRI erano riportati in forma sintetica. L'analisi finale è stata condotta su 28 report.

Seguendo l'approccio Triple Bottom Line di Elkington (1997), gli indicatori GRI sono stati classificati in tre macro-aree: economica, ambientale e sociale. In una matrice excel sono state inserite le aziende e gli indicatori GRI, rispettivamente tra le righe e le colonne della matrice. Esaminando i report di sostenibilità, per ciascuna azienda del campione è stato assegnato 1 punto in corrispondenza degli indicatori citati e 0 punti in corrispondenza degli indicatori non citati. I punteggi sono stati aggregati per dimensione (economica- ambientale-sociale). I risultati ottenuti sono poi stati ponderati in base al numero di indicatori presenti in ciascuna dimensione al fine di epurare i risultati in modo che il punteggio associato a ciascuna dimensione offrisse una rappresentazione dell'interesse complessivo delle aziende verso le tre aree.

3.2. Analisi di materialità

Per la seconda domanda di ricerca, è stata esaminata la sezione dei temi materiali dei report, dove le aziende indicano le questioni prioritarie per gli stakeholder, in linea con il GRI 3: Material Topics. Dopo uno screening qualitativo, sono stati esclusi 2 report che non definivano chiaramente i temi materiali, portando il campione a 27 report. Dall'analisi dei contenuti sui report di sostenibilità del campione sono stati individuati i temi materiali ricorrenti. È stato effettuato un ulteriore screening per evitare duplicazioni di temi simili o equipollenti. I temi individuati sono stati organizzati in tre dimensioni E-S-G: ambientale, sociale e di governance. A ciascun tema è stato assegnato un punteggio da 0 a 1 in corrispondenza di ogni azienda facente parte del campione: 1 punto per i temi classificati come principali, 0,66 punti per i secondari, 0,33 per quelli meno importanti e 0 se non menzionati. Il grado d'importanza riconosciuto dalle aziende del campione a ciascun tema materiale è stato desunto in maniera oggettiva in base alle indicazioni esplicite contenute nei report di sostenibilità analizzati. Laddove non è stato possibile distinguere un livello di importanza intermedio è stato assegnato 1 punto ai temi presentati nell'analisi di materialità e 0 punti ai temi che non erano citati nella matrice di materialità delle aziende oggetto d'indagine. La somma dei punteggi, divisa per il numero di aziende, ha fornito un punteggio medio rappresentativo del livello di priorità riconosciuto dai grandi operatori del settore cartario italiano a ciascun tema materiale.

$$\textbf{Material theme score} = \frac{\sum_{i=1}^{27} jx_i}{y}$$

j= livello di importanza attribuito all'argomento materiale dalle aziende. Dati estrapolati dall'interpretazione qualitativa delle informazioni rendicontate nei bilanci di sostenibilità del campione. $j \in [0,1]$.

y= numero totale di aziende

xi= aziende del campione

Infine, i risultati dell'analisi dei temi materiali sono stati anche categorizzati per area geografica, per valutare l'influenza del territorio sulle scelte delle aziende in materia di sostenibilità.

Figura 1. Approccio metodologico

4. Risultati preliminari

4.1. Analisi GRI

Dall'analisi degli indicatori GRI emerge che le aziende cartarie italiane riportano più frequentemente dati relativi all'ambiente, con un totale di 389 menzioni, seguite da indicatori

sociali (370) e da quelli economici, meno utilizzati (106). Ponderando i dati per il numero di indicatori associati dal sistema GRI ad ogni dimensione, l'area ambientale risulta la più rilevante, seguita dalla dimensione sociale e infine da quella economica. Questi risultati riflettono le peculiarità del settore, che è caratterizzato da: opportunità legate all'economia circolare, margini economici generalmente buoni e forte impatto ambientale della produzione di carta, in termini di consumo energetico ed emissioni.

Gli indicatori ambientali più utilizzati riguardano il consumo di energia all'interno dell'azienda e le emissioni dirette e indirette di gas serra, oltre alla gestione dei rifiuti prodotti. Il GRI 302-1 "Consumo di energia all'interno dell'organizzazione" ha ottenuto un punteggio di 22; i GRI 305-1 "Emissioni dirette di gas serra (Scope 1)" e 305-2 "Emissioni indirette di energia (Scope 2)" hanno entrambi totalizzato 24 punti. Il GRI 306-3 "Rifiuti generati" ha ottenuto un punteggio di 21. Gli indicatori meno riportati concernono la biodiversità (GRI 304, GRI 304-1, GRI 304-2, GRI 304-4), l'energia consumata al di fuori dell'organizzazione (GRI 302-2) e gli impatti ambientali lungo la filiera dei fornitori (GRI 308-2).

Nella dimensione sociale, i temi più presenti riguardano la salute e sicurezza sul lavoro (GRI 403-1 e GRI 403-2), la formazione dei dipendenti (GRI 403-5) e gli infortuni professionali (GRI 403-9). Indicatori meno usati includono il rispetto dei diritti dei popoli indigeni (GRI 411-1), la libertà di associazione (GRI 417-1) e la partecipazione politica (GRI 415-1).

Infine, la dimensione economica è quella meno rappresentata. Gli indicatori più riportati riguardano il valore economico diretto generato e distribuito e gli episodi confermati di corruzione, mentre indicatori relativi alla trasparenza fiscale sono quasi del tutto assenti.

4.2. Analisi di materialità

La maggior parte delle aziende ha utilizzato un'analisi di materialità di impatto. Solo una minoranza delle aziende ha adottato un approccio di doppia materialità, valutando non solo l'impatto delle attività aziendali sull'ambiente e sulle persone, ma anche gli effetti dei rischi ESG sulle performance finanziarie aziendali.

L'analisi dei temi materiali mostra che la dimensione ambientale è la più rilevante per le politiche di sostenibilità delle aziende cartarie italiane (ha ottenuto un punteggio di 0,54), seguita da quella sociale (punteggio di 0,41) e infine da quella di governance (punteggio di 0,38). Tra i temi ambientali più discussi emergono il cambiamento climatico (ottiene un punteggio di 0,9), l'uso delle materie prime e delle risorse idriche. Per la dimensione sociale, i temi prioritari sono la salute e sicurezza sul lavoro (punteggio di 0,81), la diversità e inclusione e la tutela dei diritti umani. In ambito governance, i temi più trattati sono etica e integrità, qualità dei prodotti e controllo della catena di fornitura.

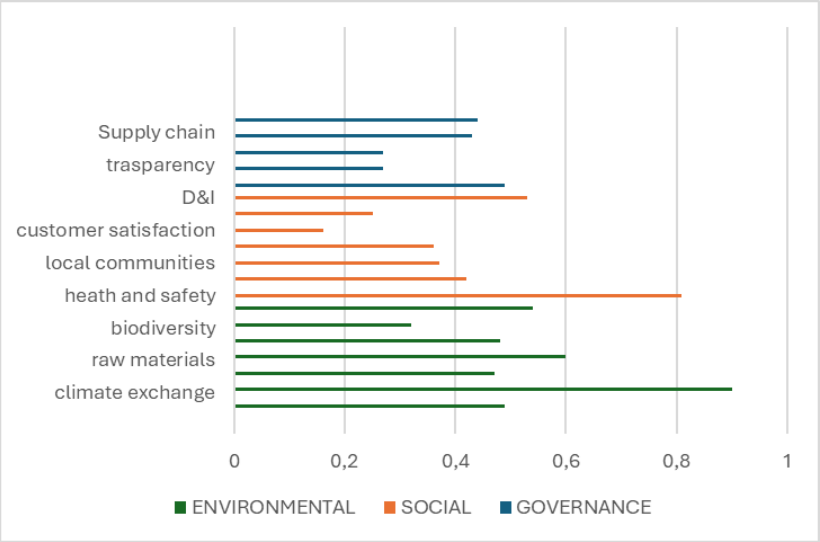

Figura 2. Principali temi materiali

L'analisi territoriale evidenzia differenze legate alla localizzazione delle aziende. Le imprese del Nord Italia, storicamente le più sviluppate del settore cartario, mostrano una forte attenzione ai temi ambientali e sociali, con particolare focus su salute e sicurezza, gestione dei rifiuti e economia circolare. Le aziende del Centro Italia attribuiscono maggiore importanza ai temi di governance, come qualità dei prodotti, etica e controllo della filiera, mentre i temi sociali risultano leggermente meno rilevanti. Le aziende del Sud Italia, pur limitate nel numero, mostrano come prioritari il cambiamento climatico, la salute e sicurezza sul lavoro e la gestione dei rifiuti, con minore attenzione ad altri temi sociali e di governance.

In sintesi, le aziende cartarie italiane mostrano un focus sui temi ambientali e sociali, con i temi relativi alla governance generalmente meno trattati. Inoltre, è possibile confermare che la scelta dei temi materiali è condizionata anche dalla collocazione geografica delle imprese.

5. Discussione e implicazioni

I risultati della content analysis sui GRI mostrano che gli indicatori più frequentemente utilizzati sono GRI 305-1, GRI 305-2 e GRI 306-3, relativi alla dimensione ambientale, GRI 403-1, GRI 403-2 e GRI 403-5, relativi alla dimensione sociale. Gli indicatori economici più utilizzati sono GRI 201-1 e GRI 205-3. Il GRI 305-1 e il GRI 305-2 riguardano le emissioni dirette e indirette di gas serra (GHG) in atmosfera. Gli indicatori sociali più utilizzati riguardano la "Gestione della Salute e Sicurezza sul Lavoro" (GRI 403-1), che si realizza attraverso la "Formazione dei Lavoratori" (GRI 403-5) e la "Valutazione dei Rischi" (GRI 403-2), come attività preventive, e il "Monitoraggio degli Infortuni sul Lavoro" (GRI 403-9) come attività di controllo.

Nel complesso, i risultati dell'analisi di materialità sono coerenti con quelli dell'analisi GRI ed evidenziano che le aree ESG strategiche per le grandi aziende dell'industria cartiera sono quelle ambientali, seguite da quelle sociali. In particolare, il cambiamento climatico e la salute e la sicurezza dei lavoratori sui luoghi di lavoro sono considerati come temi prioritari. Le aziende della carta sono aziende energivore e pertanto hanno interesse a ridurre le proprie emissioni in atmosfera. Molte aziende del settore hanno investito in sistemi di cogenerazione e trigenerazione il che fa aumentare le emissioni GHG Scope 1 ma fa diminuire più che proporzionalmente le emissioni GHG indirette, Scope 2 (Tomasin, 2012). Nel caso della salute e sicurezza sui luoghi di lavoro, le stringenti leggi sul tema in Italia hanno indotto gli imprenditori ad aumentare il controllo e la qualità dei sistemi di controllo della sicurezza. Ciò è particolarmente vero nelle

imprese di più grandi dimensioni (Cagno et al., 2014). Una scarsa attenzione è dedicata alla biodiversità, sebbene quest'industria abbia effetti diretti e indiretti sulla biodiversità come: l'uso eccessivo delle risorse legnose, la deforestazione, l'inquinamento delle acque, l'erosione del suolo (Dutta and Dutta, 2024; Jaworska et al., 2020; Liu et al., 2023; Tripathy et al., 2022). La tutela della biodiversità rientra tra gli obiettivi dell'Agenda 2030 e non dovrebbe essere trascurato dalle aziende dell'industria cartiera. Allo stesso tempo, gli autori avendo notato uno scarso interesse generale sui temi di governance relativi alla supply chain, si aspettano che ciò cambi a seguito dell'evoluzione della normativa europea sancita dall'approvazione della CSDDD (Corporate Sustainability Due Diligence Directive) in merito al controllo di matrice ESG che le aziende che superano determinati parametri dimensionali saranno obbligate ad effettuare lungo tutta la propria filiera di appartenenza.

6. Conclusioni

Le recenti normative europee impongono alle grandi imprese di rendicontare informazioni non finanziarie nei propri report di sostenibilità, spinte anche dalle crescenti aspettative degli stakeholder. Il settore cartario, particolarmente sensibile ai temi ESG per l'elevato consumo energetico e le significative emissioni (Amandio et al., 2022), riveste un ruolo strategico in Italia: con 8,16 miliardi di euro di fatturato e 19.000 occupati, è il secondo in Europa dopo la Germania (Assocarta, 2024) e leader nella produzione di carte igieniche e per uso domestico.

Alla luce di ciò, la ricerca è volta ad individuare gli indicatori di sostenibilità maggiormente utilizzati dalle imprese cartarie italiane nei loro report. A tal fine, è stata condotta un'analisi del contenuto dei principali report di sostenibilità del settore, articolata in due approcci di codifica manuale: il primo basato sul modello del Triple Bottom Line e sugli indicatori GRI, il secondo sull'analisi di materialità secondo la prospettiva ESG condivisa con gli stakeholder.

Il percorso metodologico adottato ha garantito un'interpretazione solida dei dati, ma ha evidenziato alcune criticità. Il campione, composto da 29 report di sostenibilità, è stato selezionato secondo criteri rigorosi (dimensione aziendale, adesione agli standard GRI 2016-2021, disponibilità di dati dettagliati), garantendo comparabilità ma limitando la varietà di prospettive. La codifica manuale, pur accurata, resta soggetta a un certo grado di soggettività tipico dell'analisi qualitativa.

Meno della metà delle aziende del campione ha certificato i propri report, e solo il 30% tramite società di revisione delle Big Four, riducendo la credibilità e affidabilità delle informazioni (Aureli et al., 2020; Elalfy et al., 2020) e aumentando il rischio di greenwashing. Infine, il sistema di ponderazione dei temi di materialità, seppur metodologicamente corretto, potrebbe essere migliorato in future ricerche con misure quantitative aggiuntive o validazioni indipendenti.

Questo studio apre nuove prospettive di ricerca. I risultati mostrano che solo una parte limitata delle aziende ha certificato i propri report di sostenibilità, evidenziando la necessità di ulteriori studi sull'attendibilità delle informazioni contenute nei report. Le evidenze possono inoltre contribuire allo sviluppo di politiche pubbliche più efficaci in ambito di sostenibilità. Il lavoro valorizza un approccio metodologico ancora poco utilizzato – la qualitative content analysis dei report di sostenibilità – che, grazie ai criteri di selezione, alla codifica manuale e all'uso degli standard GRI e delle matrici di materialità, può essere replicato in altri settori o contesti geografici per costruire confronti e benchmark comparativi.

Essendo un work in progress, la ricerca è in fase di completamento. Pertanto, le successive fasi prevederanno:

- l'utilizzo di strumenti di text mining per migliorare la comparabilità e la robustezza statistica dei risultati;
- la definizione di grafici e tabelle;
- l'approfondimento, in fase di valutazione, del nesso tra area geografica e materialità.

Parole chiave: GRI standard; ESG; report di sostenibilità; matrice di materialità; agenda 2030a

Turismo resiliente nelle montagne biellesi: la terza attitudine della Pezzata Rossa d'Oropa

Luca Salvai[1], Alessandro Bonadonna[2]

1. Sviluppo concettuale

Le attività agricole nelle aree montane europee affrontano sfide sistemiche che ne minano la sostenibilità economica e sociale, portando all'abbandono dei terreni e alla perdita di biodiversità (Dax et al., 2021). In risposta a queste sfide, emerge la necessità di nuovi modelli di sviluppo che integrino la produzione primaria con servizi ad alto valore aggiunto (Velenik et al., 2007). Questi modelli si concentrano sulla valorizzazione delle risorse endogene, trasformando i vincoli territoriali in opportunità di mercato (Montrasio et al., 2017).

Il presente lavoro seleziona come caso studio il territorio della Provincia di Biella (Alpi Occidentali Italiane), in quanto epicentro del suo principale asset di biodiversità zootecnica: la Pezzata Rossa d'Oropa (di seguito PRO). Questa razza bovina autoctona, ufficialmente classificata dalla Regione Piemonte e dalle misure dell'Unione Europea come "razza a rischio di estinzione" (SRA 14 | ACA 14 – Allevatori custodi dell'agrobiodiversità), si definisce per le sue caratteristiche di robustezza e capacità di valorizzare pascoli magri, rendendola un elemento co-evolutivo inscindibile dal suo territorio (Lucchesi, Mattiello, 2008). Come verrà dimostrato empiricamente nella sezione "Risultati Conseguiti" (cfr. Tabella 1), l'analisi dei dati dell'Associazione Nazionale Allevatori Razza Bruna (ANARB) giustifica questa delimitazione, evidenziando come il Biellese ospiti l'assoluta maggioranza (59,21%) delle aziende allevatrici nazionali.

La simbiosi tra animale e ambiente rilevabile sul territorio genera due corollari fondamentali. In primo luogo, le produzioni da essa derivate (siano esse lattiero-casearie o di carne) acquisiscono un carattere di unicità e specificità territoriale. In secondo luogo, la razza stessa diventa un elemento paesaggistico attivo: la sua diffusa e quasi esclusiva presenza in alpeggio è il principale strumento di manutenzione contro l'imboschimento e il dissesto idrogeologico, preservando l'attrattività estetica e la fruibilità turistica del territorio.

Storicamente, la PRO possedeva tre attitudini: la prima lattiero-casearia, la seconda legata alla carne, e una terza, legata al lavoro nei campi. Con la meccanizzazione agricola del secondo dopoguerra, questa terza attitudine è divenuta obsoleta ed è di fatto scomparsa, senza essere sostituita.

Questo studio ipotizza che il vuoto possa essere colmato attraverso un'efficace strategia di place branding (Acharya et al. 2016), intesa come veicolo per una moderna 'terza attitudine' turistica. Tale approccio mira a replicare nel contesto biellese le dinamiche di successo di consolidati modelli alpini (quali quelli di Bolzano, Trento e Aosta), capaci di accoppiare promozione comunicativa e offerta di prodotti tipici per generare ricchezza diffusa. Il branding territoriale, in questi scenari, ha valorizzato senza stravolgere le organizzazioni socio-economiche tradizionali, dimostrando come l'autenticità possa divenire un motore economico sostenibile.

2. Obiettivo

L'obiettivo primario di questa ricerca, attualmente in divenire, è esplorare le condizioni di fattibilità per l'attivazione di una "terza attitudine" turistica per la filiera della PRO.

La domanda di ricerca centrale è la seguente: È possibile stimolare e strutturare un'attitudine turistica (didattico-gastronomica) per gli allevamenti di Pezzata Rossa d'Oropa, utilizzando le produzioni lattiero-casearie e di carne come leve di valorizzazione esperienziale e territoriale?

Per rispondere a questa domanda, lo studio si prefigge i seguenti obiettivi secondari:

- Mappare il sistema produttivo esistente (allevatori, consistenze, trasformatori) e il sistema turistico parallelo (poli attrattori, flussi, ricettività).
- Indagare la visione, i desiderata e le barriere percepite dagli stakeholder chiave della filiera, utilizzando un approccio qualitativo strutturato.
- Identificare strategie di sviluppo differenziate, basate sulla segmentazione degli allevatori (per dimensione, posizionamento geografico e vocazione produttiva).
- Proporre un modello metodologico per favorire l'allineamento strategico (governance) tra gli attori pubblici e privati del territorio.

La promozione turistica in questo contesto può esplicitarsi attraverso una gamma diversificata di attività, la cui fattibilità dovrà essere validata dagli stakeholder. Esempi di possibili strategie sono: la vendita diretta (in azienda e in alpeggio), la creazione di "strade del formaggio" o itinerari tematici che colleghino i produttori ai sentieri escursionistici, lo sviluppo di esperienze agrituristiche (come "casaro per un giorno", visite guidate in stalla o fattorie didattiche), l'attivazione di partnership con il settore Ho.Re.Ca. locale (ristoranti, rifugi) per la creazione di menu a "filiera cortissima", e, infine, l'integrazione della narrazione (o storytelling) della PRO nel marketing territoriale dell'ATL Biellese.

3. Quadro metodologico

Per affrontare la complessità del sistema socio-tecnico in esame, si è adottato un approccio a metodi misti (mixed-method), che combina l'analisi spaziale quantitativa con un'indagine qualitativa approfondita basata sulla visione degli stakeholder (Duglio et al. 2019).

Fase 1: Mappatura quantitativa e analisi apaziale (work in progress)

Il primo passo consiste nella costruzione di un data-base geo-riferito che mappa due sistemi paralleli:

- Il Sistema Produttivo: Utilizzando i dati dell'Anagrafe Zootecnica (ANARB), si mappano la localizzazione (coordinate) e la consistenza (numero capi) di tutti i 164 allevamenti di PRO in provincia di Biella, nonché dei 3 principali trasformatori industriali.
- Il Sistema Turistico: Si procede alla mappatura dei principali attrattori e delle infrastrutture ricettive.

Questa mappatura non è solo descrittiva, ma propedeutica all'analisi strategica (cfr. Risultati Attesi), che utilizzerà queste variabili per modellare la "pressione logistica" (Analisi delle Isocrone) e l'opportunità di mercato (Analisi di Prossimità Turistica).

Fase 2: Indagine qualitativa (metodo Delphi, primo round)

Per analizzare criticamente la realtà territoriale, sono state predisposte interviste semi-strutturate nel solco del Metodo Delphi (Adler et al., 1996). Questa tecnica permette di raccogliere e aggregare in modo strutturato le opinioni di un panel di esperti (stakeholder), favorendo la convergenza attraverso round multipli e anonimi.

Gli stakeholder sono stati segmentati in:

- Stakeholder Primari: I produttori (allevatori) e i trasformatori (caseifici industriali e artigianali).
- Stakeholder Secondari: I rivenditori (negozianti), gli enti, le agenzie e le amministrazioni pubbliche e le associazioni civili radicate sul territorio e storicamente attive nella sua promozione-sviluppo.

Il primo round di interviste Delphi, attualmente in corso, prevede un'intervista semi-strutturata per indagare tre direttrici di discorso principali: la razza e i suoi prodotti, il territorio provinciale e la collaborazione interna. Il contenuto delle domande viene adattato qualitativamente in base al ruolo dello stakeholder (Primario o Secondario), al fine di mappare in modo olistico le visioni e i desiderata dei vari attori territoriali.

Per raggiungere tale obiettivo di mappatura, l'architettura dell'intervista semi-strutturata è stata progettata per coprire queste diverse dimensioni in modo sistematico. Nello specifico, il questionario si articola attorno alle tre direttrici di discorso precedentemente menzionate, il cui contenuto è stato differenziato come segue.

La prima direttrice, La Razza e i suoi Prodotti, indaga il valore intrinseco. Agli Stakeholder Primari vengono poste domande focalizzate sulle criticità tecniche e interne: le performance della razza, i costi di produzione in ambiente montano (validando qualitativamente i dati quantitativi sull'orografia), la costanza qualitativa della materia prima (latte) e le barriere burocratiche percepite. Per gli Stakeholder Secondari, l'indagine si sposta sulla percezione esterna e di mercato: la riconoscibilità del marchio PRO, gli argomenti di storytelling che giustificano un premium price (es. il legame con l'alpeggio), e le debolezze in termini di packaging o standardizzazione.

La seconda direttrice, Il Territorio Provinciale, analizza il contesto operativo. Con gli Stakeholder Primari, si indagano le barriere logistiche, indagando l'impatto dei tempi di percorrenza reali sui costi e sulla sostenibilità economica dell'autoproduzione e/o della raccolta industriale. Con gli Stakeholder Secondari, si mappano le opportunità turistiche: la domanda specifica dei turisti (locali vs. esterni), la consapevolezza della vicinanza tra produttori e poli attrattori e quali prodotti esperienziali siano richiesti dal mercato.

La terza direttrice, La Collaborazione, valuta la governance del sistema. Attraverso domande omogenee per entrambi i gruppi, si indaga la qualità delle relazioni di filiera (verticali: fiducia tra produttori e trasformatori; orizzontali: frammentazione tra pari) e la percezione del ruolo degli enti di promozione. Infine, per omogeneizzare la percezione delle priorità strategiche, viene posta a tutti gli stakeholder una domanda chiave di ripartizione del budget, formulata come segue: "Dovendo allocare un budget ideale di 100 euro tra le seguenti tre macro-aree – (1) Infrastrutture fisiche, (2) Marketing territoriale e (3) Creazione di Rete (collaborazione) – come distribuirebbe l'investimento?".

Fase 3: Analisi dati e sviluppo (Delphi Round 2 e NGT)

A valle del primo round, le risposte qualitative verranno analizzate e codificate. L'analisi mirerà a individuare le percezioni e i desiderata più frequenti, prestando particolare attenzione a differenziare le risposte in funzione della dimensione dell'allevamento.

L'analisi qualitativa consentirà di modulare il secondo round di interviste Delphi. In questa fase si proporranno agli stakeholder delle strategie mirate, emerse dal Round 1 (approccio bottom-up), mostrando un atteggiamento propositivo e mai impositivo, al fine di testare il livello di consenso.

Infine, data la natura "compressa" delle relazioni interpersonali nella provincia, si è pianificato di far seguire al Metodo Delphi una Nominal Group Technique (NGT) (Harvey et al., 2012). L'NGT è un workshop strutturato che guida un gruppo (in presenza) dalla generazione di idee alla loro prioritizzazione tramite voto. L'obiettivo è trasformare il "consenso" emerso dal

Delphi in un allineamento strategico su azioni concrete, neutralizzando le dinamiche di dominanza e i campanilismi che spesso affliggono le realtà locali.

4. Risultati conseguiti e attesi

Fase 1: Mappatura quantitativa e analisi spaziale

Come primo risultato della mappatura quantitativa, l'analisi dei dati nazionali ANARB (detentore dei Registri Anagrafici) ha permesso di validare empiricamente la scelta metodologica di delimitare il campo d'indagine. L'analisi distributiva, illustrata nella [Tabella 1], evidenzia come il territorio biellese rappresenti l'epicentro indiscusso della razza, ospitando da solo il 59,21% del totale delle aziende allevatrici a livello nazionale.

Provincia	**N° Aziende**	**% Rispetto al Totale**
Alessandria	5	1,81%
Cuneo	22	7,94%
Novara	6	2,17%
Verbano Cusio Ossola	52	18,77%
Biella	**164**	**59,21%**
Vercelli	23	8,30%
Bergamo	1	0,36%
Como	2	0,72%
Varese	1	0,36%
Roma	1	0,36%

Tabella 1. Distribuzione provinciale PRO. Fonte:Elaborazione personale, dati ANARB

Sebbene le province limitrofe di Verbano-Cusio-Ossola (18,77%) e Vercelli (8,30%) presentino consistenze significative, la loro esclusione da questa fase dello studio è motivata da una fondamentale eterogeneità istituzionale. Questi territori, infatti, pur condividendo un assetto morfo-produttivo e tecniche di allevamento assimilabili, afferiscono a enti di promozione turistica, gestione sanitaria e sviluppo territoriale differenti. Tale omogeneità istituzionale è invece un prerequisito per un'efficace analisi del modello di governance. I territori esclusi costituiscono, tuttavia, un ideale terreno per future repliche del modello di analisi qui proposto.

Focalizzando dunque l'analisi sui 164 allevamenti biellesi, si è proceduto alla mappatura delle sedi aziendali. Come evidenziato dalla mappa [Figura 1], le sedi aziendali mostrano una distribuzione capillare sull'intero territorio provinciale, sviluppandosi "a raggiera" dal polo urbano di Biella sia verso le valli montane sia verso le aree planiziali. Sebbene questa rappresentazione fornisca un'immagine chiara della diffusione della PRO, essa presenta un limite metodologico fondamentale: la non coincidenza tra la sede legale (l'indirizzo fiscale registrato, spesso l'abitazione dell'allevatore) e la sede operativa (l'ubicazione fisica della stalla).

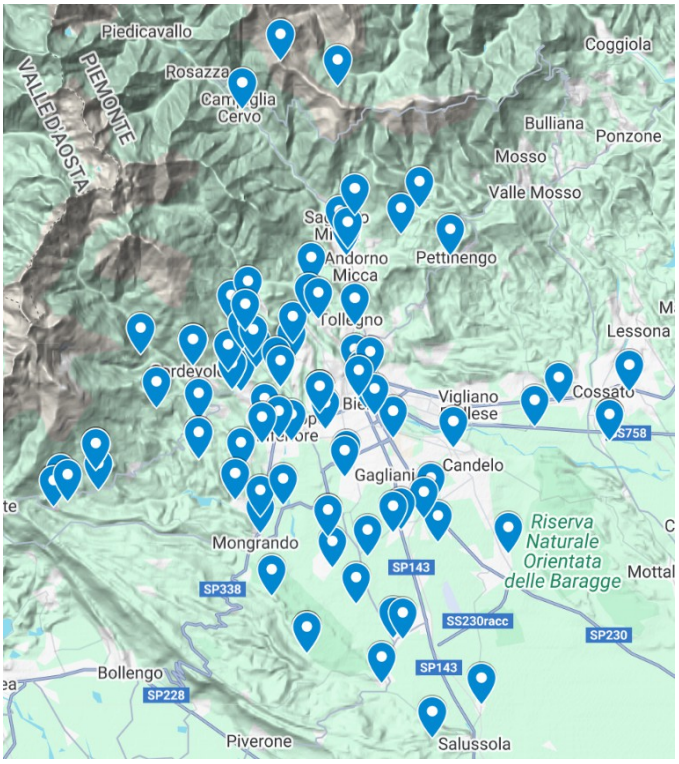

Figura 1. Mappa della distribuzione delle sedi aziendali degli allevamenti di PRO[3]

Questo limite è aggravato dalla natura stessa degli indirizzi rurali biellesi, che non aderiscono alla toponomastica standard (via/numero civico) ma si basano su riferimenti locali (toponimi, nomi di frazioni o cascine). Tali indirizzi, pur funzionali alla comunità locale, risultano incomprensibili ai sistemi di geo-codifica automatica. Ad oggi, questo approccio ha permesso di mappare con certezza 93 allevamenti sui 164 totali, evidenziando la necessità di una validazione manuale "in campo" per consolidare il database geografico delle sedi operative.

Parallelamente, sono stati mappati i tre principali trasformatori di latte organizzati a livello industriale. Si tratta di stabilimenti di trasformazione e stagionatura che non possiedono allevamenti propri e che, come mostra (in rosso) la Figura 2, sono tutti ubicati in un cluster in prossimità del capoluogo. Tale prossimità geografica implica, presumibilmente, dinamiche logistiche e di mercato simili; fattore che se da un lato può facilitare un coordinamento strategico, dall'altro acuisce la competizione sulla raccolta della materia prima. La presenza di soli tre attori industriali rende, tuttavia, l'analisi della governance di filiera un obiettivo cruciale e pragmaticamente approcciabile.

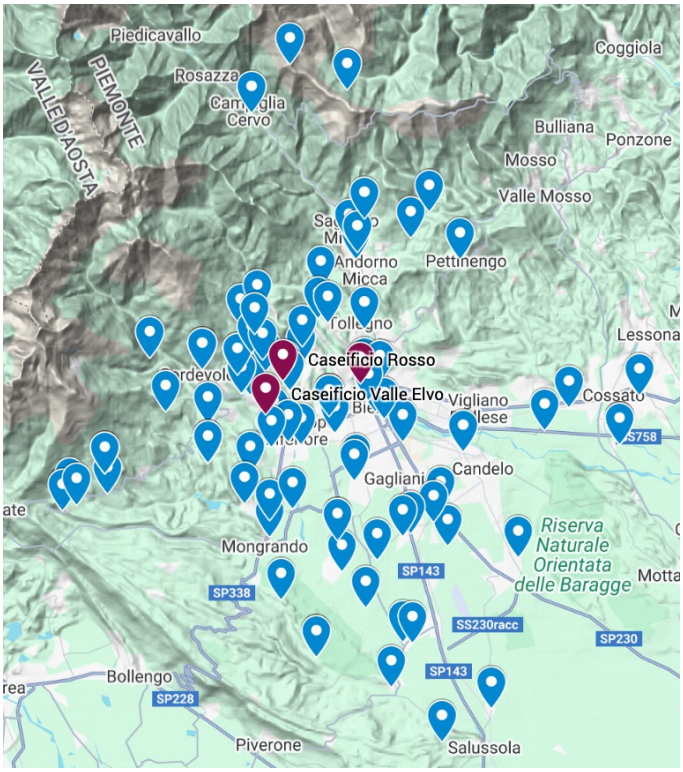

Figura 2. Mappa degli allevamenti (BLU) e dei trasformatori (ROSSO)

Per superare i limiti della mappatura statica (le stalle invernali) e mappare l'effettivo utilizzo del territorio – i.e. l'areale di pascolo effettivo – è in fase di definizione una collaborazione con l'Azienda Sanitaria Locale (ASL-BI). L'obiettivo è ottenere l'ubicazione dei pascoli estivi (alpeggi), fondamentali per mappare la "filiera stagionale" e permettere l'effettiva intersezione tra le aree di presenza della PRO (maggio-ottobre) e i punti di interesse turistico.

Per quanto riguarda la mappatura del sistema turistico, il processo di sistematizzazione si è rivelato meno lineare. In assenza di un database aggregato, si sta procedendo alla raccolta di dati secondari frammentati (es. catasto sentieri, elenchi rifugi). Sorprendentemente, l'indagine Delphi (Fase 2) si sta rivelando uno strumento euristico fondamentale: interrogando gli stakeholder secondari, oltre a richiedere indicazioni su dove reperire dati strutturati (come elenchi di rifugi o catasti sentieri), si stanno recuperando iniziative di valorizzazione passate, permettendo di inquadrare l'evoluzione comunicativa del territorio.

Fase 2: Indagine qualitativa (metodo Delphi, primo round)

Come fase preliminare del primo round Delphi, si è testato il questionario semi-strutturato su un campione pilota di stakeholder.

Dai Produttori (Stakeholder Primari), è emersa una forte componente identitaria: la scelta di allevare la PRO non risponde a logiche di massimizzazione produttiva, ma a ragioni di prosecuzione generazionale e tradizione territoriale. Emerge con trasparenza che i contributi europei – come l'intervento SRA 14 (Allevatori custodi dell'agrobiodiversità, ex-Misura 10) e l'intervento SRB 01 (Sostegno alle zone con svantaggi naturali montani, ex-Misura 13) – sono cruciali per la sostenibilità economica dell'allevamento. Interpretiamo questo dato come un'indicazione di ricettività verso la diversificazione del reddito, come quella offerta dalla "terza attitudine" turistica.

Sul fronte del prodotto, la domanda locale per le produzioni lattiero-casearie a latte crudo è talmente alta da superare l'offerta, portando a una stagionatura breve (max 6 mesi) e a una scarsa notorietà extra-provinciale. Paradossalmente, è la stessa alta domanda locale, unita alla cronica assenza di cooperazione tra produttori che non ha mai favorito alcuna forma di standardizzazione o promozione collettiva, a mantenere il prezzo medio relativamente basso e a limitare il potenziale di valorizzazione del prodotto al di fuori dei confini biellesi.

Per quanto riguarda l'attitudine "carne", sebbene le sue proprietà organolettiche la rendano meno competitiva sul mercato del fresco rispetto ad altre razze piemontesi, le interviste hanno evidenziato un grande successo nelle iniziative di ristorazione locale. In contesti in cui la razza è visibile e valorizzata (come rifugi o agriturismi in alpeggio), la promozione di piatti tipici a base di PRO riscuote un forte richiamo, legandosi a un consumo esperienziale. Questo successo narrativo si trasferisce ai prodotti trasformati e confezionati (come bresaola e ragù in vasetto). Per questi prodotti, uno sforzo comunicativo mirato che leghi il prodotto al territorio permette di ottenere buoni margini, sebbene i quantitativi siano destinati a una distribuzione di nicchia (vendita diretta, rivenditori locali) e non alla Grande Distribuzione Organizzata. Il principale fattore che limita lo sviluppo di questa filiera è il recente e drastico aumento del prezzo delle vacche a fine carriera (+56% secondo dati dell' Istituto di Servizi per il Mercato Agricolo Alimentare (ISMEA), riferito alla PRO), che contrae la disponibilità di materia prima per queste produzioni di nicchia.

Dalle interviste svolte, è emersa la possibilità di segmentare gli allevamenti secondo tre classi dimensionali che riflettono diverse logiche imprenditoriali:

- Artigianale (< 25 capi): L'allevamento non è la fonte di reddito primaria. Prevale una logica di integrazione al reddito, autoconsumo o "custodia" del territorio.
- Professionale (25-40 capi): È la dimensione che permette all'allevatore di trarre uno stipendio primario dalla conduzione personale e autonoma della stalla.
- Strutturata (> 40 capi): L'organizzazione del lavoro cambia radicalmente, seguendo logiche imprenditoriali più complesse, con dipendenti e spesso integrate nella filiera industriale.

Abbiamo quindi interrogato il nostro database per categorizzare gli allevamenti in questo senso, ottenendo:

Tipologia di allevamento	**Quantità**	**% del Totale Complessivo**
Artigianale (< 25 capi)	63	38%
Professionale (25-40 capi)	37	23%
Strutturata (> 40 capi)	64	39%
Totale complessivo	164	100%

Tabella 2. Classificazione dimensionale allevamenti PRO. Fonte: Elaborazione personale, dati ANARB

Nonostante ci sembri essere una distribuzione quasi proporzionale nelle tre classi, va notato che, considerando la popolazione degli allevamenti della provincia di Biella, la mediana della consistenza di un allevamento (32,5) è decisamente inferiore rispetto alla media (41). Ciò testimonia che poche grandi aziende "trascinano" la media, mentre il tessuto produttivo è primariamente composto da realtà medio-piccole (artigianali e professionali). Quest'utile informazione logistica, ci permette di poter tenere in considerazione che le risposte e i desiderata degli allevatori che a mano a mano intervisteremo è più che verosimile che varino al variare della classe dimensionale di appartenenza.

Dagli Stakeholder Secondari emerge un fattore limitante cruciale: l'alta faziosità e la storica resistenza a forme di aggregazione. Tuttavia, emerge anche un dato incoraggiante: tutti i precedenti tentativi di collaborazione sono percepiti come viziati da interessi particolari, mentre

un approccio super partes guidato dalla ricerca universitaria (come quello in essere) viene visto come un'opportunità inedita per superare i campanilismi.

In conclusione, oltre a seguire i tre filoni tematici (la razza e i suoi prodotti, il territorio provinciale e la collaborazione), queste interviste mirano indirettamente a mappare i Punti di Forza (Strengths) e i Punti di Debolezza (Weaknesses) come attualmente percepiti dagli operatori in situ, nonché le Opportunità (Opportunities) e le Sfide (Challenges) che si percepiscono in questo momento storico-legislativo (Analisi SWOC). Le stesse matrici SWOC, poi, potrebbero anche essere create per ciascuna attitudine, fornendo del materiale operativo su cui basare le strategie di sviluppo territoriale future.

Non si esclude la possibilità che ci sia stato un sample bias (distorsione del campione) per cui si sia partito da allevatori e attori particolarmente ben disposti rispetto agli obiettivi della ricerca. Si potrebbe inoltre argomentare che, procedendo per interviste semi-strutturate, sia difficile comparare le risposte ottenute in maniera rigorosa. Confrontandoci a valle di questi test, ci siamo risposti che questo approccio aiuta a valorizzare l'intervistato come protagonista di un cambiamento di cui sarà, sperabilmente, attore e non ricettore passivo. Dati i passati fallimenti di collaborazione, cogliere le sfumature individuali nelle risposte è cruciale per acquisire una maggiore consapevolezza nell'approccio e nei modi in cui portare avanti questa ricerca.

Fase 3: Analisi dati e sviluppo (risultati attesi)

Trattandosi di un work in progress, i risultati di questa fase sono attesi e di natura strategica. Per rispondere alla nostra domanda di ricerca – se sia possibile o meno riattivare una terza attitudine per la PRO – l'obiettivo non è fornire una soluzione unica, ma una "mappa strategica" che permetta la segmentazione e l'identificazione di percorsi di sviluppo differenziati.

Per oggettivizzare l'analisi e sfruttare la mappatura quantitativa (Fase 1), si procederà alle seguenti analisi spaziali, che metteranno in relazione la mappa produttiva e quella turistica:

- Analisi di Densità Kernel Ponderata (Weighted Kernel Density): Per identificare gli hotspot produttivi, ovvero i "bacini" dove la concentrazione di capi (non solo di aziende) è massima, superando i confini amministrativi.
- Analisi delle Isocrone (Isochrone Analysis): Per mappare la pressione logistica, calcolando i tempi di percorrenza reali dagli allevamenti ai trasformatori, identificando così gli allevatori "remoti" (logisticamente svantaggiati) e quelli "accessibili" rispetto ai trasformatori.
- Analisi di Prossimità Turistica (Tourism Proximity Analysis): Per mappare l'opportunità di mercato, incrociando la posizione degli allevatori (in particolare quelli "remoti" e "artigianali") con la rete sentieristica e ricettiva per identificare chi è già posizionato per intercettare i flussi turistici.

L'output finale sarà una matrice di strategie differenziate. Ad esempio, un allevatore "remoto" (>40 min), ma "prossimo" ai sentieri (<1 km) e di tipo "Artigianale" (<25 capi), sarà un candidato ideale per una strategia di filiera corta esperienziale (vendita diretta, agriturismo). Al contrario, un allevatore "accessibile" (<20 min) e "Strutturato" (>40 capi) sarà indirizzato verso una strategia di valorizzazione della filiera lunga, in partnership con i trasformatori e la ristorazione locale (Ho.Re.Ca.).

Questi risultati verranno poi re-inseriti nel processo Delphi. Seguirà infatti un secondo round in cui tali tendenze e la matrice strategica verranno proposte agli stakeholder. Lo scopo è duplice: allargare le loro visioni individuali a quelle "mediane" del territorio e testare la fattibilità percepita delle strategie proposte.

Per costruire infine un modello di governance e favorire l'allineamento strategico, si utilizzerà la Nominal Group Technique (NGT). Questa fase trasla la ricerca da interviste individuali a "tavole rotonde" (workshop) strutturate. L'NGT, tramite la generazione di idee e un voto palese o segreto, trasforma il consenso qualitativo del Delphi in una lista di priorità operative condivise, neutralizzando le dinamiche di dominanza e i campanilismi.

Il successo della "terza attitudine" non dipende infatti dai singoli, ma dalla capacità del sistema territoriale di agire in modo coeso: è fondamentale che gli enti di promozione supportino questo modello, che le amministrazioni facilitino la transizione, e che le associazioni civili accompagnino il processo con una narrativa positivistica.

In conclusione, questo studio risponde alla domanda di ricerca dimostrando che la "terza attitudine" turistica non solo è possibile, ma è necessaria per la sostenibilità della filiera. Attraverso la mappatura socio-spaziale parallela (Fase 1), lo studio identifica dove si trovano le risorse produttive e turistiche. Attraverso l'indagine qualitativa (Fase 2), si comprende perché il sistema attuale è bloccato e come gli attori sono disposti a muoversi. Infine, attraverso l'analisi strategica e la NGT (Fase 3), si definisce cosa fare, fornendo una matrice di interventi differenziati.

Questo lavoro pone le basi per un modello metodologico scalabile, applicabile ad altri territori marginali europei. Dimostra come un approccio socio-spaziale possa supportare lo sviluppo di produzioni iper-locali, oggi minacciate da dinamiche di spopolamento, emarginazione e concorrenza globale. La perdita di queste produzioni non è solo economica, ma rappresenta una perdita irreversibile del patrimonio culturale e della biodiversità che animano il territorio europeo.

Parole chiave: Marketing territoriale; sviluppo locale sostenibile; multifunzionalità zootecnica; governance della filiera; metodo Delphi

1. Introduction

The concept of welfare is becoming increasingly central to organisational policies in Italy (e.g., Gasparri, 2021; Ascoli, Natali, Pavolini, 2018), partly due to the introduction of laws that progressively support and encourage its implementation.

The benefits of welfare measures extend well beyond the economic and legal advantages that often drive their adoption. When effectively integrated into corporate strategies, welfare policies lead to greater employee satisfaction, increased productivity, and enhanced company attractiveness, which helps to identify and retain talent in the area. There are various classifications of welfare assets, which can be traced back to four main pillars. The first is "welfare" in its strict sense, meaning actions aimed at the redistribution of resources. The second is equal opportunities, which guarantee fair access to resources and protect against all forms of discrimination. The third pillar is quality of life, referring to interventions that improve sustainability in environmental and social dimensions. Lastly, organisational well-being includes actions that promote the physical, mental, and emotional well-being of an organisation's human capital.

Despite this growing interest, few studies systematically map which actions companies actually implement, which methods are used to detect needs, and which issues must be addressed. Moreover, the available studies rarely employ collaborative methodologies, in which scientists,

companies, and sector organisations contribute to formulating the project idea, collecting data, and discussing the results. The aim of the research we present, currently in progress, is to address both these gaps, which represents the most original feature of this contribution.

2. The W.I.N W.I.N project

The project examines the welfare initiatives implemented by companies in the province of Biella, north-west Italy.

The project is developed through joint planning by UIB (Unione Industriale Biellese), University of Torino and other partners, such as Cassa di Risparmio di Biella. In particular, the Management Department of the University of Turin is the scientific leader of the project. The Department of Psychology, ESOMAS Department, Department of Law, Department of Foreign Languages and Literatures and Modern Cultures, Department of Culture, Politics and Society, and Department of Neuroscience also collaborate in various phases of the research.

The heterogeneity of partners ensures multidisciplinary perspectives and methodologies. The heterogeneity of perspectives, both theoretical and practical, presents a challenge as it requires mediation between different languages and methodologies. At the same time, it enables a greater understanding of complex realities such as the one of interest.

The Biella area, through UIB (Unione Industriale Biellese) and other partners such as Cassa di Risparmio di Biella promoted this project for several important reasons.

The province of Biella has a long history of industrial excellence, but as the IV Annual Report 2024 by Osserva Biella clearly highlights, a profound transformation of companies in response to new competitive challenges – including increasing globalisation, digitalisation, and the ecological transition – requires innovative drive to foster industry, employment, and sustainability.

This integrates environmental, social, and economic aspects (the so-called ESG criteria) into daily strategies and operations to create long-term value for all stakeholders, not just profit.

To achieve this, companies must focus on a long-term, ethical, and transparent vision, worker well-being, responsible innovation, resource efficiency, and open communication with the community and dependants.

Innovation, sustainability, and investment in human capital are key factors in meeting these challenges and strengthening the position of Biella companies in the markets. Welfare actions can enhance the value of people within the company, who are a true driving force of innovation, and increase the attractiveness of the entire industrial area.

3. Aim and methodology

The aim of this research is to develop an innovative corporate welfare model by integrating dialogue among businesses, academia, and stakeholders in the civil economy with sustainable and replicable strategies that enhance organisational well-being and workers' quality of life, thereby contributing to sustainable and inclusive growth.

The first step to achieving this ambitious goal is to establish a participatory dialogue in which the voice of companies is not only heard but also considered as a guide. In the first part, indeed, semi-structured interviews with entrepreneurs or managerial figures working in the Province of Biella are conducted to understand which welfare actions have been implemented so far in their corporation.

In the second part, a questionnaire is developed based on the literature and interview results. The questionnaire will be administered to employees of the companies included in the study. The results of the interviews and questionnaires will be combined in a summary of guidelines and best practice.

4. Semistructured interviews

In the first part, semi-structured interviews with entrepreneurs or managerial figures working in the Province of Biella are conducted to understand which actions have been implemented so far in their corporation.

The study is currently scheduled from November 2025 to March 2026.

All participants are informed that participation in the study is voluntary and that no compensation is provided. Interviews are recorded, subject to the participants' written consent. Each interviewee is informed in advance about the purposes of the research and privacy considerations. Anonymity and confidentiality of the collected material – used exclusively for educational and research purposes – as well as the possibility to terminate the interview at any time, will be guaranteed.

UIB has more than 400 subsidiary companies. 167 companies were selected. They are distributed across six production sectors: food and beverages (8), spinning (34), mechanics (37), wool mills (20), ennoblement (41), technological services (17), tourism and culture (4), other (6).

Although time-consuming, we chose to conduct this first phase of the research through interviews to gain in-depth knowledge of each productive reality.

All interviews will be conducted by the same person, an expert in qualitative methods in order to provide the best uniformity in data collection.

The interviews are audio-recorded and transcribed verbatim.All participants are contacted by telephone to arrange a date for the interview so as not to interfere with the companies' activities. Everyone receives the interview questions in advance via email.

The questions asked to respondents are as follows:

- Please provide a brief description of your business.
- What welfare initiatives has your company implemented in recent years? How did you select these initiatives over others? What were the funding sources?
- What were the main outcomes? For example, the number of workers involved, level of satisfaction, etc.
- Have any of these initiatives involved other local businesses?
- To what extent do welfare initiatives contribute to the attractiveness of your business and the local area?

Interviews take less than half an hour. Great care is taken to remain within this time frame to ensure the process is manageable, given the often very busy schedules of companies. Many interview requests have been ignored by prospective participants precisely because of the numerous requests for interviews and questionnaire completion.

The interview transcriptions will be analysed using Alceste software. Alceste 6.0 is software for textual and statistical analysis, suitable for large volumes of qualitative data, such as written texts or verbalised conversations. The software performs several operations on the text, creating a word frequency matrix, assigning semantic categories to words, analysing word groups, and generating graphs and tables to display the results. Alceste processes the text data using descending hierarchical classification (DHC). The text is first divided into elementary context units (EUA) and then into homogeneous classes. Alceste proposes an analysis of the internal structure of the corpus, which is not determined by the post-coding grids chosen by the researcher, but results from the distribution of words used by participants to discuss a given topic The software identifies the most homogeneous classes in terms of content, which therefore have a different lexical-semantic universe from the others. The use of certain words seems to convey the conceptual context of the topic to which they belong, as well as the situation in which they are used. Thus, if a particular word is used frequently, it means that the underlying argument acquires particular thematic significance. In contrast, if a particular word is used infrequently, it may mean that it is not relevant to the topic or that the speaker is not predisposed to use that word.

The software also makes it possible to highlight recurring segments, i.e. the associations of the most frequent words in a class and the classes associated with the selected variables. These

are called illustrative variables and contain additional information about the text corpus that allows the researcher to identify the specific characteristics that define individuals who share the same semantic universe.

5. Preliminary data emerging from the interviews

Below, we report the preliminary results of pilot interviews conducted to test the quality of the interview plot.

The questions are relevant and allow the interview to be completed within the indicated time frame (approximately 20 minutes).

Ten people were interviewed, all HR managers from different companies. Eight companies have more than 50 employees (the other two have less than 50 employees). They belong to the seven identified sectors (two are spinning mills). Six are family-run companies and two are multinationals.

The results we present are only preliminary and will be supplemented by further interviews in the coming weeks.

Welfare measures taken (an overview)

Before Covid, welfare measures appeared to focus on shopping vouchers, fuel cards, or tickets restaurant. After the pandemic, many companies began to incorporate medical services. Initially, medical services included reimbursement for treatment or specialistic visits, whereas now many companies incorporate prevention initiatives, cancer screening, nutrition programmes, and mental health services.

Some companies (the largest) provide insurance that provides financial support to families in the event of the death of the employee and other forms of income support in the event of serious illness or injury.

Welfare actions designed to reconcile family and working life are not uncommon: support for nurseries, for the purchase of textbooks, or for summer camps.

Little attention is paid to the needs of families with grown children (e.g. financial support for university studies, for off-site rentals, for driving school payments). No welfare measures were mentioned to support caregiving, nor for children with disabilities or for the spouse or parent needing constant help.

To blue-collar workers it is difficult to ensure flexible hours and smart working, while these measures are regularly adopted for administrative staff.

A highly appreciated service is the possibility of making the tax return with professionals made available by and in the company itself.

Needs analysis

Needs analysis is conducted through the involvement of unions, internal anonymous surveys, and input from the entrepreneur.

How are providers chosen?

All companies state that they prefer welfare service providers closely connected to the local area. Some previously used large agencies based in big cities, but later returned to local providers. This choice was made for two reasons: to make it easier for employees to use the services and to support the growth of the local economy.

Companies with a high percentage of blue-collar workers and people over 50 said they chose simple delivery methods that require minimal use of digital or web platforms. These tools, although advanced, encounter significant resistance.

Can welfare measures contribute to attractiveness?

All the interviewees consider welfare measures important for contributing to attractiveness. Family-based companies appear to place more emphasis on worker retention than on recruitment.

In the second part of the research, a questionnaire will be developed basing on the literature and interview results. The questionnaire will be administered to employees of the companies included in the study and analyzed through SPSS software. The results of the interviews and questionnaires will be combined in a summary of guidelines and best practice.

This second part of the project will only be launched in the Spring 2026.

6. Expected results

From the interviews, we expect to be able to map the welfare actions implemented in companies of the Biella area. We are particularly interested in analysing the steps taken by different production entities to identify the welfare needs of their employees. In addition, it will be possible to identify the drivers, beyond the fiscal advantages, that motivate these actions. We expect good practices and pilot projects to emerge.

The mapping could also reveal any critical issues or implementation difficulties. Finally, we are interested in understanding whether companies are able to build dialogue and networks on these issues. We also believe that simply answering the interview questions encourages important reflection on the topics discussed. Finally, we hope that the good practices identified can help increase the attractiveness of the area's business fabric.

It should be noted that the expected number of interviews represents a significant methodological effort, which nevertheless enables a comprehensive mapping of the existing reality. The large number of interviews also makes it possible to analyse the corpus by sector, allowing any specificities of each sector to be highlighted.

The collected data collected through the questionnaires will provide a different perspective, that of the employees and will provide quantitative information.

Mapping of this kind provides an accurate snapshot of production reality and serves as an important benchmarking tool not only for academia, but also, and perhaps above all, for the local industrial fabric. Looking ahead, it may also serve as a valuable tool for larger territorial areas.

7. The innovative of this project

The methodological approach, which involves data collection from both those who design and provide the service (the enterprise) and those who use it (the enterprise’s employees).

The initiation of a dialogue that will highlight best practices which not only have an impact on public image (for example, in public opinion) but are also positively evaluated by the beneficiaries themselves.

These aspects will enable the improvement of practices for the benefit of users (for example, by increasing the pool of potential users of a given service or by changing the criteria for inclusion in initiatives).

8. Limitation

The main limitation of this study is its narrow geographical focus on the Province of Biella. Although this area is an industrial district of great historical and economic. Its specific

characteristics may however limit the generalisability of the results. The methodology (both the interviews and the resulting questionnaire) can be easily replicated and favoured for possible extensions over time.

Keywords: Welfare; interview; guidelines; attractiveness; territorial welfare

Acknowledgments

We would like to thank the partners outside UNITO: Unione Industriali Biellese (UIB), Città Studi S.p.A., and the Cassa di Risparmio di Biella Foundation for their support of the project.

Verso un consumo responsabile e sostenibile: un'analisi dei fattori che guidano lo spreco alimentare in ambito domestico

Veronica Ungaro[1], Federica Bisceglia[2], Laura Di Pietro [3], Roberta Guglielmetti Mugion[4], Maria Francesca Renzi[5], Olimpia Martucci[6], Francesco Lista[7]

1. Introduzione

Lo spreco alimentare rappresenta una delle principali sfide ambientali, economiche e sociali del nostro tempo. Secondo uno studio realizzato da WWF, il 40% del cibo prodotto a livello globale va sprecato (WWF, 2021). Lo spreco alimentare si riferisce alla rimozione dalla filiera alimentare di cibo ancora adatto al consumo umano. Ciò avviene sia per scelta sia perché il cibo si deteriora o per negligenza e si verifica tipicamente a livello di vendita al dettaglio e di consumo (Rezaei and Liu, 2017).

Le conseguenze di questa pratica sono profonde e riguardano dimensioni ambientali, climatiche e sociali. Anzitutto, lo spreco alimentare comporta un enorme dispendio di risorse naturali, acqua, suolo ed energia, utilizzate lungo l'intera filiera produttiva per alimenti che, alla fine, non vengono consumati. Inoltre, con-tribuisce in modo significativo al cambiamento climatico, i rifiuti organici in discarica rilasciano metano. Infine, rappresenta una seria ingiustizia sociale, poiché avviene in un contesto globale in cui milioni di persone soffrono la fame (WWF, 2021). Il principio dello "zero waste" rappresenta uno dei pilastri dell'economia circolare, che si fonda sulla riduzione dei rifiuti, sulla circolazione continua di prodotti e materiali e sulla rigenerazione dei sistemi naturali (Ellen MacArthur Foundation, 2024). In questo quadro, diventa importante analizzare anche l'impegno del consumatore, il cui contributo è decisivo per il raggiun-gimento di tali obiettivi (Karpen et al., 2023).

Secondo un report di Capgemini, ogni anno circa 931 milioni di tonnellate di cibo vengono sprecate nelle fasi di vendita al dettaglio e di consumo. La maggior parte dello spreco che avviene nelle parti finali della filiera viene generato dalle famiglie (circa il 61%) evidenziando quanto comportamenti, abitudini e atteg-giamenti dei consumatori incidano in modo determinante sul fenomeno (Capgemini 2022).

Dal momento che i consumatori contribuiscono in modo significativo allo spreco alimentare complessivo, la riduzione a livello domestico è riconosciuta come una delle azioni più cruciali per il miglioramento della sostenibilità ambientale e della sicurezza alimentare (Stancu et al., 2016). Allo stesso tempo, la maggio-ranza dei consumatori considera lo spreco alimentare un

[7] Università degli Studi Roma Tre; fra.lista2@stud.uniroma3.it

problema rilevante e vorrebbe avere una più am-pia conoscenza sulle conseguenze e sulle soluzioni per ridurlo (Gaiani et al., 2018). La maggior parte delle persone prova disagio o senso di colpa quando spreca cibo, perché lo percepisce sia come uno spreco di denaro sia come un problema morale e di ingiustizia sociale. Tuttavia, questa consapevolezza non si tradu-ce necessariamente in un impegno concreto a ridurlo, ciò accade perché, nelle scelte quotidiane, entrano in gioco altre priorità e gerarchie di valori che spesso prevalgono (Van Geffen et al., 2020). Il Waste and Re-sources Action Programme distingue gli sprechi alimentari domestici in tre categorie principali. La prima comprende i rifiuti evitabili, cioè alimenti ancora perfettamente commestibili che vengono comunque get-tati, come carne, pane o frutta e verdura leggermente danneggiate. La seconda riguarda i rifiuti possibil-mente evitabili, ovvero parti di cibo che alcune persone consumano e altre no, come bucce o gambi. Infi-ne, vi sono i rifiuti inevitabili, costituiti dagli scarti non commestibili, come gusci d'uovo (Waste and Re-sources Action Programme, 2009; Ministero della Salute, 2017).

Alla luce di queste evidenze, il presente studio mira a comprendere le cause che portano i consumatori a sprecare cibo e a individuare strategie efficaci per ridurre lo spreco domestico, inteso come l'insieme degli alimenti scartati nelle abitazioni tra il momento dell'acquisto e quello del consumo.

Per raggiungere l'obiettivo della ricerca è stata condotta un'indagine empirica adottando un approccio quantitativo. Un questionario strutturato è stato somministrato a un campione di 319 cittadini. I dati raccolti sono stati analizzati mediante tecniche statistiche descrittive. L'originalità del presente studio risiede nell'approfondimento delle prospettive dei consumatori su un tema di crescente rilevanza ovvero la ridu-zione della produzione di rifiuti, con particolare attenzione allo spreco alimentare. Allo stesso tempo la ri-cerca contribuisce anche al raggiungimento dell'Obiettivo 12 dell'Agenda 2030 e, in particolare, del target 12.3, volto a dimezzare lo spreco pro capite lungo l'intera filiera alimentare (United Nations, 2015). La restante parte dell'articolo è organizzata come segue: dopo questa introduzione viene presentata la metodo-logia, seguita dalla descrizione dei risultati, e infine vengono esposte le discussioni e le conclusioni insieme alle implicazioni della ricerca, ai limiti dello studio e alle direzioni per futuri approfondimenti.

2. Metodologia

Per indagare le abitudini, le percezioni e la consapevolezza dei consumatori in merito allo spreco alimenta-re, è stato condotto in Italia uno studio empirico (work in progress) basato su un approccio quantitativo, mediante la somministrazione online di un questionario a 319 rispondenti. L'utilizzo di metodi quantitativi consente di individuare pattern generalizzabili all'interno di popolazioni più ampie (Backman et al., 2025). Pur trattandosi di un campionamento non probabilistico, il campione di convenienza è stato ritenuto ade-guato alla natura esplorativa dello studio (Toni et al., 2021) e idoneo al raggiungimento degli obiettivi co-noscitivi entro i limiti operativi esistenti (Di Pietro et al., 2015).

La struttura del questionario è stata definita a partire da un'approfondita revisione della letteratura su con-tributi analoghi ed è articolato in sette sezioni, per un totale di 40 domande. La Tabella 1 riporta i dettagli di ciascuna sezione. Le risposte sono state misurate utilizzando una scala Likert a 5 punti. I dati sono stati analizzati impiegando tecniche di statistica descrittiva tramite l'ausilio del software Minitab. Nella presen-te fase della ricerca sono state condotte e qui riportate le analisi descrittive dei dati raccolti, integrata dai test non parametrici, dal test del chi quadrato e dal coefficiente di Spearman al fine di esplorare le associa-zioni tra variabili. Le ulteriori analisi inferenziali, quali analisi fattoriale, cluster analysis e regressione multipla, sono attualmente in corso e saranno approfondite nelle fasi successive dello studio.

SEZIONE	**N. ITEM**
ABITUDINI DI ACQUISTO Questa sezione del questionario mira a raccogliere informazioni sul comportamento dei consumatori, focalizzandosi sulla frequenza di acquisto e sui criteri di scelta dei prodotti.	9
GESTIONE DEL CIBO Questa parte analizza come i rispondenti gestiscono l'organizzazione, la conservazione e il consumo degli alimenti, includendo le pratiche quotidiane e i comportamenti legati all'uso delle risorse alimentari.	3
CONSAPEVOLEZZA SULLO SPRECO ALIMENTARE Questa sezione analizza le conoscenze, la consapevolezza, le opinioni e i comportamenti dei consumatori in relazione allo spreco alimentare.	7
SOLUZIONI E BARRIERE PER LA RIDUZIONE DELLO SPRECO ALIMENTARE Questa parte mira a individuare strategie per ridurre lo spreco alimentare e a identificare gli ostacoli che limitano comportamenti più responsabili nella gestione del cibo.	6
GOVERNO, IMPRESE E TECNOLOGIE In questa sezione del questionario sono stati analizzati i ruoli di governo, imprese e tecnologie nella gestione e riduzione dello spreco alimentare.	2
SCENARIO In questa sezione del questionario si è indagato il comportamento dei rispondenti in uno scenario ipotetico di spreco alimentare, in cui, dopo aver cucinato in abbondanza per una cena con amici, rimangono degli avanzi destinati a essere gettati	4
PROFILAZIONE Raccolta di informazioni sociodemografiche	9

Tabella 1. Sezioni del questionario

3. Risultati

3.1. Descrizione del campione

Il campione è composto da 319 rispondenti, prevalentemente maschi (198), con età compresa tra i 25 e i 35 anni. La maggioranza proviene dal Centro e Sud Italia. Per quanto riguarda la condizione occupaziona-le, il campione include principalmente studenti (166) e lavoratori (119), mentre i restanti 34 partecipanti risultano non occupati.

3.2. Abitudini di acquisto e gestione domestica del cibo

La frequenza con cui i consumatori si disfano degli avanzi si colloca su valori medio-alti. Il test non para-metrico (Figura 1) evidenzia una mediana pari a 3,5, significativamente superiore

alla mediana ipotizzata (2; $p < 0.05$), indicando comportamenti di spreco ricorrenti, spesso connessi alla percezione soggettiva del-la non commestibilità degli alimenti.

Test

Butto via gli avanzi o il cibo che non considero più buono	319	3,5

Figura 1. Test non parametrico sulla frequenza di spreco

Emergono differenze sociodemografiche significative. L'età risulta inversamente correlata allo spreco: i soggetti più giovani mostrano frequenze più elevate (Figura 2). Il test di Kruskal-Wallis indica inoltre dif-ferenze tra generi, con uomini che riportano mediane di spreco maggiori (4) rispetto alle donne (2) ($p < 0.05$) (Figura 3). Anche la situazione lavorativa incide: il test chi quadrato mostra che gli studenti presen-tano un'incidenza di spreco elevato superiore alle attese e una minore frequenza di spreco basso, indicando una tendenza più marcata allo spreco (Figura 4). I principali alimenti che vengono gettati via sono: latticini (come latte, formaggio, ecc.), frutta, verdura e pane (Figura 5).

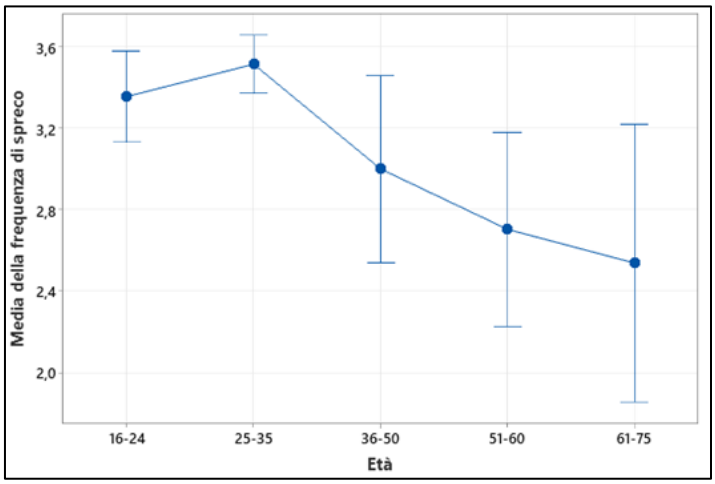

Figura 2. Frequenza di spreco in base all'età

Figura 5. Media di spreco degli alimenti (risultati su scala Likert, da 1 (non spreco mai) a 5 (spreco sempre))

3.3. Consapevolezza e percezioni sullo spreco alimentare

L'esposizione al tema risulta ampia ma non omogenea: il 43,6 % dichiara di venire a conoscenza del tema occasionalmente, il 22% regolarmente, mentre solo il 2,2% non ne sente mai parlare (Figura 6). Un test non parametrico conferma un livello significativo di consapevolezza (Figura 7).

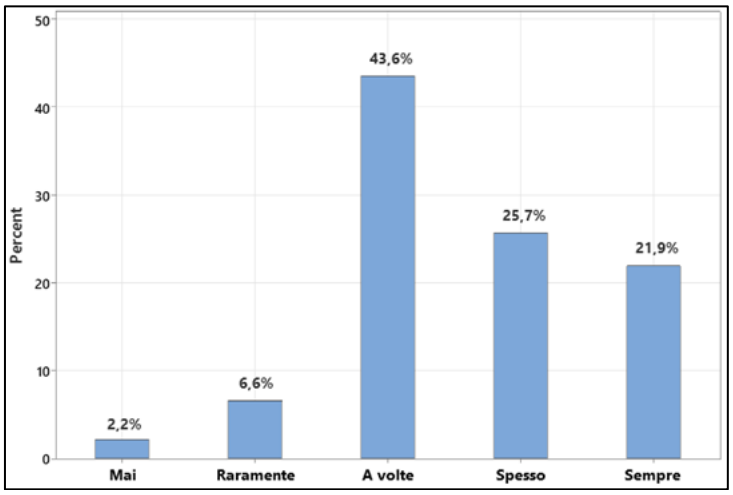

Figura 6. Frequenza con cui si sente parlare di spreco alimentare

Test

Null hypothesis	$H_0: \eta = 3$

Sono consapevole del problema dello spreco alimentare	229	21448,00	0,000

Descriptive Statistics

Sample	N	Median
Sono consapevole del problema dello spreco alimentare	319	4

Figura 7. Test non parametrico sulla consapevolezza del problema dello spreco alimentare

Tuttavia, il 43,3 % dei rispondenti afferma di non essere pianamente consapevole della quantità reale di cibo sprecato (Figura 8). Solo il 17,2% si definisce molto preoccupato dal fenomeno, mentre una quota consistente esprime indifferenza (27,6%) o bassa preoccupazione (30,1%) (Figura 9). Le emozioni più as-sociate allo spreco sono preoccupazione e senso di colpa, mentre l'indifferenza risulta correlata a una maggiore frequenza di spreco (Figura 10 e 11).

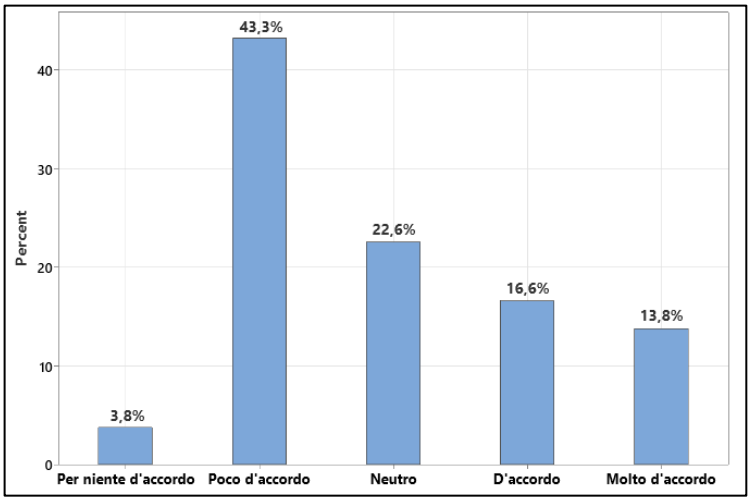

Figura 8. Consapevolezza rispetto alla quantità di cibo sprecato

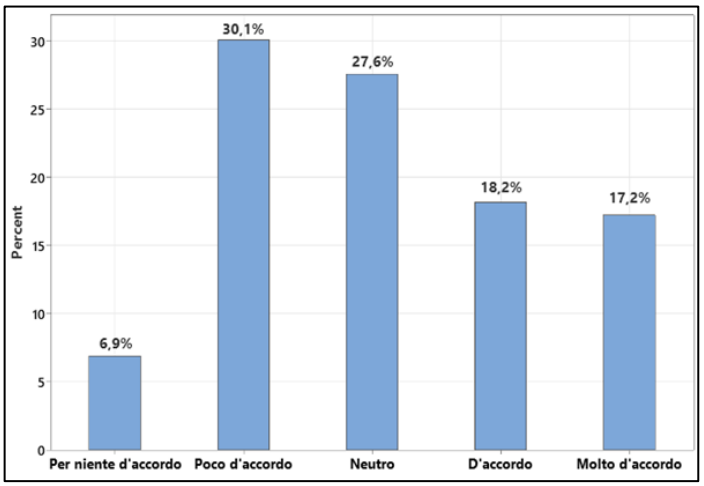

Figura 9. Preoccupazione per lo spreco alimentare

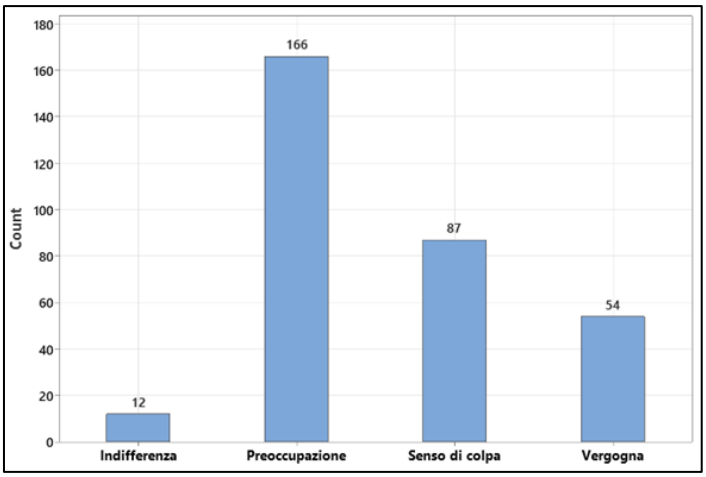

Figura 10. Emozioni suscitate dallo spreco alimentare

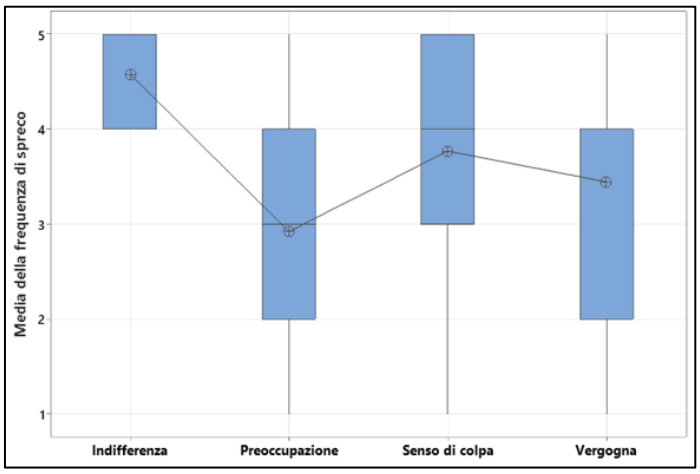

Figura 11. Media della frequenza di spreco in base alle emozioni

L'impegno dichiarato nel ridurre lo spreco è variabile: il 37,3% è poco incline a adottare comportamenti concreti, mentre il 17,9% si dichiara d'accordo e il 22,6% molto d'accordo a intraprendere azioni di ridu-zione (Figura 12). La correlazione di Spearman conferma una

relazione positiva significativa tra preoccu-pazione e impegno alla riduzione ($\rho = 0.555$, $p < 0.05$) (Figura 13).

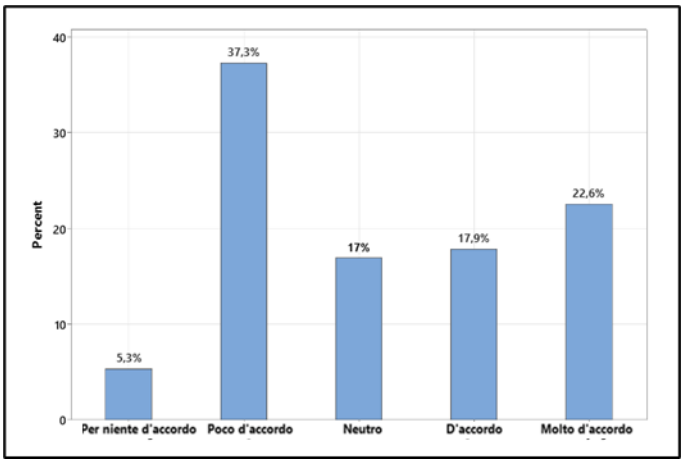

Figura 12. Impegno nel ridurre lo spreco alimentare

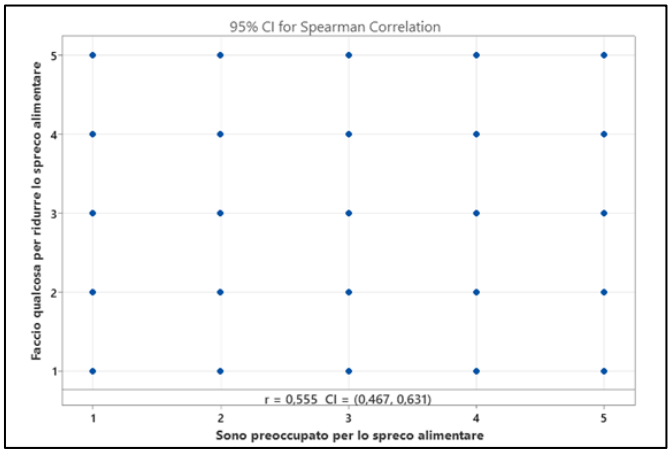

Figura 13. Correlazione tra impegno a ridurre lo spreco e preoccupazione per lo spreco

3.4. Soluzioni e barriere allo spreco alimentare

Le cause maggiormente riconosciute come origine dello spreco includono: cattivo odore o sapore, scaden-za degli alimenti, rimanenze dei pasti, presenza di muffa e porzioni eccessive (Figura 14).

Statistics

Variable	N	N*	Mean
Cibo scaduto	319	0	3,3856
Presenza di muffa sul cibo	319	0	3,1160
Presenza di cattivo odore/sapore nel cibo	319	0	3,6050
Rimanenza di cibo da un pasto	319	0	3,3041
Acquisto in eccesso di un prodotto	319	0	2,5517
Confezione troppo grande	319	0	2,1755
Scarse capacità culinari	319	0	1,4796
Conservazione errata del prodotto	319	0	2,3605
Porzioni a casa troppo abbondante	319	0	2,8589
Alimenti non graditi o che non rispecchiano le aspettative	319	0	1,7085

Figura 14. Media delle cause di spreco alimentare

Le strategie giudicate più efficaci per ridurlo sono: pianificazione dei pasti, acquisti consapevoli, corretta conservazione, donazione delle eccedenze, educazione sullo spreco alimentare e riutilizzo degli avanzi in nuove preparazioni (Figura 15).

Variable	N	N*	Mean
Penso sia utile pianificare i pasti	319	0	3,8245
Penso sia utile acquistare solo ciò che serve	319	0	3,7712
Penso sia utile conservare correttamente il cibo	319	0	4,0251
Penso sia utile donare cibo in eccesso	319	0	3,9122
Penso sia utile educare riguardo lo spreco alimentare	319	0	4,2038
Penso sia importante utilizzare gli avanzi in altre preparazioni	319	0	4,1818

Figura 15. Medie delle strategie per ridurre lo spreco alimentare

Tra le leve motivazionali, il fattore economico risulta particolarmente rilevante: molti consumatori dichia-rano che ridurrebbero lo spreco se dovessero pagare in base ai rifiuti generati. Anche una maggiore infor-mazione sugli impatti ambientali ed economici dello spreco emerge come incentivo importante (Figura 16).

Variable	N	N*	Mean
Sprecheresti meno cibo se fossi più informato sugli impatti negativi dello spreco alimentare sull'ambiente e sull'economia	319	0	3,6082
Sprecheresti meno cibo se fossi più informato sulla quantità di denaro che spreco	319	0	3,7806
Sprecheresti meno cibo se il cibo fosse più costoso	319	0	3,3386
Sprecheresti meno cibo se dovessi pagare in base alla quantità di spreco che genero	319	0	4,2226
Sprecheresti meno cibo se fossi più abituato a pianificare gli acquisti e i pasti	319	0	3,4545
Sprecheresti meno cibo se avessi maggior accesso a strumenti per conservare meglio il cibo	319	0	3,0125
Sprecheresti meno cibo se avessi confezioni più piccole o adattabili	319	0	2,8871

Figura 16 - Media dei motivi di minor spreco

Riguardo alle barriere, il test non parametrico indica che i rispondenti non concordano con l'idea che non esistano barriere (mediana = 2 < 3; $p < 0.05$) (Figura 16). Il tempo limitato non è percepito come un osta-colo rilevante. Lo sono invece la mancanza di informazioni, la scarsa motivazione o attenzione, e le abitudini consolidate difficili da modificare (Figure 17-20).

Test

Null hypothesis	H_0: $\eta = 3$
Alternative hypothesis	H_1: $\eta < 3$

Sample	N for Test	Wilcoxon Statistic	P-Value
Non esistono barriere che impediscono la riduzione dello spreco alimentare	267	4685,50	0,000

Descriptive Statistics

Sample	N	Median
Non esistono barriere che impediscono la riduzione dello spreco alimentare	319	2

Figura 17. Test non parametrico sull'esistenza delle barriere che ostacolano la riduzione dello spreco

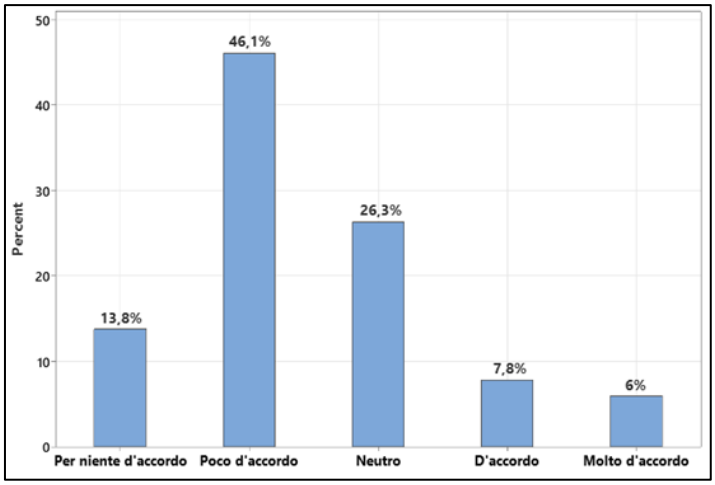

Figura 18. Opinioni dei consumatori sul tempo limitato per preparare i piatti come ostacolo alla riduzione dello spreco

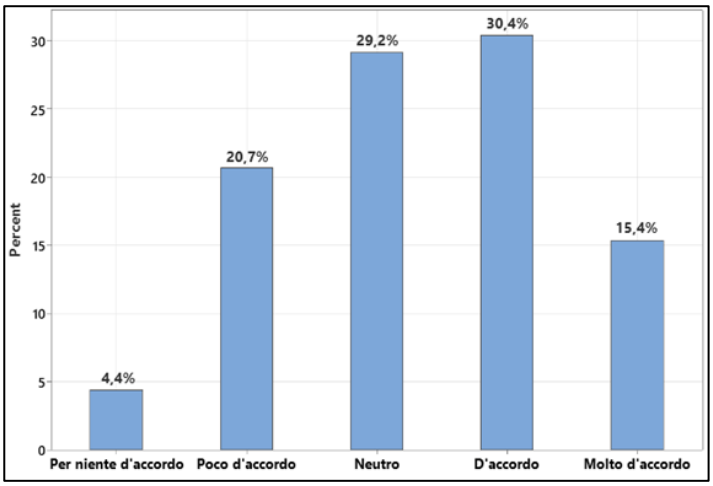

Figura 19. Opinioni dei consumatori sulla mancanza di informazioni come ostacolo alla riduzione dello spreco alimentare

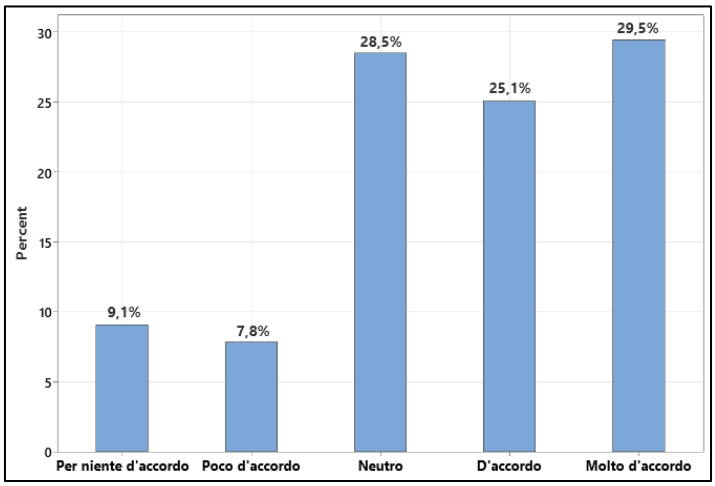

Figura 20. Opinioni dei consumatori sulla mancanza di motivazione o attenzione nella gestione del cibo come ostacolo alla riduzione dello spreco alimentare

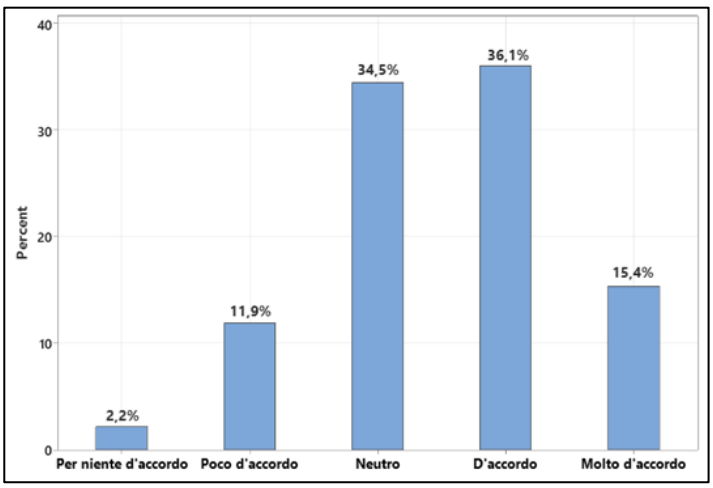

Figura 21. Opinioni dei consumatori sulle abitudini consolidate come ostacolo alla riduzione dello spreco alimentare

3.5. Ruolo percepito di governo, imprese e tecnologie

In merito al livello di fiducia nei confronti di vari attori (come governi, imprese e ristoranti) rispetto agli sforzi per ridurre lo spreco alimentare, emerge un quadro critico. Il 45,5% è poco d'accordo riguardo all'impegno del governo nel contrastare lo spreco; percentuali simili emergono per imprese (54,9%) e ri-storanti (43,3%) (figure 22-23-24).

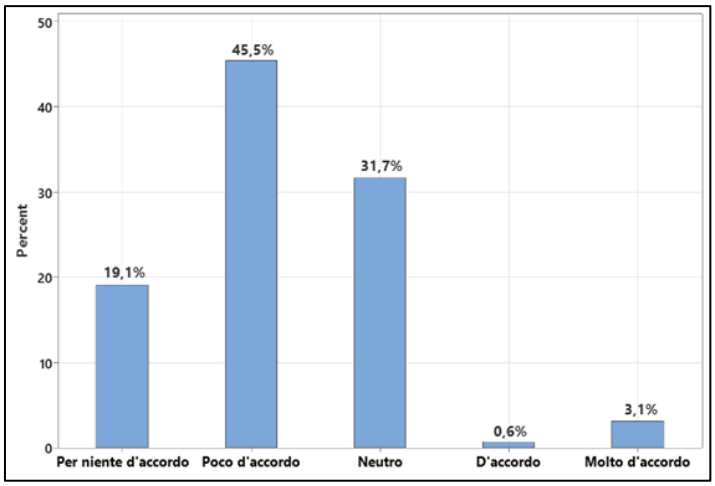

Figura 22. Opinioni dei consumatori sull'impegno del governo riguardo lo spreco alimentare

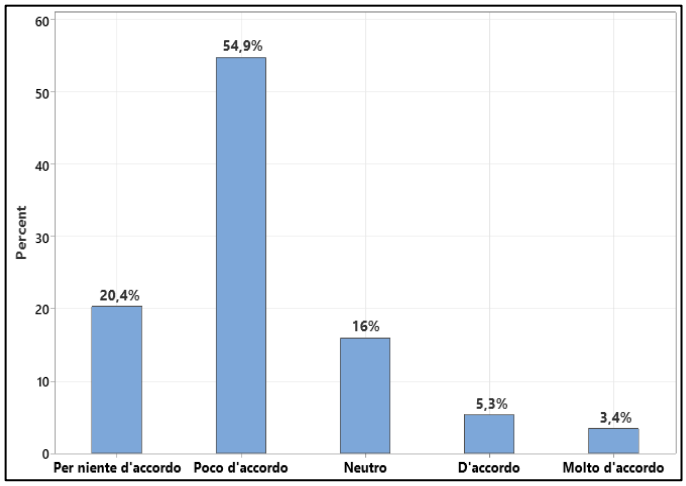

Figura 23. Opinioni dei consumatori sull'impegno delle imprese riguardo lo spreco alimentare

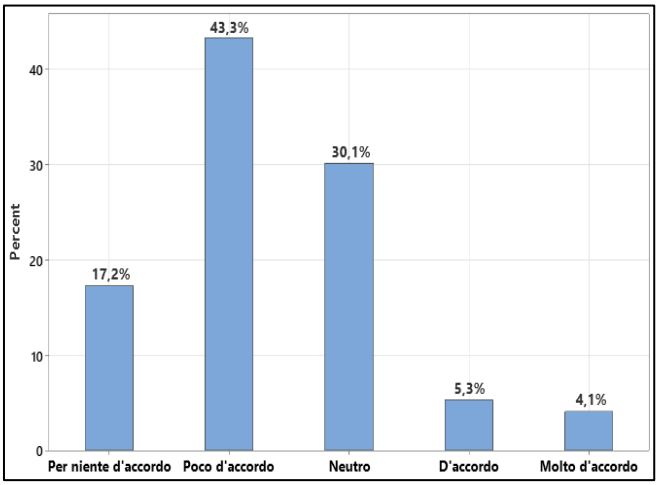

Figura 24. Opinioni dei consumatori sull'impegno dei ristoranti riguardo lo spreco alimentare

La tecnologia, al contrario, è percepita come un alleato importante: il 46% ritiene che possa contribuire in maniera significativa alla riduzione dello spreco, e il 19% è molto d'accordo con tale affermazione (Figura 25).

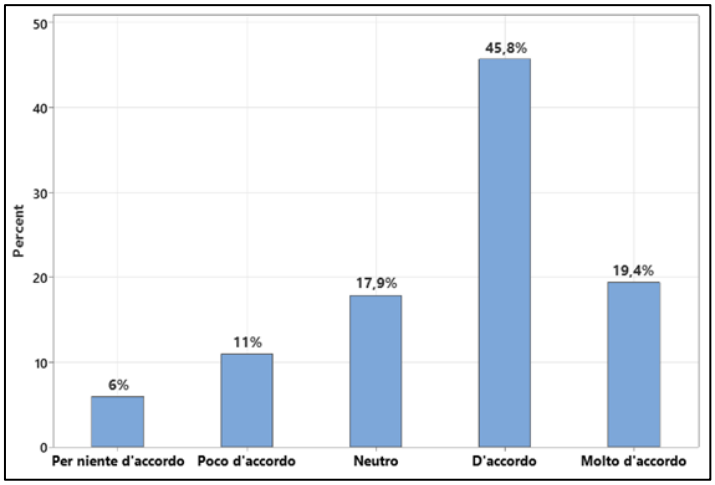

Figura 25. Opinioni dei consumatori sull'importanza della tecnologia per ridurre lo spreco alimentare

3.6 Scenario realistico di spreco

Per analizzare le sensazioni e gli atteggiamenti dei consumatori dopo aver generato spreco alimentare, è stato creato uno scenario realistico. Si è simulata una cena tra amici, in cui il consumatore, per fare buona impressione e soddisfare tutti, acquista e cucina in eccesso. Alla fine della serata, però, si accorge che molto cibo è avanzato e dovrà essere buttato. Sulla base di questo racconto, è stato chiesto ai consumatori di riflettere sulle loro emozioni e atteggiamenti in quel contesto.

Dai dati raccolti emerge che i rispondenti hanno sperimentato un livello moderato ma significativo di sen-so di colpa (mediana 3,5; $p < 0.05$; Figura 26).

4. Discussione e conclusioni

Il presente studio si propone di analizzare il fenomeno dello spreco alimentare, con un focus specifico sul-le principali cause che si manifestano in ambito domestico, e di individuare strategie efficaci per orientare e migliorare le abitudini di consumo. A tal fine, sono stati approfonditi i fattori che influenzano sia le deci-sioni di acquisto sia le modalità di gestione e consumo degli alimenti.

L'analisi mette in luce diversi comportamenti significativi dei consumatori rispetto allo spreco alimentare. Un primo aspetto riguarda il livello di consapevolezza, sebbene circa il 25,7% degli intervistati dichiari di sentir parlare spesso di questo problema, il 43,3% ammette di non

avere una reale percezione della quanti-tà di cibo che viene sprecata nella propria quotidianità. Questo dato mette in luce una discrepanza tra la conoscenza teorica del fenomeno e le pratiche concrete di gestione degli alimenti nelle abitazioni.

Dal punto di vista emotivo, la maggior parte delle persone associa lo spreco alimentare a emozioni negati-ve. Si nota una correlazione tra le emozioni provate e la frequenza con cui si spreca il cibo, chi affronta il problema con indifferenza tende ad avere abitudini meno virtuose, con un livello di spreco piuttosto eleva-to. Al contrario, chi vive il tema con maggiore coinvolgimento emotivo, mostra comportamenti più attenti e una frequenza di spreco sensibilmente più bassa.

In generale, i partecipanti tendono a gettare via alimenti che giudicano non più buoni, anche se spesso questi potrebbero essere ancora commestibili o facilmente riutilizzabili in altri pasti. Questo comportamen-to, tuttavia, sembra ridursi con l'avanzare dell'età, le persone più adulte mostrano una maggiore attenzione e una minore propensione allo spreco rispetto ai più giovani. Analizzando le differenze di genere, emerge che gli uomini tendono a sprecare più frequentemente rispetto alle donne, suggerendo una possibile mag-giore sensibilità femminile verso la gestione degli alimenti. Anche la situazione lavorativa sembra incidere su questi comportamenti, gli studenti risultano essere tra la categoria più incline allo spreco.

Più della metà dei partecipanti tende a minimizzare la gravità del problema o, comunque, non lo considera una priorità nella propria quotidianità. Solo una minoranza – il 17,2% – esprime una preoccupazione nei confronti dello spreco alimentare, segnalando un coinvolgimento emotivo più marcato. Questo dato sugge-risce che ci sia ancora molto lavoro da fare in termini di sensibilizzazione e cambiamento culturale e quin-di la necessità di rafforzare le campagne educative e di sensibilizzazione per motivare comportamenti più responsabili nella vita quotidiana.

Lo spreco alimentare domestico è spesso il risultato di abitudini quotidiane che, con un po' di attenzione, potrebbero essere facilmente corrette. Tra le cause più frequenti indicate dai partecipanti emergono la con-vinzione che un alimento sia "andato a male" anche quando potrebbe ancora essere consumato, la scarsa pianificazione dei pasti e la difficoltà nel dosare correttamente le porzioni. Tutto ciò evidenzia l'importanza di promuovere una maggiore educazione alimentare, mirata a fornire strumenti pratici per aiutare nella riduzione degli sprechi nella vita di tutti i giorni.

La maggior parte delle persone concorda sul fatto che esistano effettivamente ostacoli o barriere che ren-dono difficile ridurre lo spreco alimentare nella vita quotidiana. Tra i principali fattori individuati dagli in-tervistati emergono la carenza di informazioni utili su come gestire al meglio gli alimenti, la mancanza di motivazione o di attenzione durante la preparazione e conservazione del cibo, e l'influenza di abitudini consolidate che risultano difficili da cambiare.

Tra le strategie considerate più efficaci per ridurre lo spreco alimentare in ambito domestico spiccano una maggiore educazione sul tema e il riutilizzo creativo degli avanzi in nuove ricette. In molti riconoscono l'importanza di ricevere informazioni più chiare e accessibili su come evitare gli sprechi.

Esiste un diffuso scetticismo tra i consumatori rispetto all'impegno di governi, aziende e ristoranti nella lotta contro lo spreco alimentare. Questi attori non vengono percepiti come sufficientemente attivi nella riduzione del problema, indicando un problema di fiducia che potrebbe ostacolare l'efficacia delle politi-che e delle iniziative in questo contesto. Al contrario, la tecnologia è percepita come un alleato strategico nella lotta contro lo spreco alimentare. I consumatori nutrono una certa fiducia nell'innovazione, ritenendo che possa fornire soluzioni pratiche e concrete.

In conclusione, vi è una certa consapevolezza da parte dei consumatori riguardo al problema dello spreco alimentare, ma emerge come molti sottostimano la quantità effettiva di cibo che viene sprecata, conside-rando erroneamente gli alimenti scaduti come cibo da buttare. Questo fenomeno è in gran parte dovuto a una carenza di informazione e educazione sul tema così come alla

presenza di linee guida pratiche a sup-porto, che rende difficile un cambiamento reale nei comportamenti di acquisto e consumo, ostacolando co-sì gli sforzi per ridurre lo spreco a livello domestico.

Come tutti gli studi, anche questa ricerca presenta alcune limitazioni che possono essere superate attraver-so future analisi. In particolare, l'indagine ha coinvolto un solo Paese (Italia) e ricerche future potrebbero estendere l'analisi ad altre aree geografiche e contesti. Inoltre, il campione potrebbe essere ulteriormente ampliato e analisi successive potrebbero considerare anche le prospettive di altri attori del sistema, come le imprese, per comprendere cosa avviene nelle altre fasi della filiera. Infine, lo studio potrebbe essere repli-cato per indagare il fenomeno dello spreco alimentare anche in altri ambiti come quello alberghiero e della ristorazione.

Soluzioni circolari e sostenibili nel vitivinicolo: un caso studio

Bianca Maria Tragnone[1], Ioannis Arzoumanidis[2], Luigia Petti[3], Luca Chiusano[4], Andrea Raggi[5]

1. Introduzione

Sebbene sempre più iniziative mirino a favorire la transizione verso un'economia circolare, la circolarità di una soluzione non ne determina necessariamente la maggiore sostenibilità, che andrebbe invece valutata caso per caso (Schaubroeck, 2020; Deutz et al., 2025).

Il Progetto PRIN2022 "Towards circular and sustainable agrifood systems: metrics for assessment (CIRCULAGRIS)" (finanziato dall'Unione Europea - Next Generation EU, Missione 4, Componente 2, CUP D53D23011220006) mira ad approfondire la dibattuta relazione tra circolarità e sostenibilità, attraverso la misurazione del grado di circolarità e la valutazione della sostenibilità di soluzioni circolari adottate nel settore agroalimentare con riferimento a filiere strategiche per l'economia italiana, tra cui quella vitivinicola (Raggi et al., 2024).

L'Italia, infatti, secondo le stime riferite al 2024, è il Paese dell'Unione Europea con il più alto valore aggiunto agricolo (ISTAT, 2025) e tra i maggiori produttori di vino a livello mondiale (OIV, 2024). Il settore agricolo determina impatti significativi a livello economico, ambientale e sociale (Rodino et al., 2023; Santagata et al., 2021; Turi et al., 2014) e quello vitivinicolo ne è uno dei più critici comparti, generando considerevoli quantità di residui, con connessi elevati impatti ma anche con un grande potenziale in termini di circolarità (Coelho et al., 2020).

Nell'ambito del progetto, con riferimento specifico a soluzioni circolari adottate nelle filiere vitivinicole, la misurazione della circolarità sarà effettuata tramite indicatori scelti, tenendo conto dello specifico settore di applicazione e della tipologia di soluzione, all'interno del set di indicatori per la misurazione della circolarità nel settore agroalimentare oggetto di precedente ricerca e selezione volta a individuare quelli più idonei a tal fine (Raggi et al., N.D.).

La valutazione della sostenibilità sarà invece condotta attraverso l'applicazione delle metodologie con approccio al ciclo di vita, quali la Life Cycle Assessment (LCA), la Social Life Cycle Assessment (S-LCA) e il Life Cycle Costing (LCC), riconosciute in letteratura come particolarmente idonee a tal fine (Roos Lindgreen et al., 2021; Walker et al., 2021).

Più in particolare, lo studio LCA, già oggetto di implementazione nel settore agroalimentare per aumentare la sostenibilità delle filiere (Notarnicola et al., 2016), consentirà di valutare i potenziali impatti ambientali del prodotto analizzato (ISO, 2006a; ISO, 2006b).

La LCA consiste, infatti, nella compilazione e valutazione degli input, degli output e dei potenziali impatti ambientali di un sistema di prodotto lungo il suo ciclo di vita (ISO 2006a). Il framework metodologico si articola in quattro fasi tra loro interconnesse, parte di un processo iterativo: definizione degli obiettivi e del campo di applicazione; analisi dell'inventario del ciclo di vita; valutazione dell'impatto del ciclo di vita; interpretazione del ciclo di vita (ISO, 2006a; ISO, 2006b).

[5] Professore ordinario, ECON-10/A, Università degli Studi "G. d'Annunzio"; andrea.raggi@unich.it

La S-LCA permetterà invece di valutare, in un'ottica di ciclo di vita, gli aspetti sociali e socioeconomici del prodotto analizzato che incidono, positivamente e negativamente, sugli stakeholder coinvolti. La S-LCA è, infatti, una "una metodologia per valutare gli impatti sociali dei prodotti e dei servizi durante il loro ciclo di vita" (UNEP, 2020b, p. 20), anch'essa già oggetto di applicazione ai prodotti agroalimentari (Petti et al., 2018; Tragnone et al., 2022), il cui framework metodologico, originariamente definito dalle Guidelines for Social Life Cycle Assessment of products and organizations 2020 (UNEP, 2020) e oggi dettato dallo standard ISO 14075:2024 (ISO, 2024a), si basa su quello proposto per la LCA ed è quindi strutturato nelle stesse quattro fasi, sebbene con alcuni adattamenti.

La metodologia LCC, infine, consentirà di valutare i costi del prodotto analizzato durante il suo intero ciclo di vita (Hunkeler et al. 2008) sulla base, in assenza di standard di riferimento, di un codice di condotta (Swarr et al., 2011).

Tramite l'applicazione delle richiamate metodologie life cycle-based, nell'ambito del progetto CIRCULAGRIS saranno oggetto di valutazione, come caso di studio, le soluzioni circolari implementate da un'azienda vitivinicola in Emilia-Romagna per la coltivazione biosimbiotica e per il packaging del vino così prodotto.

Più in particolare, la coltivazione biosimbiotica adottata mira a nutrire il terreno e le piante senza ricorrere a sostanze chimiche, riducendo l'impatto ambientale e migliorando la salubrità, la fertilità e la pulizia del suolo, favorendo la coltivazione di piante più resistenti agli stress ambientali e alla siccità, aumentandone la capacità di assorbire l'acqua e le altre sostanze nutritive presenti nel suolo (ARGEA, 2024). La viticoltura biosimbiotica, infatti, si basa sull'inoculazione di microrganismi fungini, le micorrize, che instaurano un'associazione positiva con le radici della pianta, nutrendo il suolo e creando un ambiente favorevole ai microrganismi utili alla crescita delle piante e, al contrario, sfavorevole agli agenti patogeni e ai parassiti (ARGEA, 2024).

D'altra parte, il packaging, progettato in un'ottica di ecodesign, privilegia materiali parzialmente derivati da scarti delle filiere agroalimentari, con un alleggerimento complessivo degli imballaggi e l'abbandono di materie prime di origine fossile. Specificamente, la soluzione che sarà oggetto di studio prevede la sostituzione delle componenti precedentemente impiegate con le seguenti: una bottiglia in vetro bordolese standard più leggera; una capsula in gommalacca totalmente naturale a base di cera d'api; un tappo tecnico microgranulato realizzato interamente con materiali naturali senza l'uso di fonti fossili, caratterizzato dall'utilizzo di un legante per unire la microgranina ottenuto da residui della filiera di lavorazione dei cereali; un'etichetta composta per il 15% da cellulosa estratta da residui della lavorazione dell'uva della zona del Prosecco, per il 40% da carta riciclata e per il restante 45% da carta certificata Forest Stewardship Council (FSC) (ARGEA, 2025).

Le soluzioni descritte sono in linea con la più ampia nozione di economia circolare proposta dallo standard ISO 59020:2024 (ISO, 2024b) e confermata dal recente aggiornamento della specifica tecnica UNI/TS 11820:2024 (UNI, 2024).

La sostenibilità del vino biosimbiotico sarà valutata considerandone l'intero ciclo di vita (studio stand-alone) e, quindi, comparando gli scenari pre- e post-implementazione del nuovo packaging (studio comparativo). Tale analisi consentirà di comprendere i potenziali impatti sociali (S-LCA), ambientali (LCA) ed economici (LCC) di entrambi gli scenari.

Al fine di garantirne la coerenza, gli studi saranno condotti utilizzando la stessa unità funzionale (una bottiglia di vino biosimbiotico da 0,75 L) e adottando gli stessi confini del sistema, dalla fase agricola all'imbottigliamento (from cradle to gate), con un focus sulla sola fase di imbottigliamento per gli studi comparativi.

Per quanto riguarda la valutazione della performance ambientale, lo studio LCA di tipo stand-alone avrà l'obiettivo di identificare i punti critici e le categorie di impatto più influenzate nel ciclo di vita di una bottiglia di vino biosimbiotico. I confini del sistema includeranno la fase agricola, la vinificazione, l'affinamento e l'imbottigliamento, considerando, per la prima fase, anche i prodotti impiegati esclusivamente nella viticoltura biosimbiotica. Invece, nella LCA

comparativa i confini del sistema includeranno la sola fase di imbottigliamento per le due opzioni pre- e post-ecodesign, con un focus sulle scelte dei materiali, confrontando quelli tradizionali e quelli circolari.

Lo studio sarà basato su dati site-specific forniti dall'azienda produttrice del vino biosimbiotico. La raccolta dati, attualmente in corso, si avvale di schede elaborate dal gruppo di ricerca all'esito di ripetuti colloqui con i referenti aziendali e di visite in sede, al fine di tenere conto delle varie fasi del ciclo di vita e delle specifiche caratteristiche di ciascuna di esse. Alcuni dei dati già forniti hanno richiesto ulteriore elaborazione sulla base di documenti integrativi e di schede tecniche dei prodotti e dei macchinari impiegati nei processi produttivi analizzati.

Sulla base dei dati acquisiti, una prima applicazione della metodologia LCA (Arzoumanidis et al., 2025) è stata effettuata con l'obiettivo di valutare la performance ambientale della soluzione di packaging pre- e post-ecodesign con riferimento ai soli materiali dello stesso, escludendo i flussi energetici ed idrici. Per tale studio sono stati utilizzati il software SimaPro (Pré, 2025), la banca dati Ecoinvent (Ecoinvent Association, 2025) e, per quanto riguarda il metodo di valutazione degli impatti (Life Cycle Impact Assessment), il ReCiPe Midpoint (H) (Huijbregts et al., 2017).

I risultati preliminari della valutazione, a livello di caratterizzazione, mostrano come l'imballaggio post-ecodesign risulti più performante per tutte le categorie di impatto analizzate, tranne una (eutrofizzazione marina), che comunque presenta una performance molto simile tra le due soluzioni. Invece, per quanto riguarda i risultati a livello di normalizzazione, la categoria di impatto maggiormente influenzata risulta essere il consumo idrico (water consumption), seguita da tossicità cancerogena per l'uomo (human carcinogenic toxicity) e da ecotossicità terrestre (terrestrial ecotoxicity). Analizzando nel dettaglio i risultati per le tre categorie di impatto citate, si evince come il maggior contributo agli impatti potenziali, per tutte le categorie e per entrambe le opzioni (pre e post-ecodesign), derivi dalla produzione del vetro utilizzato per la bottiglia. L'opzione post-ecodesign mostra impatti ambientali inferiori rispetto a quelli pre-ecodesign, e quindi un miglioramento della performance ambientale, grazie alla sostituzione della bottiglia di vetro con una versione di peso ridotto, pur mantenendo invariato il volume.

Infatti, per il consumo idrico, la versione pre-ecodesign presenta per il vetro un valore pari a 0,8867 m^3, mentre per quella post-ecodesign il valore scende a 0,4926 m^3 (con una riduzione del 44%). Un miglioramento analogo si osserva per la tossicità cancerogena per l'uomo, che diminuisce del 44% (da 0,00418 a 0,00232 kg 1,4-DCB), e per l'ecotossicità terrestre, anch'essa ridotta del 44% (da 0,8763 a 0,4869 kg 1,4-DCB). Tuttavia, il trasporto del vetro rimane una fase impattante, soprattutto nell'opzione post-ecodesign. Infine, l'utilizzo del cartone per l'imballaggio incide in misura minore in entrambe le opzioni, pur registrando una riduzione nella versione post-ecodesign.

Con riferimento invece allo studio S-LCA, in ragione dell'obiettivo di valutare la sostenibilità sociale della soluzione circolare di packaging rispetto a quella utilizzata prima della sua implementazione, essendo tutti i correlati processi imputabili ad aziende diverse da quella produttrice del vino biosimbiotico oggetto dello studio e parte della sua supply chain, la valutazione degli aspetti sociali sarà condotta focalizzando l'attenzione sui processi di background con l'ausilio del Product Social Impact Life Cycle Assessment (PSILCA) database (Hamed et al., 2025) in openLCA (openLCA, 2025).

Il sistema di prodotto sarà quindi modellizzato ad hoc su software utilizzando dati site-specific forniti dall'azienda produttrice del vino biosimbiotico per costruire il foreground. A tal fine, la connessione tra i processi di foreground e di background sarà effettuata considerando la quantità di ogni singolo input nei processi di foreground come input monetario dei corrispondenti processi generici in PSILCA.

Più in particolare, l'inventario sarà costruito su quello dello studio LCA e integrato con dati generici (a livello di settore e Paese) per i singoli indicatori sociali presenti nel database, che saranno raccolti appositamente considerando l'anno di riferimento di ciascuno dei processi

modellizzati, con i costi e la provenienza geografica di ciascun input e con le ore di lavoro effettuate per ciascun processo.

Tale impostazione dello studio consentirà di calcolare i rischi sociali associati alla produzione biosimbiotica e alla soluzione circolare adottata nel packaging, anche in comparazione con quelli della soluzione pre-ecodesign, anch'essa oggetto di modellizzazione e successiva valutazione tramite database.

Infine, sarà condotto uno studio LCC volto a valutare i costi associati al ciclo di vita del vino biosimbiotico. A tal fine la raccolta dati sarà integrata con gli ulteriori costi necessari.

L'applicazione delle metodologie richiamate consentirà di valutare l'effettiva sostenibilità della soluzione circolare analizzata e, quindi, di comprendere se e in che termini la sua implementazione si traduca in un miglioramento delle performance ambientali, sociali ed economiche, nonché di identificare i trade-off tra le dimensioni della sostenibilità.

Sebbene, infatti, le scelte oggetto di studio siano adottate in un'ottica di maggiore sostenibilità, non ci si attende un risultato che esprima necessariamente un miglioramento in tutte le sue dimensioni e, all'interno di ciascuna di esse, per tutte le categorie di impatto analizzate.

D'altra parte, l'utilizzo di indicatori di circolarità appositamente selezionati consentirà di misurare il grado di circolarità della soluzione analizzata, tenendo conto degli aspetti relativi alle risorse materiche ed energetiche.

L'intelligenza artificiale come infrastruttura cognitiva per l'economia circolare: capacità dinamiche e riconfigurazione dei modelli di business

Mauro Sciarelli[1], Lorenzo Turriziani[2], Anna Prisco[3], Martina Percuoco[4], Giovanni Catello Landi[5]

1. Introduzione

La transizione dal modello tradizionale lineare "prendere, produrre e smaltire" a configurazioni economiche improntate alla circolarità rappresenta oggi una delle traiettorie più rilevanti – e al tempo stesso più sfidanti – dei percorsi di sostenibilità delle imprese. La letteratura sull'economia circolare (EC) ha messo in luce come tale paradigma miri a disaccoppiare la crescita economica dal consumo di risorse e dagli impatti ambientali, promuovendo la chiusura dei cicli materiali, l'estensione della vita utile dei prodotti, il riuso e il recupero di valore lungo le filiere.

In questo quadro, i modelli di business circolari (circular business models, CBM) sono concepiti come architetture di creazione e cattura del valore che incorporano principi di progettazione per il riuso e la rigenerazione, logiche di servizio in sostituzione della mera vendita di prodotto e nuove forme di relazione con clienti e altri attori dell'ecosistema orientate alla riduzione strutturale di rifiuti e sprechi (Bocken et al.,2016; Geissdoerfer et al.,2017; Lüdeke-Freund et al.,2019).

L'implementazione dell'economia circolare risulta ancora discontinua e spesso confinata a progetti pilota o iniziative sperimentali, in particolare nelle imprese incumbent inserite in filiere lunghe e complesse. Diventa pertanto fondamentale esplorare come i modelli di business circolare possano essere effettivamente progettati, implementati e resi sostenibili nel tempo per superare i meccanismi di "path dependency", ovvero la "dipendenza" delle traiettorie di sviluppo dalle scelte, dalle pratiche e dalle routine sedimentate nel tempo, che sovente generano vincoli o meccanismi di lock-in rispetto a possibili percorsi di cambiamento sistemico.

Nel contesto dell'EC, la path dependency non si esaurisce in vincoli tecnologici o infrastrutturali, ma rimanda a un intreccio di routine operative, standard produttivi, sistemi di misurazione, competenze "situate" e riferimenti istituzionali sedimentatisi nel tempo attorno al paradigma lineare. In molti settori, le infrastrutture fisiche sono progettate per flussi unidirezionali di materiali, le catene di fornitura privilegiano volumi elevati e la riduzione dei costi unitari, mentre i sistemi di controllo di gestione restano ancorati a indicatori economico-finanziari di breve periodo. Ne deriva un insieme di meccanismi "autorinforzanti" che restringono lo spazio

[1] Professore ordinario, ECON-07/A, Università degli Studi di Napoli Federico II; mauro.sciarelli@unina.it

[2] Ricercatore, ECON-07/A, Università degli Studi di Napoli Federico II; lorenzo.turriziani@unina.it – corresponding author

percepito per la sperimentazione circolare e agiscono a più livelli, intrecciando vincoli organizzativi, dinamiche di filiera e assetti istituzionali. Le path dependencies assumono, in questo senso, una duplice natura materiale e cognitivo-istituzionale: radicate nei processi produttivi, nelle routine organizzative e negli schemi cognitivi dei manager, limitano la capacità di introdurre innovazioni radicali e di generare cambiamenti strategici (Vergne e Durand,2011).

In risposta a tali vincoli, la prospettiva delle dynamic capabilities ha assunto un ruolo di primo piano per spiegare come le imprese possano riorientare le proprie traiettorie di sviluppo in contesti ad alta complessità e incertezza. Queste ultime, tipicamente articolate nelle dimensioni di sensing, seizing e reconfiguring, rinviano alla capacità di individuare e interpretare segnali di cambiamento, tradurli in scelte strategiche e in nuovi modelli di business, e riconfigurare intenzionalmente risorse, strutture e relazioni per sostenere nel tempo logiche differenti di creazione di valore (Teece et al.,1997; Teece,2007). Applicate ai percorsi di EC, tali capacità consentono di leggere la transizione circolare non come una mera adozione di pratiche "verdi", bensì come un processo dinamico di costruzione e ricombinazione di asset materiali e immateriali, di ridefinizione delle value proposition e di rinegoziazione dei ruoli lungo la filiera (Reim et al.,2021; Santa-Maria et al.,2022).

Parallelamente, la crescente attenzione per l'artificial intelligence (AI) ha aperto un filone di ricerca che interpreta l'EC alla luce delle trasformazioni digitali. Numerosi contributi hanno evidenziato come l'AI, integrata in più ampie architetture di digitalizzazione (Internet of Things, big data analytics, piattaforme cloud), possa supportare la progettazione e la gestione di sistemi circolari, migliorando la tracciabilità dei flussi di materiali, ottimizzando l'uso delle risorse, abilitando strategie di manutenzione predittiva e di product-as-a-service, nonché favorendo l'emersione di marketplace per il riuso e la valorizzazione di scarti e sottoprodotti (Rosa et al.,2020; Kristoffersen,2021). In particolare, il contributo di Tutore et al. (2024) mostra come l'AI sia già impiegata a supporto di molte azioni riconducibili al framework ReSOLVE e propone un modello articolato in quattro fasi – ottimizzazione del sistema, ridisegno del sistema, ridisegno del modello di business e innovazione di ecosistema – suggerendo che il potenziale dell'AI non si esaurisce nelle applicazioni operative, ma può estendersi fino alla ridefinizione strategica dei modelli di business e delle relazioni di ecosistema. In una prospettiva complementare, Sjödin et al. (2023) concettualizzano le capacità percettive, predittive e prescrittive dell'AI come leve abilitanti per nuove forme di circular business model innovation in contesti di digital servitization, collegandole a specifiche configurazioni di dynamic capabilities.

Questi contributi suggeriscono che l'AI possa operare come "infrastruttura cognitiva" e organizzativa, capace di potenziare i processi di sensing, seizing e reconfiguring orientati alla circolarità. Nonostante tali potenzialità, la letteratura sull'intersezione tra AI ed EC presenta ancora significative lacune. Da un lato, la maggior parte degli studi adotta un approccio prevalentemente tecnologico e ingegneristico, concentrandosi su applicazioni algoritmiche in ambiti quali il riciclo, la selezione dei rifiuti o l'ottimizzazione dei processi produttivi (Wu et al.,2024; Kroell et al.,2024). Dall'altro lato, risultano meno approfonditi i contributi che indagano come l'AI venga effettivamente integrata nei processi gestionali e strategici e in che modo essa possa favorire la riconfigurazione dei modelli organizzativi e delle logiche di creazione del valore (Ronaghi,2023; Jabbour et al.,2019). Rimangono poco esplorati i processi attraverso cui l'AI viene incorporata nelle routine e nei processi decisionali che sostengono l'innovazione dei modelli di business circolari, nonché il ruolo delle competenze contestuali di coordinamento e di "traduzione" tra attori e linguaggi differenti nel rendere possibile un uso effettivamente trasformativo delle tecnologie di AI. I contributi che combinano dynamic capabilities, AI ed EC richiamano esplicitamente l'esigenza di studi empirici in grado di chiarire come le imprese costruiscano e mettano in atto capacità di sensing, seizing e reconfiguring orientate alla circolarità a partire dall'impiego dell'AI.

Partendo da tali premesse, il presente lavoro, che si configura esplicitamente come "ricerca in corso", vuole analizzare in profondità come l'AI venga mobilitata nel contesto di un'impresa

incumbent impegnata nell'innovazione dei propri modelli di business in senso circolare, al fine di comprendere in che modo essa contribuisca: (a) allo sviluppo di capacità dinamiche orientate alla circolarità; (b) all'allentamento dei vincoli di path dependency; (c) alla configurazione di competenze contestuali di coordinamento e traduzione tra attori, linguaggi e logiche d'azione eterogenee in una prospettiva ecosistemica. In termini più specifici, la ricerca è guidata dalle seguenti domande:

- RQ1: In che modo le applicazioni di intelligenza artificiale contribuiscono a sviluppare e articolare le dynamic capabilities di sensing, seizing e reconfiguring nelle imprese impegnate nell'innovazione dei modelli di business circolari?
- RQ2: Come l'uso dell'intelligenza artificiale interagisce con i vincoli di path dependency, sia sul piano materiale sia su quello cognitivo-istituzionale, e quali competenze contestuali di coordinamento e traduzione emergono per renderne possibile un impiego trasformativo?
- RQ3: In che misura e attraverso quali meccanismi le configurazioni organizzative e relazionali abilitate dall'intelligenza artificiale contribuiscono a ridefinire il posizionamento delle imprese all'interno degli ecosistemi di riferimento, sostenendo percorsi di trasformazione circolare?

Per rispondere a tali interrogativi, il lavoro adotta un approccio qualitativo di impostazione interpretativista, basato su un singolo caso di studio approfondito mediante la tecnica narrativa. L'impresa analizzata è un gruppo multinazionale con un posizionamento consolidato nelle tecnologie per il recupero delle risorse e la gestione circolare dei materiali, che impiega in modo estensivo soluzioni di intelligenza artificiale per ottimizzare i flussi di materiali, migliorare la tracciabilità dei rifiuti e supportare strategie di manutenzione predittiva, facilitando la transizione verso modelli di business circolari. Grazie a tali tecnologie, l'azienda è in grado di adattarsi rapidamente ai cambiamenti del contesto e di riorganizzare le proprie risorse per promuovere soluzioni sostenibili, configurandosi come un caso particolarmente adatto per esplorare l'intersezione tra AI, capacità dinamiche e circolarità.

Sul piano teorico, il lavoro intende integrare in un unico quadro interpretativo la letteratura sui modelli di business circolari, quella sulle dynamic capabilities e i recenti sviluppi sugli impieghi dell'intelligenza artificiale nei contesti di sostenibilità, mostrando come l'AI possa operare come infrastruttura cognitiva e relazionale attraverso cui le imprese rinegoziano i propri percorsi di sviluppo e i propri ruoli all'interno degli ecosistemi. Sul piano manageriale e di policy, la ricerca mira a offrire, una volta completata l'analisi empirica, indicazioni per la progettazione e il governo di percorsi di adozione dell'AI coerenti con gli obiettivi di circolarità, valorizzando in particolare le competenze di coordinamento e traduzione necessarie a superare la dipendenza dal percorso e ad attivare forme di innovazione circolare a livello organizzativo, inter-organizzativo e territoriale.

2. Theoretical framework

Il quadro teorico di riferimento mira a combinare tre prospettive interagenti – modelli di business circolari, dynamic capabilities e il ruolo dell'AI nelle configurazioni ecosistemiche – per la costruzione di una lente unitaria e "multilivello" sui processi di trasformazione e di implementazione dei modelli di business in chiave circolare.

Gli studi sull'EC hanno chiarito come il passaggio da logiche lineari a configurazioni circolari implichi una ridefinizione delle modalità di creazione e diffusione del valore. In tale prospettiva, i CBM vengono concettualizzati come configurazioni che consentono di "chiudere" e "rallentare" i flussi di risorse attraverso strategie di estensione della vita utile dei prodotti, riuso, remanufacturing, riciclo e rigenerazione dei materiali, nonché forme di offerta basate su servizi e performance anziché sulla mera vendita dell'output fisico (Bocken et al., 2016; Geissdoerfer et

al., 2017; Lüdeke-Freund et al., 2019). Su questa base, alcuni contributi hanno proposto tassonomie che ordinano la varietà dei CBM, mostrando come la circolarità si declini su più dimensioni – proposta di valore, struttura di filiera, relazioni con i clienti, meccanismi di pricing – configurate in modo interdipendente (Pieroni et al., 2019; Geissdoerfer et al., 2020).

Per comprendere come le imprese possano rinegoziare tali traiettorie, la prospettiva delle dynamic capabilities rappresenta un ambito fertile per il riconoscimento dei percorsi di sviluppo. Queste ultime consentono di leggere la trasformazione dei CBM come una sequenza di processi in cui l'impresa individua e interpreta segnali di cambiamento riconducibili all'EC (pressioni regolatorie, aspettative degli stakeholder, opportunità tecnologiche), seleziona e mette in atto nuove value proposition, e infine riconfigura risorse, strutture e relazioni per sostenere nel tempo le nuove logiche di creazione di valore (Reim et al., 2019; Sandberg e Hultberg, 2021; Santa-Maria et al., 2022). In tale prospettiva, le dynamic capabilities rappresentano il meccanismo attraverso cui le imprese possono, almeno in parte, "disancorarsi" dai vincoli di path dependency e riorganizzare il proprio CBM in senso circolare.

L'AI si inserisce in questo quadro come potenziale infrastruttura abilitante – e talora vincolante – di tali capacità dinamiche. Alcuni studi recenti, già richiamati precedentemente, evidenziano come le soluzioni AI-based, agiscano su diversi livelli, rendendo possibile una lettura più efficace dei flussi di risorse e delle interdipendenze lungo la filiera, supportando forme di sperimentazione e apprendimento continuo sui modelli di offerta e, al tempo stesso, incidendo sulle modalità con cui le imprese interagiscono con clienti, fornitori e altri attori dell'ecosistema (Rosa et al., 2020; Jabbour et al., 2019; Tutore et al., 2024). In questa prospettiva, l'AI diviene uno dei principali dispositivi attraverso cui le imprese configurano e mobilitano AI-enabled dynamic capabilities, poiché orienta ciò che può essere "visto", "simulato" e "valutato" nei percorsi di trasformazione circolare (Sjödin et al., 2023; Neri et al., 2023). Ne deriva un'interpretazione dell'AI non come fattore esterno ai processi di sensing, seizing e reconfiguring, bensì come loro componente costitutiva, legata ai sistemi informativi, agli algoritmi e alle infrastrutture digitali sviluppate e rese operative (Neri et al., 2023; Warner e Wäger, 2019).

Allo stesso tempo, l'integrazione dell'AI nei processi decisionali introduce nuove dipendenze da specifiche infrastrutture di dati, da standard tecnici e da sistemi algoritmici, che possono a loro volta generare forme inedite di path dependency digitale e di lock-in. In tal senso, l'AI si configura come leva potenzialmente abilitante, ma anche come elemento che ridefinisce i vincoli e le traiettorie di sviluppo dei CBM in chiave ecosistemica.

Non in ultimo, gli studi sulle competenze contestuali, sul coordinamento interfunzionale e sugli ecosistemi di innovazione consentono di ricondurre queste dinamiche a pratiche situate e a specifiche configurazioni relazionali (Nan e Huang, 2025; Sjodin et al. 2024). In tale prospettiva, la letteratura sulla gestione della conoscenza, sui confini inter-funzionali e sui boundary objects (Williams, 2002) evidenzia come l'innovazione sistemica richieda figure e pratiche in grado di mettere in relazione linguaggi e logiche d'azione differenti – tra funzioni tecniche, controllo di gestione, sostenibilità, marketing, attori pubblici e comunità locali – e come tali processi di traduzione siano decisivi per trasformare dati e algoritmi in decisioni organizzative e cambiamenti di modello di business (Feldman, 1989; Nonaka e Takeuchi, 1995; Carlile, 2002). Parallelamente, i contributi sugli ecosistemi di innovazione e sulle transizioni socio-tecniche sottolineano che la creazione di valore in chiave circolare tende sovente a svilupparsi in reti di attori interdipendenti, in cui imprese, fornitori, clienti, piattaforme digitali e istituzioni co-producono soluzioni (Adner, 2017; Jacobides et al., 2018; Kanda et al., 2021). Ne discende che le dynamic capabilities abilitate dall'AI si dispiegano in competenze di coordinamento e "traduzione di linguaggi" operanti nell'intersezione tra funzioni e organizzazioni, e che l'evoluzione dei CBM circolari vada letta in chiave ecosistemica più che meramente intraorganizzativa.

È possibile, dunque, interpretare il legame tra CBM, dynamic capabilities e intelligenza artificiale come un processo coevolutivo e multilivello, in cui i tre ambiti non rappresentano compartimenti stagni, ma si collocano su piani diversi e si influenzano reciprocamente. In primo

luogo, il CBM rappresenta "l'architettura operativa" esistente, definendo il modo in cui l'impresa crea e distribuisce valore, gli attori coinvolti, i flussi di risorse fisiche e di informazioni attivate. Tale modello, sovente segnato da meccanismi di path dependency, configura quel pattern di premesse decisionali che retroagiscono sul campo organizzativo condizionando i processi organizzativi, l'infrastruttura digitale e informativa disponibile e, di conseguenza, le applicazioni di AI inizialmente concepibili e considerate accettabili. Su tale sfondo, le dynamic capabilities agiscono come meccanismo processuale di trasformazione. In quest'ottica, le capacità di sensing, seizing e reconfiguring fungono da "cerniera" tra la configurazione iniziale dei CMB e le traiettorie di cambiamento, mentre i sistemi di AI intervengono come "infrastruttura cognitiva" e meccanismo abilitante in grado di potenziare e riconfigurare tali capacità. Ad esempio, l'AI può estendere l'ambito del sensing (attraverso analisi predittive sui flussi di materiali, sugli usi dei prodotti, sulle prestazioni degli impianti), rendere possibili modalità di seizing più sperimentali e data-driven (come nuove value proposition "circolari") e sostenere processi strutturati di reconfiguring organizzativo o a livello di filiera (mediante ridisegno dei contratti, dei meccanismi di pricing o finanche riconfigurazione dei confini organizzativi con processi di integrazione a monte o a valle). In tale logica, l'AI non è solo uno strumento a supporto delle dynamic capabilities, ma ne diviene parte costutiva e "abilitante": ciò che l'impresa è in grado di percepire come opportunità o minaccia, le opzioni strategiche che riesce a valutare e implementare, il modo in cui può riconfigurare risorse e relazioni dipendono dalle capacità percettive, predittive e prescrittive incorporate nei sistemi AI.

L'esito di tale processo, benché contingente e "idiosincratico", è una trasformazione progressiva del CBM, in cui le informazioni generate dai sistemi di AI, filtrate e tradotte in risorse organizzative attraverso l'azione delle dynamic capabilities e delle competenze di coordinamento e "traduzione", si cristallizzano in nuove architetture di valore circolari. Il nuovo CBM, a sua volta, genera ulteriori dati e cicli di retroazione, ridefinisce le interfacce tecniche e organizzative e apre spazi per applicazioni successive di AI, attivando un circuito di feedback in cui la configurazione di business, le capacità dinamiche e l'infrastruttura digitale coevolvono e si alimentano a vicenda.

In sintesi, il framework integrato, così presentato, identifica i CBM come il livello strutturale di fondo dell'offerta e delle relazioni di valore, in cui le dynamic capabilities costituiscono il meccanismo abilitante che potenzialmente consente di riorientare tali strutture e di sperimentare percorsi di sviluppo. In tale quadro, i sistemi di AI agiscono come infrastruttura cognitiva e organizzativa che alimenta e riconfigura le dynamic capabilities, permettendo all'impresa di superare, almeno in parte, i vincoli di path dependency, intraprendendo traiettorie di innovazione circolare a livello sia organizzativo sia ecosistemico.

3. Metodologia

L'impostazione metodologica si colloca in un'ottica qualitativa e interpretativista, volta a comprendere in profondità i processi attraverso i quali l'AI viene mobilitata nei percorsi di innovazione dei CBM. Coerentemente con questo obiettivo, la ricerca adotta un disegno di studio di caso, in linea con le indicazioni di Eisenhardt (1989) e Yin (2014) sulla costruzione di teorie a partire dai casi, nonché con l'approccio applicato ai fenomeni complessi in contesti reali. La scelta di un caso singolo in profondità risponde al criterio di "methodological fit" proposto da Edmondson e McManus (2007), secondo cui fenomeni emergenti e ancora poco strutturati richiedono disegni esplorativi, flessibili e fortemente ancorati alla specificità del contesto empirico.

L'impresa oggetto di analisi è un gruppo multinazionale con un posizionamento consolidato nelle tecnologie per il recupero delle risorse e per la gestione circolare dei materiali. L'azienda sviluppa e fornisce sistemi di raccolta e selezione automatizzata basati su sensori lungo diverse fasi della catena del valore, posizionandosi esplicitamente come abilitatore tecnologico dell'EC.

Tali caratteristiche rendono il caso particolarmente adatto a indagare come l'intelligenza artificiale e l'analisi avanzata dei dati siano integrate nei modelli di business circolari, non solo a livello di singolo impianto o processo, ma anche nelle relazioni di ecosistema che collegano attori industriali e istituzionali.

La raccolta dei dati si basa su una combinazione di fonti, in un'ottica di triangolazione. La componente principale è costituita da interviste semi-strutturate in profondità rivolte a membri del top management, responsabili di divisione e di linea di business, figure tecniche coinvolte nello sviluppo di soluzioni AI-based e ruoli di interfaccia con clienti, partner e attori pubblici. Le interviste mirano a ricostruire le traiettorie di sviluppo delle soluzioni tecnologiche, le interpretazioni interne del legame tra AI e circolarità, le tensioni tra eredità lineari e nuove logiche circolari e le trasformazioni del modello di business in corso. A questa fonte primaria si affianca l'analisi della documentazione interna ed esterna, con l'obiettivo di integrare prospettive diverse e rafforzare la robustezza interpretativa.

L'analisi dei dati segue una logica abduttiva e iterativa, ispirata alle procedure di costruzione della teoria a partire da studi di caso proposte da Eisenhardt (1989). In una prima fase, le trascrizioni e i documenti vengono sottoposti a una codifica aperta, volta a identificare episodi chiave, pratiche ricorrenti e configurazioni organizzative relative all'uso dell'AI nei processi di sensing, seizing e reconfiguring, nonché riferimenti a vincoli di path dependency e a dinamiche di ecosistema. In una seconda fase, la codifica assume un carattere più teoretico-informativo, articolando le categorie emergenti in dialogo con il quadro concettuale relativo ai modelli di business circolari, alle dynamic capabilities e alle AI-enabled capabilities. L'obiettivo non è la verifica di ipotesi precostituite, ma la progressiva elaborazione di un modello concettuale capace di descrivere come una grande impresa tecnologica utilizzi l'intelligenza artificiale per negoziare la propria transizione verso modelli di business circolari.

4. Risultati attesi

In coerenza con la natura del lavoro in corso e con il disegno qualitativo adottato, i risultati attesi non vanno intesi come una verifica di ipotesi precostituite, bensì come esito di un processo di elaborazione teorica guidato dall'analisi del caso. In primo luogo, ci si attende che lo studio consenta di descrivere in modo articolato le modalità con cui l'AI viene progressivamente incorporata nei processi di sensing, seizing e reconfiguring dell'impresa, in relazione alle diverse linee di attività considerate. La presenza di soluzioni basate su sensori, algoritmi e analisi avanzate dei dati in ambiti eterogenei dovrebbe consentire di identificare diverse configurazioni di AI-enabled capabilities, orientate all'ottimizzazione operativa, alla sperimentazione di nuove value proposition circolari e allo sviluppo di offerte data-driven centrate su servizi e insight. Si prevede che, a partire dal confronto tra tali configurazioni, emerga un quadro processuale in cui l'AI non assume un significato univoco, ma contribuisce in modo differenziato alla trasformazione del modello di business circolare in funzione delle combinazioni di risorse, attori e obiettivi di circolarità in gioco.

Un secondo ambito di risultati attesi riguarda la relazione tra l'uso dell'AI e i vincoli di path dependency. Il caso selezionato, per la combinazione tra una forte eredità industriale e un posizionamento esplicito sull'EC, appare particolarmente adatto a mettere in luce l'ambivalenza dell'AI rispetto ai percorsi storici dell'impresa. L'analisi dovrebbe consentire di individuare situazioni in cui le tecnologie AI-based vengono impiegate principalmente per raffinare e rendere più efficienti assetti esistenti, accanto a contesti in cui esse sostengono processi di problematizzazione delle metriche di performance, di ridefinizione dei confini della filiera e di sperimentazione di nuove forme di relazione con clienti e partner.

Un terzo filone di risultati attesi riguarda l'emersione e la caratterizzazione delle competenze contestuali di coordinamento e di traduzione come "microfondamenti" delle dynamic capabilities orientate alla circolarità. La natura multitecnologica e multiattore del caso lascia prevedere il

ruolo cruciale di figure ibride, team interfunzionali e pratiche di mediazione tra linguaggi differenti — tecnico, economico-finanziario, ambientale, istituzionale — nella trasformazione dei dati e degli output algoritmici in decisioni su investimenti, configurazioni di offerta e modalità di collaborazione con gli stakeholder. L'analisi dovrebbe consentire di comprendere come tali competenze si formino e si consolidino in relazione a specifici contesti progettuali e settoriali, mostrando in che modo esse contribuiscano a integrare l'AI nei processi di sensing, seizing e reconfiguring e a tradurre l'orientamento all'EC in scelte di modello di business.

Infine, un quarto insieme di risultati attesi riguarda la ridefinizione del posizionamento dell'impresa all'interno degli ecosistemi in cui è inserita. La struttura multiattore dei contesti analizzati suggerisce che l'integrazione di soluzioni AI-based possa incidere non solo sui processi interni, ma anche sui ruoli che l'impresa assume a livello di sistema. L'analisi dovrebbe contribuire a chiarire se e in che modo l'impresa evolva da semplice fornitore di tecnologia a nodo informativo centrale e, potenzialmente, a orchestratore di dati e standard di circolarità. In questa prospettiva, i risultati attesi mirano a illuminare il nesso tra le trasformazioni del modello di business circolare, le configurazioni di AI-enabled capabilities e i processi di "salita di ruolo" ecosistemica, evidenziando le implicazioni in termini di responsabilità e di contributo alla governance delle transizioni verso l'EC.

5. Contributo potenziale

Il contributo potenziale del lavoro è duplice. Sul piano teorico, il primo avanzamento atteso riguarda l'elaborazione di una lettura integrata dell'AI come componente interna alle dynamic capabilities orientate alla circolarità. L'analisi del caso dovrebbe mostrare come specifiche configurazioni tecnologiche concorrano a strutturare i processi di sensing, seizing e reconfiguring, incidendo su ciò che viene percepito come rilevante, negoziabile e realizzabile nei modelli di business circolari. In questo senso, il lavoro si inserisce nel dibattito sulle dynamic capabilities e sulle AI-enabled capabilities, contribuendo a chiarirne i "microfondamenti" in un contesto in cui l'EC costituisce il fulcro del posizionamento strategico.

Un secondo contributo teorico atteso riguarda la qualificazione del rapporto tra AI e path dependency, evidenziandone l'ambivalenza, ovvero come strumento di rafforzamento e razionalizzazione di logiche lineari esistenti, ma anche potenziale leva di problematizzazione e di riposizionamento. Rendendo visibili le condizioni organizzative, culturali e istituzionali associate a esiti differenti, il lavoro mira a superare visioni semplicistiche della tecnologia come intrinsecamente "disruptive" o "abilitante" e a mostrare come l'uso trasformativo dell'AI dipenda dal modo in cui essa viene inscritta in assetti di governance, sistemi di misurazione, relazioni con gli stakeholder e narrazioni identitarie. In parallelo, l'attenzione alle competenze contestuali di coordinamento e traduzione contribuisce a mettere in luce il ruolo di figure ibride, di team interfunzionali e di pratiche di mediazione nella traduzione degli output algoritmici in scelte di modello di business e nella ridefinizione del ruolo dell'impresa negli ecosistemi circolari.

Sul piano manageriale, la distinzione tra configurazioni dell'AI orientate alla mera efficienza e configurazioni capaci di abilitare nuove logiche di creazione del valore può supportare scelte più consapevoli in termini di investimenti, strutture organizzative e profili professionali da sviluppare. Infine, per i policy maker, il caso può contribuire a identificare condizioni abilitanti – in termini di infrastrutture di dati, standard e schemi di collaborazione pubblico-privato – favorevoli all'emersione di attori capaci di orchestrare reti circolari supportate dall'AI, con ricadute sulla progettazione di politiche per l'EC maggiormente allineate alle dinamiche organizzative ed ecosistemiche osservate.

Parole chiave: Intelligenza artificiale; economia circolare; dynamic capabilities

Dalla gestione dei residui alla creazione di valore condiviso: simbiosi industriale e transizione circolare nel settore agroalimentare italiano

Flaviana Capolini[1], Maria Francesca Renzi[2], Olimpia Martucci[3], Roberta Guglielmetti Mugion[4], Laura Di Pietro[5] , Veronica Ungaro[6]

1. Introduzione

A livello globale, i sistemi alimentari sono responsabili di circa un terzo delle emissioni totali di gas serra, considerando produzione, trasformazione, distribuzione e consumo (Crippa et al., 2021). L'agricoltura utilizza circa il 70% dell'acqua dolce disponibile a livello mondiale, rappresentando la principale fonte di consumo idrico antropico (FAO, 2018). Oltre un terzo (≈ 33%) della superficie terrestre globale è oggi dedicata alla produzione di alimenti, con significative implicazioni in termini di perdita di biodiversità e deforestazione (IPBES, 2019). Circa il 17% del cibo prodotto a livello mondiale viene perso o sprecato prima di essere consumato, aggravando i costi ambientali dell'intero sistema alimentare (UNEP, 2021). In Italia, il settore agroalimentare contribuisce per circa l'8–9% delle emissioni totali di CO_2 equivalente, considerando produzione primaria, trasformazione e distribuzione. In Italia, la raccolta differenziata dei rifiuti organici ha raggiunto circa 7,5 milioni di tonnellate annue, evidenziando l'esistenza di grandi flussi di materia organica potenzialmente valorizzabili in ottica circolare (ISPRA, 2022). Studi e applicazioni sperimentali condotti da ENEA hanno dimostrato significative opportunità di simbiosi industriale in Italia, tra cui la valorizzazione di scarti agroalimentari in compost, biomassa ed energia rinnovabile (Cutaia et al., 2018). Diversi studi di caso condotti in Italia mostrano come la simbiosi industriale possa svilupparsi anche in contesti agro-alimentari e in cluster produttivi esistenti, evidenziando opportunità concrete di valorizzazione dei flussi organici in chiave circolare (Taddeo et al., 2017; Cutaia et al., 2018; Hamam et al., 2023).

Il settore agroalimentare italiano rappresenta un comparto produttivo strategico per rilevanza economica e occupazionale (Istat, 2024). Allo stesso tempo, lungo le fasi di coltivazione, trasformazione e distribuzione si generano impatti ambientali rilevanti, che contribuiscono alla pressione sui sistemi naturali e sulle emissioni globali associate ai sistemi alimentari (Crippa et al., 2021). La riduzione degli sprechi e la valorizzazione dei residui sono oggi priorità centrali

nelle politiche europee di transizione circolare (European Commission, 2020; Ellen MacArthur Foundation, 2019). Inoltre, la produzione e il trattamento dei residui organici costituiscono una componente rilevante dei flussi materiali nazionali, con margini significativi di valorizzazione in ottica circolare (ISPRA, 2022).

In tale prospettiva, l'economia circolare si configura come paradigma volto a superare la logica lineare produzione–consumo–scarto, promuovendo la rigenerazione dei flussi materiali e la massimizzazione del valore attraverso il riutilizzo, il riciclo e la valorizzazione dei residui (Ellen MacArthur Foundation, 2019; European Commission, 2020). All'interno di questo quadro, la simbiosi industriale rappresenta una delle principali modalità di implementazione operativa della circolarità, basata sullo scambio inter-organizzativo di materiali, energia, acqua, sottoprodotti e competenze, con l'obiettivo di ottimizzare l'uso delle risorse e ridurre gli impatti ambientali lungo i cicli produttivi (Chertow, 2000; Chertow & Ehrenfeld, 2012). Studi recenti confermano la crescente rilevanza della simbiosi industriale come strategia per l'attuazione della transizione circolare, evidenziandone il potenziale nel favorire collaborazioni tra attori e migliorare l'efficienza nell'utilizzo delle risorse (Palagonia et al., 2025).

In questo quadro, il settore agroalimentare risulta particolarmente idoneo a processi simbiotici, data l'elevata generazione di residui organici e materiali secondari valorizzabili lungo l'intera filiera produttiva (European Commission, 2020; Cutaia et al., 2018). La letteratura evidenzia tuttavia barriere istituzionali, culturali e logistiche che ne ostacolano la diffusione sistemica, richiedendo una maggiore integrazione tra attori, infrastrutture abilitanti e strumenti di coordinamento territoriale (Boons & Spekkink, 2014; Chertow & Ehrenfeld, 2012).

2. Background teorico e sviluppo concettuale

La teoria della simbiosi industriale (IS) affonda le sue radici nell'ecologia industriale, disciplina che mira alla creazione di sistemi produttivi assimilabili a ecosistemi naturali, in cui gli scarti di un processo diventano risorse per un altro (Frosch & Gallopoulos, 1989; Chertow, 2000). La definizione classica di IS identifica tale pratica come il coordinamento tra imprese distinte per lo scambio di materiali, energia, acqua e sottoprodotti, con l'obiettivo di ottenere un vantaggio competitivo collettivo (Chertow, 2000). In questo quadro, la prossimità geografica facilita la fattibilità operativa dello scambio di risorse e riduce i costi logistici relativi al trasferimento dei materiali secondari (Jacobsen, 2006; Chertow, 2000; Lombardi & Laybourn, 2012).

L'economia circolare (CE), invece, si presenta come modello sistemico che mira alla rigenerazione dei materiali e alla chiusura dei cicli produttivi, sostituendo il concetto di fine vita del prodotto con riuso, riciclo e recupero (Kirchherr et al., 2017). Tale paradigma si posiziona come trasformazione strutturale rispetto al modello lineare "take–make–dispose", promuovendo la massima valorizzazione delle risorse e la minimizzazione delle perdite di materia (World Economic Forum, 2014). Nel quadro europeo, l'economia circolare è riconosciuta come strategia chiave per la competitività sostenibile, con l'Unione Europea che la definisce come un sistema di condivisione, riutilizzo, riparazione e riciclo dei materiali esistenti il più a lungo possibile (European Commission, 2023).

In ambito agroalimentare, la connessione tra IS e CE assume una rilevanza specifica data l'abbondanza di residui organici lungo le supply chain, generando opportunità concrete in termini di produzione di biomassa, compost, energia rinnovabile e fertilizzanti (Cutaia et al., 2018; Hamam et al., 2023; Taddeo et al., 2017). Tale potenziale è confermato da ricerche recenti che indicano come i sistemi agroalimentari siano altamente predisposti all'implementazione di ecosistemi simbiotici e scambi intersettoriali di materia. Nonostante ciò, la letteratura evidenzia anche una frammentazione degli approcci, con una prevalenza di analisi tecniche e carenza di studi sulle dimensioni relazionali, comunicative e istituzionali della simbiosi industriale nel settore alimentare (Hamam et al., 2023).

Ulteriori analisi indicano che la diffusione dell'IS è spesso ostacolata da barriere normative, incertezza regolativa sulla distinzione tra rifiuto e sottoprodotto e limitata fiducia tra attori della filiera alimentare (Cutaia et al., 2018). Tali difficoltà contribuiscono a limitare la maturazione di ecosistemi simbiotici stabili, nonostante i benefici ambientali ed economici dimostrati in numerosi contesti internazionali — tra cui Kalundborg, Śmiłowo, British Sugar e altri cluster agroindustriali (Jacobsen, 2006; Hamam et al., 2023; Lombardi & Laybourn, 2012).

3. Obiettivi di ricerca e questioni esplorative

L'obiettivo generale della ricerca è analizzare come pratiche di simbiosi industriale possano facilitare la transizione verso modelli circolari nel settore agroalimentare italiano, favorendo il recupero e la valorizzazione di residui organici e sottoprodotti lungo la filiera di produzione, trasformazione e distribuzione (Hamam et al., 2023).
La ricerca intende approfondire le dinamiche relazionali e collaborative all'interno delle reti di attori coinvolti, ponendo particolare attenzione al ruolo della fiducia, della condivisione informativa e delle condizioni istituzionali e organizzative che abilitano lo scambio reciproco di risorse (Cutaia et al., 2018).
Inoltre, l'indagine mira a individuare le barriere normative, culturali, logistiche ed economiche che ostacolano la diffusione della simbiosi industriale nel contesto agroalimentare nazionale e la transizione verso forme più avanzate di circolarità settoriale.
Infine, lo studio intende contribuire allo sviluppo teorico proponendo un possibile modello interpretativo della simbiosi industriale applicata all'agroalimentare italiano, capace di integrare dimensioni tecniche, organizzative e relazionali nell'analisi dei processi di recupero funzionale dei sottoprodotti.

Alla luce di tali obiettivi, le seguenti domande di ricerca guidano il lavoro:

- RQ1: In che modo si formano e si sviluppano le reti collaborative di scambio di materiali, energia e sottoprodotti nel settore agroalimentare italiano?
Tale domanda mira a comprendere le logiche di configurazione delle relazioni inter-organizzative e dei flussi di risorse, analizzando le condizioni di prossimità, interdipendenza e mutuo vantaggio tra gli attori (Chertow, 2000).
- RQ2: Quali attori svolgono funzioni strategiche nella facilitazione degli scambi simbiotici e quali ruoli assumono nell'ambito della rete?
Il quesito si concentra su soggetti quali imprese leader, cooperative, consorzi di filiera, enti pubblici o organismi intermedi che possono svolgere funzioni di coordinamento, governance e matching informativo (Lombardi & Laybourn, 2012).
- RQ3: Quali barriere e criticità limitano la piena implementazione della simbiosi industriale nel settore agroalimentare italiano, e quali fattori ne favoriscono invece l'adozione?
La ricerca esplorerà sia gli elementi abilitanti (incentivi economici, innovazioni tecnologiche, piattaforme digitali) sia gli ostacoli (incertezze regolative, scarsa fiducia tra attori, costi logistici) (European Commission, 2023).
- RQ4: In che misura il contesto istituzionale, culturale e territoriale italiano influenza l'emergere di ecosistemi simbiotici efficaci e duraturi?
Questa domanda permette di interrogare l'ipotesi secondo cui la territorialità, le tradizioni produttive locali e la natura delle relazioni tra imprese influenzano la configurazione della simbiosi (Hamam et al., 2023).

4. Metodologia

La ricerca adotterà un approccio metodologico misto (*mixed method*), combinando una componente qualitativa esplorativa con una componente quantitativa descrittiva al fine di sviluppare una comprensione articolata e triangolata del fenomeno (Creswell & Plano Clark,

2011). L'analisi qualitativa costituirà l'asse principale dell'indagine e si baserà su interviste semi-strutturate rivolte ad attori coinvolti nei processi di valorizzazione dei sottoprodotti agroalimentari (Kvale, 2008), integrate da osservazione diretta e analisi documentale di report ambientali, dati aziendali e documenti di filiera (Bowen, 2009). Parallelamente, laddove disponibili, saranno raccolti dati quantitativi relativi ai volumi di output residuali, alle quantità di materia recuperata e alla frequenza degli scambi simbiotici, con l'obiettivo di supportare la componente qualitativa con evidenze numeriche descrittive.

A tale impostazione si affianca una fase preliminare di analisi bibliometrica e revisione sistematica della letteratura, finalizzata a mappare l'evoluzione degli studi su simbiosi industriale, economia circolare e recupero funzionale dei sottoprodotti nel settore agroalimentare. L'analisi bibliometrica consente l'individuazione di cluster tematici, traiettorie di sviluppo e reti di co-citazione (Donthu et al., 2021), mentre la revisione sistematica permette di definire le lacune concettuali e metodologiche rilevanti per la successiva indagine empirica (Tranfield et al., 2003).

La selezione dei casi di studio seguirà i criteri metodologici suggeriti da Eisenhardt & Graebner (2007), cioè un approccio teorico-pragmatico per la costruzione di case studies robusti. I contesti selezionati saranno scelti tra imprese agroalimentari italiane che mostrano potenziali pratiche di simbiosi industriale o scambio inter-impresa di risorse. In continuità con la fase analitica preliminare, sarà inoltre costruito un repertorio di pratiche rilevanti di simbiosi industriale e modelli circolari nel comparto agroalimentare, con finalità comparativo-esplorative e di supporto alla definizione di categorie interpretative. Tale repertorio fungerà da base metodologica per la successiva analisi cross-case.

In particolare, l'analisi si focalizzerà su quattro configurazioni rilevanti:

- Caviro Group — tramite la sua divisione Caviro Extra — rappresenta un esempio significativo di economia circolare nel comparto vitivinicolo italiano: attraverso la trasformazione di sottoprodotti e residui di vinificazione in bioetanolo, acido tartarico, biocarburanti, energia rinnovabile, fertilizzanti e compost, il gruppo dichiara un tasso di recupero prossimo al 99 % e una significativa riduzione degli scarti (Caviro Group 2024; sito Caviro Extra, 2025).
- ENEA – Symbiosis Users Network (SUN): piattaforma nazionale di simbiosi industriale che supporta le imprese nella mappatura dei flussi, nell'identificazione di opportunità di scambio dei materiali secondari e nella facilitazione di reti collaborative, incluse filiere agroalimentari territoriali (Symbiosis Users Network, 2025).
- Food Crossing District (Emilia-Romagna): progetto pilota che connette attori come Barilla e Casalasco per la valorizzazione di residui come bucce di pomodoro e crusca di frumento, mediante piattaforma digitale di matching delle risorse (ENEA, 2024).
- Simbiosi Srl (Lombardia) rappresenta un esempio di iniziativa privata orientata alla valorizzazione circolare delle risorse attraverso soluzioni integrate per acqua, energia, recupero di residui organici e rigenerazione dei suoli. Secondo la documentazione aziendale, il modello sviluppato mira a creare ecosistemi territoriali ad elevata simbiosi tra attori e flussi materiali (Simbiosi, 2025).

L'analisi qualitativa sarà condotta mediante codifica tematica, con l'obiettivo di identificare ricorrenze, categorie concettuali e pattern interpretativi emergenti dalle interviste e dalla documentazione raccolta. La successiva analisi comparata tra i casi selezionati consentirà di evidenziare convergenze e divergenze nelle dinamiche di scambio, nelle configurazioni relazionali e nei meccanismi di coordinamento, supportando lo sviluppo di una tipologia interpretativa delle configurazioni simbiotiche nel sistema agroalimentare italiano.Tale processo prevede la lettura sistematica del materiale empirico, l'assegnazione di codici ai segmenti rilevanti e la successiva aggregazione in temi ricorrenti, confrontando risultati e narrazioni tra attori e contesti al fine di evidenziare somiglianze, divergenze e relazioni strutturali. L'approccio metodologico si fonda sui principi della thematic analysis e dello sviluppo induttivo dei costrutti teorici, ampiamente adottati negli studi organizzativi e nei contesti di innovazione sostenibile (Braun & Clarke, 2006; Gioia, Corley & Hamilton, 2013).

I risultati qualitativi saranno integrati con ulteriori evidenze documentali e settoriali attraverso triangolazione metodologica, così da incrementare l'affidabilità e la solidità interpretativa delle analisi (Jick,1979). La ricerca è attualmente in fase di implementazione; pertanto, gli esiti qui discussi rappresentano anticipazioni e aspettative basate sulla letteratura esistente e sulle osservazioni iniziali, nel rispetto della natura *work-in-progress* del progetto.

5. Risultati attesi (work in progress)

I risultati attesi si configurano come esiti preliminari e non derivano ancora da analisi empirica definitiva, in coerenza con la natura qualitativa esplorativa della ricerca. In linea con le recenti riflessioni sul potenziale circolare dei sistemi agroalimentari (Hamam et al., 2023), ci si attende di individuare dinamiche collaborative emergenti tra imprese interessate alla valorizzazione dei sottoprodotti e alla riduzione degli scarti di lavorazione. Tali relazioni potrebbero manifestarsi in forma di alleanze informali, accordi di scambio e coordinamenti di filiera basati sulla prossimità funzionale e sull'identificazione reciproca di opportunità di recupero di risorse (Chertow, 2000). Si prevede inoltre che possano emergere attori "centrali" (hub) all'interno delle reti di simbiosi industriale, chiamati a svolgere funzioni cruciali di coordinamento, facilitazione degli scambi e aggregazione della domanda e dell'offerta dei materiali secondari e residui. Tale ipotesi trova supporto nella letteratura più recente sulle dinamiche di rete e sui modelli organizzativi delle piattaforme di simbiosi industriale (Akrivou et al., 2021; Sellitto et al., 2024). Parallelamente, è plausibile che emerga una segmentazione dei ruoli tra imprese produttrici di residui organici, imprese trasformative secondarie e operatori specializzati nella valorizzazione o conversione dei flussi residuali, secondo logiche di complementarità funzionale osservate nello sviluppo di reti simbiotiche in cluster produttivi italiani (Taddeo et al., 2017). È ragionevole ipotizzare che la rete collaborativa di simbiosi industriale presenti una configurazione flessibile e dinamica nel tempo, in cui l'intensità delle relazioni e la partecipazione degli attori possano variare in funzione di determinanti economico-organizzativi (es. redditività, disponibilità di sottoprodotti), nonché in relazione a fattori di fiducia, percezione del rischio e condizioni istituzionali. Questa ipotesi si fonda su una concezione estesa di simbiosi industriale, che considera la rete come un sistema sociotecnico in continua evoluzione (Lombardi & Laybourn, 2012). Si prevede che la ricerca contribuirà alla comprensione delle condizioni che favoriscono la generazione di valore condiviso attraverso lo scambio circolare di risorse e, sulla base delle evidenze derivanti dai casi studio, potrà proporre un modello interpretativo suscettibile di essere replicato in altri contesti agro-industriali italiani. La plausibilità di tale contributo trova riscontro nella letteratura recente sulla potenzialità e le barriere dell'industrial symbiosis (Neves et al., 2019).

6. Valore scientifico potenziale e contributo alla letteratura

La ricerca si propone di contribuire all'analisi degli aspetti organizzativi e relazionali delle reti di simbiosi nel settore agroalimentare, rispondendo a un crescente interesse della letteratura che evidenzia come molti studi sull'industrial symbiosis in ambito agri-food si siano tradizionalmente concentrati sui flussi materiali e tecnologici, dedicando minore attenzione alle dimensioni di governance, coordinamento e interazione tra attori. Lo studio si colloca nella prospettiva che interpreta la simbiosi industriale come fenomeno reticolare e socialmente costruito, ponendo attenzione alle dinamiche inter-organizzative, ai meccanismi di coordinamento e ai processi relazionali che ne abilitano l'efficacia (Lombardi & Laybourn, 2012). La ricerca adotta la prospettiva della network theory per analizzare le relazioni inter-organizzative tra imprese all'interno della rete di simbiosi, considerando la struttura dei legami, la posizione degli attori e le dinamiche di coordinamento come determinanti della capacità della rete di veicolare scambi di risorse e creare sinergie (Borgatti & Halgin, 2011). Attraverso un approccio

empirico qualitativo, la ricerca mira a sviluppare categorie interpretative emergenti dalle evidenze raccolte, con l'obiettivo di offrire un possibile quadro analitico utile anche ad altri contesti produttivi caratterizzati da flussi residui valorizzabili e logiche collaborative (Glaser & Strauss, 1967).

Infine, la ricerca mira a contribuire alla comprensione del ruolo delle imprese agroalimentari all'interno di reti simbiotiche territoriali, non solo in termini di scambio fisico di risorse, ma anche rispetto alle condizioni organizzative e di coordinamento che ne abilitano la collaborazione (Taddeo et al., 2017).

7. Conclusioni e stato della ricerca (work in progress)

La ricerca si colloca in uno stadio intermedio di sviluppo: l'impostazione teorica è stata delineata, il disegno metodologico definito e la fase di selezione dei contesti di studio e di raccolta qualitativa delle evidenze empiriche è attualmente in corso. Data la natura esplorativa e qualitativa dell'indagine, i risultati presentati sono da considerarsi preliminari e riflettono aspettative basate su evidenze scientifiche consolidate e osservazioni iniziali, piuttosto che conclusioni definitive. La prosecuzione del lavoro consentirà di affinare il quadro concettuale e verificare empiricamente le ipotesi emergenti, contribuendo a consolidare una comprensione sistematica dei meccanismi di collaborazione che abilitano la simbiosi industriale nel settore agroalimentare italiano. L'obiettivo finale del progetto è contribuire all'avanzamento della riflessione scientifica nei campi dell'economia circolare, dell'organizzazione industriale e della gestione sostenibile delle risorse, offrendo una prospettiva integrata sulle condizioni che favoriscono la riconfigurazione circolare dei sistemi produttivi e dei modelli di collaborazione inter-impresa.

Parole chiave: Simbiosi industriale; economia circolare; settore agroalimentare; valorizzazione dei residui; reti collaborative

L'organisational misconduct nelle imprese italiane: analisi organizzativa dei casi di amministrazione giudiziaria avviati dalla Procura di Milano

Marta Ingaggiati[1], Tea Maistro[2]

1. Introduzione

Negli ultimi anni si sta diffondendo, in diversi ordinamenti giuridici, l'uso di strumenti alternativi per la risoluzione dei casi di comportamento illegale delle organizzazioni (definiti come organizational misconduct), adottando approcci di "giustizia preventiva" al posto dei procedimenti penali tradizionali (Markoff, 2013). In paesi come Stati Uniti, Canada, Inghilterra, Galles e, più recentemente, Francia ((Arlen, 2020; Grasso, 2016), la definizione dei casi di criminalità d'impresa avviene sempre più spesso tramite pretrial diversion agreements, tra cui i deferred prosecution agreements (DPA). Tali accordi consentono alle imprese di evitare il processo e la prosecuzione penale, a condizione che rispettino specifiche misure correttive concordate con la procura. Queste misure possono includere l'ammissione dei fatti, il pagamento di sanzioni ridotte, il risarcimento delle vittime o la riforma dei programmi di compliance. In tal modo, i pubblici ministeri lasciano alle organizzazioni un certo margine di discrezionalità nella definizione delle modalità di riparazione.

Questi interventi riflettono una visione più evoluta del misconduct, che non è più attribuito alla "mela marcia", ma al "barile marcio": non il singolo individuo, bensì le strutture e le dinamiche organizzative possono favorire comportamenti devianti. Tuttavia, la loro efficacia è oggetto di ampio dibattito. Da un lato, questi strumenti consentono di evitare la "morte organizzativa" e le conseguenze economiche devastanti di un processo, potendo così preservare occupazione e valore economico, e, in alcuni casi, generare cambiamenti diffusi. Dall'altro lato, diversi studi ne evidenziano l'efficacia limitata, a causa delle frequenti recidive (De Vita & Vozza, 2024). Diversi Autori sostengono che gli accordi pre-processuali, oltre a essere intrinsecamente iniqui, rischiano di erodere la responsabilità penale delle imprese, indebolire lo Stato di diritto e fallire nella deterrenza dei comportamenti illeciti.

Dal punto di vista organizzativo, la diffusione di questi strumenti solleva ulteriori questioni. Quando il discorso giuridico viene tradotto in termini organizzativi, alle imprese è lasciata un'ampia discrezionalità su come attuare le azioni correttive. Tali interventi richiedono infatti una cooperazione attiva tra organizzazioni e procure, che può comportare la riforma dei programmi di compliance, il cambiamento dei vertici o la creazione di meccanismi di monitoraggio delle riforme concordate. Tuttavia, queste azioni possono essere implementate in modo accomodante, affrontando in modo sostanziale le rivendicazioni degli stakeholder e le cause profonde del problema, oppure in modo difensivo, attraverso azioni simboliche che tutelano i manager o le risorse organizzative, dando solo l'apparenza di un cambiamento (Hersel et al., 2019).

Alla luce di ciò, la nostra ricerca si interroga su una questione centrale: quando un'organizzazione ha un certo grado di discrezionalità nell'attuare le azioni correttive dopo un episodio di misconduct, quale tipo di cambiamento produce? Si tratta di un cambiamento accomodante e sostanziale, oppure difensivo e simbolico? E, soprattutto, perché?

[1] Assegnista di ricerca, ECON-08/A, Università degli Studi di Milano; marta.ingaggiati@unimi.it – corresponding author

[2] Dottoranda di ricerca, GSPS-08/A, Università degli Studi di Milano; tea.maistro@unimi.it

Per rispondere a questa domanda ci focalizziamo sul caso italiano in quanto, negli ultimi anni, anche in Italia – e in particolare presso la Procura di Milano – si è fatto ricorso a un istituto analogo: l'Amministrazione Giudiziaria (art. 34 C.A.). Si tratta di una misura di prevenzione volta alla "bonifica" di organizzazioni che abbiano agevolato fenomeni di sfruttamento del lavoro. Tale bonifica è affidata a un amministratore nominato dal giudice, che esercita i poteri spettanti ai titolari dei diritti sui beni e sulle imprese oggetto della misura.

2. Framework teorico

2.1. Organizational misconduct

Il misconduct rappresenta un fenomeno complesso. È definito come "qualsiasi comportamento all'interno di un'organizzazione che viola norme morali, etiche o legali ampiamente accettate, e che minaccia il benessere di individui, gruppi o dell'organizzazione stessa, indipendentemente dal fatto che sia intenzionale o meno" (Mayer et al., 2010).

Come sottolinea Palmer (2012), tale fenomeno non deve essere considerato un'eccezione, bensì una componente normale e strutturale dell'agire organizzativo. In questa prospettiva, il comportamento deviante non deriva da singoli individui "cattivi", ma è radicato negli stessi processi e strutture che rendono le organizzazioni efficienti e performative. Le persone che lo perpetrano sono spesso soggetti ordinari che operano in contesti in cui logiche di efficienza, competizione e lealtà interna possono entrare in tensione con i principi della moralità. Questa concezione comporta un'importante implicazione teorica: la prevenzione del misconduct non può limitarsi alla sostituzione dei singoli individui, ma deve riguardare la revisione delle strutture, dei processi e della cultura organizzativa. La letteratura individua diversi fattori antecedenti al misconduct (Vaughan, 1999), che possono essere classificati come segue:

- Fattori ambientali: condizioni esterne che generano pressioni o incertezze sistemiche tali da favorire errori, cattive condotte. Ad esempio, l'elevata competizione per risorse scarse, l'incertezza ambientale, la regolazione inefficace o la dipendenza da poteri esterni, nonché pressioni istituzionali e culturali per ottenere legittimità.
- Fattori organizzativi strutturali: caratteristiche che favoriscono la devianza routinaria, come la divisione del lavoro e la conseguente "segretezza strutturale", l'eccessiva centralizzazione o formalizzazione, le gerarchie che scoraggiano la segnalazione di errori e la goal displacement, ossia la sostituzione degli obiettivi originari con fini distorti.
- Fattori organizzativi processuali: dinamiche interne che trasformano pressioni esterne in pratiche deviate, come conflitti di potere tra subunità, incentivi alla violazione delle regole, trappole decisionali che amplificano gli errori, ritualizzazione o negazione dell'errore.
- Fattori tecnologici e di compito: caratteristiche delle tecnologie o delle attività lavorative che creano rischi intrinseci, come la complessità tecnica e l'accoppiamento stretto dei processi, la conoscenza tacita e la flessibilità interpretativa che possono generare incomprensioni.
- Fattori sociali e culturali: norme, valori e significati condivisi che modellano la percezione della devianza, come la normalizzazione delle pratiche scorrette, la cultura del successo a ogni costo o la giustificazione delle violazioni in nome della performance.
- Fattori individuali e cognitivi: limiti cognitivi e processi interpretativi che portano a decisioni deviate, come la razionalità limitata, gli errori di sensemaking, la giustificazione post hoc e la routine che genera "incapacità addestrata".

A seguito della scoperta di comportamenti illeciti, le organizzazioni possono subire conseguenze significative: perdita di legittimità, riduzione della produttività e della soddisfazione lavorativa, boicottaggi da parte dei consumatori, cali del valore azionario e sanzioni legali. Tuttavia, la letteratura ha posto crescente attenzione anche sulle azioni correttive che i manager e le organizzazioni intraprendono dopo un episodio di misconduct. Le azioni correttive sono comportamenti organizzativi volti a mitigare gli effetti negativi del misconduct sull'impresa e sui suoi stakeholder. Hersel et al. (2019) distinguono tre principali tipologie di azioni correttive:

- Sostituzione dei vertici (executive dismissal), che consiste nella rimozione e sostituzione dei leader responsabili, come il CEO o i membri del consiglio di amministrazione, per riaffermare la legittimità organizzativa.
- Comunicazioni organizzative (organizational accounts), attraverso cui le imprese spiegano o reinterpretano il proprio ruolo nel misconduct, offrendo giustificazioni o ammettendo responsabilità.
- Cambiamenti di policy, che includono modifiche strategiche, strutturali o procedurali — come l'aggiornamento dei codici etici, l'introduzione di programmi di formazione sull'etica o l'adozione di nuovi meccanismi di controllo.

Le modalità di implementazione di tali azioni possono variare notevolmente. In particolare, Hersel et al. (2019) distinguono tra risposte accomodanti e risposte difensive. Le risposte accomodanti affrontano in modo sostanziale le preoccupazioni degli stakeholder, offrendo soluzioni tangibili ai problemi emersi e impegnandosi in un cambiamento reale. Ad esempio, la rimozione dei manager responsabili o la revisione dei meccanismi di governance possono rappresentare segnali di autentica assunzione di responsabilità. Analogamente, modifiche di policy volte a ridurre gli incentivi al misconduct (come nuovi standard operativi, procedure di whistleblowing o maggiore coinvolgimento degli stakeholder) indicano un impegno verso il cambiamento organizzativo profondo. Le risposte difensive, al contrario, mirano a prendere le distanze dal misconduct agli occhi degli stakeholder e a limitare le perdite reputazionali o strategiche dell'impresa. Queste includono lo scapegoating dei responsabili, la negazione del coinvolgimento, la minimizzazione della gravità del comportamento o l'adozione di cambiamenti formali facilmente reversibili.

2.2. Evoluzione dei sistemi giudiziari

In diversi ordinamenti giuridici, è ormai comune che i casi di corporate misconduct vengano risolti al di fuori del processo penale tradizionale, attraverso strumenti di composizione alternativa come i pretrial diversion agreements.

Il dibattito attorno a questi accordi si è sviluppato prevalentemente nell'ambito della letteratura giuridica, concentrandosi sui loro vantaggi e svantaggi sotto il profilo del diritto penale e dell'efficacia deterrente. Tuttavia, tali strumenti assumono una rilevanza crescente anche dal punto di vista organizzativo e manageriale, poiché incidono sulle dinamiche interne delle imprese coinvolte e sulle modalità con cui queste attuano le azioni correttive successive al misconduct.

I deferred prosecution agreements (DPA) rientrano nella più ampia categoria degli alternative dispute resolutions, ovvero negoziazioni tra procura e impresa finalizzate alla risoluzione dei casi penali al posto del processo. Attraverso un DPA, la procura sospende temporaneamente l'azione penale in cambio dell'impegno dell'organizzazione a realizzare specifiche riforme o azioni riparative: l'implementazione di programmi di compliance, la ristrutturazione della governance, o la collaborazione attiva alle indagini.

La letteratura è tuttavia divisa circa la loro efficacia. Alcuni autori ritengono che i DPA rappresentino uno strumento adeguato a gestire il corporate misconduct (Parker & Dodge, 2023), mentre altri ne evidenziano i limiti come deterrente rispetto ai crimini d'impresa (Uhlmann, 2013). In particolare, De Vita & Vozza (2024) sostengono che, sebbene tali accordi offrano un trattamento preferenziale alle grandi imprese multinazionali, essi falliscono nel prevenire la recidiva e nel generare un cambiamento reale nei comportamenti organizzativi.

Le evidenze mostrano dunque che gli esiti di questi accordi dipendono fortemente dalla complessità del contesto legale e dal grado di discrezionalità lasciato alle organizzazioni. Quando le imprese sono chiamate a implementare autonomamente le misure correttive, la natura del cambiamento — sostanziale o simbolico, accomodante o difensiva — dipende in larga misura dal modo in cui interpretano e gestiscono tale margine di autonomia.

3. Obiettivo e domande di ricerca

Alla luce del quadro teorico e delle esperienze internazionali discusse, questo studio intende analizzare se e in che modo strumenti di natura non punitiva, come l'Amministrazione Giudiziaria (AG), possano generare un cambiamento effettivo all'interno delle organizzazioni coinvolte in casi di misconduct, oppure se producano prevalentemente effetti cosmetici o simbolici.

L'Amministrazione Giudiziaria, introdotta in Italia con l'art. 34 del Codice Antimafia, è una misura di prevenzione che mira alla "bonifica" di organizzazioni che abbiano agevolato fenomeni di illegalità, in particolare quelli legati allo sfruttamento del lavoro. Essa prevede la nomina di un

amministratore giudiziario incaricato di esercitare, per un periodo limitato, i poteri gestionali e decisionali dell'impresa, al fine di ristabilire la legalità e ripristinare condizioni operative conformi alla legge.

Pur rappresentando un'innovazione significativa nel panorama della giustizia economica italiana, l'Amministrazione Giudiziaria solleva interrogativi cruciali circa la natura del cambiamento organizzativo che produce. In particolare, il nostro obiettivo è comprendere se tale strumento induca:

- un cambiamento di tipo accomodante, ossia sostanziale e orientato al miglioramento dei processi, della cultura e delle relazioni con gli stakeholder; oppure
- un cambiamento di tipo difensivo, volto principalmente ad adempiere formalmente agli obblighi imposti, senza modificare in profondità le logiche organizzative che hanno originato il misconduct.

Per esplorare tali aspetti, la ricerca si concentra sull'applicazione dell'Amministrazione Giudiziaria nei settori della moda e della logistica in Italia — due ambiti frequentemente oggetto di intervento da parte della Procura di Milano — e si propone di rispondere alle seguenti domande di ricerca:

1. L'Amministrazione Giudiziaria produce un cambiamento di tipo difensivo o di tipo accomodante?
2. Perché?

4. Metodologia

La ricerca si fonda su un approccio qualitativo, volto a esplorare in profondità le modalità attraverso cui l'Amministrazione Giudiziaria (AG) produce cambiamento nelle organizzazioni coinvolte.

4.1. Raccolta dei dati

Sono state condotte 11 interviste semi-strutturate con tre categorie di attori chiave:

- 6 Amministratori Giudiziari, direttamente coinvolti nella gestione delle imprese sottoposte alla misura;
- 3 rappresentanti sindacali, impegnati nella tutela dei lavoratori nei settori interessati;
- 2 rappresentanti aziendali, appartenenti a organizzazioni oggetto della misura.

A supporto delle interviste, è stata condotta un'ampia analisi documentale su 7 provvedimenti giudiziari di disposizione e di revoca dell'Amministrazione Giudiziaria, per un totale di 564 pagine.

I casi analizzati appartengono a due settori ad alta incidenza di interventi di AG:

- Settore logistica: BRT, Ceva, Geodis, Uber

- Settore moda: Alviero Martini, Armani, Dior

4.2. Analisi dei dati

L'analisi dei dispositivi di revoca ha permesso di identificare le azioni correttive intraprese dalle imprese durante il periodo di Amministrazione Giudiziaria e di classificarle in relazione ai fattori antecedenti del misconduct individuati dalla letteratura (Vaughan, 1999; Hersel et al., 2019). Questa categorizzazione ha consentito di valutare se le azioni implementate agiscano su dimensioni strutturali e processuali (ad esempio, modelli organizzativi e sistemi di controllo) o su dimensioni sociali e culturali (norme, valori e significati condivisi), permettendo di inferire la natura del cambiamento: difensiva o accomodante. In parallelo, l'analisi delle interviste ha consentito di comprendere le logiche e le motivazioni che guidano tali trasformazioni, con particolare attenzione ai vincoli istituzionali, alla durata del mandato, alla cooperazione tra attori e al grado di coinvolgimento degli stakeholder esterni.

5. Risultati

Domanda di ricerca 1: l'amministrazione giudiziaria produce un cambiamento di tipo difensivo o di tipo accomodante?

Dall'analisi dei dispositivi di revoca è emerso che le azioni correttive intraprese dalle imprese durante il periodo di Amministrazione Giudiziaria si sono concentrate prevalentemente su livelli organizzativi strutturali e processuali, e solo in minima parte su aspetti sociali e culturali. In particolare, gli interventi osservati hanno riguardato principalmente la creazione o revisione dei modelli organizzativi di controllo, come l'adozione di un modello 231, la nomina di un organismo di vigilanza, la designazione di società di revisione contabile e la costituzione di comitati per la valutazione dei fornitori. Tali azioni, sebbene rilevanti sul piano formale, sono prevalentemente orientate all'adempimento e non incidono sui valori, le norme e le culture che orientano l'agire organizzativo. Questo orientamento suggerisce che la risposta prodotta dall'Amministrazione Giudiziaria sia principalmente di tipo difensivo, in quanto mira a introdurre modifiche strutturali e procedurali per garantire la conformità normativa, piuttosto che promuovere un cambiamento sostanziale e durevole nei comportamenti o nelle logiche organizzative.

Livello	Definizione sintetica	Riscontro fattuale nei dispositivi di revoca
Ambientale		
Organizzativo – Strutturale	Caratteristiche strutturali che generano devianza routinaria per effetto della complessità, gerarchia o frammentazione dell'informazione.	creazione di un modello organizzativo; adozione di un modello 231; nomina organismo di vigilanza; nomina di società di revisione legale dei conti; creazione di un comitato di valutazione dei fornitori che esamini i profili di rischio; rimozione dei contratti con imprese che fanno caporalato; interruzione del rapporto con i fornitori evidenziati nel decreto di

		disposizione
Organizzativo – Processuale	Dinamiche interne e interazioni che trasformano pressioni esterne in pratiche deviate o in errori sistematici.	aggiornamento del sistema di controlli; aggiornamento delle condizioni generali di contratto e dei codici di condotta; ; definizione di standard operativi nei confronti dei lavoratori; rispetto della privacy dei lavoratori
Organizzativo – Task/tecnologico	Le caratteristiche delle tecnologie e delle attività di lavoro come fonti intrinseche di rischio e incertezza.	
Sociale / Culturale	Norme, valori e significati condivisi che modellano la percezione della devianza e la definizione di situazioni rischiose o accettabili.	comunicazione del nuovo sistema di controlli
Individuale / Cognitivo		

Tabella 1. Risultati preliminari

Domanda di ricerca 2: perché?

L'analisi delle interviste con amministratori giudiziari, rappresentanti sindacali e aziendali consente di identificare una serie di fattori di contesto e di design istituzionale che spiegano l'esito prevalentemente difensivo degli interventi.

- Ambiguità del mandato e natura legale delle competenze. Il mandato dell'Amministrazione Giudiziaria è definito in termini prevalentemente giuridici, e le competenze mobilitate da Procura e Amministratori sono anch'esse di natura legale. Ne deriva una marginalizzazione delle competenze organizzative e manageriali, che restano prerogativa dell'impresa ma raramente vengono attivate.
- Assenza di un coinvolgimento multilaterale degli stakeholder. L'attuazione dell'Amministrazione Giudiziaria avviene come un processo "chiuso", privo di dialogo con soggetti esterni come i sindacati o le autorità locali.

o I sindacati possiedono competenze utili per supportare processi di cambiamento accomodante e per sensibilizzare i lavoratori ai vantaggi della regolarizzazione; tuttavia, vengono raramente coinvolti.

o Le autorità locali, che beneficiano economicamente della presenza delle aziende logistiche, potrebbero essere attori chiave nel sostegno alla trasformazione, ma restano generalmente escluse dal processo.

- Temporalità breve e assenza di follow-up. Il mandato dell'Amministrazione Giudiziaria è limitato nel tempo e non prevede momenti di verifica successiva, né con la Procura né con gli stakeholder, favorendo un approccio episodico e orientato ai risultati immediati.
- Pressione mediatica e reputazionale. L'alta visibilità pubblica dei casi induce tutti gli attori coinvolti — Procura, Amministratori e imprese — a privilegiare azioni dimostrative e risultati rapidi: le prime per consolidare la propria immagine pubblica, le seconde per "sparire dal radar".
- Focalizzazione sulla singola impresa e non sul contesto settoriale. Gli interventi si concentrano sull'organizzazione specifica "inciampata" nel misconduct, senza considerare i fattori ambientali e sistemici che rendono ricorrenti tali episodi nei medesimi settori (moda e logistica). Ciò suggerisce che l'Amministrazione Giudiziaria possa rappresentare, metaforicamente, "la risposta giusta al livello sbagliato": efficace sul singolo caso, ma incapace di intervenire sulle cause strutturali e ambientali del problema.

6. Conclusioni e implicazioni

L'Amministrazione Giudiziaria rappresenta un dispositivo innovativo nel panorama italiano, in quanto introduce una forma di intervento che, invece di punire l'impresa responsabile di misconduct, mira a promuovere la rigenerazione dell'organizzazione attraverso un'azione di "bonifica" interna. Tuttavia, i risultati di questa ricerca mostrano che, pur generando un cambiamento tangibile, l'Amministrazione Giudiziaria tende a produrre trasformazioni di tipo difensivo, orientate alla conformità formale più che a un apprendimento sostanziale. Le azioni implementate si concentrano su dimensioni strutturali e procedurali — come la creazione di modelli di controllo, la definizione di procedure e la revisione dei sistemi di monitoraggio — mentre incidono solo marginalmente sugli aspetti culturali e valoriali dell'organizzazione.

Le ragioni di questo esito risiedono in alcuni elementi di design istituzionale che caratterizzano l'Amministrazione Giudiziaria:

- la natura ambigua del mandato e la prevalenza di competenze giuridiche rispetto a quelle manageriali;
- la mancanza di coinvolgimento degli stakeholder esterni (sindacati, autorità locali, comunità);
- la breve durata dell'intervento e l'assenza di momenti di verifica o follow-up;
- la pressione mediatica che incentiva risultati rapidi e visibili;
- la focalizzazione sul singolo caso piuttosto che sui fattori sistemici e ambientali che alimentano il misconduct nei settori interessati.

Alla luce di tali evidenze, appare necessario riformulare le aspettative circa il potenziale trasformativo dell'Amministrazione Giudiziaria. Essa può costituire un importante strumento di risanamento, ma solo a condizione che venga ripensata in chiave più ampia e sistemica, superando la logica episodica e reattiva che ne limita oggi l'impatto. In questa prospettiva, sarebbe auspicabile integrare le competenze organizzative e manageriali nel mandato dell'Amministratore Giudiziario; istituzionalizzare momenti di monitoraggio successivi alla revoca della misura; promuovere una maggiore partecipazione degli stakeholder per favorire processi di apprendimento collettivo; e infine, estendere l'attenzione dai singoli casi alle dinamiche di settore e di filiera, per affrontare le cause strutturali del misconduct. L'Amministrazione Giudiziaria, dunque, fa un passo importante nella direzione di una giustizia preventiva e rigenerativa, ma per

realizzare appieno il suo potenziale deve evolvere da strumento di compliance formale a leva di apprendimento organizzativo di più ampio respiro.

Parole chiave: Misconduct; amministrazione giudiziaria; cambiamento organizzativo

SDG Coherence: From Disclosure to Performance

Diletta Vianello[3], Rebecca Miccini[4], Giovanni Liberatore[5]

1. Introduction

Over the past decade, the corporate sustainability landscape has been shaped by the rapid institutionalization of the Sustainable Development Goals (SDGs) as a global framework for responsible business conduct. Since their adoption by the United Nations in 2015, the SDGs have become a central reference for firms seeking to communicate their contribution to sustainable development through sustainability and non-financial reporting. However, while the diffusion of SDG-related disclosures suggests a growing corporate commitment to global sustainability, a growing body of literature warns that such references often remain largely symbolic (Costa et al., 2025; Del Río et al., 2024). The phenomenon of SDG washing—analogous to greenwashing—emerges when companies emphasize symbolic references to the SDGs without implementing aligned actions or measurable outcomes.

This study introduces the concept of SDG coherence as a metric to evaluate the alignment between a company's stated commitment to the SDGs and its actual environmental, social, and governance (ESG) performance. While the number of SDGs mentioned in corporate reports serves as a proxy for disclosure, coherence is assessed through objective, sector-relevant ESG indicators, such as board diversity and training investments.

By bridging the gap between narrative and action, this approach aims to contribute to a more evidence-based evaluation of corporate sustainability, shedding light on firms that integrate SDGs into their operational model, the so-called "greenwalking" versus those that engage in performative disclosure, the so-called "SDG-washing".

2. Theoretical framework

The proliferation of frameworks and standards—ranging from the Global Reporting Initiative (GRI) to the SDG Compass—has increased heterogeneity in corporate approaches to SDG integration, raising questions about the comparability and reliability of reported information.

This concern has given rise to the notion of SDG-washing, a process whereby companies selectively disclose or exaggerate their contributions to the SDGs without demonstrating substantive, measurable progress (Van Zanten & Van Tulder, 2021). Much like greenwashing, SDG-washing can be understood as a legitimacy-seeking behavior in which firms use sustainability narratives to align with stakeholder expectations while maintaining business-as-usual operations (Bebbington & Unerman, 2018). The resulting misalignment between discourse and performance undermines both corporate accountability and the transformative ambition of the 2030 Agenda.

This study introduces the concept of SDG coherence, defined as the degree of alignment between a company's stated commitment to the SDGs (disclosure) and its measurable performance (action). The central research question is:

[3] Post-doctoral Researcher, ECON-06/A, University of Florence; diletta.vianello@unifit.it – corresponding author

Is there a misalignment between the extent of SDG disclosure in corporate reports and the actual performance of firms?

By operationalizing SDG coherence as a quantitative construct, this study contributes to bridging the gap between symbolic and substantive corporate engagement with the SDGs.

The theoretical foundations of this work draw from both legitimacy theory (Suchman, 1995) and stakeholder theory (Freeman, 1984). From a legitimacy perspective, organizations use sustainability disclosure as a communicative mechanism to seek stakeholders' approval, thus emphasizing symbolic alignment with the SDGs. In contrast, stakeholder theory posits that genuine alignment between strategic intent, operational action, and transparent reporting can create shared value and strengthen stakeholder relationships (Donaldson & Preston, 1995). The tension between these two perspectives, i.e. legitimacy-seeking versus stakeholder-engaged behavior, frames the conceptual terrain of SDG coherence.

The study also builds on the analytical framework proposed by Del Río et al. (2024), who distinguished between ex ante and ex post indicators of SDG engagement. Ex ante (bottom-up, stakeholder-driven) indicators, such as those embedded in the SDG Compass (United Nations, 2021), are designed as internal learning and planning tools that orient corporate action towards the SDGs. They reflect organizational intentions and are typically qualitative in nature. Conversely, ex post (top-down, expert-driven) indicators, such as the SDG Compliance assessment, represent external evaluations of firms' sustainability performance. Del Río et al. (2024) demonstrated that inconsistencies between these two types of indicators create fertile ground for greenwashing and SDG-washing, as firms may selectively report or emphasize those indicators that portray them in the most favorable light.

Drawing inspiration from this dual-indicator framework, our study develops SDG coherence as an integrated measure of alignment between narrative disclosure (ex ante commitment) and objective performance (ex post evidence). In this conceptualization, coherence reflects the convergence of intention and outcome. Firms that exhibit high coherence demonstrate a consistent relationship between their SDG-related discourse and ESG performance, indicating substantive engagement or "greenwalking". Those with low coherence display a wide gap between stated goals and measurable actions, suggesting performative or symbolic commitment.

3. Empirical design

The empirical analysis adopts a mixed-methodology research design, combining the content analysis technique with quantitative statistical analyses. The dataset is composed by English and Italian companies that disclose GRI-based non-financial reports in the period 2022-2023; the database of companies was extracted from LSEG Datastream and from the Italian DNF Observatory . For coherence reasons, we analyzed only companies that disclose SDG-related information according to the GRI standards.

We extracted data from two complementary sources of information. First, SDG disclosure data were extracted from GRI-based sustainability reports and non-financial statements. Each firm received a disclosure score ranging from 0 to 1 based on the number of SDGs explicitly referenced compared to the maximum number of SDG indicators (17). Secondly, we created two SDG presence-score respectively called: SDG5, which assumed value of 1 if a company disclosed the SDG 5 and 0 otherwise, and SDG4, which assumed value of 1 if a company disclosed the SDG 4 and 0 otherwise.

Then, quantitative indicators relevant to key SDGs were obtained from the financial statements and from the AIDA database. For instance, the proportion of women on the board of directors served as a proxy for SDG 5 (Gender Equality), while training expenses as a share of revenue captured engagement with SDG 4 (Quality Education). These indicators serve as proxies for the companies' actual engagement (performance) with the sustainability goals they report.

To quantify coherence, we will build a coherence matrix to compare disclosure intensity with performance outcomes and assess the alignment between disclosure and performance. Each performance indicator will be scored on a 0–2 scale (0 = no evidence; 1 = partial alignment; 2 = full alignment) and aggregated into an overall SDG Coherence Score ranging from 0 to 6. Firms will then be classified into three categories: high coherence (4–6), medium coherence (2–3), and low coherence (0–1). Statistical analyses, including descriptive statistics, correlation analysis, and one-way ANOVA, will be conducted to explore the relationship between disclosure, performance, and contextual variables such as industry and company size (Galeazzo et al., 2024; García-Meca & Martínez-Ferrero, 2022).

4. Expected results, contributions and future research

We expect our results to reveal a discrepancy between disclosure and actual performance. Specifically, we expect firms to disclose a large number of SDGs in their reports, but with a measurable outcome disclosed only for a limited subset of goals. This "SDG inflation" mirrors findings by Mengistu and Panizzolo (2022), who identified an overabundance of indicators used to demonstrate progress toward the SDGs. The analysis may suggest that companies frequently highlight those SDGs that are easiest to integrate into existing CSR activities or that align with reputational priorities, while neglecting others that require deeper systemic change.

We believe that cross-sectoral comparisons will indicate that industries characterized by high regulatory scrutiny, such as finance, utilities, and energy, display the highest disclosure levels but relatively low coherence scores. In contrast, firms in manufacturing and industrial sectors, though less vocal in their SDG reporting, tend to exhibit stronger alignment between communication and performance (García-Meca & Martínez-Ferrero, 2022). These findings echo Del Río et al. (2024), who identified sectoral patterns in the gap between SDG Compass (ex ante) and SDG Compliance (ex post) indicators.

At the governance level, we expect that companies with diverse and independent boards, the presence of sustainability committees, and a long-term strategic orientation show higher coherence. This supports the view that governance structures play a pivotal role in translating symbolic commitments into measurable outcomes (García-Sánchez et al., 2022). Conversely, firms with concentrated ownership or short-term financial incentives are more prone to SDG-washing, using disclosures primarily as legitimacy tools.

Theoretically, we expect our findings to reinforce the insights of legitimacy theory by illustrating how firms may use SDG discourse to construct a socially acceptable narrative without substantive behavioral change (Bebbington & Unerman, 2018; Del Río et al., 2024). However, the introduction of SDG coherence extends this framework by quantifying the degree to which legitimacy is grounded in measurable performance. In doing so, it also operationalizes the stakeholder theory proposition that long-term value creation depends on the alignment between stakeholder expectations, corporate strategy, and verifiable outcomes (Freeman, 1984; Donaldson & Preston, 1995).

The results may help highlight different typology of firms based on their coherence profiles. High-coherence firms are those who exhibit a strategic integration of SDGs into their business models, supported by tangible ESG metrics. These firms engage in "greenwalking," demonstrating both narrative and operational alignment. Medium-coherence firms are those who display partial consistency, often constrained by limited data availability or weak measurement systems. Lastly, low-coherence firms are those who engage in SDG-washing, prioritizing symbolic communication over actual performance. This typology offers a nuanced lens through which scholars and practitioners can evaluate corporate sustainability maturity.

Beyond theoretical contribution, the study may offer several practical implications. First, the SDG Coherence Score provides regulators, investors, and analysts with a replicable and transparent tool for evaluating the authenticity of corporate SDG engagement. As sustainability

disclosures increasingly influence access to capital and stakeholder trust, coherence can serve as a diagnostic measure to identify firms whose sustainability narratives are substantiated by evidence. Second, the findings underscore the need for integrated reporting frameworks that explicitly link SDG disclosure to quantifiable ESG metrics. Regulatory initiatives such as the European Union's Corporate Sustainability Reporting Directive (CSRD) and the Sustainable Finance Disclosure Regulation (SFDR) can benefit from incorporating coherence-based assessments to mitigate risks of symbolic compliance.

The study also identifies avenues for future research. While our current analysis employs two ESG indicators to operationalize coherence, future studies should expand the indicator set to include environmental metrics (e.g., carbon intensity, waste reduction) and social dimensions (e.g., employee well-being, community investment), in line with Ferrón Vílchez et al. (2022). Moreover, longitudinal analyses could trace how coherence evolves over time, revealing whether firms transition from symbolic to substantive SDG engagement. Comparative research across institutional contexts could further elucidate the role of regulation, culture, and stakeholder pressure in shaping coherence.

In conclusion, this study may contribute to the growing discourse on corporate accountability and the SDGs by introducing and empirically testing the concept of SDG coherence. Grounded in legitimacy and stakeholder theories and informed by the ex ante/ex post framework of Del Río et al. (2024), it provides a novel methodological approach to assessing the authenticity of corporate sustainability efforts. The findings may suggest that the proliferation of SDG references in corporate reports does not necessarily equate to substantive progress. Instead, what truly matters is the degree of alignment between disclosure and performance which mirrors the coherence between what companies claim and what they achieve.

By transforming this alignment into a measurable construct, SDG coherence bridges the divide between symbolic communication and tangible performance, offering scholars, practitioners, and policymakers a tool to evaluate and promote genuine contributions to sustainable development. It invites organizations to reconceptualize sustainability not as a communicative exercise but as an operational reality, thus advancing the transition from disclosure to performance, from legitimacy-seeking to value creation, and from SDG-washing to SDG coherence.

Keywords: Sustainable Development Goals (SDGs); ESG performance; sustainability reporting; non-financial disclosure; SDG-washing

A ten-years empirical analysis (2015-2026) on companies listed in the two most digitalized European Countries. Danis and Finnish blue-chip firms

Alberto Sinatra[1], Elisa Rita Ferrari [2], Daniel Malan[3]

1. Introduction

Over the past ten years, Artificial Intelligence (AI) has undergone a remarkable evolution – from aspirational prototypes and proof-of-concept pilots to integrated, high-stakes systems deployed across finance, manufacturing and services. This shift has expanded the domain of risk and oversight: beyond classic financial or regulatory risk, firms now confront algorithmic bias, data governance failures, opacity and accountability gaps. In this context, corporate boards are increasingly judged not only by their strategic vision, but by how they govern and supervise AI itself.

However, despite the proliferation of frameworks and normative prescriptions for AI governance, the empirical record remains thin on how boards structurally adapt over time. Do boards rearrange their internal governance architecture (for instance, creating committees with explicit mandates over technology or AI)? Do they revise charters or adopt clearer accountability lines? Do they recruit directors with scientific, computing, or AI expertise? And – crucially – how do these changes unfold over a longer horizon, especially straddling regulatory inflection points such as the adoption of the EU's AI Act in 2024?

This study seeks to address that gap by examining a decade-long trajectory (2015-2025) of Danish and Finnish listed firms. Denmark and Finland are compelling cases: both are among the leading EU nations in AI uptake, with robust digital infrastructure and high institutional capacity. For example, in 2023, approximately the 66.22% of Danish Larger Enterprises and 51.17% of Finnish Larger Enterprises reported "using any AI technology" – well above the EU average (28.41%). These countries thus serve as relevant 'laboratories' for observing board-level adaptation in mature digital economies (Eurostat, 2024).

We focus on firms within the OMXC25 (Denmark) and OMX Helsinki 25 (Finland). By tracking changes in committee mandates and board expertise across this decade, we aim to document how corporate governance bodies respond, gradually or abruptly, to evolving AI exposure and regulation. Our analysis is descriptive and comparative, avoiding premature claims of causality, but structured enough to detect systematic patterns.

In doing so, we situate recent developments not as isolated responses but as part of a continuum of governance adaptation, thereby providing a more robust baseline for interpreting future shifts as the AI Act's obligations deepen.

2. Theoretical background

Bridging two literatures – AI governance and board governance – this research draws on foundational and contemporary contributions.

On the AI governance side, scholars increasingly emphasize that AI adoption must be governed through structural arrangements, relational dynamics, and procedural safeguards. Papagiannidis et al. (2025) articulates such a layered framework, arguing that responsible AI adoption requires coherent arrangements from top to bottom. Batool, Zowghi & Bano (2025), in a systematic review, underscore that while governance mechanisms (e.g. audit trails, risk committees, model oversight frameworks) are well articulated, we see few studies that trace their adoption over time within corporate boards.

This gap – between prescriptive governance design and longitudinal empirical observation – is exactly what our study seeks to address.From the perspective of board governance and IT oversight., the notion that boards should retain accountability over technology is long established. Nolan & McFarlan (2005) urged boards to consider information technology as strategically critical, not just an operational support function.

Subsequent empirical works, such as Turel, Liu & Bart (2017), have shown that board-level IT governance practices – such as committee structures, charters and oversight processes – are meaningful associated with firm performance and risk mitigation, particularly when aligned with organizational maturity.

More recently, Caluwe et al. (2024) warn against isolating technology oversight in silos, advocating instead for embedding AI or IT oversight within the board's core architecture and ensuring coherence across committees. Their argument is particularly relevant in a context where AI is both pervasive and cross-cutting: governance cannot rest in a single committee disconnected from strategic, risk, or audit oversight.

Layered on top of this is the literature on algorithmic accountability, ethics, and governance pressures. Mittelstadt (2019) incisively critiques the idea that broad principles (e.g. fairness, transparency) are suffice without robust implementation structures. Jobin, Ienca & Vayena (2019) map the landscape of AI ethics guidelines globally but caution that norms without enforcement mechanisms risk being symbolic. Kroll et al. (2017) dive deeper into the notion of 'accountable algorithms', arguing that for algorithmic systems to be held to account, oversight lines must be clear and enforceable, often necessitating formal structures like audits or governance committees. Together, these literatures suggest that boards confronting AI exposure must move beyond rhetorical buy-in to structural and processual reform.

By integrating these streams, we reason that boards under increasing AI exposure may gradually (or in punctuated shifts) redesign committee architectures, revise charters to explicitly reference AI oversight, and recruit directors with digital or AI credentials. Yet, exactly how these shifts unfold over time – especially in comparable settings – is largely uncharted, which underscores our study's contribution.

3. Research Question and Exploratory Hypotheses

To clarify scope and evaluability, we formulate our research question as follows:

[RQ]: How have board committees structures and board-level digital/AI expertise evolved in Danish and Finnish blue-chip firms between 2015 and 2025, reflecting governance adaptation to technological and regulatory pressures?

We operationalize board adaptation along these measurable dimensions:

(i) committee architecture: number and type of committees with explicit AI/technology/data mandates; establishment dates, renaming, or scope expansions;

(ii)mandate revisions: formal charter updates mentioning AI, data governance, algorithmic risk, or digital oversight responsibilities;

(iii) board human capital: percentage and number of directors with backgrounds in IT, AI, computer science, data science, or tech leadership.

To guide the analysis, we develop exploratory hypotheses:

[H1]: Formal charter revisions referencing AI/data governance will cluster around 2024-2025, following the EU AI Act's adoption;

[H2]: Technology-intensive sectors (ICT, telecom, energy, industrial engineering) will show higher rates of new committee creation than financial services, where AI oversight will be integrated into existing audit/risk committees;

[H3]: The proportion of directors with digital/AI expertise will increase gradually over 2015-2025, with accelerations after regulatory or institutional milestones (e.g. AI Act 2024);

[H4]: Firms disclosing higher AI adoption levels will exhibit more extensive board adaptation (committees, mandates, expertise) than peers with limited AI engagement.

These hypotheses will allow empirical evaluation while preserving the study's exploratory character.

4. Methodological approach

To address our research question, we conduct a longitudinal qualitative document analysis covering all firms in the OMXC25 and the OMXH25 indices for each year from 2015 through 2025. Following the methodological guidelines from Bowen (2009) and Morgan (2022), we systematically select, appraise, code, and synthesize the documents under analysis.

The OMXC25 Index (OMX Copenhagen 25) includes the 25 most actively traded and largest companies listed on the Nasdaq Copenhagen Stock Exchange. It is a free-float market capitalization- weighted index with a capping mechanism designed to prevent any single company from exerting excessive influence. The index composition is reviewed periodically to maintain both liquidity and market representativeness.

Similarly, the OMXH25 Index (OMX Helsinki 25) comprises the 25 most actively traded companies on the Nasdaq Helsinki Stock Exchange. It is also capitalization-weighted, with a maximum weight cap of 10% per company to limit excessive concentration. The composition of the index is reviewed semi-annually, while the weights are rebalanced quarterly.

Both indices therefore serve as representative benchmarks for the Danish and Finnish markets, respectively, and are widely employed in empirical research and financial analysis. Our focus on firms listed in these indices is motivated by two complementary considerations. First, companies admitted to trading on a regulated market and meeting the capitalization, liquidity, and governance criteria required for index inclusions are, by definition, classified as 'Large Enterprises' under European Union terminology. These firms typically exhibit mature corporate structures, greater administrative resources, and advanced reporting capabilities. Second, listed companies are subject to strict transparency and disclosure requirements, both financial and non-financial, including those under the Transparency Directive, the MAR regulation, and the forthcoming CSRD Rules. These obligations ensure that financial statements, management reports, sustainability disclosures, and other corporate communications are made public and accessible.

By focusing on companies included in the two indices, we maximize the likelihood of obtaining reliable, comparable, and sufficiently comprehensive information to support both longitudinal and cross-sectional analyses with methodological rigor.

We construct a balanced panel of 50 firms – 25 OMXC25 constituents and 25 OMXH25 constituents – and maintain this sample across the entire 2015-2025 period under investigation. The reference set is defined as of 30 June 2025, corresponding to the index constituents at the midpoint of the year, and we then track these same firms retrospectively throughout the preceding decade.

This approach follows established practices in panel data analysis, where maintaining a balanced panel ensures that all firms are observed in each period, thereby improving comparability and simplifying longitudinal inference. In financial market research, the 'fixed-constituent approach' has been widely adopted in European and Nordic studies examining stock market indices, provided the ex-post sample selection biases – in particular, survivorship and look-ahead biases – are acknowledged and appropriately mitigated.

As highlighted by Vaihekoski (2023) in his review of Nordic index construction methodologies, fixing the sample ex post is methodologically acceptable if accompanied by robustness checks, suchas point-in-time analyses or alternative weighting schemes. These measures ensure that findings are not unduly influenced by the peculiarities of surviving firms or by retrospective knowledge of index composition. Consistent with this guidance, our empirical strategy includes sensitivity analyses to assess the stability of results under alternative sample definitions, thereby enhancing the credibility of our conclusions and mitigating concerns about potential biases.

The documentary sources employed in our study include:

- Annual Reports and Corporate Governance disclosures;
- Board Committee Charters, Renewal Amendments, and Committee Descriptions;
- Biographical Profiles of Directors;
- Governance Statements or ad hoc updates concerning board or industry transformations.

As previously stated, our methodology consists of a longitudinal qualitative document analysis applied to all firms within the indices under review.

According to Corbin and Strauss (2008), document analysis constitutes "a systematic procedure for reviewing or evaluating documents – both printed and electronic. Like other analytical methods in qualitative research, document analysis requires that data be examined and interpreted in order to elicit meaning, gain understanding, and develop empirical knowledge". While document analysis is frequently combined with other qualitative methods for purposes of triangulation – "the combination of methodologies in the study of the same phenomenon" (Denzin, 1970, p. 217) – the exploratory and descriptive nature of the present study does not necessitate the adoption of additional methodologies. At the same time, it is worth noting that document analysis has often been employed as a 'stand-alone' methodology; indeed, several significant qualitative studies have relied exclusively on documentary sources (e.g. McMahon et al., 2009).

As emphasized by Bowen (2009), documentary materials serve five specific functions, among which our study focuses on the fourth: using documents as a "means of tracking change and development".

Where multiple versions of the same document are available, researchers can compare them to identify alterations over time. Even minor revisions may signal important organizational or governance changes (Yin, 1994). Moreover, the analysis of periodic and final reports – where accessible – enables the researcher to obtain a comprehensive view of how a company or a program evolved over time (Bowen, 2009).

5. Institutional Context and Reasoned Expectations

Denmark and Finland are among the EU's more advanced economies in terms of digital readiness and AI diffusion. Eurostat's data show that in 2023, the 66.22% of the Large Enterprises in Denmark and the 51.17% of Large Enterprises in Finland reported "using any AI technology", significantly above the European Union average which was of the 28.41%. Actually, 2023 was the first year that the European Commission started to measure how companies in Europe were using artificial intelligence tools. Therefore, we used 2023 as the year for this study. This high base suggests that large firms in these jurisdictions face mounting expectations for internal governance refinement.

The EU AI Act, which came into force on 1 August 2024, established a phased regime that introduces accountability, auditability, transparency, and risk management obligations for AI systems – particularly high-risk ones – with many obligations coming into force in 2025-2026. The AI Act, thus represents a potential regulatory tipping point for boards, raising the salience of formal oversight.

From our theoretical framing, we might reasonably expect adaptation to accelerate post-2022, with more frequent charter revisions and committee redefinitions in 2024-2025, as firms reposition governance in light of regulation. We also anticipate sectoral differentiation: technology, telecommunications, industrial engineering, or clean energy sectors may lead in establishing dedicated oversight committees, whereas financial services firms may respond by expanding scope in audit/risk committees rather than creating standalone boards.

Still, these expectations remain provisional until coding is complete.

6. Contribution and Significance

This research, aims to offer three central contributions:

(i) empirical depth over time: by mapping board-level AI adaptation over a full decade, we move beyond snapshots to reveal how governance evolves gradually, accelerates, or stalls in response to adoption and regulation;

(ii) theory bridging: we connect high-level AI governance frameworks (structural, relational, procedural) with observable board design decisions (committees and human capital), providing a practical bridge between normative prescriptions and corporate practice;

(iii) practical and normative relevance: in a period of heightened regulatory scrutiny (AI Act era), our findings can guide boards, investors, regulators, and standard-setters. Board may benchmark their own AI oversight maturity; regulators or exchanges can better understand how structural constraints and institutional legacies influence governance responses.

Moreover, by focusing on two advanced but distinct Nordic markets, the study offers comparative insight into how institutional context conditions adaptation.

7. Limitations and Paths Forward

Because our design relies on publicly disclosed documents, it may omit internal or informal governance arrangements that are not visible externally. Furthermore, this descriptive design does not allow us to infer causality – we cannot definitively say adoption of AI caused governance change, or vice versa.

To deepen insight, future extensions might include semi-structured interviews with board chairs, governance committees, or corporate secretaries to understand the drivers, barriers, and dynamics of adaptation. Another route is to expand the study to additional European markets to test generalizability. Finally, correlating changes in committee design or director expertise with firm-level outcomes (innovation, AI adoption success, risk incidents) would allow stronger inference about the performance implications of governance adaptation.

Startups' Adoption of Growth Hacking: An Empirical Study in Tunisia

Nesrine Agrebi[1], Lala Hu[2]

1. Introduction

It has become widely recognized that entrepreneurship plays a fundamental role in addressing the social and economic challenges facing the African continent, as well as in promoting job creation, technological advancement, and economic diversification. Tunisia is considered a vital hub for innovation in Africa, despite the structural challenges and limited resources faced by entrepreneurs. In Tunisia, pioneering legislative initiatives such as the 2018 Startup Law have helped create a favorable environment offering tax incentives, distinctive branding, and seed funding (Sold, 2018). However, the Tunisian entrepreneurial ecosystem continues to face numerous obstacles, such as limited access to venture capital, uneven levels of digital infrastructure, and regulatory uncertainty that may restrict startups' global expansion. In these circumstances, characterized by a lack of creativity, marketing innovation has become a necessity. This study examines how Tunisian startups use digital marketing strategies, including growth hacking techniques, to support their startups.

Tunisian startups find themselves under pressure to expand rapidly despite severe financial constraints. In this context, digital marketing and growth hacking emerge as vital tools that allow them to overcome traditional barriers to market entry and turn constraints into opportunities thanks to digital agility. Therefore, this study explores the fundamental processes of this transformation within the Tunisian ecosystem and highlights the unique adaptation strategies developed by local entrepreneurs to achieve success despite the obstacles. Digital marketing has become the cornerstone of modern growth strategies. It encompasses a diverse range of tools and techniques, such as the strategic use of social media, search engine optimization (SEO), content marketing, email campaigns, and online advertising. The goal is to boost brand visibility, attract new customers, and retain existing ones at costs that are often lower compared to traditional marketing (Tiago & Veríssimo, 2014; Olivieri & Testa, 2024). At the same time, the field of growth hacking has emerged as a flexible and experimental discipline that combines elements of marketing, engineering, and data analysis.

Unlike traditional marketing strategies, growth hacking focuses on unconventional and often cost-effective methods that rely on experimentation to significantly increase user numbers and improve key performance indicators (KPIs) (Bohnsack & Liesner, 2019; Bargoni et al., 2024). Recent academic studies indicate that growth hacking fosters a culture of rapid experimentation and iterative learning. However, most empirical research focuses on well-developed systemic environments such as Silicon Valley, London, or Berlin, where startups have robust data systems, easy access to specialized consultants, and abundant venture capital (Macca et al., 2024; Cavallo et al., 2023). Theoretical frameworks often rely on the presence of advanced digital platforms and highly skilled teams conditions that may not always reflect the reality faced by Tunisia. In fact, African startups typically operate in environments characterized by limited access to digital platforms, underdeveloped technological infrastructure, and scarce specialized skills (Kabengele & Hahn, 2025).

[1] Ph.D. Candidate, ECON 07/A, Università Cattolica del Sacro Cuore; agrebi.nesrine@universitecentrale.tn - corresponding author

[2] Senior Assistant Professor, ECON 07/A, Università Cattolica del Sacro Cuore; lala.hu@unicatt.it

In Tunisia, most startups are run by small teams that often lack formal training in marketing and find themselves operating in a fragmented market with limited resources. For this reason, this research seeks to address the current academic gap by posing the following question: *How do Tunisian entrepreneurs adopt digital marketing strategies and growth hacking within a resource-constrained environment?* The objective is to determine whether growth hacking, in its adapted form, can foster sustainable development and provide a competitive advantage in the context of an emerging economy despite structural difficulties. To explore this complex issue and investigate the details of entrepreneurial practices, we adopted a qualitative approach centered on multiple case studies. This approach is particularly well-suited for conducting an in-depth analysis of decision-making processes, entrepreneurial behaviors, and adaptation strategies within their original context, facilitating the capture of the complexities and nuances of the individuals' experiences. The dataset comprises 19 semi-structured interviews conducted between November 2024 and July 2025.

Participants were selected to ensure a diversity of perspectives and representation of various aspects of the Tunisian entrepreneurial landscape. The group included 10 startup founders from diverse sectors such as agritech (e.g., smart irrigation), edtech (e.g., educational platforms), tourism (e.g., tech-enabled travel), culture, biotechnology, and digital services; as well as 5 experts from the ecosystem, including business incubator directors, entrepreneurship coaches, and strategic marketing consultants. Four end-users who interact with innovations in urban transportation, agritech, or educational services were also included. This multi-perspective approach contributed to improving the quality of the research and increasing the credibility of the results. The interviews, which lasted approximately 30 to 45 minutes, were recorded with the participants' consent, then transcribed verbatim and analyzed using NVivo 14.

We adopted the Gioia method (Gioia et al., 2013), which involves detailed and iterative data analysis, with the aim of transforming raw information into core concepts, then into sub-themes, and finally into integrated dimensions. This strategy ensures scientific integrity while preserving the depth of personal narratives. The qualitative study revealed three integrated dimensions that reflect the complex landscape of marketing in Tunisian startups. The most striking observation is that many Tunisian entrepreneurs start with an insufficient understanding of their target customers. Since they typically come from technical fields, they tend to prioritize the appeal of their technical innovations over a comprehensive assessment of customer needs. This problem is often exacerbated by the lack of reliable and accessible market data in Tunisia (Chakraborti et al. Nevertheless, there are rapid shifts toward adaptation. When facing difficulties with initial sales, founders begin to leverage customer insights to develop or improve their products.

This customer-centric approach represents an early stage of growth hacking: they experiment, face challenges, learn, and make adjustments. Startups rely on prototypes and minimum viable products (MVPs) to test their assumptions in practical, often informal, but effective ways. The study indicates that the most successful entrepreneurs are those who can translate customer feedback into product improvements. This rapid response mechanism is at the heart of growth hacking. In this way, agility becomes a substitute for costly market research (Kaffka & Krueger, 2024). Although its value has increased by 205% according to some recent studies (Siddiqui, 2024), the Tunisian landscape remains fragmented. Entrepreneurs who participated in the survey pointed to a lack of coordination among various support structures. Although business incubators provide general assistance, they often lack mentors with advanced skills in digital marketing, data analysis, or growth hacking strategies.

This fragmentation leads to the emergence of so-called "blind spots," where startups are forced to make critical strategic decisions on their own (Sold, 2018). This drives entrepreneurs to become "self-taught marketers." They seek online courses, webinars, or networking with peers to acquire essential skills. Findings show that the most successful startups are those that manage to integrate into global expert networks or growth-oriented initiatives. There is also a clear gap between university curricula and the immediate operational skills required in digital marketing

for startups. The experts interviewed emphasized the need to strengthen cooperation between the public and private sectors. Although the Startup Act represents a major development, its practical application in the field of marketing remains limited. Support systems should be developed to become true hubs for technological and strategic resources (Lay & Tafese, 2025). Despite the widespread availability of digital tools, their use is often superficial. Platforms such as Facebook, Instagram, and LinkedIn are the most preferred for gaining visibility. WhatsApp Business is also commonly used for customer relationship management.

However, most marketing campaigns lack in-depth analysis. Growth hacking is often seen as more of a trend than a systematic approach. Nevertheless, entrepreneurs unconsciously engage in "hacking" out of necessity: organic growth, collaborations with influencers, and referral initiatives. The fundamental problem remains in measuring performance. Only a handful of startups use advanced analytics tools or conduct A/B tests regularly. Budget decisions are often driven by intuition rather than specific metrics such as customer acquisition cost (CAC) or lifetime value (LTV). This lack of data-driven thinking hinders startups' ability to optimize their campaigns and validate their spending (Agarwal & Sharma, 2024). This research contributes to the literature on entrepreneurship in resource-constrained environments. It demonstrates that digital marketing frameworks and growth hacking strategies designed specifically for developed markets are not always directly applicable. In Tunisia, marketing is adopted within a strategic improvisation (Baker & Nelson, 2005).

We propose to redefine the concept of growth breakthrough in developing countries so that it is not viewed merely as an accumulation of advanced technological resources, but rather as an advanced educational capacity (Teece, 2007). The lack of financial resources is compensated for by enhancing flexibility and the ability to leverage informal social networks. This study also contributes to enriching the theory of marketing capabilities by illustrating how entrepreneurial instinct and adaptability, under certain conditions, can compensate for the lack of official data.

The findings of this study offer actionable recommendations. For entrepreneurs, it is essential to move beyond the tech bubble and adopt a data-driven mindset. For business incubators and accelerators, support must be more detailed and tailored. Policymakers, meanwhile, need to reinforce startup legislation with initiatives that enhance access to marketing expertise and digital infrastructure (Sanasi et al., 2023). In short, this study reveals the paradox in startup marketing in Tunisia: where remarkable innovation and strong adaptability coexist alongside a lack of organization and formality.

While an ad-hoc strategy has led to tangible achievements, the long-term sustainability and international expansion of Tunisian startups depend on their ability to implement professional expansion strategies. This study faces certain limitations due to the small sample size which limits the generalizability of the results. Moreover, the research was conducted only in a single country at a specific point in time. Future research could adopt a longitudinal perspective and compare results across different African countries. Furthermore, quantitative studies are necessary to gain a deeper understanding and confirm this phenomenon on a broader scale. Ultimately, growth hacking in Tunisia represents much more than just a marketing strategy; it embodies a new generation of entrepreneurs who are transforming the economic landscape thanks to smartphones and their innovative ideas. Innovation is not just a matter of financial investment; rather, it is fundamentally based on intellectual talent and the ability to adapt and learn faster than competitors.
