XLI CONVEGNO NAZIONALE AIDEA

LE INTELLIGENZE AZIENDALI PER LA COMPETITIVITÀ SOSTENIBILE E IL BENE COMUNE

Accademia Italiana di Economia Aziendale

22/23 Gennaio 2026

Università Cattolica del Sacro Cuore
Milano

ISBN 9788894783933

Lettera del presidente

Il XLI Convegno Nazionale di AIDEA è stato un'importante occasione di confronto sulle profonde trasformazioni che stanno interessando le imprese, le istituzioni, la società e naturalmente anche le università e le nostre discipline economico-aziendali.
La crescente diffusione dell'intelligenza artificiale sta imprimendo ai processi economici, organizzativi e sociali una velocità di cambiamento senza precedenti. Essa modifica le modalità attraverso cui si genera e si utilizza la conoscenza, si assumono le decisioni, si organizzano le attività e si costruiscono le relazioni con i diversi portatori di interesse: in sintesi, come si genera, si comunica e si distribuisce valore. La rapidità del progresso tecnologico non deve, tuttavia, farci dimenticare che la tecnologia non è mai del tutto neutrale: incorpora scelte, criteri, priorità e visioni della società. L'intelligenza artificiale deve rimanere uno strumento al servizio della responsabilità e della libertà umane, senza trasformarsi in un criterio autonomo e impersonale al quale delegare decisioni che incidono sulla vita delle persone e delle comunità.
Ciò richiede trasparenza, responsabilità e capacità di controllo, ma soprattutto la piena riconoscibilità della Governance aziendale cui compete la decisione finale. Le possibilità offerte dagli algoritmi non possono attenuare la responsabilità di chi progetta, governa e utilizza tali sistemi all'interno delle imprese e delle organizzazioni. In questa prospettiva, il bene comune non rappresenta un limite esterno all'innovazione, ma il suo criterio più alto di orientamento. Le imprese sono chiamate a concorrervi attraverso scelte che sappiano armonizzare competitività, sostenibilità, rispetto della persona e responsabilità verso le generazioni future. La loro capacità di perdurare non può essere separata dal contributo che offrono in termini di valore economico e di tutela del patrimonio umano, sociale e ambientale nel quale operano.
Gli studi raccolti in questi Atti testimoniano la vitalità della comunità italiana delle aziendaliste e degli aziendalisti, una comunità che ha sempre saputo confrontarsi con le trasformazioni del proprio tempo senza rinunciare alla solidità delle proprie centenarie radici scientifiche e alla responsabilità del proprio ruolo. È proprio dalla capacità di coniugare tradizione e innovazione, rigore metodologico e apertura interdisciplinare, che può nascere un contributo autorevole alla comprensione del presente e alla costruzione del futuro.
Nel corso di una storia più che bicentenaria, AIDEA e la tradizione scientifica che essa rappresenta hanno attraversato profonde trasformazioni ed anche diverse rivoluzioni industriali. Con il medesimo spirito, la nostra Accademia saprà continuare ad essere una comunità scientifica aperta, responsabile e capace di proiettarsi positivamente nel futuro, contribuendo a orientare anche la nuova rivoluzione che interessa le intelligenze aziendali.

Il Presidente

Gennaro Iasevoli

Il convegno

La celebrazione del XLI Convegno dell'Accademia Italiana di Economia Aziendale si è confermata un'eccellente opportunità per un ampio ed aperto confronto scientifico fra studiose e studiosi di discipline aziendali su temi che animano un dibattito accademico e culturale vivacissimo ed ormai giunto a un livello di maturazione e approfondimento tale da richiedere sintesi teoriche unitarie che si rivelino utili a integrare i paradigmi interpretativi utilizzati dai cultori delle discipline aziendali per condurre i loro studi e orientare l'agire manageriale.

L'amplissima partecipazione di socie e soci, la più alta mia registratasi da quando AIDEA ha adottato il nuovo modello di governance, è stata la dimostrazione più evidente dell'interesse per la tematica del Convegno e della crescente attenzione che le nostre comunità mostrano per le iniziative scientifiche di altro prestigio che AIDEA promuove con impegno e costanza.

Il successo del Convegno è il risultato di uno sforzo collettivo che ha richiesto l'impegno di numerosissime Colleghe e Colleghi e del numeroso ed efficiente staff dell'Università Cattolica del Sacro Cuore di Milano. Tutte le persone coinvolte, ciascuna nel proprio ruolo, hanno apportato un contributo importante nell'esclusivo interesse di AIDEA. Il consiglio direttivo, il comitato scientifico, il comitato organizzativo i coordinatori e i componenti delle track, le chair persons, i relatori e le relatrici, gli illustri ospiti della seduta plenaria e della track del Journal of Management and Governance, i dottorandi e le dottorande che hanno animato le attività precongressuali.

Il Convegno è stata un'occasione per riflettere sulle sinergie tra intelligenza artificiale e intelligenze aziendali. Se le intelligenze aziendali sono messe al servizio della generazione di valore, se la collaborazione e l'integrazione fra componente umana e artificiale genera maggiore valore, se le aziende restano al servizio "dell'uomo", è cruciale che questo maggior valore sia non solo generato, ma anche misurato, rendicontato ed equamente condiviso. Evidentemente non si tratta solo di valore in senso strettamente finanziario. In particolare, le nuove conoscenze generate dall'interazione delle intelligenze aziendali dovrebbero essere appannaggio di tutti per non rendere impari le relazioni economiche. La proposta di modelli teorico-interpretativi e di soluzioni operative per affrontare efficacemente anche le problematiche appena richiamate è un ulteriore impegno culturale che, grazie anche a questo Convegno, aziendaliste e aziendalisti hanno di mostrato di sapere assumere. Nell'esercizio del loro sforzo teorico, per accademiche e accademici, è utile tenere a mente l'ammonimento di Ursula Franklin: "La fattibilità della tecnologia, come la democrazia, dipende alla fin fine dalla pratica della giustizia e dall'imposizione di limiti al potere".

Smart city project organizational design for public value: a configurational approach

Emanuele Gabriel Margherita[1], Stefania Denise Escobar[2], Giovanni Esposito[3], Nathalie Crutzen[4]

1. Introduction

Public value is a key goal for public administration (PA) (Palumbo and Manesh 2023). Broadly, public value involves what is good for and positively valued by the public (Moore 1995). Specific forms of public value may include services characterized by higher efficiency, effectiveness, and other higher-order forms, such as accountability, fairness, justness (Moore 1995); as well as services that are more accessible to both citizens and tourists (Escobar and Hall 2025). In this work, we use the conceptualization of public value used by (Castelnovo et al. 2016) in terms of the intended outcomes (direct short-term effects) of the PA initiatives implemented. Digital transformation is considered a driver of public value in PAs because it can create less expensive and citizen-centric services (Chen et al. 2020). To this end, smart city projects play a pivotal role in the transition of PAs to digitalize their processes (Escobar and Margherita 2021; Margherita et al. 2023). Smart city projects can be understood as organizational subunits whose primary goal is to implement digital tools that enhance urban services, thereby creating public value while meeting timelines, staying within budget, and complying with predefined performance standards (Viitanen and Kingston 2014). For instance, Hong Kong's municipality developed 8 smart city projects to create public value through mobility enhancement, energy efficiency, smart recycling, and e-government portals (Lam and Yang 2020).

Although previous studies have mostly limited their analysis to the relationship between technological tools and the expected public value outcomes (Bibri and Krogstie 2017), they tend to overlook a more complex examination of the organizational design choices of smart city projects. Such an analysis is essential because each PA has different needs, and the diversity of digital tools requires distinct sets of activities to generate public value. In other words, the traditional "one-size-fits-all" approach to smart city projects must shift toward a "one-size-does-not-fit-all" perspective that takes into account the specific needs of each PA (Nam and Pardo 2011; Esposito et al. 2021).

Designing a smart city project involves a series of organizational choices that we conceptualize along three dimensions: (1) technological choices that enable digital transformation (e.g., first-generation digital technologies or AI systems); (2) implementation arrangements that structure the inter-organizational collaboration for innovation (e.g., public–private partnerships or tendering); and (3) training and capability-building initiatives aimed at preparing human resources of public servants to effectively engage with digital tools.

The first key organizational decision for PAs in smart city projects concerns the technological solutions chosen to sustain digital transformation. These can be broadly categorized

[1] Assistant Professor, ECON-08/A, Link University; e.margherita@unilink.it – corresponding author

[2] Assistant Professor, ECON-07/A, Catholic University of Sacred Heart; stefaniadenise.escobar@unicatt.it

[3] Associate Professor, GSPS-02/A, Université libre de Bruxelles; giovanni.esposito@ulb.be

[4] Full Professor, ECON-06/A, Smart City Institute - HEC Liege; ncrutzen@uliege.be

into two types. The first category includes digital technologies that require active human input, which we term first-generation digital technologies. Public servants operate these systems by entering, managing, or processing data to deliver enhanced services to citizens (Kummitha 2019). A primary example is e-government, defined as the reorganization of public administration and management systems to maximize the use of ICTs in delivering administrative services to citizens (Aleisa 2024). These tools enable the transition from paper-based and in-person workflows to digital, networked procedures. However, they typically require ongoing updates and maintenance, particularly when administrative processes change (Chidama and Ononiwu 2023). Beyond e-government, digital scheduling and platform systems also fall within this category. These include systems that allow public servants to manage transport networks or cultural events, while enabling citizens to reserve tickets or access services online. These systems are typically designed so that PAs can modify or update them as needed (Esposito et al. 2025).

The second category encompasses AI, defined as "the ability of a machine to learn from experience, adjust to new inputs, and perform human-like tasks" (Duan et al. 2019). Unlike first-generation tools, AI systems act autonomously, assisting public servants in decision-making and providing real-time insights. Examples include city's platforms, which offer live analytics on urban mobility, and smart waste management systems, which employ AI to monitor and analyse air quality data (Margherita et al. 2023).

Beyond the selection of technological solutions, PAs also make organizational decisions about how to structure collaboration with external actors, often by creating an inter-organizational field that supports the deployment of smart city projects (Mora et al. 2023). Given that public administrations often lack the specialized technical skills required to manage complex smart city initiatives or to develop digital tools in-house, they commonly rely on external technology providers (Chu et al. 2021). These actors are typically engaged through Public–Private Partnerships (PPPs) and public tenders, which represent two distinct modes of inter-organizational coordination (Kummitha 2019; Esposito, Taffoni, et al. 2024).

Public–private partnerships (PPPs) are long-term collaborative arrangements in which PAs and private organizations co-design, co-invest in, and co-implement smart city projects (Quan and Solheim 2023). In PPPs, the inter-organizational collaborations are structured through joint governance mechanisms, shared responsibilities, and negotiated objectives, fostering a strategic and integrative relationship between public and private actors. In contrast, tendering is a form of regulatory coordination (Kummitha 2019), used to contract specific services or technological implementation through competitive public calls. Through tendering procedures, public administrations establish quasi-markets, where innovation is delegated to external providers selected via open bidding (Esposito, Terlizzi, et al. 2024). Here, the inter-organizational collaboration is organized through formal contracts, clear task specifications, and time-limited engagements, emphasizing transactional accountability rather than strategic co-development (Esposito, Terlizzi, et al. 2024).

Moreover, digital skills have increasingly been recognized as a critical prerequisite for the effective adoption and use of digital technologies (Ciarli et al. 2021). They have become central to both academic and practitioners' debates on the diffusion of digital technologies, particularly in public sector contexts (Helsper and van Deursen 2015). Therefore, human resource training aimed at developing digital competencies represents a third key organizational choice in the design of smart city projects (Gerli et al. 2022). This includes targeted training programs and continuous professional development initiatives, which are essential to enable public servants to operate digital tools effectively and to support the reconfiguration of administrative processes in line with digital transformation goals (Gerli et al. 2022).

So far, the literature has largely examined the organizational design choices of smart city projects for public value - technological tools, inter-organizational collaboration instruments, and training initiatives - in isolation. However, the smart city projects in PAs require the combined effect of multiple interdependent choices. As a result, there is a lack of comprehensive,

configurational studies that investigate how different design elements interact to support the successful development and implementation of smart city projects for public value. To address this gap, we pose the following research question: "What configurations (if any) of smart city project organizational design are associated with the realization of expected public value?"

To address these gaps, this study conducts a fuzzy-set qualitative comparative analysis (fsQCA). fsQCA accounts for the complexity of causal relationships and enables the identification of alternative smart city project organizational design choices through which public value may emerge. Our sample consists of 85 smart city projects initiated under the call for projects "Walloon Smart Territory – 2019". The empirical focus on this specific regional context allows us to account for real-world variation of smart city projects across municipal administrations.

This study contributes to the literature on the organizational design of innovation and smart city projects (De Vries et al. 2016; Kummitha 2019), as the first to empirically examine organizational choices oriented toward public value in an integrated manner. Moreover, it identifies three distinct configurations of smart city project organizational design aimed at generating intended public value.

2. Methodology and sample

We conduct fsQCA (Ragin 2008). It embraces a configurational logic that accounts for the interaction effects among various characteristics within a case (Misangyi et al. 2017). fsQCA investigates causal complexity and conjunctural mechanisms through the logic of set theory, allowing the conceptualization of configurations and their conjunctural nature as combinations of fuzzy sets (Margherita and Braccini 2020; White and Burger 2022). For this study, we use as our sample 85 project proposals submitted in response to the Walloon Smart Territory call (2019). This is a valid sample because this initiative invited PAs to propose smart city projects aimed at adopting digital technologies or AI and related training to enhance public service value with the help of inter-organizational instruments. Therefore, this sample allows to analyse the theoretical conditions of smart city projects (inter-organizational instruments, technological solutions, and investment in training) in relation to the outcome of public value, grounded on enhanced public services. fsQCA requires the calibration of each condition and outcome, i.e., the grading of a scale of membership ranging from full membership to full non-membership. When working with textual data, an indirect calibration method is recommended (Ragin 2008). This method enables researchers' to categorize each case based on its degree of membership in the relevant condition and outcome sets. For the five conditions (PPPs, tenders, first-generation digital technologies, AI systems, training) and the outcome (public value) a three-level scale is employed. This scale identifies whether a condition is present (0.95) or absent (0.05) with 0.5 as a cross-over point, representing maximum ambiguity (Berné-Martínez et al. 2021). Following the selection of these calibration scales, a deductive thematic analysis was conducted to identify the presence, absence, and ambiguity of each condition and the outcome within the project proposals (Braun and Clarke 2006).

3. Findings, discussion, and conclusion

The fsQCA methodology provides three main analyses: necessary condition, sufficient condition, and robustness analysis. In this extended abstract, we focus on the complex solution of the sufficient conditions analysis (Table 1). The complex solution presents all the possible combinations of conditions for the outcome (Margherita and Escobar 2025). The results are presented according to the notation proposed by (Fiss 2011), which is widely adopted in studies employing the fsQCA methodology. In this notation, a filled circle (●) indicates the presence of

a condition contributing to the outcome, a crossed circle (⊗) represents the absence of that condition, and a blank space (–) denotes indifference of the condition with respect to the outcome.

	Solutions		
Condition	1	2	3
PPPs	●	●	⊗
Tenders	⊗	⊗	●
First-generation digital technologies	⊗	●	●
AI	●	⊗	⊗
Human resource training	-	●	●
Raw coverage	0.31	0.37	0.23
Unique coverage	0.20	0.19	0.05
Consistency	0.86	0.92	0.91
Solution coverage	0.62		
Solution consistency	0.86		
Legend: ●= Causal condition present ⊗ = Causal condition absent - = indifference			

Table 1. The sufficient conditions analysis: complex solution

The analysis reveals three main configurations. The first solution shows that smart city projects are designed to create public value through the use of PPPs combined with AI systems (Szpilko et al. 2023). This configuration is grounded in the idea that PPPs act as long-term collaborative instruments, enabling the continuous management of complex AI systems that require co-design and the ongoing monitoring and adjustment beyond the initial implementation phase to ensure public value realization (Kummitha 2019; Ahad et al. 2020). The second solution highlights the role of PPPs in managing first-generation digital technologies jointly with training programs for public servants (Esposito et al. 2025). In this case, PPPs facilitate the implementation of complex smart city projects that involve first-generation digital technologies requiring continuous updates over time, such as e-government systems capable of delivering multiple services over time (Aleisa 2024). These technologies demand high levels of digital competence among public employees; consequently, technology providers can provide ongoing training to ensure effective technology use and maintenance of the system (Chidama and Ononiwu 2023). Finally, the third solution emphasizes the role of traditional public tenders in developing smart city projects that foster public value creation. In this configuration, technology vendors are capable of delivering well-defined first-generation digital technologies that do not require frequent updates, while also equipping public servants with the necessary skills for their effective use (Margherita et al. 2023; Esposito et al. 2025). This study has a limitation: it does not allow us to analyse the achieved public value of smart city projects, but only their intended public value. Nevertheless, this limitation does not diminish the relevance of the research, as most smart city initiatives remain largely conceptual (Appio et al. 2019). In contrast, this work provides one of the first empirical perspectives on how such projects are actually being developed.

Keywords: Smart city project; organizational design; public value; fsQCA; artificial intelligence

Intelligenza Artificiale e readiness organizzativa nella PA locale: il caso del Comune di Sezze

Sabrina Restante[1], Francesco Bellini[2], Irina Gorelova[3], Bernardino Quattrociocchi[4]

1. Introduzione

Negli ultimi anni, la Pubblica Amministrazione (PA) italiana è stata coinvolta in un articolato processo di trasformazione digitale, guidato dal Piano Nazionale di Ripresa e Resilienza (PNRR) e da strategie orientate alla semplificazione e alla trasparenza amministrativa. In questo scenario, l'integrazione di tecnologie basate sull'Intelligenza Artificiale (AI) costituisce una delle principali sfide per le amministrazioni locali, che devono equilibrare esigenze di efficienza, accessibilità e inclusione. Il Comune di Sezze, situato nella provincia di Latina, rappresenta un esempio significativo di ente impegnato, nel periodo 2022-2025, in un percorso strutturato di digitalizzazione dei servizi informativi, culminato nell'analisi di fattibilità di un "chatbot AI civico" a supporto delle attività informativo-amministrative. Il presente contributo si propone di esplorare, attraverso un'indagine interna rivolta al personale comunale, le condizioni organizzative, il livello di competenze digitali e le percezioni associate a tale innovazione, adottando il quadro teorico della co-creazione di valore pubblico e del digital government come riferimento interpretativo.

Il presente studio non persegue obiettivi di rappresentatività statistica, bensì di generalizzazione analitica, coerentemente con l'impostazione del single embedded case study. Il Comune di Sezze è stato selezionato in quanto caso teoricamente informativo, caratterizzato da condizioni organizzative ricorrenti in un'ampia platea di enti locali di medie e piccole dimensioni: risorse digitali limitate, elevata pressione informativa multicanale e un capitale amministrativo consolidato. In tale prospettiva, i risultati non sono intesi come generalizzabili all'insieme delle amministrazioni locali, ma come trasferibili per analogia a contesti organizzativi che presentano condizioni strutturali e operative comparabili, mentre non si applicano direttamente a grandi amministrazioni metropolitane o a enti con elevata maturità digitale.

L'assenza di una triangolazione con indicatori oggettivi di processo o di performance rappresenta un limite dello studio; tuttavia, essa riflette consapevolmente l'attenzione rivolta alle dimensioni organizzative e percettive che precedono e condizionano l'adozione effettiva delle tecnologie di intelligenza artificiale nelle amministrazioni pubbliche.

2. Framework teorico

Il digital government è considerato uno dei pilastri della trasformazione digitale nelle PA, insieme alla leadership digitale ("digital leadership") e alla gestione digitale delle risorse umane ("digital HRM") (Hunitie & Akhorshaideh, 2025). Negli ultimi anni, il dibattito scientifico sul digital government ha evidenziato come la transizione digitale nella PA non possa essere ridotta a una mera questione tecnologica. La digitalizzazione, per produrre benefici concreti e duraturi, deve infatti accompagnarsi a una profonda trasformazione organizzativa, capace di ripensare processi, competenze e relazioni all'interno delle PA (Mergel, Edelmann & Haug, 2019). Come osservano Dunleavy et al. (2006), l'introduzione di tecnologie digitali in assenza di una visione integrata può generare un effetto paradossale: anziché semplificare o innovare, si rischia di automatizzare rigidità preesistenti, rafforzando la burocrazia anziché trasformarla.

Questa analisi risulta particolarmente pertinente nel contesto italiano, in cui la digitalizzazione della pubblica amministrazione, sebbene incentivata da iniziative nazionali quali il PNRR, evidenzia ancora fenomeni di frammentazione e discontinuità. Gli studi di Bonomi Savignon et al. (2022) rilevano che, in particolare nei comuni di piccole e medie dimensioni, l'introduzione di strumenti digitali non si traduce necessariamente in una revisione dei processi di programmazione, controllo e gestione, riflettendo una digitalizzazione prevalentemente orientata alla conformità normativa anziché all'innovazione di valore. Contestualmente, l'adozione di soluzioni digitali può rappresentare un'opportunità per migliorare la qualità dei servizi offerti dalla PA e favorire il superamento della frammentazione territoriale nel quadro nazionale (Sacchi & Scarano, 2025).

La letteratura sul valore pubblico fornisce una cornice teorica utile per comprendere cosa significhi realmente "innovare" nella PA. L'approccio proposto da Moore (1995) e successivamente arricchito da studi più recenti (Bannister & Connolly, 2014; Criado & Gil-García, 2019) sottolinea che il valore creato dalle PA non può essere valutato esclusivamente in termini di efficienza economica, ma deve includere dimensioni fondamentali come l'equità, la trasparenza, la fiducia e l'inclusione (Deidda Gagliardo et al. 2024). In questo senso, le tecnologie digitali e in particolare l'intelligenza artificiale, devono essere valutate non solo per le loro performance tecniche, ma anche per la loro capacità di abilitare relazioni più eque, inclusive e significative tra cittadini e istituzioni.

In questo contesto, il concetto di readiness digitale riveste un ruolo strategico fondamentale. Esso non si limita alla semplice disponibilità delle tecnologie necessarie, ma implica la capacità di attivare competenze specifiche, promuovere una cultura organizzativa adeguata e implementare strutture di governance efficaci a supporto di processi di cambiamento trasformativo. Come evidenziato da Cinar, Trott e Simms (2022), la readiness digitale rappresenta una competenza organizzativa complessa, frutto dell'integrazione tra risorse umane, tecnologiche e cognitive, da sviluppare progressivamente attraverso iniziative di apprendimento, adattamento e sperimentazione.

La letteratura recente insiste inoltre sulla necessità di costruire una capacità digitale resiliente nella PA, intesa come la combinazione tra competenze digitali diffuse, flessibilità operativa e orientamento al miglioramento continuo (Dubei et al., 2023). L'introduzione dell'AI, in particolare, richiede non solo infrastrutture adeguate, ma anche una diffusa AI literacy, ovvero la comprensione critica degli strumenti intelligenti e delle loro implicazioni sul lavoro pubblico e sul rapporto con l'utenza (OECD, 2021; Eubanks, 2018).

La digitalizzazione nella PA può quindi generare valore pubblico soltanto se inserita in un percorso di trasformazione sistemica, in cui tecnologia e organizzazione si evolvono congiuntamente. La readiness non è una condizione data, ma un processo da costruire, che richiede attenzione alle persone, alla cultura e alla governance, oltre che alla dimensione tecnica. È in questa prospettiva che il presente studio si colloca, proponendo una lettura della readiness organizzativa all'adozione dell'AI centrata su quattro dimensioni interdipendenti: competenze, processi, percezione del valore e supporto organizzativo.

3. Metodologia

Lo studio adotta un disegno di caso singolo di tipo embedded (embedded single-case study design), secondo l'approccio metodologico proposto da Yin (2018). Tale impostazione consente di indagare un fenomeno contemporaneo, in questo caso, la readiness organizzativa e la percezione del valore pubblico connessa all'adozione di un chatbot AI, all'interno del suo contesto reale, quando i confini tra fenomeno e contesto non risultano chiaramente separabili. L'unità di analisi principale è costituita dal Comune di Sezze, mentre l'unità di analisi incorporata (embedded unit) è rappresentata dal personale comunale coinvolto nella survey interna. L'indagine, condotta nel luglio 2025 in collaborazione con il Dipartimento di Management della Sapienza Università di Roma, ha utilizzato un questionario strutturato somministrato digitalmente a tutto il personale (n=54), ricevendo 32 risposte valide (59,2%). Il questionario comprendeva sette sezioni: profilo organizzativo e professionale; attività prevalenti e rapporto con l'utenza; ripetitività e standardizzabilità delle richieste informative; livello di digital literacy e familiarità con strumenti AI; percezione di utilità e rischi; disponibilità alla sperimentazione e al coinvolgimento; suggerimenti qualitativi.

L'analisi dei dati è stata condotta attraverso (i) un'analisi descrittiva delle frequenze e delle percentuali relative alle principali variabili e (ii) un'analisi qualitativa interpretativa delle risposte aperte, mediante lettura tematica e categorizzazione induttiva (open coding). L'integrazione di metodologie quantitative e qualitative consente di offrire una prospettiva olistica e multilivello del fenomeno, contribuendo ad accrescere la validità interna della ricerca. L'obiettivo principale non risiede nella generalizzazione statistica, bensì nella generalizzazione analitica (Yin, 2018).

Si specifica che la raccolta dei dati si basa prevalentemente su informazioni autoriportate, al fine di cogliere le percezioni, le rappresentazioni e le disposizioni organizzative degli attori interni rispetto all'introduzione di strumenti di intelligenza artificiale. Tale scelta metodologica è coerente con l'obiettivo esplorativo dello studio e con il focus sulla readiness organizzativa, intesa come costrutto in larga misura cognitivo e culturale, particolarmente rilevante nelle fasi iniziali dei processi di innovazione digitale, antecedenti alla produzione di risultati misurabili in termini di performance.

4. Risultati

Profilo organizzativo e cultura digitale. Il campione analizzato è composto da 32 dipendenti su un totale di 54 unità (tasso di risposta pari al 59,2%), distribuiti tra dirigenti/responsabili di settore (31,3%), funzionari categoria D (25%) e personale operativo o di vigilanza (9,4%). La maggioranza dei rispondenti (59,4%) possiede un'anzianità di servizio superiore ai vent'anni, evidenziando un capitale amministrativo consolidato. Il 46,9% dichiara un buon livello di familiarità con strumenti digitali evoluti, mentre il 43,8% ha già utilizzato chatbot in ambito personale o professionale. Permane tuttavia un gap formativo: il 21,9% non ha mai partecipato a corsi di formazione digitale e il 25% vi ha preso parte oltre due anni fa.

Standardizzabilità dei flussi informativi e pressione comunicativa. Il 46,9% dei rispondenti considera le richieste informative ricevute altamente ripetitive e standardizzabili. Le tipologie più frequenti riguardano orari e contatti (62,5%), modulistica e documentazione (59,4%), stato delle pratiche (40,6%) e informazioni tributarie (21,9%). Parallelamente, il 50% giudica la qualità dell'accesso informativo "migliorabile", mentre solo il 31,3% la ritiene "molto buona". Questi risultati indicano una pressione informativa significativa, con richieste veicolate su canali multipli: telefono (56,3%), e-mail istituzionale (53,1%) e front office (43,8%).

Percezione di valore e rischi associati al chatbot. I benefici attesi includono la riduzione del carico telefonico (28,1%), la possibilità di dedicare più tempo ad attività complesse (28,1%), un miglioramento dell'efficienza del front office (12,5%) e una maggiore uniformità delle risposte (9,4%). Tra i rischi prevalgono le possibili risposte errate o generiche (56,3%), le difficoltà per utenti anziani o fragili (21,9%) e la potenziale perdita del rapporto umano (15,6%). Ne emerge

un atteggiamento di cauto ottimismo: il potenziale di efficienza è riconosciuto, ma la fiducia è condizionata dalla qualità del servizio e dall'inclusività.

Readiness al cambiamento e condizioni abilitanti. Il 37,5% dei rispondenti si dichiara favorevole con convinzione alla sperimentazione del chatbot e il 34,4% con riserva. Il 65,7% risulta disponibile a collaborare alla costruzione del sistema (ad es. definizione Q&A e validazione contenuti) e il 75% richiede supporti strutturati all'adozione (formazione interna, manuali operativi, referenti tecnici di settore). Le risposte qualitative sottolineano la necessità di accompagnamento culturale e comunicativo, con il mantenimento di canali tradizionali per utenze fragili.

Governance dell'innovazione e assetto istituzionale del progetto. L'analisi del contesto organizzativo evidenzia come il percorso di introduzione dell'intelligenza artificiale nel Comune di Sezze sia stato promosso da una chiara spinta politica, espressa dal Sindaco e dall'Assessore Fernandez, titolare della delega alla digitalizzazione. Tale indirizzo politico ha rappresentato il principale fattore abilitante dell'avvio dell'iniziativa, orientata all'esplorazione delle potenzialità dell'AI per il miglioramento dell'accessibilità e dell'efficienza dei servizi comunali.

Sul piano operativo e amministrativo, il progetto è stato ricondotto all'area del SUAP, individuata come struttura di riferimento per il coordinamento delle attività, sotto la responsabilità del dirigente Salvatore Molinari. L'implementazione dell'analisi di readiness e delle attività di ricerca è stata affidata a una ricercatrice incaricata attraverso un assegno di ricerca finanziato dal Comune, configurando una collaborazione strutturata tra amministrazione locale e ricerca accademica.

Pur in presenza di un chiaro indirizzo politico e di un presidio amministrativo definito, il progetto si colloca in una fase ancora esplorativa, caratterizzata dall'assenza di una governance formalizzata dell'innovazione in termini di ruoli trasversali, procedure codificate e meccanismi stabili di coordinamento intersettoriale. Tale configurazione emerge in coerenza con i risultati dell'indagine, che evidenziano una forte disponibilità individuale all'adozione dell'AI, accompagnata da una diffusa richiesta di supporti organizzativi e strategici più strutturati.

5. Discussione e conclusioni

La AI Readiness Matrix proposta in questo studio deve essere interpretata come uno strumento di natura esplorativa e diagnostica, finalizzato a supportare la riflessione manageriale e organizzativa nelle fasi iniziali dei percorsi di innovazione. Essa non ambisce a fornire previsioni deterministiche sull'adozione tecnologica, ma a rendere visibili tensioni, condizioni abilitanti e aree di intervento che influenzano la readiness delle organizzazioni pubbliche rispetto all'introduzione dell'intelligenza artificiale.

L'indagine interna consente di riflettere sul ruolo dell'Intelligenza Artificiale come leva di innovazione amministrativa e, al contempo, sulle condizioni organizzative necessarie affinché tale innovazione possa tradursi in valore pubblico sostenibile. In linea con la letteratura sul digital government, i risultati confermano che l'introduzione di tecnologie avanzate nella PA non può essere considerata una semplice innovazione tecnica, ma implica profondi cambiamenti organizzativi, culturali e cognitivi (Mergel, Edelmann & Haug, 2019; Janssen & van der Voort, 2016). I dati raccolti mostrano come la readiness digitale non dipenda unicamente dalla disponibilità di risorse tecnologiche o finanziarie, ma sia il frutto di un ecosistema organizzativo maturo, dove fattori umani (competenze, motivazione), strutturali (processi, leadership) e cognitivi (percezione del rischio/opportunità) si integrano. Questo approccio si rifà alle teorie della digital maturity nella PA (Capgemini, 2020) e alla nozione di digital capability come capacità collettiva di apprendere, adattarsi e innovare (Dubei et al., 2023). La presenza di un personale con elevata anzianità e consolidate competenze amministrative rappresenta una risorsa chiave in termini di conoscenza istituzionale. Tuttavia, come evidenziato da Cinar, Trott & Simms

(2022), la trasformazione digitale richiede politiche attive di change management per valorizzare il capitale esperienziale esistente e favorire una cultura dell'apprendimento continuo.

Dal punto di vista teorico, lo studio conferma che la digitalizzazione nella PA contribuisce alla creazione di valore pubblico solo quando la tecnologia è percepita come abilitante e complementare al lavoro umano, e non come sostitutiva o disumanizzante (Moore, 1995; Bannister & Connolly, 2014). La visione tecnologico-centrica, se non bilanciata, può infatti produrre effetti contro-intuitivi, come rigidità burocratica o esclusione digitale (Lips, 2022).

Sotto il profilo manageriale, si evidenziano tre implicazioni fondamentali. In primo luogo, la governance dell'innovazione deve essere improntata alla partecipazione, poiché il diretto coinvolgimento del personale nei processi di co-progettazione degli strumenti digitali contribuisce a rafforzare il senso di appartenenza organizzativa e ad attenuare eventuali resistenze al cambiamento (Criado & Gil-García, 2019; Mergel, 2016). In secondo luogo, il consolidamento della readiness presuppone investimenti mirati e strutturati nella formazione continua, sia in termini di alfabetizzazione digitale sia di competenze specifiche sull'intelligenza artificiale, mediante percorsi differenziati che rispondano alle esigenze delle diverse figure professionali presenti nell'ente (OECD, 2020). Infine, la trasformazione tecnologica deve essere guidata da principi di inclusione digitale e accessibilità, ponendo attenzione tanto alle disuguaglianze interne tra i dipendenti quanto a quelle esterne tra i cittadini, e promuovendo soluzioni che garantiscano l'accesso equo e la piena partecipazione di tutti agli strumenti digitali (OECD, 2021; Eubanks, 2018).

I risultati relativi alla governance dell'innovazione mostrano come, nel caso analizzato, l'adozione dell'intelligenza artificiale sia stata inizialmente sostenuta da un forte commitment politico, successivamente tradotto in un assetto amministrativo funzionale ma ancora in via di strutturazione. Questo evidenzia come, nei contesti della PA locale, la leadership politica possa svolgere un ruolo decisivo nell'innescare processi di innovazione digitale, mentre la loro istituzionalizzazione richiede il progressivo sviluppo di meccanismi di governance più formalizzati, in grado di trasformare l'iniziativa sperimentale in capacità organizzativa stabile (Dunleavy et al. 2006, Mergel et al., 2019).

La AI Readiness Matrix (vedi Tabella 1) proposta rappresenta un primo strumento operativo per valutare la predisposizione delle amministrazioni locali all'introduzione di chatbot o sistemi AI conversazionali. Essa consente di identificare le aree prioritarie di intervento (formazione, governance, percezioni), supportando la pianificazione strategica e la coerenza degli investimenti rispetto agli obiettivi di trasformazione digitale.

Per rafforzare l'utilizzo analitico e operativo della AI Readiness Matrix, si propone una sua formalizzazione attraverso l'identificazione di indicatori specifici per ciascuna delle quattro dimensioni: competenze digitali, processi, percezione dell'AI e supporto organizzativo (vedi Figura 1). L'obiettivo è trasformare la matrice da strumento descrittivo a framework valutativo trasferibile, applicabile anche in altri contesti della PA locale.

Readiness dimension	**Operational definition**	**Key indicators (examples)**	**Assessment scale**
Competenze digitali	Livello di alfabetizzazione digitale e familiarità con gli strumenti di IA tra il personale	% del personale che ha completato corsi di alfabetizzazione digitale/AI	Basso/Medio/Alto (o punteggio da 1 a 5)
Processi	Grado di standardizzabilità e digitalizzabilità delle attività informative	% di richieste di informazioni ripetitive % di processi documentati	Basso/Medio/Alto

Percezione dell'AI	Fiducia, aspettative e preoccupazioni relative all'uso dell'IA nei servizi pubblici	% di percezione positiva dell'IA (sondaggio) Principali preoccupazioni segnalate	Negativo/Neutro/Positivo (o punteggio da 1 a 5)
Supporto organizzativo	Infrastrutture, formazione e governance a sostegno dell'adozione delle tecnologie	Presenza di un piano di formazione Presenza di un responsabile tecnico AI Coinvolgimento nella progettazione del sistema	Assente/Parziale/Strutturato (o punteggio 1-5)

Tabella 1. Formalizzazione della matrice, fonte: propria elaborazione

Dimensione	**Livello rilevato a Sezze**	**Evidenze dalla survey**
Competenze digitali	Medio	46,9% ha buona familiarità digitale; ma 21,9% mai formato, 25% formazione >2 anni fa
Processi	Medio-Alto	46,9% richieste ripetitive e standardizzabili; 62,5% info su orari/modulistica
Percezione dell'AI	Medio (ottimismo cauto)	56,3% teme risposte errate; 28,1% vede beneficio in riduzione carico telefonico
Supporto organizzativo	Medio	75% richiede formazione; 65,7% disponibile a co-progettazione; governance ancora assente

Tabella 2. Readiness organizzativa, fonte: propria elaborazione

In prospettiva, lo studio suggerisce che il percorso verso una PA intelligente e sostenibile non si misura solo in termini di digitalizzazione dei processi, ma nella capacità di preservare la componente umana e relazionale del servizio pubblico, integrandola con le opportunità offerte dall'automazione. Come sostenuto da Dunleavy et al. (2006) e dalla più recente "human-centered AI" agenda dell'Unione Europea, la tecnologia può migliorare i servizi pubblici solo se incorporata in una visione etica, partecipativa e orientata al bene comune. Il Comune di Sezze si configura, in questo senso, come un laboratorio emblematico di AI readiness nella PA locale italiana.

6. Implicazioni teoriche e manageriali

Dal punto di vista teorico, i risultati di questa ricerca confermano e al tempo stesso ampliano alcune riflessioni centrali della letteratura sulla trasformazione digitale nel settore pubblico. In primo luogo, lo studio rafforza la prospettiva secondo cui l'adozione di tecnologie intelligenti nella PA non può essere interpretata esclusivamente come un cambiamento tecnico o strumentale, ma deve essere considerata come un processo complesso di ristrutturazione organizzativa, cognitiva e culturale (Mergel, Edelmann & Haug, 2019; Lips, 2019). La ricerca contribuisce inoltre al dibattito sul valore pubblico generato dalle innovazioni digitali, suggerendo che il valore non risiede unicamente nei guadagni di efficienza, bensì nella capacità della tecnologia di abilitare relazioni più trasparenti, inclusive e significative tra cittadini e istituzioni (Moore, 1995; Bannister & Connolly, 2014; Criado & Gil-García, 2019). In tal senso, l'adozione di chatbot o strumenti di

AI conversazionale si configura come un potenziale "abilitatore relazionale" – a condizione che sia progettato e implementato in modo coerente con i principi di accessibilità, trasparenza e co-produzione.

Un ulteriore contributo teorico riguarda il concetto di digital readiness come capacità organizzativa evolutiva e non lineare. I risultati dello studio sostengono la visione di Cinar, Trott e Simms (2022), secondo cui la readiness digitale si costruisce nel tempo attraverso un equilibrio dinamico tra competenze, cultura organizzativa e strutture di governance. Questa prospettiva si allinea anche al concetto di digital resilience, intesa come la capacità delle organizzazioni pubbliche di adattarsi e rispondere alle sfide digitali in modo flessibile e sostenibile (Dubei et al., 2023). L'adozione di soluzioni basate su intelligenza artificiale nella PA locale richiede un ripensamento integrato delle pratiche manageriali, andando oltre l'implementazione tecnica. La governance dell'innovazione dovrebbe essere strutturata in modo partecipativo, coinvolgendo attivamente il personale sin dalle prime fasi progettuali, al fine di favorire l'appropriazione dei processi e ridurre le resistenze al cambiamento. La co-progettazione dei contenuti del sistema, in particolare nel caso di chatbot informativi, consente di valorizzare la conoscenza operativa interna e contestualizzare le risposte alle esigenze specifiche del territorio (Mergel, 2016). In secondo luogo, la formazione rappresenta una leva strategica fondamentale; percorsi di digital upskilling e AI literacy vanno costruiti in modo mirato e differenziato per profilo professionale, alternando moduli pratici, momenti di confronto operativo e accompagnamento continuo (OECD, 2021). L'implementazione di strumenti di intelligenza artificiale necessita del supporto di un sistema di monitoraggio multidimensionale, che integri indicatori di efficienza quantitativi (ad esempio, il numero di interazioni gestite) con metriche qualitative quali la soddisfazione dell'utenza, l'inclusività e la qualità delle risposte fornite. Al fine di assicurare l'allineamento tra innovazione tecnologica e servizio pubblico, risulta opportuno adottare un approccio iterativo, user-centered, articolato in fasi di testing, validazione partecipata e aggiornamento continuo, nel rispetto dei principi europei di trasparenza, inclusività e centralità della persona nell'ambito dell'intelligenza artificiale (European Commission, 2021).

Parole chiave: Pubblica amministrazione locale; intelligenza artificiale; valore pubblico; digitalizzazione; readiness organizzativa; governance

Ringraziamenti

Si ringrazia il Comune di Sezze per la collaborazione e disponibilità dimostrata durante tutte le fasi dello studio.

1. Sviluppo concettuale

La ristrutturazione delle reti di offerta di servizi sanitari e socio-sanitari territoriali, imposta a livello normativo dalla Missione 6 del PNRR e dal D.M. 77/2022, rende necessaria una revisione complessiva delle logiche manageriali sottostanti i processi di presa in carico (PIC) dei pazienti più fragili (Longo et al., 2022). La razionalizzazione dei servizi di community health (medicina di base e specialistica, cure domiciliari integrate, servizi di prevenzione, assistenza residenziale e semi-residenziale, ecc.) può essere favorita ricorrendo ad opportuni strumenti di networking e governance collaborativa (Meneguzzo, 1996). Essi possono consistere nell'implementazione di modelli organizzativi multidisciplinari e "integrati" di gestione dei processi di cura. L'integrazione a livello territoriale di diverse pratiche assistenziali può essere inquadrata nel contesto di riforma manageriale del sistema sanitario, la quale ha introdotto una serie di standard organizzativi volti ad assicurare un maggiore coordinamento funzionale tra i diversi attori istituzionali (aziende pubbliche e private del SSN, Enti locali e del terzo settore) e operatori professionali che contribuiscono alla erogazione di servizi a carattere sanitario e socio-assistenziale.

Sotto il profilo teorico, il lavoro di ricerca in preparazione si riconnette al filone di studi economico-aziendali e di public governance incentrati sulla performance dei network di interesse pubblico (Longo, 2005) e sul problema della creazione di Valore Pubblico (VP) a livello di filiera (Bryson et al., 2017). Il concetto di VP da prendere in considerazione per indagare le potenzialità dei network è definito dalla capacità degli attori (nodi) della rete inter-aziendale di soddisfare in modo efficiente ed efficace i bisogni collettivi che compongono la mission istituzionale dei soggetti economici aderenti alle reti in parola (Alford e O'Flynn, 2009). In particolare, possiamo definire il VP come la somma degli impatti positivi - outcome o effect - generati dalla rete sui beneficiari e, indirettamente, sugli altri soggetti in vario modo coinvolti nei setting assistenziali interessati (famigliari, caregiver, volontari, comunità nel loro complesso). Si prende in considerazione, pertanto, una dimensione specifica del VP creato dalla rete, rappresentata dalla performance in termini di efficacia del servizio. La dimensione dell'efficacia dei network va intesa come la capacità di soddisfare adeguatamente le aspettative dei fruitori dei servizi (community-level performance), rispettando gli obiettivi quali-quantitativi prefissati e assicurando dei risultati migliorativi rispetto alle condizioni di partenza dei singoli utenti (Provan e Milward, 1995, 2001; Cepiku et al., 2010).

Tutto questo pone una serie di sfide ai manager dei network che intendano ottimizzare i propri processi. Si sottolinea come la maggior parte dei contributi teorici che hanno proposto modelli interpretativi delle determinanti della performance dei network pubblici abbia identificato

una serie di strumenti manageriali in grado di "spiegare" l'efficacia relativa di tali assetti gestionali. L'implementazione di sistemi integrati di gestione ed erogazione di servizi ad alto contenuto professionale, quali sono i servizi socio-sanitari, rappresenta un terreno sul quale è possibile "testare" la validità dei modelli concettuali che identificano i principali fattori abilitanti della performance dei network. L'integrazione e il raccordo a livello territoriale di servizi e pratiche di carattere sanitario, assistenziale e sociale, secondo l'obiettivo del potenziamento del welfare socio-sanitario community-based, costituisce un tentativo significativo di trasformazione degli assetti gestionali che intende superare la tradizionale prospettiva ospedalocentrica al fine di razionalizzare la spesa sanitaria pubblica, decentralizzare l'erogazione dei servizi primari e rendere più accessibili e prossimi i luoghi di cura per i più fragili (Cinelli et al., 2024).

In tal senso, il già citato D.M. 77/2022 identifica alcuni strumenti operativi e standard organizzativo-gestionali tramite i quali le aziende sanitarie sono chiamate ad attuare gli obiettivi di integrazione dei propri servizi sul territorio. Tra gli altri, si possono rammentare le seguenti innovazioni organizzative:

- le Case della Comunità (CdC) per l'erogazione dei servizi di natura extraospedaliera (di base, di prevenzione, diagnostici e di assistenza domiciliare integrata);
- gli Ospedali di Comunità (OdC) per quanto concerne le cure intermedie, long-term e di riabilitazione;
- le Centrali Operative Territoriali (COT), istituite a livello distrettuale e attivabili per la transizione dei pazienti lungo le varie fasi del percorso assistenziale (casa, ospedale, territorio, ecc.);
- il Numero Unico Europeo 116.117;
- lo sviluppo della telemedicina e di altri strumenti digitali a supporto dell'assistenza domiciliare;
- il rafforzamento dei Distretti socio-sanitari, quali articolazioni organizzative territoriali delle ASL cui è attribuito un set più ampio di funzioni manageriali che vanno dalla programmazione al coordinamento dei servizi sanitari di comunità.

É appena il caso di notare che il tema dell'integrazione fra i diversi livelli assistenziali e professionisti coinvolti nell'erogazione delle prestazioni rappresenta tuttora una sfida fondamentale per coloro che dovranno attuare i nuovi standard di organizzazione sanitaria disciplinati a livello nazionale, regionale e aziendale. In particolare, le Regioni costituiscono il livello istituzionale-amministrativo al quale è demandato il compito di stabilire i principi generali e gli standard di gestione dei meccanismi di integrazione appena richiamati, in osservanza delle disposizioni normative generali disciplinate dal D.M. 77/2022. In questo ambito, pertanto, gli enti regionali assumono la funzione di "Network Administrative Organization" (NAO), ovvero di autorità pubblica preposta alla regolamentazione, alla programmazione e al coordinamento delle attività svolte all'interno dei network socio-sanitari territoriali (si vedano i modelli di governance delle reti descritti da Provan e Kenis, 2008).

Fatte queste premesse, il presente lavoro focalizza in particolare l'attenzione sul ruolo della COT, quale meccanismo di integrazione dei network e di riconciliazione dei diversi step del percorso ospedaliero-territoriale di presa in carico della cronicità (Ferrara et al., 2021; Dalponte et al., 2022; Cinelli et al., 2024). Nello specifico, «l'obiettivo della COT è quello di assicurare continuità, accessibilità ed integrazione dell'assistenza sanitaria e sociosanitaria» (D.M. 77/2022, all. 1, p. 8). Le COT assicurano, quindi, un più elevato livello di coordinamento clinico e di raccordo fra i servizi e i professionisti ricompresi nei vari setting organizzativi della rete di offerta, così da gestire in modo più unitario ed efficace la PIC dei pazienti target individuati all'interno di specifici cluster di soggetti fragili, anziani o non autosufficienti (soggetti ad alta complessità socio-sanitaria). A livello internazionale il ruolo della COT viene etichettato con la locuzione "Transitional Care" (Zazzera et al., 2021). Si fa notare come la dimensione più appropriata per inquadrare tale strumento organizzativo sia proprio quella dei network, atteso che le COT aziendali - operanti a livello di singolo distretto - sono funzionali rispetto all'obiettivo di integrare

tra loro attività territoriali svolte da attori pubblico-privati diversi dalla sola ASL d'afferenza, quali possono essere ospedali e altre strutture di ricovero, residenze socio-sanitarie, servizi sociali dell'Ambito territoriale, enti non profit, ecc.

L'obiettivo perseguito da questo vettore organizzativo è quello di riconciliare i vari interventi clinico-assistenziali al fine di rendere più efficienti le transizioni ospedale-territorio, territorio-ospedale e territorio-territorio (Ferrara e Dalponte, 2023), attraverso le procedure di "ammissione e dimissione protette". Il fabbisogno di integrazione della rete complessa di attori e servizi sanitari e socio-sanitari, al quale fa fronte il modello delle COT, risponde pertanto all'obiettivo di rafforzare l'accessibilità, la continuità e la qualità delle cure a beneficio degli utenti con bisogni di salute più complessi (cronici, disabili, post-acuti, ecc.) e contribuire a innalzare i livelli di efficienza ed efficacia delle aziende sanitarie, grazie alla riduzione del numero di ospedalizzazioni non necessarie e di interventi clinici inappropriati.

Il funzionamento della COT non può prescindere dall'implementazione di opportuni strumenti di network management. Uno di questi è rappresentato dai sistemi di scambio di dati e informazioni fra gli attori coinvolti nel network, identificabile come uno dei fattori abilitanti della performance a livello di rete (Turrini et al., 2010). I sistemi informativi, in quanto strumenti necessari per dare forma a un assetto organizzativo aziendale ben funzionante (Paoloni e Grandis, 2007), sono indispensabili anche in un contesto networked al fine di mantenere costantemente interconnessi gli attori della rete e consentire la predisposizione di adeguati sistemi condivisi di performance management (raccolta ed elaborazione dei dati e misurazione, valutazione e comunicazione della performance). Non a caso, l'importanza cruciale dei sistemi informativi nei contesti inter-organizzativi è da mettere in relazione alla possibilità per il management di disporre di dati da utilizzare per alimentare i processi di pianificazione, programmazione e controllo. Nel caso dello strumento organizzativo preso in esame (la COT), l'integrazione del network è favorita dall'esecuzione di una serie di attività di raccolta, monitoraggio e trasmissione delle informazioni riguardanti i pazienti presi in carico. Tali attività hanno come obiettivo non solo lo svolgimento della funzione di raccordo tra gli operatori e di supporto logistico, ma anche la verifica degli esiti delle procedure di transito tra i diversi livelli e luoghi di cura. Tali attività consistono nella raccolta, nel tracciamento e nell'utilizzo dei dati concernenti lo stato di salute pre- e post-transizione, al fine di supportare i case manager nella formulazione delle decisioni cliniche.

2. Obiettivi

Considerato il quadro teorico fin qui richiamato, il presente progetto intende focalizzarsi sulla capacità dei network di servizi di dotarsi di adeguati sistemi informativi a supporto della gestione della performance, guardando più nello specifico al problema della qualità dei sistemi in parola (Bouckaert, 1993). Come è stato suggerito da alcuni studi di management pubblico tra i più accreditati, uno dei fattori chiave alla base dell'efficacia dei network d'interesse generale è costituito dalla presenza di condizioni strutturali atte a promuovere un costante scambio di dati e informazioni tra i partecipanti alle attività della rete, nell'ottica di una sempre maggiore integrazione tra le funzioni svolte dagli stessi.

La progettazione e l'implementazione di appropriati sistemi informativi a supporto dell'integrazione delle varie componenti della rete rappresenta un campo d'indagine che può essere approfondito nell'ambito operativo dei servizi sanitari e socio-sanitari territoriali. La qualità dei sistemi di rilevazione ed elaborazione delle informazioni riguardanti le transizioni tra setting e luoghi di cura (parametri di valutazione della performance) costituisce un aspetto critico per i manager delle reti di servizi socio-sanitari e, in particolare, per il funzionamento delle COT. Infatti, le COT sono impegnate nel favorire l'attuazione di profondi cambiamenti riguardanti gli standard operativi e i processi decisionali e di controllo.

La funzione di monitoraggio e coordinamento delle procedure di transizione tra luoghi di cura/setting assistenziali assicurata dalle COT consente alle reti di servizi distrettuali e ospedalieri

(composte da unità organizzative e professionisti appartenenti ad entità aziendali diverse dalla sola ASL competente nel proprio territorio) di disporre di un patrimonio informativo condiviso. Esso può comprendere, tra le altre cose:

- la classificazione dei bisogni di salute dei pazienti presi in carico;
- la disponibilità di posti letto nei luoghi di ricovero del territorio (funzione di commissioning);
- la composizione dei Piani Diagnostico Terapeutici Assistenziali (PDTA), anche tramite l'attivazione delle Unità di Valutazione Multidimensionale (UVM) e il tracciamento delle relative decisioni cliniche;
- gli esiti post-transizione.

Partendo da un framework fornito dalla letteratura sul management dei sistemi informativi aziendali (DeLone e McLean, 1992, 2003), si tenterà di analizzare le diverse dimensioni esplicative della qualità dei sistemi di rilevazione e gestione dei dati adottati dalle COT. Il modello concettuale richiamato tiene conto di una serie di condizioni indispensabili affinché i diversi soggetti operanti all'interno di un sistema aziendale siano in grado di scambiarsi tempestivamente e correttamente flussi di informazioni utili per il controllo dei processi interni. In tal senso, l'efficacia dei sistemi informativi aziendali dipende da almeno sei ambiti di misurazione, tra loro interconnessi: 1) la qualità dell'intero "processo di produzione e trasmissione" dei dati; 2) la qualità delle diverse tipologie di informazioni "prodotte" nell'ambito del sistema informativo aziendale (si rimanda alla metodologia di misurazione e valutazione della qualità delle informazioni proposto da Lee et al., 2002); 3) la qualità del servizio di raccolta, registrazione, processamento e invio dei dati, dal punto di vista delle tecnologie di connessione e archiviazione adottate; 4) il grado di effettivo utilizzo dei dati a fini manageriali; 5) il livello di soddisfazione da parte dei destinatari delle informazioni circa la qualità delle procedure applicate; 6) i benefici globali, in termini di performance individuali e organizzative, derivanti dall'utilizzo di un determinato sistema informativo.

L'adattamento del modello poc'anzi sintetizzato al contesto organizzativo dei network, già sperimentato in alcuni contributi sul tema dell'integrazione dei servizi socio-sanitari (Bianchi et al., 2017), implica un ulteriore elemento da tenere in considerazione per valutare la qualità di un sistema informativo. Esso corrisponde alla dimensione della governance complessiva del sistema informativo applicato a livello di network. Il concetto di governance, in questo ambito, coincide con l'insieme delle regole operative e dei criteri di assegnazione di responsabilità, compiti e ruoli tra i vari operatori preposti alla rilevazione, registrazione, analisi e trasmissione dei dati. La definizione di un adeguato assetto di governance volto a regolare le relazioni tra gli attori coinvolti, nonché gli standard di processo cui uniformarsi, rappresenta un passaggio fondamentale nella creazione di un sistema informativo di qualità. Si può affermare che l'esistenza di apposite soluzioni di governance dei sistemi informativi a supporto delle COT per la "gestione" e il monitoraggio dei transiti di pazienti costituisca una precondizione per il rafforzamento della performance dei network socio-sanitari (efficientamento dei processi e/o miglioramento della qualità delle prestazioni assistenziali fornite).

Pertanto, si analizzerà se e con quali soluzioni operative le Regioni, per il ruolo ricoperto come NAO - insieme alle ASL -, hanno affrontato il tema della governance dei sistemi informativi a supporto delle proprie COT. Si tenteranno di analizzare altresì i riflessi generati da tali meccanismi di coordinamento dei network sulle dimensioni della qualità dei flussi informativi generati e del loro utilizzo in ottica di miglioramento dei processi decisionali e di controllo, considerata la presenza di una varietà di attori che dovranno operare come "produttori" e "utenti" delle informazioni. La complessità del problema è dettata non solo dalla presenza di un sistema reticolare di attori interni ed esterni al quale adattare il modello di interpretazione della qualità del sistema informativo, ma soprattutto dal fatto che tale sistema dovrà consentire lo scambio di dati e informazioni provenienti da svariati servizi ricompresi nella rete, ciascuno dei quali caratterizzato da differenti standard operativi e modelli organizzativi.

Il lavoro si propone perciò di rispondere alle seguenti domande di ricerca (RQ):

- Quale ruolo possono esercitare i sistemi informativi adottati dalle Centrali Operative Territoriali (COT) nel favorire il miglioramento dei livelli di performance dei network di servizi socio-sanitari?
- Quali sono gli strumenti e i modelli prevalenti di governance dei sistemi informativi adottati nella realtà delle COT al fine di supportare i processi decisionali e di controllo dei network socio-sanitari?

3. Quadro metodologico

Dal punto di vista metodologico, il raggiungimento degli obiettivi di ricerca può essere conseguito adottando un modello di analisi qualitativo, basato sul ricorso ad un approccio mixed-methods già sperimentato in diversi lavori emersi sul tema della qualità (success) dei sistemi informativi a supporto dei network di servizi sanitari (Bianchi e Trimigno, 2019). La natura esclusivamente qualitativa del lavoro si giustifica alla luce della particolare novità del tema delle COT nel panorama manageriale dei servizi socio-sanitari italiani. Si segnala come l'analisi descrittiva dei sistemi informativi a supporto delle COT sarà condotta indagando alcune delle dimensioni individuate nel modello concettuale di DeLone e McLean (2003), ossia: la governance dei sistemi informativi; la qualità del sistema informativo complessivamente considerato (dalla "produzione" dei dati alla trasmissione delle informazioni rilevanti agli "utenti" della rete); la qualità delle informazioni scambiate; l'uso effettivo che i responsabili dei servizi intendono fare delle informazioni ricavate dal processo di raccolta ed elaborazione dei dati.

Questo tipo di approccio si compone di almeno tre fasi:

- selezione dei casi di studio più significativi, allo scopo di indagare le caratteristiche dei sistemi informativi a supporto delle COT. Si prenderanno in considerazione alcune esperienze tratte dai modelli organizzativi istituiti nel contesto delle ASL pugliesi finalizzati alla gestione delle transizioni fra i diversi setting e servizi del territorio;
- analisi desk, consistente nell'esame di documenti a valenza legislativa, regolatoria o istituzionale in materia di COT, rientranti nel contesto di riforma manageriale e organizzativa dell'assistenza territoriale (documenti programmatici compresi nel PNRR M6, D.M. 77/2022, documenti strategici e linee di indirizzo regionali, piani operativi aziendali, ecc.). In tal senso, la Regione Puglia ha adottato con la D.G.R. 625/2023 delle Linee guida riguardanti i requisiti funzionali e gli schemi operativi della piattaforma di gestione che ciascuna ASL dovrà implementare a supporto delle proprie COT, ai sensi di quanto previsto in tema di standard tecnologici e strutturali (infrastrutture informatiche integrate, applicativi di gestione aziendale, strumenti di telemedicina, software con accesso ai database aziendali e al Fascicolo Sanitario Elettronico, sistema informativo connesso alla Centrale 116.117) dalla D.G.R. 1532/2024, all. A, p. 3.5.
- review della letteratura di public performance management e information systems management nell'ambito dei network di servizi, così da individuare eventuali nuovi spunti teorici relativi ai fattori abilitanti della qualità dei sistemi informativi;
- interviste semi-strutturate somministrate ad attori chiave delle Cure di Transizione dei network socio-sanitari, nell'ambito del caso/dei casi studio (dirigenti regionali del Dipartimento Salute, direttori di distretti socio-sanitari, responsabili medici/infermieristici delle COT aziendali e distrettuali, manager delle altre aziende di servizi inclusi nella rete) finalizzate a far emergere le informazioni necessarie per rispondere alle domande di ricerca.

4. Risultati e impatti scientifici attesi

Si prevede che il progetto di ricerca fin qui delineato consentirà di comporre un quadro interpretativo più preciso delle regole, dei principi e dei meccanismi operativi alla base dei

modelli incipienti applicati dalle COT. La valutazione dell'efficacia di alcuni sistemi informativi adottati nell'ambito di un insieme circoscritto di esperienze di network sanitari permetterà di perfezionare la nostra conoscenza dei fattori organizzativi, tecnologici e di contesto in grado di facilitare la creazione di modelli di integrazione tra servizi assistenziali sempre più orientati alla continuità e alla personalizzazione delle cure.

Gli outcome del presente lavoro dovranno costituire un utile strumento di supporto per l'azione dei decisori pubblici e dei manager delle aziende coinvolte nella governance del sistema sanitario, fornendo una serie di suggerimenti che possano favorire il conseguimento degli obiettivi di tutela dei cittadini cronici e innalzamento dei livelli di efficacia, efficienza, equità e integrazione dei servizi. L'indagine qualitativa da condurre si pone, inoltre, l'obiettivo di individuare alcuni aspetti del percorso di implementazione delle COT che siano replicabili in altri contesti regionali o aziendali, al fine di uniformare dal punto di vista territoriale i modelli di servizio adottati. È utile ribadire come la capacità delle aziende sanitarie di dotare le proprie reti di sistemi informativi efficaci e improntati alla completezza e alla correttezza delle informazioni prodotte rappresenti un passaggio chiave per migliorare i propri sistemi di controlli, grazie al potenziamento delle banche dati relative alle prestazioni eseguite e ai risultati ottenuti.

Dal punto di vista scientifico, il lavoro intende contribuire alle conoscenze attualmente disponibili in tema di creazione e misurazione di VP, aggiungendo nuovi elementi empirici in grado di approfondire la dimensione dell'efficacia dei sistemi informativi a supporto delle reti di servizi pubblici. Il contributo si focalizzerà sul ruolo della governance dei sistemi informativi nel garantire una più forte integrazione tra i servizi e gli attori coinvolti nelle reti socio-sanitarie. Si evidenzia come l'originalità della ricerca in corso consista nell'applicazione di un modello di analisi della qualità dei sistemi di raccolta, gestione e scambio di informazioni aziendali in un ambito multi-attore ancora poco esplorato e significativamente complesso - vista la numerosità dei servizi da integrare nel funzionamento del network - qual è quello delle Cure di Transizione.

Parole chiave: Cure di transizione; public value; network management; reti socio-sanitarie

Between the bright and dark side of co-production: analysing co-assessment in healthcare through the lens of paradox theory

Martina Pisarra[1], Marta Ingaggiati[2], Giovanni Barbato[3], Adina Dudau[4]

1. Introduction

Stakeholder engagement in public service processes has attracted increasing scholarly attention, sparking research under the concepts of co-creation and co-production (Brandsen et al., 2018; Cepiku et al., 2020). This literature has significantly treated its rhetoric as inherently positive, focusing on the generative power that the inclusion of groups of stakeholders has on value creation for the broader community (Bryson et al., 2017; Dudau et al., 2023; Acar et al., 2025). Accordingly, much of this research has emphasized the benefits of involving stakeholders in decision-making processes, public service design, delivery, and also assessment (Nabatchi et al., 2017; LoeXler & Bovaird, 2020; Barbera et al., 2025). Co- production supports democratic enhancement, as participation and empowerment mechanisms broaden the range of voices influencing public action (Pisarra et al., 2025). Through these collaborative arrangements, power becomes more shared, enabling a more balanced relationship between administrations and service users (Cepiku et al., 2020). By involving users and stakeholders directly in design and delivery processes, enhances resource eXiciency, leveraging the complementary knowledge, skills, and capacities of diXerent actors to produce more sustainable outcome (Jasper & Steen, 2021). Ultimately, these dynamics contribute to the creation of public values, not only in terms of improved service quality, but also through strengthened trust, increased legitimacy, and deeper representativeness of public needs. Drawing on Jasper & Steen (2019), Acar et al. (2025) diXerentiates between three categories of public values: service – including eXectiveness, eXiciency, quality, satisfaction, sutainability, diversity, etc.; relationship – comprising education and learning, consideration of needs and capacities, individual freedom, power relations, responsibility, trust, etc.; and democratic quality – embedding accountability, empowerment, inclusion, equity, legitimacy, transparency, participation, etc. While co-production appears to be an enabling condition for most of these values, for others uncertain relationships remain.

A growing body of literature has however complained with this romanticized view, by uncovering potential downsides of the co-paradigms and tensions in public value co-creation (Jasper & Steen, 2019; Virtanen & Jalonen, 2020; Sancino et al., 2023; Cui & Osborne, 2023). This research emphasizes the existence of a "dark side" of co-production and high potential of value (co)destruction (Steen et al., 2018; Oliver et al., 2019; Williams et al., 2020; Jasper & Steen, 2021). Scholars have noted how stakeholder participation can produce pitfalls and drawbacks related to unequal opportunities for participation, uneven service quality and disproportionate distribution of benefits. Stakeholders may prioritize self-interested goals and create value primarily for themselves rather than for the community; public administrations may

opportunistically exploit the relationship to oXload responsibility onto citizens (Steen et al., 2018; Palumbo & Manna, 2018). In addition, factors such as the unequal power of certain groups or the competences required for eXective engagement may create inequalities rather than enhancing participation. Building on prior research (e.g., Williams et al., 2016), Steen et al. (2018) eXectively classified the pitfalls of co-production into seven evils, sparking an ongoing debate (Jasper & Steen, 2021). These evils include the rejection of responsibility by public organizations, failing accountability structures, transaction costs, loss of democratic, reinforced inequalities, implicit demands (from vulnerable indivituals) and participation pressures and, lastly, value co-destruction.

This overall picture suggests that bright and dark elements can coexist. Such coexistence the need for a more nuanced understanding of how these collaborative arrangements unfold in practice. For this reason, recent research has begun to address the potential tensions related to co-production through the lens of paradox theory. Paradoxes, defined as "contradictory yet interdependent elements that exist simultaneously and persist over time" (Smith & Lewis, 2011, p. 382). Paradox theory explains how organizations can eXectively and simultaneously address competing demands, thereby fostering long-term organizational sustainability. Organisational paradoxes are a pervasive feature of organisational life and emerge fromunderlying contradictions. For example, between social purpose and profit, change and stability, or autonomy and control. Once made salient, paradoxes manifest as concrete decision-making challenges. Due to their persistent nature, the opposing poles are equally significant and cannot be permanently resolved, requiring actors to manage competing demands through tightrope-like balancing, collaboration and flexibility (Stadtler, 2018). Paradoxes become pathological when rather than serving as a source of creativity and renewal, they assume the nature of pragmatic paradoxes, situations where power diXerentials and constrained agency prevent actors from flexibly managing contradictory demands (Berti & Simpson, 2021). Collaborations, including interorganisational arrangements, have increasingly been examined through a paradox lens, as they are inherently diXicult to manage (e.g., Jasper & Steen, 2021). Yet, despite the inherently paradoxical nature of these dynamics, the co- creation and co-production paradigm has not been extensively theorised through a paradox lens (Qi & Ran, 2024). In our view, the coexistence of the bright and dark sides of co-production can be conceived as an overarching paradox within the co-paradigm. For example, while the inclusion of multiple actors in co-production may be beneficial and is often emphasized as an inherently positive, a potential dark side remains: stakeholders may pursue heterogeneous goals in the creation of public value, which can come into conflict (Brandsen & Helderman, 2012; Farr, 2016; Osborne et al., 2016).

Building on paradox theory, this study seeks to unravel how the bright and dark sides of co-production manifest and how actors involved in co-production initiatives enact strategies to cope with such paradoxes. We conceive the dark side not as a "necessary evil", but as an integral component of the co-paradigm itself. Viewing the bright and dark sides as interrelated poles of a paradox allows us to reconcile seemingly opposing elements and, in turn, deepen our understanding of how public value is co-created and, at times, co-destroyed.

Specifically, the study focuses on co-assessment processes, namely the bundle of activities aimed at monitoring and evaluating public services (Sanchietti & Savignon, 2023). Traditionally, performance-related activities are undertaken by public oXicials or external consultants; however, in co-production, state and lay actors work together to assess service quality, problems, and/or areas for improvement (Bovaird & LoeXler 2012). While the co-production literature has primarily focused on co-design and co-delivery, it has largely overlooked co- assessment, that is, the role of citizens in "monitoring and evaluating public services" (Nabatchi et al., 2017, p. 772). Although co-assessment is retrospective in nature - being about toward past performance - it can also be leveraged prospectively to rethink and enhance services, ultimately strengthening public value co-creation.

Accordingly, this study addressed the following research question: how can the tensions experienced by actors involved in co-assessment processes be understood as manifestations of the overarching paradox between the bright and dark sides of co-production?

To answer this question, we conducted an in-depth single case study (Eisenhardt, 1989) of an Italian public healthcare organization that has long being engaged in co-assessment initiatives. In the healthcare sector, involving citizens - namely patients - in assessing the healthcare services and identifying strategic priorities for health interventions is pivotal to fostering a patient-centric approach in PHOs' planning and service provision (De Rosis, Barchielli, et al., 2022). The organization has followed a stakeholder engagement approach for decades, which has gradually been formalized through a series of structured initiatives, such as the stakeholder forum and the participation conference. These initiatives have evolved over time and are now held regularly, approximately three to four times a year, according to a predefined meeting schedule. When each initiative is established, a public call is issued, allowing any patient or citizen association to join. Participation in the meetings is voluntary. The meetings take place as structured encounters between organizational members and representatives of these associations. As scholarship has not adequately considered the perspectives of external stakeholders in co-assessment processes, data were collected through interviews (the actual number is 12 but interviews are currently being conducted). Interviews are currently ongoing with both state actors (i.e., PSOs' managers responsible for performance planning and measurement and specifically co-assessment initiatives) and lay actors (i.e., citizen and patient associations, third sector organizations). Interview protocols were designed to explore perceptions of co-assessment processes, challenges, benefits, and potential tensions, allowing participants to freely reflect on their experiences. Archival and document analyses were also conducted, including organizational reports, surveys, procedures, planning documents. Data analysis followed an abductive approach, iteratively moving between empirical evidence and theory. Two authors independently conducted a qualitative content analysis, coding interviews and documents based on the theoretical framework. Themes and patterns were identified and refined through iterative discussions, with discrepancies resolved collaboratively. This systematic procedure allowed for the identification and refinement of paradoxes characterizing the bright and dark sides of co-production in the co-assessment context. Our preliminary analysis uncovers a set of intertwined of paradoxes inherent in co- assessment within healthcare organizations. First, we observed a Short-term vs. Long-term tension, whereby actors alternated between prioritizing immediate operational gains and pursuing strategic, long-term goals requiring sustained investment. A second paradox emerged around Formalization vs. Creativity, as the need for structured, institutionalized procedures (e.g., predefined meetings and agendas) often clashed with the aspiration for more open, substantive, and creative debate capable of fostering diverse voices beyond formal boundaries. The Collectivism vs. Individualism tension further highlighted competing logics between advancing individual claims rapidly and the choice to aggregate interests collectively, a strategy that increased influence but risked slowing decision-making. Similarly, the Engagement for Legitimacy vs. Purposeful Engagement paradox illustrated how participatory initiatives were sometimes mobilized primarily to gain external legitimacy rather than to foster genuine shared decision-making and internal empowerment. A fifth tension, Centralization vs. Decentralization, reflected contradictions between reliance on formal, centralized channels for submitting proposals/service assessment and the desire to enable broader, more distributed contributions. We also found a persistent Continuity vs. Change paradox: while organizational stability and the long-term role of the participatory body were emphasized, leadership turnover repeatedly introduced uncertainty and discontinuity. Moreover, the Representativeness vs. EXiciency tension surfaced as eXorts to ensure inclusiveness and democratic representation competed with pressures to streamline participation to improve eXiciency. Finally, a Professionalization vs. Commitment paradox emerged, revealing the diXiculty of balancing the technical expertise required for informed debate with the need to give voice to all participants, even at the expense of technical

depth. Together, these paradoxes illustrate the complex and often contradictory forces shaping value creation within co- assessment processes. Some coping strategies (both and; more than; either or) were also identified but are currently under analysis.

Building on the paradox theory (Smith & Lewis, 2011), the research contributes to the literature on co-production and particularly on the bright and dark sides of this co-paradigm (e.g., Palumbo 2017; Steen et al., 2018; Oliver et al., 2019; Williams et al., 2020) in several ways. First, it provides a systematic conceptualization of the bright and dark sides of co-production. Second, it sheds light on the paradoxes in co-production processes, highlighting the bright vs dark as an overarching paradox. This means that these two sides can coexist. The paradoxes identified comprise both a process level, such as the formalization vs creativity, or the centralization vs decentralization, and an outcome level, such as the engagement for legitimacy vs purposeful engagement or the short term vs long term outcomes. We also find that such paradoxes may be perceived and articulated either jointly by associations and organizations or independently by each party. Building on this, the study identifies the coping strategies actors deploy to navigate these tensions.

Additionally, the study contributes to the co-production literature by focusing on co-assessment processes, which constitute a public service co-production phase often overlooked (Sanchietti & Savignon, 2023; Barbera et al., 2025). Then, by integrating the perspectives of patient associations and third sector organizations, the analysis further enhances the existing literature by going beyond the inflated public organization's view.

The study has also important implications for public managers involved in (or in the process of activating) co-assessment initiatives, highlighting the tensions that may realize and co-exist within these initiatives. Recognizing these tensions equips public managers with a more realistic understanding of the complexities that characterize co-assessment initiatives. Rather than interpreting tensions as signs of failure, managers can frame them as inherent features of co-production. Ultimately, giving awareness on coping strategies can enable public value creation (e.g., increasing democracy, equality, representativeness).

Keywords: Co-production; co-assessment; paradox theory; healthcare

Tra creazione e distruzione: rendicontare il valore sostenibile negli ecosistemi dei servizi pubblici digitali

Marta Marsilio[1], Martina Pisarra[2], Letizia Magnani[3], Francesco Maria Spano[4]

1. Introduzione

L'avvento della digitalizzazione ha offerto opportunità senza precedenti per riorientare l'erogazione dei servizi pubblici e, più in generale, le amministrazioni pubbliche verso la creazione di valore per la società (MacLean & Titah 2022; Luna et al., 2024). In questo contesto, tali amministrazioni hanno introdotto sempre di più innovazioni digitali all'interno dei propri processi, con l'obiettivo di incrementare il loro contributo verso la creazione di valore pubblico (Gil-García et al., 2018; Savignon et al., 2024). Notevoli sforzi sono stati indirizzati verso l'introduzione di servizi digitali, ossia servizi erogati tramite tecnologie digitali (Lindgren et al., 2019). Tali servizi si stanno diffondendo in diversi ambiti della pubblica amministrazione: dall'università alla sanità, dalle organizzazioni culturali ai comuni. Progressivamente, i servizi digitali stanno trasformando le interazioni tra funzionari pubblici e cittadini, promuovendo il coinvolgimento di questi ultimi nella co-erogazione dei sevizi e rimodellando routine organizzative, ruoli e responsabilità (Agostino et al., 2021; Loeffler 2021). Queste trasformazioni hanno il potenziale di generare valore per molteplici stakeholder, tra cui i cittadini, i funzionari pubblici, le organizzazioni pubbliche che erogano i servizi, le altre amministrazioni e l'intera società (Luna et al., 2024). Sebbene un numero crescente di studi abbia esaminato gli antecedenti e i processi di innovazione digitale nel settore pubblico (Hong et al., 2022; Mu & Wang 2022), molta meno attenzione è stata prestata all'analisi degli effetti e del valore generato da tali innovazioni nei servizi pubblici (per eccezioni, si vedano ad esempio Pisarra et al., 2025; Leite 2025). La ricerca più recente in ambito di management pubblico ha sottolineato la necessità di analizzare i processi di creazione di valore all'interno di ecosistemi dei servizi (Osborne et al., 2022; Trischler et al., 2023; Ojasalo & Kuppinen 2024), in particolare in contesti tecnologico-digitali (Petrescu 2019; Trischler & Trischler 2022). Sulla base della Public Service Logic (PSL), gli ecosistemi dei servizi pubblici sono composti da molteplici attori interagenti - cittadini, organizzazioni pubbliche, tecnologie e processi di erogazione (Petrescu 2019) - che operano su livelli interrelati: macro, meso, micro e sub-micro, nei quali il valore può essere creato (o distrutto). Il livello macro si concentra sul value-in-society e comprende tre elementi: la fornitura di beni pubblici, il soddisfacimento dei valori sociali e la creazione, diretta o indiretta, di valore aggiunto per la società attraverso un servizio pubblico. Il livello meso riguarda l'impatto delle singole organizzazioni pubbliche, delle loro reti, dei processi e delle norme interne, nonché del contesto della comunità locale, sulla creazione di valore. Tale valore è detto value-in-production e si manifesta lungo due piani. Il primo riguarda la creazione di valore a livello di servizio tramite l'apprendimento organizzativo e il miglioramento o l'innovazione di nuove forme di servizi

pubblici, attraverso il co-design e il re-design dei servizi pubblici. La seconda forma riguarda la creazione di valore per gli utenti dei servizi pubblici, per gli altri stakeholder e per i funzionari dei servizi pubblici attraverso il loro coinvolgimento nei processi di co-design e co-produzione dei servizi pubblici, indipendentemente dai risultati ottenuti. Questo valore include la competenza e l'empowerment acquisiti durante il servizio. Il livello micro analizza il ruolo degli individui e delle loro azioni nella generazione di valore. Questo comprende il valore aggiunto grazie all'uso dei servizi e si manifesta nell'ambito dei bisogni, delle aspettative e dell'esperienza del fruitore del servizio (value-in-use e value-in-context). Infine, il livello sub-micro considera i valori e le credenze personali e professionali degli individui (value-in-context).

La ricerca esistente si è principalmente concentrata sull'analisi del valore creato rispetto ai singoli livelli, specialmente nei contesti di analisi del valore generato dai servizi digitali. Ad esempio, Pisarra et al. (2025) hanno dimostrato come i servizi sanitari digitali rappresentino un'importante opportunità per la creazione di valore individuale, in termini di empowerment, soddisfazione e fiducia di pazienti e caregiver. Come tale valore venga creato (o distrutto) a livello di ecosistema, analizzando le interrelazioni tra i diversi livelli, rimane tuttavia una questione empirica aperta. Tale domanda empirica risulta ancora più rilevante nell'ambito dell'innovazione digitale dei servizi pubblici (Osborne et al., 2022).

Questo studio adotta come lente teorica la PSL e, in particolare, gli ecosistemi dei servizi pubblici (Osborne et al., 2022) per analizzare empiricamente la creazione di valore nei processi di innovazione digitale dei servizi attraverso molteplici livelli di aggregazione analitica (macro, meso, micro). Tale approccio consente di includere la prospettiva di una costellazione di attori coinvolti in tali innovazioni e di rendicontare in modo più esaustivo la natura intrinsecamente multisfaccettata del valore (Cui & Aulton 2023). In particolare, l'articolo presenta uno studio etnografico della durata di tre anni (Hammersley & Atkinson 1995), in cui i ricercatori sono stati direttamente coinvolti nel processo di digitalizzazione di un servizio sanitario pubblico sanitario. In sanità, la digitalizzazione si è intensificata in modo significativo al fine di migliorare l'erogazione dei servizi sanitari, soprattutto in risposta alle sfide poste dalla pandemia. In particolare, ci si riferisce alla diffusione delle tecnologie digitali nell'erogazione dei servizi di cura con il termine di telemedicina. Nel caso oggetto di studio, l'innovazione ha previsto la trasformazione di un percorso di cura dello scompenso cardiaco che prevedeva visite periodiche in presenza in un servizio di telemonitoraggio domiciliare supportato da una web app e da una piattaforma digitale. Tali strumenti digitali consentono ai pazienti di partecipare attivamente alla co-erogazione della cura fornendo dati clinici ai medici giornalmente. Tali dati vengono monitorati dai medici con una frequenza settimanalmente, al fine di rilevare potenziali situazioni di criticità e anticipare il deterioramento delle condizioni cliniche. L'iniziativa ha coinvolto due ospedali italiani e un'azienda farmaceutica fornitrice della web app, ed è stata implementata attraverso un trial randomizzato che ha suddiviso i pazienti in due gruppi - uno utilizzante il servizio digitale e l'altro inserito nel percorso tradizionale in presenza - al fine di valutarne gli effetti. L'approccio etnografico ha consentito di raccogliere una pluralità di dati necessari a "fare luce sulle questioni oggetto dell'indagine" (Hammersley & Atkinson 1995, p. 1) grazie a un coinvolgimento diretto e prolungato sul campo ("being there", Watson 1999). Nel corso dell'implementazione sono state raccolte molteplici fonti empiriche - osservazioni partecipanti, survey, interviste e fotografie - utili a esplorare la creazione di valore ai livelli macro, meso e micro. In particolare, la somministrazione della survey - uguale per domande di indagine nei due gruppi - ha seguito un approccio longitudinale, al fine di rilevare eventuali differenze nel tempo. Ciascun paziente ha pertanto compilato la survey in tre periodi diversi: prima del servizio di cura (t0), a tre mesi dall'inizio della cura (t1) e a sei mesi (t2) (quest'ultima rilevazione è attualmente in corso di svolgimento). Sulla base di scale validate in letteratura, la survey ha indagato alcuni elementi di valore, come la soddisfazione, la fiducia nel medico e nell'azienda sanitaria, l'empowerment del paziente, le sue competenze digitali. Le interviste sono ancora in corso di svolgimento e coinvolgono sia gli operatori sanitari coinvolti nel processo di innovazione del

servizio che i funzionari amministrativi e la direzione aziendale. Sebbene come metodologia l'etnografia rimanga ancora poco utilizzata nella ricerca in public administration e public management, essa offre un notevole potenziale per sviluppare una comprensione approfondita e olistica e una ricca "documentazione degli aspetti sociali e informali" (Huby et al., 2011; Gains 2011), quali la creazione di valore nei contesti dei servizi pubblici.

Lo studio ambisce a fornire un modello multidimensionale di valutazione del valore creato articolato su tre livelli, che consente di "alternare zoom in e zoom out" nell'analisi della creazione di valore dei processi di innovazione digitale dei servizi pubblici (Vargo & Lusch 2017, p. 50). I risultati preliminari mostrano come, per ciascun livello dell'ecosistema, sia possibile individuare effetti collocati lungo un continuum che va dalla creazione alla distruzione di valore, includendo anche la mancata opportunità di creazione di valore (Steen et al., 2018). Ad esempio, a livello micro, mentre i pazienti che utilizzavano il servizio digitale riportavano livelli significativamente più elevati di responsabilità percepita e di coinvolgimento attivo nel percorso di cura, i livelli di soddisfazione sono rimasti invariati rispetto a quelli dei pazienti nel percorso tradizionale. Inoltre, non sono state riscontrate differenze significative in termini di fiducia verso l'azienda sanitaria. Il telemonitoraggio ha però consentito ai pazienti (e i loro caregiver) di sentirsi maggiormente "sotto controllo" da parte dei medici e "al sicuro", senza dover aspettare le visite in presenza per la valutazione del proprio stato di salute. A livello meso, non sono stati registrati miglioramenti significativi nella literacy digitale dei pazienti, che è rimasta stabile, ma è stato rilevato un rafforzamento delle competenze dei medici specializzandi, i quali hanno iniziato a consultare la web app per monitorare i parametri vitali e identificare condizioni critiche. È stata inoltre osservato un approccio conservativo nelle visite di follow-up, che hanno continuato a svolgersi in presenza senza pertanto aumentare l'apprendimento organizzativo. Inoltre, se da un lato la partnership con l'azienda farmaceutica ha consentito di rafforzare il legame pubblico-privato, l'erogazione del servizio tramite tecnologie digitali ha inciso sul bilancio economico dell'azienda relativo a tale percorso di cura. A livello macro, sebbene non sia stato rilevato un incremento dell'accessibilità alle visite, sono emerse significative opportunità per migliorare la capacità di risposta ai bisogni dei pazienti, prevenendo il deterioramento clinico attraverso la raccolta dei dati (prendendo in carico in anticipo pazienti che riscontravano parametri critici grazie al telemonitoraggio), e per accrescere l'empowerment dei cittadini. L'aumento dell'accountability percepita ha rappresentato per gli operatori sanitari e l'azienda un'opportunità per una condivisione della responsabilità con i fruitori del servizio che deve però "essere gestita sia in termini organizzativi che di limitazione dell'accesso ai pazienti con le caratteristiche necessarie per partecipare".

Il modello evidenzia come il valore debba essere compreso non solo in relazione al livello specifico dell'ecosistema, ma anche ai diversi attori che lo compongono (utenti diretti del servizio, operatori pubblici, azienda pubblica, partner privati). Inoltre, i livelli sono fortemente interrelati tra di loro e si influenzano reciprocamente. Ad esempio, se la percezione di responsabilità dei cittadini aumenta con il servizio digitale, da un lato può creare un burden per i singoli e una conseguente insoddisfazione. Dall'altro, per l'azienda pubblica questo consente di aumentare nei cittadini la consapevolezza del loro ruolo nell'erogazione dei servizi. Sarà poi compito dell'amministrazione mettere in atto una serie di leve che consentono di trasformare il burden per i cittadini in valore addizionale nei loro percorsi di cura. Similmente, se la volontà dei pazienti di fornire dati personali non differisce significativamente tra i due gruppi, la digitalizzazione e il conseguente aumento dei dati clinici rappresenta un'opportunità per l'organizzazione, per il miglioramento dei percorsi di cura, e per la società, rispetto all'aumento dell'accessibilità dovuta alla prevenzione dei casi critici. Infine, lo studio sfida la logica dicotomica secondo la quale esiste (co-)creazione vs (co-)distruzione di valore, dimostrando come il valore si dispiega lungo uno spettro va dalla creazione alla distruzione, che dipende da fattori contestuali (come le capacità organizzative). Pertanto, gli effetti dei processi di innovazione digitale dei servizi pubblici devono essere valutati i) rispetto a tre livelli, ii) interrelati tra di loro e iii) attraverso una prospettiva non

dicotomica. Tali risultati contribuiscono allo sviluppo teorico della PSL e degli ecosistemi dei servizi pubblici (Petrescu, 2019; Osborne et al., 2022; Trischler et al., 2023) fornendo una verifica empirica del framework nel contesto dell'innovazione digitale. In aggiunta, questa ricerca contribuisce al dibattito sulla creazione e co-creazione di valore tra "incanto e disincanto" (Palumbo 2017; Dudau et al., 2019) rivelando una posizione intermedia tra creazione e distruzione.

Lo studio offre inoltre numerose implicazioni pratiche per i manager pubblici, fornendo un framework che consente alle organizzazioni di governare, monitorare, estendere e scalare l'innovazione digitale nei servizi pubblici, al fine di generare valore. Grazie alla sua natura dinamica lungo il continuum osservato a ciascun livello dell'ecosistema, il modello rappresenta uno strumento prezioso per decisori e policy-maker nel definire e prioritizzare le aree di creazione di valore nei contesti digitali. Inoltre, indicando le potenziali aree di conflittualità tra valore a diversi livelli lo studio evidenza come i manager e gli operatori delle aziende pubbliche debbano mettere in atto una serie di leve al fine di trasformare quello che potrebbe essere dis-valore per gli individui ma potenziale valore per l'organizzazione e la società nel suo complesso e viceversa.

Parole chiave: Service ecosystem; creazione di valore; telemedicina; sanità

Ripensare la materialità per la pubblica amministrazione: un approccio integrato per rafforzare accountability e valore pubblico

Davide Tonoli[1], Laura Rocca[2], Davide Giacomini[3]

1. Introduzione

Negli ultimi decenni, i dibattiti internazionali sulla sostenibilità si sono concentrati su una molteplicità di sfide globali tra le quali: cambiamento climatico, degrado ambientale, inquinamento, deforestazione, povertà, disuguaglianze e precarietà occupazionale (Calvin et al., 2023). Questi temi richiedono sempre più risposte integrate e misurabili da parte delle organizzazioni private e pubbliche (Kaur & Lodhia, 2019). In tale contesto, la rendicontazione di sostenibilità ha assunto un ruolo crescente come strumento di accountability, con l'obiettivo di integrare le performance economiche con gli obiettivi dello sviluppo sostenibile.

Il Global Reporting Initiative (2013, p. 3) definisce la sostenibilità come "la pratica di misurare, comunicare e assumersi la responsabilità nei confronti degli stakeholder per le performance verso lo sviluppo sostenibile". Questa definizione evidenzia pertanto due dimensioni fondamentali. Da un lato, la misurazione e comunicazione sistematica degli impatti economici, sociali e ambientali. Dall'altro, la centralità dei meccanismi di accountability, intesi come processi che collegano le azioni organizzative alle aspettative sociali più ampie.

Nel settore pubblico, il ruolo delle Public Sector Organizations (PSOs) è particolarmente rilevante poiché esse operano come intermediari tra istituzioni politiche, cittadini e territorio, contribuendo direttamente al benessere collettivo (Cappellieri et al., 2025; Tallaki et al., 2024). I cittadini, a loro volta, richiedono che le amministrazioni pubbliche agiscano con trasparenza, responsabilità e orientamento alla sostenibilità, non solo nella gestione delle risorse, ma anche nella definizione di politiche capaci di promuovere l'uso responsabile dei beni comuni (D'Amore et al., 2024). La crescente domanda di accountability ha indirizzato le organizzazioni pubbliche verso politiche di nonfinancial reporting ma la loro adozione resta disomogenea e spesso limitata a iniziative volontarie (Manes-Rossi et al., 2020; Uyar et al., 2022). Inoltre, la letteratura evidenzia come, sebbene le PSOs abbiano cominciato a pubblicare report ambientali o di sostenibilità, siano ancora carenti strutture metodologiche condivise per identificare i temi rilevanti, coinvolgere efficacemente gli stakeholder e integrare i risultati nei processi decisionali (Cappellieri et al., 2025; Farneti & Guthrie, 2009).

In aggiunta, l'IPSASB (International Public Sector Accounting Standards Board) (2025) ha recentemente sottolineato la necessità di rendere la rendicontazione pubblica più coerente con i principi di sostenibilità, ponendo enfasi su materialità e coinvolgimento degli stakeholder come elementi cardine per la qualità informativa. Tuttavia, come osservano Morrison et al. (2025), l'applicazione del concetto di materialità alle PSOs resta "sottosviluppata e contestata", in quanto

[3] Professore associato, ECON-08/A, Università degli studi di Brescia; davide.giacomini@unibs.it

priva di una definizione metodologica specifica per contesti caratterizzati da pluralismo di attori, finalità pubbliche e accountability condivisa.

Alla luce di queste lacune e attraverso l'integrazione della stakeholder theory (Donaldson & Preston, 1995; Freeman, 1984) con il modello di collaborative advantage e strategic planning di Bryson et al. (2016; 2024), il presente lavoro si propone di definire un processo di materialità strutturato e sensibile al contesto delle organizzazioni pubbliche. L'analisi di materialità è quindi intesa come fase strategica della pianificazione pubblica, capace di allineare obiettivi istituzionali, istanze sociali e criteri di accountability. A seguito delle precedenti premesse, si riporta in seguito la domanda di ricerca: Come può essere progettato e implementato un processo di analisi della materialità strutturato e contestuale nelle PSOs, al fine di supportare l'accountability, aumentare l'engagement degli stakeholder e rafforzare la capacità decisionale sostenibile?

2. Framework teorico

2.1. La rendicontazione di sostenibilità nelle organizzazioni pubbliche

Il dibattito su contabilità e rendicontazione nel settore pubblico ha progressivamente superato la visione finanziaria tradizionale per abbracciare il concetto di public value (Moore, 2014; Steccolini, 2018; Stoker, 2006). In tale prospettiva, le organizzazioni pubbliche sono chiamate non solo a garantire efficienza e controllo della spesa, ma a creare valore collettivo rispondendo ai bisogni di cittadini e comunità. Tale concetto, come evidenziato da Jørgensen & Bozeman (2007), si fonda sul principio che le amministrazioni pubbliche debbano perseguire obiettivi che riflettano valori sociali condivisi, andando oltre la logica di performance economica per includere dimensioni di equità, inclusione e sostenibilità. In aggiunta, come osservano Garlatti et al. (2024), le pubbliche amministrazioni hanno il dovere di "andare oltre l'approccio finanziario per includere gli interessi pubblici che rappresentano la ragion d'essere di ogni ente pubblico". Tale ampliamento implica un orientamento verso la sostenibilità, estendendo la misurazione delle performance a dimensioni immateriali come inclusione, equità, qualità ambientale e benessere diffuso. In questa direzione, la rendicontazione di sostenibilità nel settore pubblico non deve essere percepita come mero adempimento tecnico, ma come strumento per rafforzare la legittimità democratica e la fiducia dei cittadini (Adams, 2023). Come noto, le PSOs operano in ambienti complessi, sfaccettati e politicamente eterogenei (Anessi-Pessina & Steccolini, 2005), nei quali la pluralità di stakeholder implica un equilibrio continuo tra interessi contrastanti. L'accountability assume pertanto una natura dialogica: le istituzioni devono non solo rendere conto, ma anche coinvolgere, negoziare e rendere visibile il processo decisionale (Cassano, 2013). Sebbene l'adozione di strumenti di nonfinancial reporting sia in crescita, le evidenze empiriche mostrano che tali pratiche rimangono immature (CIPFA, 2023). Molte PSOs pubblicano report di sostenibilità o integrati, ma raramente esplicitano i processi di engagement e i criteri di materialità utilizzati (Tirado-Valencia et al., 2019). Ciò comporta una perdita di coerenza tra obiettivi dichiarati, risultati ottenuti e aspettative sociali. La mancanza di integrazione tra rendicontazione e creazione di valore pubblico e la necessità di metriche orientate al public value sono state evidenziate in numerosi lavori di ricerca (Garlatti et al., 2024; Talbot, 2009; Bryson et al., 2014). Tali studi invitano a sviluppare modelli di reporting capaci di rappresentare non solo gli output, ma anche gli impatti sociali delle politiche pubbliche.

2.2. Materialità – principio e processo

Nella letteratura di economia aziendale, il concetto di materialità è stato storicamente definito come soglia oltre la quale un'informazione è rilevante per le decisioni economiche (Messier et al., 2005). L'evoluzione della rendicontazione di sostenibilità ne ha ampliato il significato, attribuendole anche una dimensione di sostenibilità (Fasan & Mio, 2017; Lai et al., 2017). Più

recentemente, secondo il GRI (2021), un tema è materiale, ovvero rilevante, se rappresenta "l'impatto significativo dell'organizzazione sull'economia, sull'ambiente e sulla società". Questa definizione sposta il focus dall'efficienza interna agli effetti esterni e collettivi. La Direttiva CSRD (2023) ha ulteriormente formalizzato il principio di doppia materialità, imponendo alle organizzazioni di rendere conto sia di come pressioni esterne influenzano la loro performance finanziaria, sia di come le loro attività influenzano la società e l'ambiente.

Nel settore pubblico, tuttavia, la traduzione operativa di questi principi incontra specifiche difficoltà. Le organizzazioni pubbliche rispondono a una molteplicità di stakeholder, con interessi spesso in conflitto e difficili da uniformare. È stata pertanto identificata una carenza di criteri standardizzati per definire e ponderare la rilevanza dei temi. Infine, la governance pubblica, fortemente influenzata da aspetti politici, tende spesso a favorire logiche di breve periodo e di legittimazione più che processi sistematici di stakeholder engagement (Bryson et al., 2022). Recenti studi suggeriscono quindi di interpretare la materialità non solo come soglia informativa, ma come processo partecipativo fondato su dialogo, confronto e deliberazione (Morrison et al., 2025; Puroila & Mäkelä, 2019). In questa prospettiva, l'analisi di materialità integrare stakeholder engagement e formulazione strategica, migliorando la coerenza e la trasparenza delle decisioni pubbliche.

2.3. Stakeholder Theory e Collaborative Advantage – framework integrato

La stakeholder theory costituisce un riferimento centrale per analizzare le relazioni tra organizzazioni e soggetti che influenzano o sono influenzati dalle loro attività (Donaldson & Preston, 1995; Freeman, 1984). Essa considera l'organizzazione come parte di un sistema relazionale in cui le decisioni assumono significato solo in rapporto agli interessi dei diversi attori coinvolti. Nel contesto delle organizzazioni pubbliche, questa prospettiva è particolarmente rilevante poiché tali enti operano in ambienti pluralistici caratterizzati da molteplici portatori di interesse con aspettative eterogenee (Bingham et al., 2005; Giacomini et al., 2025). In tale ambito, la teoria consente di interpretare la governance come un processo di interazione e negoziazione volto a generare valore pubblico (Bryson et al., 2016; Kaur & Lodhia, 2019). Nel campo della rendicontazione di sostenibilità, la stakeholder theory rappresenta un quadro utile per comprendere come il coinvolgimento degli stakeholder possa orientare la definizione delle priorità e accrescere la legittimità delle informazioni diffuse (Morrison et al., 2025; Vidè et al., 2025). Tuttavia, essa non fornisce chiare indicazioni operative su come tradurre le istanze dei portatori di interesse in obiettivi strategici.

A colmare questa lacuna interviene il lavoro di ricerca di Bryson et al. (2016, 2022), che attraverso il principio di collaborative advantage e il modello di strategic planning cycle indica un processo circolare di pianificazione strategica fondato su:

- Identificazione e mappatura degli stakeholder
- Analisi del contesto e definizione della missione
- Formulazione e negoziazione degli obiettivi
- Implementazione
- Valutazione e apprendimento

Bryson et al. (2022) distinguono inoltre tra goal formulation e goal formation: la prima rappresenta la definizione intenzionale e strutturata degli obiettivi, la seconda descrive la loro evoluzione dinamica nel tempo, influenzata da contesti e feedback. Questa distinzione apre alla possibilità di inserire la materialità come fase proattiva nella formazione degli obiettivi, rendendo il processo più partecipativo e fondato su evidenze. Il collaborative advantage si manifesta quando più organizzazioni, cooperando, ottengono risultati che non sarebbero raggiungibili individualmente (Huxham & Vangen, 2005). In termini di accountability pubblica, la valutazione di materialità può costituire lo strumento operativo per individuare tali obiettivi condivisi e generare valore pubblico co-prodotto.

Pertanto, l'integrazione con il processo di analisi di materialità offre una prospettiva concreta per strutturare il dialogo e la negoziazione, trasformando le istanze espresse dagli stakeholder in leve concrete per la pianificazione strategica e la rendicontazione.

Questa integrazione consente di concepire l'analisi di materialità come strumento di governance strategica articolato in cinque passaggi:

1. Mappatura degli stakeholder e analisi del contesto.

Il processo iniziale prevede l'identificazione e la mappatura degli stakeholder insieme all'analisi del contesto socio-politico e ambientale (CIPFA, 2023).

2. Coinvolgimento e identificazione delle tematiche.

Gli stakeholder vengono coinvolti tramite metodi partecipativi come focus group, interviste e questionari con l'obiettivo di raccogliere un insieme ampio di tematiche percepite come rilevanti (Giacomini et al., 2025).

3. Analisi di materialità.

Invece di definire direttamente gli obiettivi, è realizzato un processo strutturato di analisi di materialità, in cui i temi sono esaminati secondo criteri prestabiliti (rilevanza sociale, impatto ambientale, capacità istituzionale). Attraverso un processo di negoziazione e prioritizzazione, stakeholder e decisori discutono e ordinano i temi, individuando priorità condivise e potenziali trade-off (Giacomini et al., 2024; Morrison et al., 2025).

4. Formulazione degli obiettivi e integrazione strategica.

Gli obiettivi strategici derivano dai temi materiali prioritari, garantendo coerenza con le aspettative degli stakeholder e con le capacità organizzative. Tali obiettivi guidano quindi la progettazione, l'attuazione e la valutazione delle politiche (Bryson et al., 2022; Bryson & George, 2024).

5. Creazione di collaborative advantage e public value.

Fondando gli obiettivi strategici su temi materiali negoziati tra gli stakeholder, il processo accresce la condivisione, la legittimità e l'efficacia dell'attuazione, rafforzando così il vantaggio collaborativo e la generazione di valore pubblico (Bryson et al., 2016).

3. Metodologia e dati

La ricerca adotta la metodologia dell'action research (Susman & Evered, 1978), un approccio partecipativo che si basa su cicli iterativi di azione e riflessione finalizzati a produrre conoscenza teorica e soluzioni operative direttamente applicabili ai contesti osservati. Tale metodologia è particolarmente coerente con la natura pragmatica delle organizzazioni pubbliche, poiché consente di sviluppare un apprendimento collettivo e riflessivo attraverso la partecipazione attiva di ricercatori, decisori e stakeholder.

Il modello proposto viene sperimentato in due grandi amministrazioni pubbliche che operano in contesti istituzionali differenti, una situata in Italia e una in un altro Paese europeo o internazionale. La scelta di due PSOs con caratteristiche amministrative, politiche e organizzative eterogenee permette di testare il framework in contesti altamente complessi, caratterizzati da pressioni politiche e sociali rilevanti, da sistemi di governance multilivello e da diversi livelli di maturità nelle politiche e nei processi di sostenibilità. La città italiana ipotizzata si inserisce in un contesto contraddistinto da elevata complessità amministrativa, forte esposizione mediatica e dinamiche decisionali influenzate da molteplici priorità urbane e vincoli economici. La PSO internazionale rappresenta, invece, un ambiente più istituzionalizzato, con sistemi di pianificazione ambientale consolidati e una cultura amministrativa più stabilmente orientata ai principi di sostenibilità.

Il disegno metodologico segue il ciclo proposto dall'action research (Susman & Evered, 1978), articolato in cinque fasi principali: diagnosi, pianificazione, azione, valutazione e apprendimento. Ogni fase implica una continua interazione tra ricercatori e attori istituzionali, al fine di costruire un processo riflessivo e adattivo. Nello specifico:

1. Diagnosi.

In questa fase iniziale viene condotta un'analisi sistematica dei processi di rendicontazione e dei meccanismi di engagement esistenti nelle due amministrazioni. Attraverso una revisione della letteratura internazionale su approcci multi-stakeholder e metodologie di materialità nel settore pubblico, si individuano le principali criticità, tra le quali: frammentazione delle pratiche, assenza di standard comuni e limitata trasparenza nei criteri di selezione dei temi materiali.

2. Pianificazione dell'azione.

A partire dai risultati della diagnosi, i ricercatori e i rappresentanti istituzionali co-progettano un processo di materialità strutturato, che includa tre dimensioni fondamentali:

- un approccio multi-stakeholder, basato sul coinvolgimento di attori politici, cittadini, funzionari pubblici, imprese, organizzazioni del terzo settore e livelli istituzionali superiori (CIPFA, 2023);
- un approccio multi-source, che integri dati provenienti da documenti ufficiali, media, social network e interviste;
- una garanzia di indipendenza, assicurata dal coinvolgimento di un soggetto terzo (i.e. esperte/i non affiliati alle amministrazioni coinvolte) incaricato di supervisionare il processo e di validare i risultati.

3. Azione.

La fase operativa prevede la sperimentazione diretta del modello nei due enti selezionati. Il processo di materialità viene applicato attraverso attività di co-design, workshop partecipativi, interviste semi-strutturate e focus group. Il coinvolgimento attivo degli stakeholder consente di raccogliere percezioni, priorità e giudizi sulle questioni più rilevanti in termini di impatto sociale, ambientale e istituzionale.

4. Valutazione.

I dati raccolti vengono analizzati per costruire le matrici di materialità, individuando le priorità condivise e le divergenze tra i gruppi di stakeholder. Vengono inoltre stimati i costi e i tempi di implementazione del processo per valutarne la fattibilità operativa e l'efficienza in termini di risorse impiegate. L'obiettivo è comprendere se un approccio strutturato alla materialità possa essere realisticamente adottato da PSOs di diversa scala e capacità organizzativa.

5. Apprendimento e adattamento.

L'ultima fase mira a sistematizzare le conoscenze acquisite, discutendo i risultati con i partecipanti e formulando raccomandazioni operative per la replicabilità del modello in altri contesti.

La raccolta dati combina tecniche qualitative e analitiche, in un'ottica di triangolazione che rafforza la validità dei risultati.

- Analisi documentale di bilanci, piani strategici, delibere, report di sostenibilità, comunicati stampa e altri documenti ufficiali, per ricostruire il quadro istituzionale e le politiche esistenti in materia di sostenibilità.
- Content analysis di media locali, resoconti di consiglio comunale, comunicazioni ufficiali e post sui social media istituzionali, al fine di identificare la percezione pubblica dei temi ambientali e sociali e la loro rilevanza nel dibattito politico.
- Interviste semi-strutturate con una pluralità di attori: sindaci e consiglieri, dirigenti e funzionari, rappresentanti del settore privato e del terzo settore, cittadini e rappresentanti di enti sovraordinati (i.e. regioni o entità equiparate).
- Workshop partecipativi che consentono di rappresentare graficamente le connessioni tra obiettivi, interessi e aree di collaborazione tra gli stakeholder.

Le interviste vengono successivamente analizzate secondo la Gioia Methodology (2013), che permette di organizzare i dati in categorie concettuali progressive.

Infine, l'analisi dei dati mira a valutare la coerenza del framework rispetto agli obiettivi di accountability e sostenibilità. L'approccio comparativo tra le due grandi città selezionate consente di individuare pattern ricorrenti, quali la difficoltà di tradurre i processi partecipativi in decisioni

strategiche o l'assenza di criteri condivisi per la definizione delle priorità, insieme a specificità locali riconducibili alle diverse tradizioni amministrative e ai differenti sistemi politici. La validazione dei risultati viene effettuata tramite sessioni di feedback collettivo, durante le quali i ricercatori presentano le evidenze empiriche agli attori coinvolti per verificarne la coerenza interpretativa e discutere eventuali adattamenti del modello. Questa fase di confronto, centrale nell'action research, assicura che le conclusioni siano empiricamente fondate e socialmente condivise.

4. Risultati attesi e valore pubblico potenziale

Il lavoro di ricerca, attualmente nello stato di work in progress, si propone di generare risultati teorici e operativi rilevanti per l'evoluzione del dibattito sulla materialità nel settore pubblico e sul ruolo dei processi partecipativi nella definizione delle strategie di sostenibilità.

Dal punto di vista teorico, il contributo principale consiste in una concettualizzazione della materialità come processo dialogico e deliberativo, capace di integrare in modo sistematico il coinvolgimento degli stakeholder, la pianificazione strategica e le pratiche di accountability (Morrison et al., 2025; Puroila & Mäkelä, 2019). La letteratura recente, in particolare gli studi dedicati alle amministrazioni pubbliche, ha messo in evidenza come la materialità non possa essere intesa come un mero esercizio tecnico di selezione delle informazioni da comunicare, ma come un processo che richiede negoziazione, confronto strutturato e definizione condivisa delle priorità (Cappellieri et al., 2025; Giacomini et al., 2025). Il lavoro proposto approfondisce questa prospettiva, mostrando come la materialità possa divenire un dispositivo metodologico per superare la frammentazione decisionale e per rendere esplicito il contributo degli stakeholder alla definizione delle strategie pubbliche (Garlatti et al., 2024).

In secondo luogo, il lavoro offre un'integrazione tra modelli teorici spesso utilizzati separatamente. La stakeholder theory fornisce l'orizzonte interpretativo per comprendere la molteplicità delle relazioni tra PSOs e attori sociali, mentre il framework di Bryson consente di tradurre tali relazioni in processi strategici concreti (Bryson et al., 2016; Bryson & George, 2024). L'integrazione dei due approcci permette di passare da una visione descrittiva dell'engagement a un modello operativo in cui la materialità assume un ruolo centrale nella definizione degli obiettivi pubblici.

Dal punto di vista operativo, la ricerca mira a produrre una serie di risultati tangibili legati alla sperimentazione del modello relativamente alle PSOs selezionate. In primo luogo, ci si attende la costruzione di matrici di materialità pubblica orientate da criteri riconoscibili e trasparenti, quali la rilevanza sociale e l'impatto ambientale delle tematiche, come suggerito dagli indirizzi IPSASB (2025) e dalle applicazioni empiriche più recenti (Giacomini et al., 2025). Tali matrici consentiranno di rendere visibile il legame tra attese degli stakeholder e priorità strategiche, offrendo una base empirica per l'elaborazione dei piani di sostenibilità e delle politiche urbane.

Un secondo esito atteso riguarda lo sviluppo di meccanismi decisionali che permettano a decisori istituzionali, tecnici e cittadini di co-definire le priorità strategiche. Attraverso tali meccanismi, il processo decisionale potrà acquisire maggiore legittimazione, poiché sarà possibile tracciare in modo più chiaro il ruolo giocato dagli stakeholder nella definizione degli obiettivi di sostenibilità.

La comparazione tra le PSOs oggetto di analisi consentirà inoltre di osservare come le differenze di assetto istituzionale influenzino la profondità e la qualità del coinvolgimento degli stakeholder, aspetto più volte evidenziato nella letteratura sulla governance multilivello e sulla sostenibilità nelle amministrazioni locali (Farneti & Guthrie, 2009; Rocca et al., 2021).

Dal punto di vista delle implicazioni per la policy, il framework elaborato potrà supportare le amministrazioni pubbliche nel rafforzare la coerenza tra pianificazione strategica e processi di rendicontazione, migliorando al contempo la trasparenza e la fiducia dei cittadini. L'introduzione

di un processo strutturato di materialità potrà consentire di orientare le politiche verso la creazione di valore pubblico sostenibile, rendendo più esplicite le connessioni tra priorità sociali, obiettivi ambientali e scelte strategiche. Il modello potrà inoltre contribuire allo sviluppo di strumenti visuali e deliberativi capaci di facilitare la comunicazione delle priorità e la partecipazione informata degli stakeholder.

Parole chiave: Stakeholder Engagement; materialità; sustainability reporting; public management

L'Intelligenza Artificiale come leva strategica nella programmazione razionale nella PA: un'indagine sui Comuni italiani

Alessandro D'Aquino[1], Simone Cifolelli[2], Marco Berardi[3], Andrea Ziruolo[4]

1. Introduzione

Il tema della creazione del Valore Pubblico (di seguito VP) ha suscitato, negli ultimi decenni, un ampio dibattito nella letteratura che oggi lo definisce come l'obiettivo verso cui le organizzazioni pubbliche orientano la propria azione per rispondere efficacemente ai bisogni della collettività, generando benessere economico, sociale e ambientale (Moore 1995; Esposito e Ricci, 2015; Ziruolo et. al, 2023; Deidda Gagliardo et al., 2024).

Tuttavia, i profondi mutamenti economico-sociali, tra cui la crisi economica post-pandemica, la povertà, il cambiamento climatico e il calo inarrestabile del tasso di natalità, comunemente definiti wicked problems (WP), rendono sempre più complesso per i policymakers perseguire il VP (Geuijen et al., 2017; Costumato, 2024). Sul tema, parte della letteratura ha evidenziato che i WP incidono negativamente sul processo di programmazione in particolare nel contesto dell'ente locale, dove viene spesso definita "razionale", riferendosi al complesso processo di programmazione sia finanziaria (Bilancio di Previsione) che strategica/operativa (Documento Unico di Programmazione, Piano Esecutivo di Gestione e Piano Integrato di Attività e Organizzazione) (Boyne et al., 2004; Vial, 2019; Berardi, 2025).

A fronte di tali criticità, la letteratura ha individuato nel Knowledge Management (KM) uno strumento utile a supporto della programmazione razionale in contesti complessi, laddove, valorizzandone il capitale intellettuale (CI), concorre alla reingegnerizzazione dei processi delle organizzazioni (Fontana, 2009, Ziruolo 2022).

Al contempo, una parte della letteratura afferma che il solo impiego del KM non sia sufficiente a fronteggiare la complessità dei contesti decisionali contemporanei, poiché permangono vincoli informativi e cognitivi che riducono la razionalità pianificatoria, riconducibili all'apporto del CI dei soggetti coinvolti nei processi decisori delle organizzazioni (Boyne et al., 2004; Vial, 2019).

In questa prospettiva, alcuni autori evidenziano che l'utilizzo di tecnologie digitali, tra cui l'Intelligenza Artificiale (AI), la Blockchain e l'internet delle cose (IoT), diventa indispensabile nella gestione di un processo KM, in quanto capaci di automatizzare l'analisi dei dati, supportare le decisioni e potenziare la capacità cognitiva dei decisori pubblici impattando positivamente sul CI (Margetts, 2022; Jarrahi et al., 2023). In particolare, la letteratura evidenzia come l'AI, fungendo da catalizzatore del capitale intellettuale, può sostenere la pianificazione razionale, orientando i policymakers verso una programmazione orientata alla creazione del valore pubblico, obiettivo ultimo della Public Value Governance attraverso la reingegnerizzazione dei processi che

sottendono la programmazione razionale (Moore, 1995; Cepiku, 2022; Jarrahi et al., 2023; Mergel et al., 2024; Berardi, 2025).

Il rapporto tra programmazione razionale e KM è ampiamente dibattuto in letteratura soprattutto da un punto di vista teorico, mentre le evidenze empiriche restano ancora limitate. Tale limite, come evidenziato da Mergel et al. (2024) e Neumann (2024), non consente di cogliere a pieno in che modo l'integrazione tra KM e AI si traduca concretamente in processi di programmazione razionale e in che modo la reingegnerizzazione dei processi concorra a creare VP.

Per contribuire a colmare tale gap, il presente studio propone di indagare, attraverso un case study, il ruolo dell'AI come leva di accelerazione del KM nei processi di programmazione razionale e quindi di creazione di valore pubblico, nel contesto della pubblica amministrazione indagandone il ruolo nei processi decisionali che portano alla programmazione razionale.

La ricerca si concentrerà sui comuni italiani con meno di 5.000 abitanti, in quanto la letteratura ha evidenziato come le "piccole comunità" rappresentano il livello di governo più vicino ai cittadini e, al tempo stesso, il più esposto ai WP (Oates, 1972; Ziruolo, 2000; Anselmi, 2003). La letteratura mostra infatti che, in tali contesti, i WP mettono a dura prova la sostenibilità economico-finanziaria e la capacità organizzativa degli enti, rendendo necessario un ripensamento della programmazione razionale (Barca, 2012; Carbonaro et al., 2018). Inoltre, a seguito dell'evento pandemico Covid-19 il PNRR ha previsto la possibilità in particolare per i piccoli enti di attingere a risorse finanziarie dedicate ad investimenti in AI proprio al fine di reingegnerizzare i processi degli enti.

Su tali premesse, vengono formulate le seguenti domande di ricerca:

RQ1. Qual è il livello di conoscenza, consapevolezza e uso dell'intelligenza artificiale nei processi di pianificazione razionale dei Comuni italiani?

RQ2. Quali capacità e condizioni abilitanti, organizzative, istituzionali e sociali, favoriscono o ostacolano l'applicazione dell'AI alla pianificazione razionale?

2. Contesto teorico di riferimento

2.1. Ripensare il paradigma della programmazione razionale alla luce dell'intelligenza artificiale

Le pubbliche amministrazioni non vivono di decisioni estemporanee, ma devono tradurre le intenzioni del mandato politico in attività pianificate, coerenti con gli obiettivi programmatici e trascritte in piani chiari e rendicontabili (Ziruolo, 2016; Cavallini e Orsetti, 2022). Così come nel settore privato, anche la gestione pubblica, recependo il paradigma del New Public Management (Hood, 1991), fonda i propri processi decisionali su una programmazione formalizzata che consente di gestire in modo più efficace ed efficiente l'intero ciclo di gestione dell'ente. Questo processo, definito in letteratura "programmazione razionale" (Boyne et. al, 2004), traduce le volontà politiche in procedure formalizzate declinate in appositi documenti che definiscono le attività, le risorse, i tempi e le condizioni per il raggiungimento degli obiettivi che per loro natura, devono essere specifici, misurabili, raggiungibili, realistici e definiti nel tempo (S.M.A.R.T.), rendicontabili e orientati alla creazione di valore pubblico (Hood, 1991; Moore, 1995; Boyne et al., 2004; Berardi, 2025)[1].

[1] In riferimento al contesto italiano, il legislatore, avendo recepito il paradigma della programmazione razionale, nel formulare indicazioni operative per la sua applicazione negli enti locali l'ha reso norma prima con l'introduzione del Documento Unico di Programmazione (DUP, d.lgs. 118/2011, allegato 4.1) e poi

Autori come Borgonovi et al. (2018), Cepiku (2018) e Del Bene e Bartocci (2018, p.133-155) affermano che la programmazione assume una valenza strategica, contribuendo a migliorare il complessivo governo delle amministrazioni solo se condotta in modo critico, ovvero se preceduta da un'attenta riflessione su ciò che l'ente deve prioritariamente perseguire e declinata in un set coerente di indicatori e target. Tuttavia, come osservano Boyne et al. (2004), tale approccio risulta nella pratica tecnicamente complesso, al punto che la pianificazione viene talvolta abbandonata o ridotta a mero adempimento formale. Le cause risiedono sia nei limiti cognitivi dei policymakers sia nei limiti tecnici e informativi: ad esempio, i dati necessari a supportare una programmazione realmente razionale risultano spesso difficili da reperire e ancor più da interpretare (Boyne et al., 2004, Berardi, 2025).

In questa prospettiva, Ramanujam et al. (1986) sostenevano che la pianificazione razionale può essere perseguita con successo solo laddove siano disponibili risorse sufficienti per assumere pianificatori specializzati o per dotare i dirigenti di strumenti efficaci che ne potenzino le capacità di pianificazione. Ne consegue che una parte della letteratura abbia adottato un approccio critico nei confronti della pianificazione razionale, in quanto considerata fagocitante di risorse umane e un onere aggiuntivo per i costi dell'organizzazione (Jenkins, 1978; Mintzberg, 1994; Van Dooren et. al, 2015).

L'introduzione degli strumenti digitali innovativi, tra cui l'AI, porta quindi a riconsiderare le potenzialità della programmazione razionale con margini più ottimistici di fattibilità ed efficacia. Tali strumenti, infatti, consentono di superare i vincoli cognitivi, tecnici e informativi dei policymakers nel formulare il ciclo di programmazione degli enti, attraverso l'automazione dell'analisi dei dati e dei processi decisionali (Margetts, 2022; Mergel et al., 2024).

Il supporto delle tecnologie digitali emergenti permette infatti di migliorare l'accuratezza delle decisioni umane, spesso soggette a errori e bias cognitivi, fungendo quindi da leva strategica per rafforzare l'efficienza delle amministrazioni e la loro capacità di creare VP (Bonomi Savignon, 2025). Inoltre, la letteratura puntualizza che l'introduzione di tecnologie digitali deve risultare funzionale allo scopo per il quale vengono utilizzate e quindi contestualizzate e adattate ad ogni singolo contesto e organizzazione in maniera consapevole, da qui la definizione di Knowledge Management (KM).

Implementare efficacemente la gestione della conoscenza nella programmazione razionale

Numerosi studi definiscono il KM come strumento strategico per la competitività delle organizzazioni, sia pubbliche che private, che consente di gestire al meglio i processi di creazione, condivisione e utilizzo della conoscenza, valorizza il patrimonio intellettuale, stimola l'innovazione e la capacità di problem solving (Stevens, 2010; Maurer et al., 2011; Massingham e Massingham, 2014) migliorando i processi decisionali promuovendo l'apprendimento continuo che genera valore per l'organizzazione (Chow et al.,2000; Berardi et al., 2022).

Altri studi definiscono il KM "managerialità consapevole", ovvero la combinazione di informazioni, esperienze, intuizioni, competenze, capacità e abilità di tipo manageriale che risultano di valore per un'organizzazione e per i suoi membri (Chow et al., 2000; Fontana, 2013; Fontana et al., 2024).

Nelle teorie del Public Management, il KM è riconosciuto come uno degli strumenti per superare i limiti della pianificazione razionale, che derivano non tanto da ostacoli politici, quanto da carenze organizzative, mancanza di strumenti adeguati e risorse conoscitive limitate (Boyne et al., 2004). Il KM contribuisce a colmare questo divario poiché, attraverso quel processo definito di reingegnerizzazione delle fasi della programmazione razionale, consente di acquisire,

ripreso nel Piano Integrato di Attività e Organizzazione (PIAO, art. 6, DL 80/2021) (Cavallini & Orsetti, 2022).

organizzare e condividere in modo più efficace il patrimonio informativo e cognitivo dell'ente, superando i vincoli intellettuali e informativi che ostacolano la razionalità pianificatoria (Boyne et al., 2004; Edvinsson, 2006; Fontana, 2013).

Tuttavia, nonostante l'impiego del KM, permangono ancora limiti di natura tecnica che riducono la capacità delle amministrazioni di realizzare una piena razionalità pianificatoria (Vial, 2019). In tale prospettiva, le tecnologie dell'AI possono potenziare il ruolo del KM, agendo come strumenti di empowerment per i policymakers (Fontana, 2013; Jarrahi et al., 2023).

Ad esempio, i sistemi di deep learning permettono di riconoscere schemi e relazioni nei dati non ancora noti all'ente, generando nuove informazioni. Allo stesso modo, strumenti di AI come il knowledge storing and retrieving ampliano la memoria organizzativa, rendendo più efficiente e sistematico il recupero della conoscenza implicita (Jarrahi et al., 2023, p. 89). Attraverso queste tecnologie, gli enti possono attingere a informazioni provenienti da molteplici canali (banche dati, documenti di programmazione di annualità passate, atti interni, ecc.), trasformandole in risorse utilizzabili nelle fasi di programmazione e monitoraggio dei piani.

L'AI può quindi offrire un contributo diretto alla governance locale supportando le analisi:

- interna (risorse e processi dell'ente)
- esterna (ambiente istituzionale e sociale)
- di contesto (fenomeni demografici ed economici)
- di scenario (sviluppi futuri e traiettorie di cambiamento)

e coadiuvando i policy makers nella definizione di modelli di sviluppo territoriale orientati a una visione di lungo periodo e alla creazione di valore pubblico (Fontana 2013; Mergel et al., 2024; Neumann et al., 2024; Bonomi Savignon, 2025).

In questa prospettiva, l'AI rappresenta lo strumento abilitante del Knowledge Management, capace di trasformare i dati pubblici in conoscenza utile per la programmazione razionale (Boyne, 2004; Vial, 2019) e fungendo da ruolo di catalizzatore del CI capace di sostenere la pianificazione razionale e concorrendo alla creazione di valore pubblico, (Moore, 1995; Cepiku, 2022; Jarrahi et al., 2023; Mergel et al., 2024; Berardi, 2025).

3. Metodologia della ricerca

Ai fini della nostra indagine il cluster empirico di analisi è composto dai 434 enti che hanno aderito all'ambito C "Miglioramento delle attività amministrative attraverso l'uso delle tecnologie informatiche" del progetto FAST Piccoli Comuni[2].

Questa iniziativa, promossa dal Dipartimento della Funzione Pubblica e finanziata dal PON Governance e Capacità Istituzionale 2014-2020 (Azioni 1.2.1 e 1.3.1), sostiene i Comuni con meno di 5.000 abitanti facendo loro utilizzare una piattaforma sperimentale di Knowledge Management basata su un software informativo che usa tecnologie di AI (Legal Desktop) per assistere gli amministratori e i dipendenti comunali nella redazione degli atti (Forum PA, 2023).

Dopo aver definito il cluster di analisi, la ricerca utilizzerà un approccio qualitativo-esplorativo (Del Bene e Bartocci, 2018, pp. 133-155) basato sul modello interpretativo dell'AI Maturity Model (AIMM) del settore pubblico sviluppato da Dreyling et al. (2024) (Tabella 1). Questo framework è stato riadattato dal contesto generale del settore pubblico a quello dei Comuni (Tabella 2), in linea con quanto suggerito dalla letteratura sui maturity models, che raccomandano una contestualizzazione dei costrutti alle specificità dell'ambiente analizzato (Becker et al., 2009; Fukas et al., 2021; Dreyling et al., 2024). L'adattamento del modello dal settore pubblico in generale al contesto degli enti locali, si ispira al modello di Dreyling et al.

[2] In questa fase del lavoro non è ancora possibile definire con precisione gli enti da includere nell'analisi, poiché si è in attesa dell'elenco aggiornato dei comuni che hanno aderito al progetto FAST, comprensivo sia di quelli che hanno già avviato le attività sia di quelli che non le hanno ancora iniziate.

(2024) riadattando l'AIMM di Fukas et al. (2021) e il maturity model (Becker et al. 2009) al fine di analizzare come l'AI stia sostenendo la capacità pianificatoria e decisionale dei Comuni (Jarrahi et al.,2023; Mergel et al., 2024).

La metodologia adottata è inoltre supportata da una parte della letteratura (Dreyling et al., 2024; Neumann et al., 2024; Babšek et al., 2025, p. 27), secondo cui gli AIMM, se opportunamente calibrati alle specificità della pubblica amministrazione, risultano strumenti validi, in ottica esplorativa, per interpretare la capacità delle amministrazioni comunali di integrare l'AI nei propri processi di programmazione.

Level And Description	**Technology And Tools**	**Data**	**People And Competence**	**Organization And Processes**	**Leadership And Strategy**	**Financial**	**Law, Ethics And Trust**	**Security And Privacy**
LEVEL 1: INITIAL AI is almost entirely absent. Technologies are basic, data are fragmented, competencies are limited, and processes are manual. There are signs of interest, but no structured initiatives.	Ad hoc AI Technologies	Ambiguous Data Availability	Ad hoc AI Technologies	Not Started	Min AI Strategy and Leadership	Minimal Budget	Min AI Specific Legal, Ethical and Trust Compliance	Min Security and Privacy Awareness
LEVEL 2: ASSESSING Early experiments begin to emerge. The organization starts exploring AI through Proofs of Concept or isolated initiatives, but without a stable strategy or governance framework.	Explored AI Technologies	Incomplete Data processing and availability	External AI Competences	Individually & Exploring	Pre AI Strategy and Leadership	Initial Pilotin g Budget	Initial Legal, Ethical and Trust Compliance	Initial Security and Privacy Implementation
LEVEL 3: DETERMINED AI is implemented in selected processes, staff receive specific training, and initial internal policies are defined. The organization formally acknowledges AI's potential as a	Implemented AI Technologies	Project based Data	Internal AI Competences	Organization AI approach	AI Strategy and Leadership	Integrated Budget and financial goals	Integral Legal, Ethical and Trust Compliance	Partial Security and Privacy Implementation

decision-support lever.								
LEVEL 4: MANAGED AI is firmly integrated into organizational processes. Data are interoperable, competencies are widespread, and leadership adopts a strategic and data-driven approach. Implementation is supported by dedicated budgets and formal policies.	Scalable AI Technologies	Consistent Data resources	Active AI Competences	AI Coordination & Integration	Formalized AI Strategy and Leadership	Dedicated Budget and financial goals	Formal Legal, Ethical and Trust Compliance	Formalized Security and Privacy Implementation
LEVEL 5: OPTIMIZED AI becomes the organization's cognitive infrastructure, continuously integrated into decision-making, predictive, and monitoring processes. Decisions are evidence-based, data flow in real time, and ethical and security policies are embedded by design.	Continuous Improvement of AI Technologies	Data-driven Services	Leading AI Competences	AI-enabled & AI-driven	Integrated AI Strategy and Leadership	Self-sustaining Budget and financial goals	Automated Legal, Ethical and Trust Compliance	Integrated Security and Privacy Implementation

Tabella 1. Artificial Intelligence Maturity Model for public sector (Dreyling et al., 2024)

L'AIMM è un modello a matrice di autovalutazione che consente di misurare il livello di avanzamento di un ente pubblico nell'adozione dell'AI (Dreyling et al., 2024). Il modello permette di categorizzare e misurare lo sviluppo dell'uso dell'AI nelle principali aree organizzative coinvolte nei processi di adozione, articolandole in otto dimensioni (Becker et al., 2009; Fukas et al., 2021; Dreyling et al., 2024):

- Technology: misura il grado di disponibilità e utilizzo di infrastrutture digitali e tecnologie AI;
- Data: valuta la qualità e l'interoperabilità dei dati necessari per alimentare i modelli informativi;
- People and Competence: considera le competenze digitali e analitiche del personale;
- Organization and Processes: misura il livello di integrazione dell'AI nei processi operativi e nei flussi di programmazione;

- Leadership and Strategy: valuta l'impegno politico-manageriale verso l'adozione dell'AI;
- Financing: analizza la capacità dell'ente di allocare risorse economiche dedicate alla digitalizzazione e all'integrazione dell'AI nei propri processi di programmazione;
- Law, Ethics and Trust: misura l'attenzione ai temi di trasparenza, etica e fiducia nell'uso dell'AI;
- Security and Privacy: valuta l'esistenza di policy e procedure per la protezione dei dati e la gestione dei rischi digitali.

Ciascuna dimensione è valutata attraverso cinque livelli di maturità (Initial, Assessing, Determined, Managed, Optimized), che rappresentano la scala evolutiva descrivendo il percorso graduale di adozione e integrazione dell'AI all'interno dell'organizzazione (Becker et al., 2009; Dreyling et al., 2024). Una descrizione più dettagliata dei livelli è riportata nella Tabella 1.

Il nostro studio adatta l'AIMM proposto da Dreyling et al. (2024) contestualizzandolo al contesto dei comuni italiani (Tabella 2). Le otto dimensioni e i cinque livelli sono stati rielaborati in chiave operativa riferendoli direttamente ai processi di programmazione razionale. (Boyne et al.,2004; Berardi, 2025).

	Technology And Tools	**Data**	**People And Competence**	**Organization And Processes**	**Leadership And Strategy**	**Financial**	**Law, Ethics And Trust**	**Security And Privacy**
Ruolo nella programmazione razionale	Misura la disponibilità di strumenti digitali e piattaforme integrate a supporto della programmazione. Riflette il grado in cui la tecnologia agisce come leva cognitiva e non solo operativa nei processi decisionali.	Misura la qualità, l'integrazione e l'interoperabilità dei dati che alimentano i piani e i documenti di programmazione (DUP, PEG, PIAO).	Rappresenta il livello di maturità del capitale umano, che passa da un approccio esecutivo nella redazione dei documenti a un coinvolgimento attivo nei processi di analisi e progra	Indica il livello di incorporazione dell'AI nelle fasi del ciclo programmatorio. Dalla mera sperimentazione si passa alla piena integrazione di strumenti intelligenti nelle attività di analisi, pianificazione e controllo.	Riguarda la visione politico-manageriale dell'ente. Valuta se la leadership riconosce l'AI come leva strategica per migliorare la qualità delle decisioni e orientare la programmazione verso evidenze misurabili.	Considera la disponibilità di risorse economiche e dedicate alla digitalizzazione e alla gestione dei sistemi AI. La stabilità dei finanziamenti è condizione per consolidare una razionalità amministrativa sostenibile.	Richiama la dimensione valoriale e dell'amministrazione pubblica, dove trasparenza, etica e responsabilità guidano l'integrazione dell'AI e rafforzano la fiducia tra istituzioni e cittadini.	Analizza il livello di attenzione verso la protezione dei dati e la gestione consapevole dei rischi digitali, elementi che condizionano la credibilità e l'affidabilità della programmazione basata su AI.

			mmazione, fino alla co-progettazione con l'AI.					
LEVEL 1: INITIAL	L'ente elabora i piani con strumenti base (Word, Excel). Non dispone di software gestionali integrati né di funzioni automatizzate.	I dati sono frammentati, spesso cartacei e non aggiornati; la raccolta è manuale e priva di criteri di validazione.	Il personale redige i documenti senza competenze digitali o statistiche; prevale un approccio descrittivo.	I processi di programmazione sono gestiti manualmente, senza strumenti digitali o supporti di intelligenza artificiale. L'AI è totalmente assente.	L'innovazione tecnologica non è considerata nella visione politica o gestionale.	Nessuna risorsa destinata a digitalizzazione o strumenti analitici.	Assenza di riferimenti a principi etici, trasparenza o uso responsabile dei dati.	Nessuna misura di sicurezza informatica o protezione dei dati.
LEVEL 2: ASSESSING	L'ente utilizza software gestionali standard (contabilità, protocollo, personale) non collegati alla programmazione. Prime prove di cruscotti o report digitali.	I dati sono digitalizzati ma non strutturati né integrati; vengono raccolti da singoli uffici senza regole comuni.	Alcuni dipendenti mostrano interesse per le tecnologie e seguono corsi introduttivi.	L'ente usa funzioni digitali di base, ma l'AI è sperimentata solo in modo episodico e senza influenza reale sui processi di programmazione.	L'innovazione è citata nei documenti politici e programmatici come tema di modernizzazione, non come leva strategica.	Fondi sporadici (PNRR o progetti digitali) finanziano iniziative o attività formative.	Prime misure di trasparenza e pubblicazione dati, senza un quadro etico formalizzato.	Misure minime di sicurezza (backup, password, antivirus di base).
LEVEL 3: DETERMINED	L'ente utilizza software di supporto alla programmazione	I dati sono archiviati digitalmente, con controll	I responsabili di servizio o altro personale	L'AI o strumenti analitici vengono impiegati per raccoglie re,	Gli amministratori riconoscono l'AI come strumento di	Le risorse economiche e finanziano l'adozione e la sperimentazione di	Vengono rispettati i principi di trasparenza e	Sono attive policy di sicurezza di base per la protezione delle

Tabella 2. Matrice di maturità dell'AI applicata ai comuni italiani- Adattamento degli autori all'AI Maturity Model di Dreyling et al. (2024)

Per utilizzare operativamente la matrice e per rispondere alle nostre domande di ricerca, lo studio prevede una doppia fase di raccolta dei dati. La prima fase è finalizzata al posizionamento dei Comuni all'interno dell'AIMM (RQ1). Il posizionamento sarà ottenuto mediante una rilevazione basata su questionari valutati con scala Likert a 5 punte, in cui ogni valore da 1 a 5 corrisponde direttamente ai livelli della matrice AIMM (Groves et al., 2011). Il questionario sarà rivolto agli stakeholder interni (sindaci, assessori, responsabili dei servizi) e sarà strutturato in gruppi di item, ciascuno dei quali riflette una delle otto dimensioni dell'AIMM in linea con quanto già applicato da Becker et al. (2009) e Dreyling et al. (2024), secondo il quale i maturity models possono essere compilati tramite procedure standardizzate di autovalutazione, come appunto i questionari.

La seconda fase di raccolta dati, invece, è finalizzata a interpretare i motivi che facilitano o ostacolano l'eventuale utilizzo dell'AI nei processi di programmazione (RQ2).

A tale scopo verranno intervistati gli stakeholder interni agli enti (Groves et al., 2011) e saranno eseguite analisi documentali degli strumenti di programmazione degli enti, tra cui il Documento Unico di Programmazione (DUP), il Piano Esecutivo di Gestione (PEG) e il Piano Integrato di Attività e Organizzazione (PIAO) integrando la metodologia della content-analysis con il metodo Delphi (Del Bene e Bartocci, 2018, pp. 133-155; Cavallini e Orsetti, 2022).

4. Risultati attesi

Lo studio intende offrire una prima riflessione sull'implementazione dei sistemi AI nel contesto dei piccoli comuni italiani, che dovrebbe essere capace di supportare i decisori pubblici nel ripensare in modo più accurato le proprie priorità e modalità di programmazione, determinando la cosiddetta "intelligenza collaborativa" (Wilson e Daugherty, 2018, p. 5; Jarrahi et al., 2023). Inoltre, lo studio intende chiarire in che misura i policymakers stiano valorizzando il potenziale ancora inespresso dell'AI, in un contesto pubblico nazionale che, come rilevato dal Digital Decade Report (2024), presenta limitate competenze digitali tra i dipendenti e una scarsa propensione all'adozione di soluzioni informatiche, con ricadute negative sull'intera economia nazionale (Digital Decade Report, 2024). Nello specifico, i risultati attesi della ricerca e il contributo teorico apportato alla letteratura cui si ambisce sono i seguenti:

- Rilevare eventuali differenze di applicazione dell'AI nella programmazione degli enti, mostrando pratiche virtuose e non, o pattern di governance che spiegano perché alcuni comuni riescano a integrare l'AI nella pianificazione razionale mentre altri restano a uno stadio iniziale (Mergel et al., 2024; Neumann et al., 2024);
- Individuare i fattori che favoriscono o ostacolano l'adozione dell'AI, evidenziando come la gestione della conoscenza (KM) agisce o non agisce da leva per superare i limiti informativi e cognitivi della pianificazione tradizionale (Boyne et al., 2004; Fontana, 2013; Jarrahi et al., 2023).

Integrating Sustainable Development Goals in Local Strategies: Insights and Lessons from the Italian Experiences

Elisabetta Reginato[1], Michela Floris[2], Isabella Fadda[3], Patrizia Modica[4]

1. Introduction and aims of research

The adoption of the United Nations' 2030 Agenda has further accelerated the shift towards sustainability (Allen et al., 2019; Liu et al., 2018). The 2030 Agenda calls on Member States to carry out regular and inclusive progress reviews at both national and subnational levels, incorporating input from civil society, the private sector, and other stakeholders, in accordance with national contexts, policies, and priorities (United Nations 2015). Each national government determines how to integrate and align the goals with its planning processes, policies, and strategies across all dimensions of sustainability (environmental, economic, social). Local contexts, with their unique social, economic, and environmental characteristics, require tailored approaches to effectively implement the Sustainable Development Goals (SDGs) (OECD 2020; Sinervo et al., 2024; Wray, 2015). By defining specific targets and tracking progress through measurable indicators, local authorities can address their distinct challenges, foster inclusive development, and contribute to the broader global sustainability agenda (United Nations, 2015; De Matteis and Borgonovi, 2021).

Although the localisation of the SDGs in local contexts has been recently examined (Krellenberg et al., 2019; Valencia et al., 2019), these studies have not explicitly focused on integrated approaches to sustainability management within municipal organisations. Nevertheless, they emphasize that leadership appears to be a fundamental factor in the implementation of the SDGs. Furthermore, aspects such as participation and inclusiveness (across levels, actors, and sectors), the establishment of a sustainability department or the appointment of coordinators with adequate authority, and the allocation of sufficient economic and human resources are also identified as critical elements. A major challenge arising from the absence of an integrated approach is that SDG implementation often results in isolated projects with limited or no lasting impact (Grainger-Brown & Malekpour, 2019; Kranz & Gustfsson, 2021). Beyond embedding the SDGs into existing strategies, an integrated approach is also needed to avoid "cherry-picking" among the goals and to ensure they are pursued as a coherent and interdependent whole (Stafford-Smith et al., 2017).

Within this broader context, Italy has undertaken a structured and comprehensive approach to defining and implementing the SDGs in alignment with the 2030 Agenda. The process began with the development of the Italian National Sustainable Development Strategy (NSDS), first adopted in 2017 and updated in 2022. This document serves as a strategic reference for integrating sustainability into national policies, addressing social, economic, and environmental dimensions across various sectors. Regional and local governments have played a crucial role in adapting the national strategy to the specific needs and priorities of their respective territories.

[4] Full Professor, ECON-06/A, University of Cagliari; modica@unica.it

In this process, Italian metropolitan cities emerge as pivotal actors. Due to their demographic, economic, and social significance, these areas serve as laboratories of sustainable urban transformation (Mazzeo, 2018; Fiorani et al., 2024). Analysing their specific contexts provides valuable insights into how urban areas contribute to the achievement of the SDGs and how locally tailored policies can address local priorities while aligning with broader international, national and regional strategies (Cohen et al.,2023), However, the extent to which metropolitan cities align their strategic documents with global sustainability agendas varies significantly, influenced by both global pressures and local specificities (Guarini et al. 2022; McLennan et al., 2014).

This study, which is a work in progress, seeks to address the following research questions:

RQ1. How do metropolitan cities integrate SDGs into their strategic plans?

RQ2. Which SDGs are most frequently addressed by metropolitan cities, and are there notable differences related to the local context?

The research focuses on the Italian context, characterized by significant regional diversity and socio-economic disparities. To explore these questions, the study draws on two complementary theoretical perspectives: strategic planning and management theory and the theory of territorial differentiation.

The first provides a framework for understanding how municipalities translate global sustainability goals into local strategies. Strategic planning helps define long-term directions and transform them into specific goals and actions (Poister and Streib 2005), while management ensures their continuous implementation, coordination, and improvement. This perspective also highlights the importance of balancing top-down and bottom-up approaches (Albrechts and Balducci 2013).

The second perspective, territorial differentiation theory, explains why the localization of SDGs varies across cities (Storper, 1997; Rodríguez-Pose, 1998). It emphasizes how socio-economic structures, institutional capacities, and spatial characteristics shape local policy outcomes. In Italy, where governance and resources differ markedly between regions, this territorial lens is crucial to understanding the uneven integration of the SDGs.

By combining these two approaches, the study develops a framework to analyze both the process of SDG integration and the territorial diversity that characterizes its implementation across Italian metropolitan cities.

2. Materials and method

2.1. Research context

Italian governance systems

Italy is a unitary state operating under a multilevel governance system that consists of three levels of subnational government: Municipalities, Provinces or Metropolitan Cities (whose territory coincides with that of the former Provinces), and Regions. They are all autonomous entities with their own statutes, powers and functions in accordance with the principles established by the Constitution. Metropolitan Cities are fourteen, ten established by Law No. 56/2014 for ordinary statute regions (Bari, Bologna, Florence, Genoa, Milan, Naples, Reggio Calabria, Rome, Turin and Venice) and four (Catania, Messina Palermo and Cagliari) instituted by the laws of their respective special statute regions.

Their primary functions focus on the strategic development of the metropolitan area and overarching territorial planning, and are related to economic development, mobility, the environment, and the circular economy. Other areas of focus involve revising administrative boundaries, pursuing financial autonomy, providing training and empowerment for personnel, and fostering a new approach to relations between the State, Region, and Local Authorities. To support this, the law introduces a new tool: the Metropolitan Strategic Plan (MSP) (Molinaro, 2020). The MSP serves as a framework for the authority, as well as for municipalities and

municipal unions, in carrying out their responsibilities. In this context, the MSP is a three-year performance plan that defines the general, sectoral, and cross-cutting development objectives for the metropolitan area, identifying intervention priorities, the resources needed to achieve them, timelines, and implementation methods, in accordance with environmental sustainability principles.

The National Strategy for Sustainable Development

In Italy, the implementation of the 2030 Agenda is guided by the National Strategy for Sustainable Development (NSSD), approved in 2018 by the Interministerial Committee for Economic Planning (CIPE, now CIPESS) and updated in 2022. The strategy defines the national framework for planning, programming, and assessing policies aimed at achieving the Sustainable Development Goals (SDGs).

The NSDS is based on five main areas of action, aligned with the "5 Ps" of the 2030 Agenda: People, Planet, Prosperity, Peace, and Partnership. The NSDS relies on a multi-level governance model, connecting national, regional, and local strategies. Since 2018, the Ministry for the Environment and Energy Security (MASE) (formerly MITE) has played a key role in coordinating this system, promoting dialogue, collaboration, and exchange of good practices among administrations.

Italy also promotes a "whole-of-society" approach, involving civil society, businesses, academia, and other stakeholders to foster a true "culture of sustainability". Regular assessments, such as the Voluntary National Reviews (VNRs) submitted to the United Nations, help evaluate progress, identify gaps, and improve strategies toward achieving the SDGs.

Metropolitan Agendas for Sustainable Development

Localizing the SDGs means adapting global goals to local contexts, since every community faces different challenges and priorities. Achieving sustainability depends largely on local action and leadership. Therefore, actions aimed at achieving the SDGs must be tailored to local specificities, taking into account the socio-economic, environmental, and cultural context of each territory.

All Italian Metropolitan Cities are developing their own Metropolitan Agendas for Sustainable Development (MASD), a voluntary tool that:

- strengthen the focus on sustainability in urban and metropolitan planning;
- promote joint sustainable development initiatives with local institutions and stakeholders;
- raise awareness and encourage public and private engagement in sustainability issues.

The MASE supports Metropolitan Cities throughout this process, helping them integrate the Agendas with their MSP and develop indicators to monitor progress toward NSDS objectives.

This support has also led to the creation of new institutional and governance structures, such as:

- Inter-institutional Roundtables (one with Regions and Autonomous Provinces, another with Metropolitan Cities), which promote multi-level dialogue and policy coherence;
- Territorial Steering Committees, which oversee and enhance the effectiveness of local policy design, implementation, and monitoring.

Voluntary National and Local Reviews

The Voluntary National Review (VNR) is a process through which UN member states assess and report their progress in implementing the 2030 Agenda and its SDGs. At the local level, the Voluntary Local Review (VLR) serves a similar purpose, allowing local authorities to define their priorities and specific territorial characteristics. When this process includes detailed indicator

analysis, active participation from citizens and stakeholders, and an evaluation of policy coherence, it becomes a truly strategic planning tool for sustainable development.

2.2. Research Methodology

This research adopts a qualitative approach, employing document analysis to investigate how Italian metropolitan cities integrate SDGs into their strategic plans. As defined by Bowen (2009), document analysis is a systematic process for reviewing and interpreting texts to elicit meaning and develop empirical knowledge. Its naturalistic and unobtrusive nature, as highlighted by Jensen (2002: 243), makes it particularly suitable for examining institutional processes, as it involves data that are "found rather than made," free from researcher influence. Focusing on strategic plans (i.e. Metropolitan Agendas for Sustainable Development and the MSPs), policy documents, and official reports highlights the interplay between global sustainability objectives and local adaptations. Documents reflect institutional priorities and tools for shaping policy frameworks, offering rich insights into how cities align their strategies with UN Agenda 2030 while addressing regional specificities. According to Tight (2019), these documents serve as interpretative schemas that frame policy options and legitimize specific goals and approaches.

In addition, a comparative framework is developed to identify patterns of convergence (shared goals and common strategies) and differentiation (context-specific adaptations and localized approaches).

3. Preliminary findings

The findings presented in the following matrix (Table 1) represent the preliminary results of an ongoing comparative analysis between the MSPs and the MASDs of Italy's metropolitan areas. They provide an initial overview of how local governments are aligning their strategic objectives with the SDGs. Emerging patterns highlight differences in governance capacity, policy coherence, and citizen participation, offering early insights that can guide future policy design and research on urban sustainability and strategic integration.

The comparative approach is based on five key analytical dimensions:

- Main Strategic Objectives: This dimension focuses on identifying the main strategic priorities defined in each MSP and assessing how these align with the SDGs. It aims to explore whether the metropolitan strategies are framed around global sustainability principles (economic, social, and environmental), and how local priorities are "territorialized" that is, translated into context-specific actions and measurable outcomes. The comparison will also examine the degree of coherence between the strategic vision of each metropolitan plan and national or regional sustainable development frameworks (Echebarria et al. 2018; Krellenberg et al., 2019)
- Thematic Areas: Examination of cross-cutting topics such as sustainable mobility, energy, social inclusion, and resource management. The goal is to determine whether the thematic priorities of metropolitan governance reflect an integrated vision of sustainability, combining economic competitiveness, social cohesion, and environmental protection, and to assess how these are translated into coordinated sectoral policies (Guarini et al. 2022; UNSDG, 2017).
- Tools and Methods: This dimension analyses the instruments and methodologies adopted to design and implement the strategies, including action plans and system actions that operationalise objectives. The analysis highlights the degree of methodological innovation, the role of evidence-based planning, and the capacity to translate strategic visions into tangible, measurable outcomes (Kirst and Lang, 2019).
- Monitoring and reporting tools: This dimension analyses the systems for monitoring, evaluation, and reporting adopted by metropolitan administrations to track the implementation and effectiveness of their strategic plans. It explores how key performance indicators (KPI),

performance dashboards, and sustainability assessments are used to (Allen et al, 2017; Valencia et al, 2019; Klopp and Petretta 2017):

- evaluate progress towards strategic objectives and SDGs;
- ensure transparency and accountability;
- support adaptive governance and evidence-based decision-making.
- Participatory implementation: This dimension explores the forms of citizen and stakeholder participation embedded within metropolitan planning and implementation processes. It considers how cities engage local communities, private actors, universities, and NGOs in co-design, co-decision, and co-implementation, thus reinforcing democratic legitimacy and social innovation. Participation is not only a governance mechanism but also a tool to build collective ownership, improve the relevance of projects, and foster social cohesion (Fiorani et al., 2024; Caprotti et al., 2017).

This structured framework allows for a consistent and evidence-based comparison, facilitating the identification of best practices and critical gaps among Italy's metropolitan cities.

This analysis aims to bridge the gap between strategic metropolitan planning and sustainability governance in Italy. By comparing key policy documents from the metropolitan cities, the study seeks to understand how sustainability principles are operationalized at the urban level, and to what extent the SDGs are embedded within local policy frameworks. The purpose is not only to measure the degree of alignment with global sustainability objectives, but also to identify innovative practices, institutional challenges, and areas where policy coherence can be strengthened. Ultimately, these insights will contribute to enhancing metropolitan governance models that are inclusive, evidence-based, and aligned with the broader vision of sustainable urban development promoted by the 2030 Agenda.

Table 1. Comparative Matrix – MSPs and MASDs of Italy's metropolitan areas

4. Discussion

The comparative matrix highlights how Italy's metropolitan cities integrate sustainable development principles reported in their MASDs within their strategic planning frameworks (MSPs). To better capture the different stages through which metropolitan cities are integrating the SDGs, three descriptive labels can be introduced: Pioneering Integrators, Transitional Implementers, and Emerging Adopters. These categories do not represent fixed classifications, but rather interpretative tools designed to highlight common patterns, varying levels of maturity, and the evolving governance approaches observed across metropolitan contexts. Together, these three labels offer an interpretative framework for understanding the diverse pathways through which cities are approaching the SDGs, acknowledging the different starting points, governance capacities, and speeds of advancement that characterize contemporary urban sustainability efforts.

4.1. Pioneering Integrators

This category refers to cities that have reached an advanced stage in embedding the SDGs within their governance systems. In these urban areas, sustainability is understood as a shared cultural framework, shaping both long-term strategic vision and everyday policy choices. Their approaches combine foresight with concrete action while promoting participatory practices that involve citizens and local stakeholders in shaping the city's sustainable trajectory.

They perform strongly across all five analytical dimensions:

- Main Strategic Objectives are explicitly framed in SDG language and balance economic, social, and environmental goals.
- Thematic Areas are articulated as integrated trajectories (e.g. energy transition, circular economy, social inclusion, climate resilience), rather than isolated policy sectors.
- Tools and Methods include structured strategic planning processes, coherence analyses, and evidence-based instruments (e.g. SDG matrices, homogeneous zones, dedicated labs).

- Monitoring and reporting rely on advanced systems such as KPIs, dashboards, VLRs and dedicated data platforms, enabling continuous rather than episodic evaluation.
- Participatory implementation is formalised through multi-step, well-documented processes (forums, focus groups, thematic labs) that involve municipalities, stakeholders and citizens and support co-design and co-monitoring.

These cities can be considered front-runners in translating the 2030 Agenda into metropolitan governance models, combining long-term vision with concrete instruments for implementation and accountability.

This group tends to include metropolitan cities such as Bologna, Cagliari, Florence, Genoa, Messina, Milan, Reggio Calabria, Rome Capital and Turin, which show the most robust mix of SDG integration, monitoring capacity and participatory governance.

4.2. Transitional Implementers

This group is characterised by metropolitan cities that have embraced sustainability as a guiding principle and have begun aligning their strategic goals with the SDGs. Their commitment is evident, but governance processes are still undergoing consolidation: coordination among institutions remains uneven, and collaboration with communities, experts, and private actors is developing but not yet fully structured.

- Main Strategic Objectives are broadly aligned with the SDGs (e.g. social cohesion, sustainable mobility, environmental protection), but the linkage to specific targets is sometimes more implicit than explicit.
- Thematic Areas reflect an integrated sustainability vision, yet sectoral policies may still be only partially coordinated.
- Tools and Methods include strategic plans, agendas, inter-municipal coordination tools and some innovative instruments, but the degree of methodological standardisation and evidence-based planning varies.
- Monitoring and reporting are present (e.g. different types of monitoring, performance systems, periodic reviews), though indicator systems may be incomplete or not fully SDG-based, and continuous feedback loops are still emerging.
- Participatory implementation goes beyond formal consultation and involves multiple actors, but processes are less structured or less systematically documented than in pioneering cases.

These cities are in a transition phase, advancing beyond initial engagement but not yet characterized by fully integrated implementation.

Within the current sample, this pattern appears to fit metropolitan cities such as Palermo and Venice, which show clear SDG-oriented strategies and relevant tools, but comparatively less mature monitoring architectures or participation paths than the pioneering group. Bari also fits within this group but represents a less mature profile, characterised by extensive participation yet weaker evidence of SDG-based monitoring and methodological formalisation.

4.3. Emerging Adopters

Metropolitan cities in this group are at an early stage of SDG integration. The 2030 Agenda is present in political discourse and in some strategic documents, but its translation into coherent, operational and measurable strategies is still limited.

- Main Strategic Objectives refer to sustainability in general terms, often without a systematic alignment with specific SDGs or targets.
- Thematic Areas may include individual sustainability-related sectors (e.g. environment, mobility, social services), but they are not yet framed within an integrated SDG-based narrative.

- Tools and Methods rely largely on existing planning instruments, with only limited innovation or explicit SDG localisation tools; experimental projects prevail over system-wide approaches.
- Monitoring and reporting are usually based on periodic or project-based reports, with weak or fragmented indicator systems and little use of dashboards or VLR-type tools.
- Participatory implementation is mostly confined to traditional consultation practices, with fewer structured formats for co-design, co-decision and co-monitoring.

These cities are taking their first steps towards structured SDG integration. They often face constraints related to institutional capacity, yet they also display significant potential for progress through learning, inter-city cooperation and support from national and regional frameworks.

In the present sample, this trend seems to align with the metropolitan area of Naples and Catania.

5. Conclusions and implications

The comparative analysis of the MSPs and MASDs reveals that Italian metropolitan cities have embraced the 2030 Agenda as a guiding reference for policy design, translating global principles into locally meaningful priorities (Molinaro, 2020). However, this translation remains uneven (Hartman, 2016). Some cities have developed advanced governance architectures that embed SDGs into strategic objectives, thematic policies, monitoring systems, and participatory processes, while others still approach sustainability through sectoral or project-based initiatives with limited alignment to SDG targets.

A clear territorial pattern emerges when comparing SDG integration across Italian metropolitan cities. Northern cities of Milan, Turin, Bologna, and Genoa, with the exception of Venice, together with the central cases of Florence and Rome Capital, consistently fall into the category of Pioneering Integrators, characterised by robust governance architectures, structured monitoring systems, and institutionalised participatory processes. In contrast, Southern cities display a more heterogeneous landscape. Reggio Calabria, Messina and Cagliari exhibit advanced practices and join the Pioneering group, whereas Bari and Palermo behave as Transitional Implementers, showing meaningful but uneven progress in embedding the SDGs into strategic planning and monitoring. Naples and Catania remain Emerging Adopters, with limited operationalisation of SDGs, fragmented monitoring tools, and less formalised participatory infrastructures. This differentiation confirms the relevance of territorial factors in shaping institutional capacity and strategic innovation, and highlights a persistent North–South divide, albeit mitigated by notable Southern exceptions, across the Italian metropolitan governance system.

These results highlight several theoretical contributions and broader implications. This study advances strategic planning and management theory by demonstrating how SDGs act as integrative governance devices that merge planning and implementation; extends SDG localisation literature by identifying distinct maturity pathways among metropolitan cities; contributes to territorial differentiation theory by revealing hybrid and evolving geographies of institutional capacity; and offers a replicable five-dimension analytical framework that future comparative studies can adopt. It further enriches participatory governance theory by showing that iterative and multi-actor participation is central to mature SDG integration.

As for the implications, first, Italy's metropolitan governance system, supported by the NSSD and multi-level coordination, appears to be fostering progressive convergence across cities, even though different starting points and capacities produce uneven implementation patterns. Second, from a policy perspective, the findings suggest that accelerating SDG integration requires reinforcing capacities at the metropolitan scale, particularly in data management, cross-sectoral coordination, and participatory governance. Peer-to-peer exchange across cities, supported by national and regional frameworks, could further facilitate learning and convergence.

In conclusion, the Italian experience provides a valuable empirical lens for understanding how metropolitan authorities translate the SDGs into operational strategies within complex multilevel governance systems. While the process remains uneven, the trajectories observed across the 14 metropolitan cities point to a growing institutional commitment to sustainability and a progressive transformation of metropolitan governance cultures. Strengthening monitoring tools, participatory mechanisms, and inter-institutional cooperation will be essential to ensure that local strategies contribute effectively to the broader objectives of the 2030 Agenda and to foster resilient, inclusive, and sustainable metropolitan futures.

Building Financial Sustainability in Public Research Networks: Insights from an Action Research Study within SUS-MIRRI.IT

Edoardo Borlatto[1], Edoardo Crocco[2], Elisa Truant[3], Valeria Priogione[4], Cristina Varese[5]

1. Introduction

Within the broader context of the transition toward a more sustainable economic model, Italian research infrastructures play a fundamental role in generating and providing data and tools, while also supporting innovation and training. Ultimately, they play a crucial role in enhancing European competitiveness and fostering the creation of new shared knowledge (Brandão et al., 2024; Ribeiro, 2020; Draghi, 2025). It is precisely within the framework described above that the SUS-MIRRI.IT project was established, funded by the National Recovery and Resilience Plan (PNRR) under the NextGenerationEU program. The University of Turin is responsible for coordinating the project. The total budget allocated amounts to about €16.9 million, which supports the involvement of 24 operational units, belonging to 15 national institutions, distributed across the entire Italian territory. The project's main goal is to strengthen and enhance the microbial resources preserved in Italian biobanks and culture collections, by improving their characterization, management, and accessibility. Eventually, the project aims to unlock the potential of these resources to foster the development of innovative solutions and products of biotechnological interest, thereby contributing to the promotion of a sustainable, resilient, and circular bioeconomy. The SUS-MIRRI.IT project aims to establish a coordinated national network of microbial biobanks that promote scientific innovation and knowledge transfer throughout Italy and Europe. To achieve this goal, SUS-MIRRI.IT is actively engaged in enhancing infrastructures with cutting-edge technologies and quality management systems for microbial collections, creating a national platform to promote the Italian catalog of microorganisms and related metadata, and developing services and training programs targeted at the academic and industrial sectors. The project operates within the strategic framework of MIRRI-ERIC (Microbial Resource Research Infrastructure of the European Research Infrastructure Consortium). The latter is a European research infrastructure that operates in a distributed manner across the European territory, specifically dedicated to the characterization, provision, preservation, and valorization of microbial resources. In line with the political and regulatory framework of the European Union, which increasingly highlights the importance of environmental sustainability and the valorization of biological resources, and consequently the transfer of knowledge that makes this possible, the consolidation of an Italian network of research infrastructures assumes a twofold significance. Firstly, it represents a driver of specialized competences and a catalyst for technological innovation; moreover, such a network contributes to generating economic, social, and environmental value over the long term. Given the strategic

relevance of this infrastructure, established within the post-COVID-19 recovery funding initiatives, ensuring its long-term financial sustainability represents a key challenge for publicly funded research infrastructures, whose continuity often relies on project-based financing. It therefore becomes essential to address in detail the issue of financial sustainability, not only to safeguard the scientific and social impact throughout the project's duration, but also to align with the broader European agenda, which integrates the concept of long-term economic resilience into the very notion of sustainability. The research presented below illustrates the process of developing a Performance Measurement System (PMS) based on infrastructure-specific KPIs, generated through the involvement of multiple internal and external stakeholders. This system was designed to support the strategic framework and ensure the long-term financial sustainability of the SUS-MIRRI.IT network. The scientific literature defines PMSs as evaluative instruments primarily aimed at monitoring the effectiveness of organizational management and the capacity to deliver value to stakeholders (Moullin, 2004). These systems are predominantly examined within the theoretical frameworks of Stakeholder Theory (Freeman, 1984) and Agency Theory (Eisenhardt, 1989), as these perspectives provide complementary interpretations of the role and objectives of management control mechanisms (Truant, 2024). From a Stakeholder Theory perspective, PMSs are conceived as tools of accountability and dialogue, designed to balance the diverse interests of stakeholders and to support decision-making processes oriented toward shared value creation (Nielsen et al., 2019). Conversely, Agency Theory views PMSs as mechanisms to reduce information asymmetries and align the interests of principals and agents, thereby enhancing efficiency and transparency in governance relationships (Dawson et al., 2016). In this article, however, we have chosen to go beyond the traditional opposition between Agency Theory and Stakeholder Theory by adopting the perspective of Dialogic Accounting. Indeed, while Stakeholder Theory recognizes the need to be accountable to a plurality of actors, Dialogic Accounting represents its evolution (Manetti et al., 2021). This approach transforms accountability into a space for dialogue and exchange, where stakeholders actively participate in defining value and meaning. Following Brown and Dillard (2015), our approach aims at a democratization of accounting, capable of integrating pluralism and participation within governance processes Research in this field has furthermore largely focused on analyzing the design characteristics of PMSs, their impact on organizational performance, and the mechanisms of strategic and motivational alignment they can foster (Ferreira et al., 2009; Monica Franco-Santos et al., 2018). However, limited attention has been paid to the drivers and barriers affecting the implementation of such systems in complex public contexts, such as research infrastructures, where the multiplicity of actors, the long- term orientation, and the public nature of funding create distinctive challenges in terms of both managerial sustainability and accountability to society. The article positions itself within a completely new perspective, as it is carried out through the application of the Action Research (AR) methodology (Apostol et al., 2021; Coghlan & Brannick, 2014), which serves as a guiding framework for the incorporation of a KPI scheme within the Sus.MIRRI research infrastructure, under the theoretical lens of Dialogic Accounting-DA (Bebbington et al., 2007). DA refers to the collaborative involvement of diverse constituencies in designing and refining accounting tools and practices that facilitate the generation, interpretation, and communication of relevant and timely information (Bebbington et al., 2007). It challenges conventional, monologic approaches by fostering spaces of dialogue among stakeholders with differing viewpoints, thereby democratizing accounting and subjecting it to broader public accountability (Kingston et al., 2019). Rooted in Paulo Freire's pedagogical philosophy (1983, 1996), DA aspires to address contested and complex social issues, to engage with power asymmetries, and to promote both individual and collective awareness around sustainability concerns (George et al., 2023; Brown & Dillard, 2021). In this sense, AR and DA share a common orientation toward empowerment, reflexivity, and social transformation, combining practical experimentation with critical reflection to foster enduring organizational and societal change. Additionally, from a methodological perspective, the adoption of the AR methodology responds

to the need, emerging from the theoretical considerations discussed above, to develop a participatory and context-sensitive approach capable of integrating multiple stakeholder perspectives into the design of the management control system. This methodological choice enables both the generation of practical, actionable knowledge and the co- construction of evaluative instruments that are aligned with the complex and collaborative nature of research infrastructures.

2. Methodology

The AR approach is particularly suited to this context, as it is designed for situations where technical expertise among participants is limited and change must emerge through cycles of practice and reflection rather than being imposed externally. Within AR, learning is often embedded in real-time problem-solving within participants' professional environments, enabling them to translate theoretical insights into action. The cyclical process of planning, acting, observing, and reflecting encourages participants to internalize learning progressively and to integrate new practices into the organization's routines and culture. Within this framework, the conceptual perspective of DA enriches AR by emphasizing participatory knowledge creation and deliberative engagement. The first reason for the reliance on-action research as the main method is two specific aspects of the Sus.MIRRI issue. Firstly, employees are somewhat inexperienced in the financial and control areas, meaning that performance management through traditional methods will not be successful. Secondly, the infrastructure is functioning in a decentralized and dynamic governance setting, thus a method requiring collaboration, dialogue, and adaptation a step further as the essential elements would be the most suitable one. By recruiting the researchers and the practitioners as co-learners, the action research not only serves as a blueprint for putting the KPI system into practice but also as a channel for the skills necessary for the maintenance of the system to be developed. The research design follows cycles, which are iterative. Each cycle starts with collaborative planning in which the researchers along with the staff of Sus.MIRRI decide on the areas where performance indicators are most likely to be applicable and provide value. A ready-made framework is not presented; instead, the process helps to visualize the abstract concepts using simple, experience-based tools that reflect the daily activities of workers. Then, a practical run of the stage with provisional KPI templates and low-barrier digital instruments is done which are introduced in the training sessions only for explanation and hands-on practice.

The observation phase, in this case, largely depends on the actual use of the tools, besides just counting the accuracy and completeness of the reports. This means that along with engagement patterns and informal dialogues between the members, the observation also includes the ability with which the staff approach the system. Finally, the researchers and officials reflecting on questions of success, obstacles, misunderstanding, and in agreement on how the system should be changed for the coming implementation enter jointly the reflection stage which concludes each round. As a result, the KPI framework is practically brought to life, gaining new features and becoming more fundamentally a co- owned and contextually embedded management tool than just the researcher-driven initiative.

The project, then, cares a lot about the nature of participatory action research. Through each cycle, the project advances staff skills and turns them into robust users of the performance concepts and tools. The process, however, is experiential which means that the employees of the respective organizations learn the benefits of monitoring only after they embark on the actual process and they, then, move to actually defining the indicators and interpreting dashboards. In this way, external demands at first become a part of the internal routines and the dialogues among colleagues are what actually make the shared understanding get consolidated. This, in turn, leads to the establishment of a learning culture that, with time, becomes a fine complement to the technical system itself. The research data are gathered through a varied combination of

documentation done during the cycles, the direct observation of daily activities, and workers' interviews and focus groups that provide the perceptions of clarity, relevance, and challenges of the concerned parties. The reliability of these materials is ensured by triangulation, and this also helps in capturing both the formal and informal aspects of the implementation process. The methodology is thus expected to have a dual-pronged effect - to serve as a functioning KPI system specifically designed to address the infrastructural and human constraints of Sus.MIRRI and as a process of organizational learning that, on the one hand, fosters accounting awareness, and on the other hand, provides a basis for continuous improvement.

3. Expected results

Given the work-in-progress nature of the present contribution, the authors can reflect on the expected findings of the AR approach. The experience in Sus.MIRRI allowed the authors to familiarize themselves with the challenges connected to the adoption of MCS in a public context, made of organizational units that did not feature advanced levels of accounting literacy. The work has been at the same time stimulating and challenging, due to the existence of both barriers to overcome and opportunities to grow from the experience. Overall, the study aims to identify and discuss a series of challenges, barriers and risks associated with the adoption of MCS in 15 institutions with 24 operational units across Italy, as well as provide scholars with empirical evidence on the matter of MCS adoption. Along with the challenging aspects of the research, the authors note several opportunities and enablers for future research to build upon, in order to facilitate the integration of MCS in a publicly funded research environment. In exploring the above, several contributions are provided by the research, both theoretical and practical. From a theoretical perspective, the study aims to answer several calls for research on MCS and the public sector, as the area is generally considered to be under represented in the literature, despite its growing importance, especially in light of the funding received as part of the PNRR and the post-pandemic recovery. Several, narrower gaps are also addressed in said stream of research, namely the importance of cultural aspects when it comes to MCS adoption, the adaption of MCS to a non-financial, public and scientific organizational unit, and the role MCS plays in mitigating the tensions arising from the heterogeneous nature of R&D project alliances. From a practical point of view, the study aims to deliver a series of best practices and recommendations for MCS adoption in scientific project alliances that could easily be expanded and applied to several other facets of the public administration. Risks associated with lack of accounting literacy, tensions across units and difficulties of MCS implementation are discussed with the help of empirical data and the field experience of the authors, in an effort to provide scholars, practitioners and policymakers with a case study for future use. Given the significant size and importance played by the Sus.MIRRI alliance, the authors are confident that the results could be easily generalized and be of interest to several institutions worldwide, keen on adopting a MCS to better understand and monitor their financial and non-financial performance, but wanting to avoid risks and difficulties associated with said adoption.

On the configuration of management control packages in inter-organizational settings: Experiences from public healthcare services

Antonio Davide Barretta[1], Guido Noto[2]

1. Introduction

Post-New Public Management (NPM) reforms marked a shift from competitive to collaborative institutional environments, where public and private organisations, together with service users, cooperate to achieve improved outcomes (O'Flynn, 2007; Lodge C Gill, 2011). Consequently, public sector governance in Western countries has increasingly relied on networks and inter-organisational arrangements aimed at enhancing service delivery and outcomes (Ansell C Gash, 2008; Emerson et al., 2012).

Among the key challenges related to the creation of such networks and arrangements we may find the management and control of the performance at the organizational and inter-organizational level. In this sense, some authors devoted their attention to the exercise of management control (MC) in public or hybrid network aiming at delivering public services (Agostino C Arnaboldi, 2018; Steccolini, 2019; Thomasson et al., 2020; Dudau et al., 2020). Most of these authors agree that MC in this setting need to rely on both formal and informal control mechanisms – such as budgeting, performance indicators and dashboards on the one hand, and socialization, values and rituals on the other.

This view is consistent with the scientific literature that conceive MC as a 'package' – or 'system' depending on the level of interdependence among control mechanisms (Malmi C Brown, 2008; Bedford et al., 2016; Grabner C Moers, 2013; Merchant C Otley, 2020).

However, the scientific debate on control packages in the public sector is largely uncovered by extant literature (Van der Kolk C Schokker, 2016; Felicio et al., 2021; Barretta C Noto, 2023). This is mostly related to some of the barriers that make the study and research about MC packages complex in public settings, such as the blurred boundaries of public sector organizations (Van der Kolk, 2019).

To the author's knowledge, there remains a gap in understanding the antecedents of the configuration of MC packages in inter-organisational initiatives within the public sector. The objective of this article is therefore to address this gap by examining whether the genesis of the collaborative setting – i.e., initiated by the strategic apex (top-down) or by employees (bottom-up) – leads to different configurations of control packages.

To do that, the research investigates the case of the collaboration between a Teaching Hospital and a Local Health Authority in Italy. Starting from 2021, these two public healthcare organisations started various collaborations aimed at improving public healthcare services delivery. In particular, one of these collaborations focused on the robotic surgery and was promoted by the top management of the healthcare organizations; while the other, related to the paediatric surgery, was proposed by the healthcare professionals involved in the service delivery. The study develops a case study combining an interventionist research approach (Dumay, 2010; Jönsson, 2010) – as one of the authors is the top manager of the Teaching Hospital – with a set of

[1] Università degli Studi di Siena; antonio.barretta@unisi.it – corresponding author

[2] Università degli Studi di Messina; guido.noto@unime.it

semi-structured interviews, to be conducted by the other author to the key informants involved in the collaborative settings.

2. Theoretical background

2.1. Management control as a package

According to Malmi and Brown (2008), management control (MC) is a "package" that includes "all the devices and systems managers use to ensure that the behaviours and decisions of their employees are consistent with the organisation's objectives and strategies" (p. 290). Malmi and Brown (2008) define five typologies of management controls, namely planning, cybernetic controls, reward and compensation systems, administrative controls, and cultural controls.

Table 1 summarises the Malmi and Brown (2008) control taxonomy.

<table>
<tr><td colspan="8">Cultural controls</td></tr>
<tr><td colspan="2">Clans</td><td colspan="3">Values</td><td colspan="2">Symbols</td></tr>
<tr><td colspan="2">Planning</td><td colspan="4">Cybernetic controls</td><td rowspan="2">Reward and compensation</td></tr>

<tr><td colspan="2">Governance structure</td><td colspan="3">Organisational structure</td><td colspan="2">Policies and procedures</td></tr>
</table>

Figure 1. Management control systems package. Source: Malmi and Brown, 2008

Planning, cybernetic and reward/compensation controls are those specifically referring to the performance management (PM) cycle.

Planning is an ex-ante form of control that includes action plans and medium-long term plans. These are typically used to set the goals and targets an organisation aims to achieve. Cybernetic controls are represented by information and decision support systems aimed at detecting performance gaps and undertake corrective actions. Amongst cybernetic mechanisms we find budgets, financial measurement systems, non-financial measurement systems, and hybrid measurement systems (i.e. both financial and non-financial).

Reward and compensation systems focus on extrinsic motivation and aim at improving individuals and groups performance by achieving congruence between their goals and the organisational ones. The basic argument is that the presence of rewards and compensation leads to increased effort.

Administrative controls include the organisation design and structure, the governance structure, policies, and procedures. The organisational structure is a form of control that works through functional specialisation and contributes to control through the reduction of behaviour variability and, consequently, improves the coordination between groups and individuals. Governance structure consists of the formal lines of authority and accountability, as well as the systems that are in place to ensure that representatives of the various functions and organisational units meet to coordinate their activities both vertically and horizontally. Lastly, policies and procedures are mechanisms to specify (and when possible to standardise) processes and operations through the preventative definitions of the actions to be performed.

Amongst cultural controls, Malmi and Brown (2008) include values, symbols, and clan controls. Value-based controls build on the explicit and formal set of organisational definitions that are continuously communicated by managers to provide basic values, purpose, and direction for the organisation. Individuals may embrace these values either because they internalise them, or because these are set and required by the organisation to which they belong. In both cases, values influence their behaviour. The elicitation of the vision, the mission, and other values are examples of such mechanisms. Controls based on symbols take place when visible messages are created to develop an organisational culture (e.g. a dress code). Lastly, clan controls are based on the idea that individuals are exposed to socialisation processes that foster specific values and attitudes. These processes are connected to the creation of groups (i.e. clans) and it is through their "rituals" and "ceremony" that values and beliefs are developed.

2.2. Management control packages in the public sector

The concept of MC package has been widely discussed in the extant literature (Grabner C Moers, 2013; Merchant C Otley, 2020), although the debate within the public sector context still lags behind (Barretta C Busco, 2011; van der Kolk, 2019; Felicio et al., 2021).

Van der Kolk (2019) identifies among the challenges that make the design and analysis of MC packages particularly complex the porous organizational boundaries that characterize public sector organizations and their collaborative networks. In particular, while much of the literature on public sector reforms has focused on the emergence of collaborative networks, partnerships, and public–private arrangements, less emphasis has been placed on understanding how control systems operate within these complex inter-organizational contexts, and how they contribute to aligning diverse goals, fostering trust, and ensuring accountability across multiple actors.

According to Kenis and Provan (2006), control in public networks is essential to ensure efficiency and effectiveness. MC design depends on contextual factors and therefore does not allow for a "one size fits all" solution. Their study highlights the importance of combining both formal and informal mechanisms, as well as the effectiveness of the latter.

Romzek et al. (2012) proposed a preliminary theory of informal accountability to guide network members in ensuring that intended results are achieved without having to rely exclusively on formal systems. Building on this, Agostino and Arnaboldi (2018) developed research showing that MC in public networks is a multi-level and hybrid system integrating formal and informal mechanisms. They pointed out that formal mechanisms, such as indicators and reporting, should be complemented by socialization practices in order for control to be effective. This approach requires balancing accountability and collaboration while considering the dynamic relationships among network members.

Further developments in this research stream can be found in Barretta and Noto (2023), who focused on interdependencies among control mechanisms at both the network and single-organization levels. Their findings suggest that the effectiveness of MC in public networks and inter-organizational settings depends on the balancing and coupling of formal and informal control mechanisms, as well as their ability to adapt across organizational levels.

To the best of the authors' knowledge, what has been neglected in the extant literature is the analysis of differences in MC package design between networks having different genesis – i.e. those arising from voluntary initiatives and those emerging from regulatory interventions or government mandates (Barretta C Busco, 2011). According to Krogh (2022), the latter require adaptive strategies to compensate for bureaucratic rigidities resulting from regulation. Accordingly, the author suggests adopting informal mechanisms to foster collaboration among institutions.

Conversely, in networks developed through voluntary "bottom-up" intiatives, collaboration is often driven by shared objectives and values among proponents and network members (Milward C Provan, 2006; Head, 2008). However, Macciò and Cristofoli (2017) demonstrate that

formal mechanisms – through rules and standardized procedures – can also be pivotal to support network endurance, thus suggesting their adoption.

The objective of this study is to understand how the configuration of MC packages may differ based on the genesis – voluntary or mandatory – of public networks. This topic is particularly relevant in professional bureaucracies – i.e., organizations in which coordination and control are exercised through skills and competences (Mintzberg, 1983), such as healthcare organizations or universities. In these organizations, middle management positions are often held by hybrid professionals, such as physicians, whose values are strongly influenced by professional logics and backgrounds (Spyridonidis et al., 2015). Therefore, voluntary collaborations are mainly driven by the values and objectives of professionals working across different organizations, promoting bottom-up cooperation. Conversely, top-down collaborations may encounter stronger resistance from professionals when perceived as conflicting with their professional values and logic. As such, we may expect that collaborations generated by voluntary bottom-up initiatives could rely more on cultural and informal mechanisms than mandatory programmes.

3. Method

According to Van der Kolk (2021), considering the complex context in which public sector organizations operate, qualitative research methods can be considered the most promising avenue to study and analysed MC packages. On the same page, Merchant and Otley (2020) called for more field-based studies to better connect with the practical concerns of managers and to adopt a holistic view of control and control mechanisms. As such, they suggested for the development of case studies, field experiments and action research approaches.

This study focuses on the case of a Teaching Hospital (TH) based in Italy, and the collaborative settings put in place with the reference Local Health Authority (LHA).

In Italy, public healthcare is mainly provided by two kinds of organisations, LHAs that are responsible for the health of the population living in a defined region – and thus provide or buy healthcare services for this population – and Autonomous Hospitals, (such as THs) that provide complex inpatient and outpatient care services. The co-existence of these organizations may require multiple forms of collaboration to address integrated care (Nuti et al., 2016).

The reason why the authors focused on this specific case study is because the characteristics of the inter-organisational setting – which comprehend both top-down and bottom-up forms of collaborations – and the accessibility of information relating to the case allowed them to undertake an in-depth analysis. As previously mentioned, the research was conducted using the combination of an interventionist approach (see, amongst others, Jönsson, 2010; Bracci, 2017; Lukka C Vinnari, 2017) and multiple semi-structured interviews with key informants who were identified amongst the representatives of the organisations involved in the initiatives (Barretta C Noto, 2023).

One of the authors is an academic who occupied the top management position in the TH; this allowed him to actively contribute to the design and implementation of the management control package used to support the initiatives. Although it is intrinsic to the interventionist approach that the researcher is part of the process analysed and thus cannot be considered neutral, to provide a more objective view of the analysis of the results, the other researcher – who did not play any role within the analysed initiatives – will conduct a total of 8 semi-structured interviews with key informants from the organisations involved.

4. Preliminary results

Empirical setting

Two key collaborative initiatives have been developed between the TH and the LHA in the last years. The first one is related to the robotic surgery activity and was promoted top-down by

the top managers of the health organizations. The second one refers to paediatric surgery and was initiated and promoted top-down by the professionals involved.

The collaboration in the field of robotic surgery between the two healthcare organizations, formalized through the Inter-organizational agreement signed in June 2022, has been characterized by the joint work of mixed surgical teams engaged in the delivery of robotic surgery services at the TH hub. The activities have focused on the specialties of urology and gynaecology, benefiting patients under the care of professionals from the LHA.

The implementation of this partnership has generated positive effects across several dimensions of organizational and system performance, including: strengthening the capacity to meet the healthcare needs of the local community, by promoting equitable access to robotic surgery services for patients across the region; enhancing the TH Robotic Surgery Centre, both by increasing surgical volumes and optimizing the use of the robotic system (efficiency), and by ensuring higher appropriateness of surgical procedures (effectiveness); providing professionals from the LHA with access to the TH Robotic Surgery Centre, thereby fostering continuous training, skill development, and the accumulation of practical experience in the field of robotic surgery.

During 2024, mixed surgical teams performed a total of 38 robotic procedures, including 5 in gynaecology and 33 in urology, with an average monthly volume of 3.2 interventions. Overall, since the formalization of the inter-organizational agreement in June 2022, a total of 104 robotic procedures has been performed in collaboration between professionals from the two organizations.

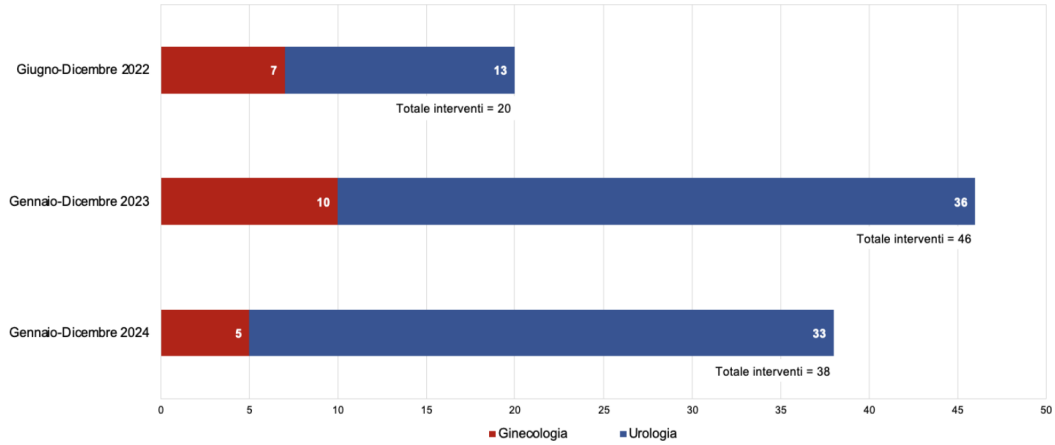

Figure 2. Volumes of discharge of robotic surgery

The inter-organizational pathway for paediatric surgery, was established under professional proposal in July, and became fully operational in 2023. The initiative involves close collaboration between the surgical teams of TH and the staff and healthcare facilities of LHA, with the dual aim of ensuring that children receive care as close as possible to their place of residence, while also promoting the quality and safety of clinical services and fostering the development of paediatric surgical and anaesthesiologic skills within LHA facilities.

In particular, the Inter-organizational agreement provides that the TH paediatric surgeons carries out outpatient consultations at LHA sites. Following this, a joint clinical and care team composed of professionals from both organizations — including a paediatric surgeon, paediatric anaesthetist, paediatrician, and nursing staff — performs the surgical intervention at the same hospital where the consultation was held, in line with principles of equity and proximity of care.

Since the launch of the collaboration in 2022 until December 2024, a total of 1,472 outpatient consultations (including 900 first visits) have been conducted, leading to the identification of 457 eligible patients, 325 surgical waiting list entries across the territorial hospitals, and 238 surgical

procedures performed. When comparing the 2024 surgical activity with that of 2023, a significant overall increase (+48%) emerges, reflecting a positive and consistent growth trend across all four hospitals.

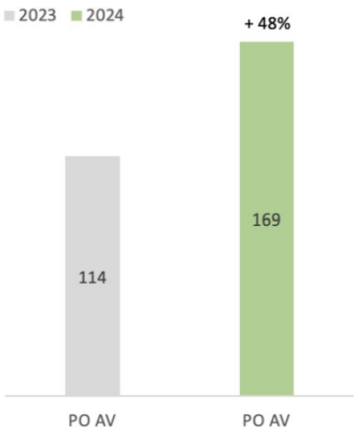

Figure 3. Volumes of discharge of paediatric surgery

5. Discussion and conclusion

The objective of this article is to explore whether the genesis – top-down or bottom-up – of a collaborative action in public organization networks determine differences in the design and implementation of MC packages. In this sense, the article contributes to an un-addressed gap of the management accounting literature in the public sector (Barretta C Busco, 2011; van der Kolk, 2019).

The case selected will allow to understand how, in the same organizational and network context, MC packages were developed to address the inter-organizational initiative control.

This study presents some limitations. First, results are only considering the perspective of the general director of the TH; as mentioned in the introduction and in the method sections, the study will be further developed through a set of interviews to the key informant involved in the collaborative projects. Moreover, the work focuses on two inter-organizational initiatives within the same public network setting. Although this choice allows to isolate for any disturbances coming from the organizational settings, a bias in the development of the MC packages may have occurred.

Comunità Energetiche Rinnovabili in Partenariato Pubblico-Privato: strumento di governance collaborativa per la creazione di valore pubblico sostenibile

Caterina Aura[1], Franco Rubino[2]

1. Introduzione

Obiettivo dell'articolo è offrire una panoramica su un importante modello di "governance collaborativa" basato sul Partenariato Pubblico-Privato (PPP), che di fatto vuole essere un punto di incontro tra le istituzioni, i cittadini e le amministrazioni locali ai fini della diffusione e creazione di valore pubblico sostenibile. Il modello proposto è quello delle comunità energetiche rinnovabili (CER) strutturate sulla base di un accordo di Partenariato Pubblico-Privato. Tale modello negli ultimi mesi è dibattuto sui tavoli politici e di "governance locale" in quanto rappresenta un innovativo e straordinario strumento di "governance collaborativa circolare", destinato a creare valore pubblico sostenibile, fungendo da leva per la transizione energetica. In Italia il Partenariato Pubblico Privato è uno strumento fondamentale per la promozione delle comunità energetiche; dall'integrazione tra PPP e CER scaturisce un modello innovativo (Martiniello, 2025), diretto alla creazione di valore sociale per la comunità (Martiniello et al., 2025).

Per la sua ottimizzazione e gestione, il modello si avvale dell'intelligenza artificiale (IA), al fine di favorire efficienza operativa, massimizzando i benefici economici, sociali e ambientali, diventando un servizio pubblico di interesse locale, che crea valore condiviso all'interno della comunità. Grazie a sistemi avanzati basati sull'IA, e ai suoi algoritmi, si gestiscono, analizzano ed elaborano i dati sui comportamenti degli utenti che ne fanno parte al fine di effettuare previsioni sulla produzione e sulla domanda energetica. Tra le tecnologie intelligenti sfruttate nelle CER, sono molto utilizzate le smart grid, infrastrutture intelligenti che collegano i partecipanti alla comunità energetica, utili per gestire in modo smart ed intelligente i sistemi di accumulo avanzati per l'elettricità non immediatamente utilizzata (Bosone et al., 2024).

Nella pratica, una comunità energetica è un sistema basato su impianti di produzione di energia di piccola o media scala, spesso integrati con sistemi di accumulo a breve termine, reti di distribuzione intelligenti (smart grids) e tecnologie per la gestione della domanda. Queste comunità sono costituite da gruppi di cittadini, Piccole e Medie Imprese (PMI) o Pubbliche Amministrazioni (PA) e rappresentano non solo un'integrazione ma anche una valida alternativa ai grandi impianti industriali e alle reti gestite da operatori professionali.

Dal punto di vista strutturale e formale, l'accordo tra le parti si configura come strumento che consente agli enti pubblici di sviluppare un modello perfettamente resiliente e sostenibile, utile a gestire rischi e crisi future sia di tipo energetico che geopolitico. Uno strumento fondato su contratti intelligenti, in cui le parti (gli utenti), possono scambiare l'energia in eccesso con i vicini, incoraggiando e sostenendo la promozione di una gestione efficiente, efficace ed economica delle risorse locali, che consente di ridurre la dipendenza dalle reti centralizzate (Tushar et al., 2020).

[2] Full Professor, ECON-06/A, Università della Calabria; franco.rubino@unical.it

Lo strumento delle Comunità Energetiche Rinnovabili, è stato introdotto inizialmente nell'ordinamento europeo con la Direttiva UE n. 2018 del 2001 già definita come. RED II; successivamente è stato recepito in Italia attraverso la disciplina di cui al decreto legislativo dell'8 novembre 2021, n. 199. Il decreto ha l'obiettivo di promuovere il consumo e l'autoconsumo di energia da fonti rinnovabili al fine di raggiungere e soddisfare i target di decarbonizzazione previsti dalla Comunità Europea entro gli anni 2030 e 2050. Con l'obiettivo di accelerare la transizione energetica, la direttiva RED II definisce un quadro normativo che rende le fonti rinnovabili protagoniste del sistema energetico europeo. Al centro di questa trasformazione vi è l'inclusione attiva degli utenti finali, chiamati a svolgere un ruolo diretto nella produzione e condivisione dell'energia.

Nell'articolo ancora in fase di elaborazione, si dimostra che integrando le CER con lo strumento di PPP, si contribuisce a realizzare un modello innovativo, che permette ai suoi membri di ridurre la dipendenza dai fornitori tradizionali di energia, aumentare l'autoconsumo e migliorare la gestione delle risorse energetiche, rendendo le pubbliche amministrazioni più resilienti a fluttuazioni di prezzo e interruzioni di servizio, ma anche più attente alle questioni ambientali. Essendo un modello aperto, democratico e sostenibile è importante scegliere la forma giuridica più adeguata; si potrebbe adottare il modello della cooperativa a mutualità prevalente, quello dell'impresa sociale, diretto a favorire oltre l'ingresso di cittadini, anche delle associazioni e delle piccole medie imprese (PMI) in un percorso che incarna perfettamente i canoni dell' economia circolare.

Gli impatti positivi sul territorio sono notevoli sia in termini di creazione di valore per i membri che per la comunità. Il modello che si crea infatti consente di coniugare sostenibilità ambientale, sviluppo locale e innovazione attraverso la collaborazione tra enti pubblici e privati contrastando anche il fenomeno dei cambiamenti climatici.

Nonostante le recenti crisi globali, e i conflitti geopolitici, che hanno amplificato il grado di dipendenza energetica dall'estero influenzando anche i settori della PA tale modello, migliora allo stato attuale la risposta alle medesime crisi nelle organizzazioni del settore pubblico. Si mitigano le crisi anche nel settore pubblico, attraverso la produzione locale di energia, la riduzione dei costi energetici e la promozione della sostenibilità. Le Comunità Energetiche permettono di distribuire energia rinnovabile prodotta localmente, riducendo la dipendenza dalle fonti fossili e migliorando la resilienza energetica, contribuendo alla riduzione delle emissioni di gas serra; nell'adozione di fonti di energia pulita, inoltre supportano gli importanti obiettivi di sviluppo sostenibile (SDG).

In Italia il Partenariato Pubblico Privato è uno strumento indispensabile per la promozione di progetti innovativi come le comunità energetiche rinnovabili perché creano valore per la comunità. In tale modello l'energia non è più considerata una semplice merce ma può diventare un servizio pubblico, grazie alla sua capacità di raggiungere obiettivi sociali e di promuovere lo sviluppo economico e civile delle comunità locali rispondendo ai valori ESG. Spesso, il privato da solo non riesce a farvi fonte a causa degli ingenti investimenti e interventi di grande portata. Mediante tale strumento si contribuisce alla creazione di una partnership strategica tra il mondo pubblico e privato in ottica di realizzazione di opere di interesse pubblico, utili a livello ambientale, economico e sociale per la comunità. Il modello è perfettamente in sintonia con l'SDG 11 "Rendere le città e gli insediamenti umani inclusivi, sicuri, duraturi e sostenibili" e l'SDG 7 "Garantire a tutti l'accesso a un'energia conveniente, affidabile, sostenibile e moderna". Le CER come modello territoriale virtuoso, inoltre promuovono la cittadinanza attiva, realizzando quell'imperativo di inclusione che è pilastro dello stesso Piano Nazionale di Ripresa e Resilienza, creando valore sul territorio in cui sono ubicate, attraverso la costruzione di un ecosistema sostenibile in cui varie categorie di stakeholder (in particolare i cittadini) sono coinvolti nella programmazione.

2. Breve review della letteratura

In letteratura gli studi che analizzano la relazione e gli impatti del modello delle CER in PPP e la creazione di valore nel settore pubblico italiano sono veramente scarsi. Tendenzialmente sono considerate una valida risposta alla necessità di ridurre le emissioni di gas serra, favorendo l'indipendenza energetica e promuovendo uno sviluppo sostenibile (Angelini, 2024), e i pochissimi e recenti tentativi di studio hanno riguardato il modello nella fattispecie della distribuzione di rischi e benefici tra i partecipanti all'operazione (Martiniello & Capparelli, 2025).

In Italia il Partenariato Pubblico Privato (PPP) è uno strumento indispensabile per la promozione di progetti innovativi come le CER, perché esse creano valore per la comunità (Martiniello et al., 2025), infatti tra auspicabili modelli di "governance sostenibile" nello scenario italiano, quello delle comunità energetiche rinnovabili (CER) sembra assumere una certa importanza. Oggi più di ieri esse rivestono il ruolo di attori principali per lo sviluppo e l'affermazione degli obiettivi ESG, degli SDG, dell'economia circolare e della transizione energetica (Aura, 2022). Il binomio CER-PPP configura un modello in cui l'energia non è più considerata una semplice merce, ma può diventare un servizio pubblico, grazie alla sua capacità di raggiungere obiettivi sociali e di promuovere lo sviluppo economico e civile delle comunità locali, rispondendo ai valori ESG. Da servizio pubblico, se combinato alla sussidiarietà, potrebbe diventare anche un servizio pubblico di interesse locale (Pi et al., 2024). La logica di questo assunto trova ragione nell'inefficienza energetica del privato, che da solo non riesce a soddisfare le medesime esigenze energetiche dei cittadini. Integrando il pubblico nel privato si riesce ad ottemperare a questa mancanza. Inoltre a causa degli ingenti investimenti e interventi richiesti per la sua creazione, in molti casi il privato non è in grado di creare strutture simili; mediante tale approccio al contrario si facilita la creazione di una partnership strategica, tra il mondo pubblico e privato, in ottica di realizzazione di opere di interesse collettivo, utili a livello ambientale, economico e sociale per la comunità.

Configurandosi altresì come iniziative 'socio-tecniche' di transizione energetica a livello locale, le CER sono finalizzate al coinvolgimento di diversi attori e organizzazioni in progetti di comunità dell'energia" (De Vidovich, et al., 2023), influenzando e stimolando la coesione sociale e la partecipazione attiva nelle decisioni e nelle scelte della comunità (Cilio, et al., 2023). Strutturalmente ambiscono a differenti modelli organizzativi, convogliati in una tripartizione di modelli: il"public lead", il "pluralista", e il modello delle "community energy builder" (De Vidovich, et al., 2023).

Recentemente hanno guadagnato popolarità nelle comunità locali, promuovendo la solidarietà e la costruzione del bene comune (Eroe, 2023). Si possono mettere in luce i "possibili approcci di "commoning" che le caratterizzano (o potrebbero caratterizzarle) laddove la produzione e distribuzione di energia è intesa come "bene comune urbano" (Bernardi e Tricarico, 2021). Buona parte degli studiosi ne descrive lo scopo principale, come soddisfacimento dei bisogni ambientali, economici e sociali dei propri associati, che vengono messi in primo piano rispetto ai profitti finanziari (Cielo A., et al, 2021; De Vidovich et al, 2023). Si inseriscono perfettamente nell'ottica del nuovo paradigma dell'economia circolare in quanto favoriscono il passaggio, verso un sistema energetico a zero emissioni di carbonio, utilizzando fonti energetiche rinnovabili. Contribuiscono quindi a superare l'approccio lineare dell'attuale modo di produrre energia basato sul possesso dell'impianto e sul consumo individuale.

Un modello sostenibile, che oltre a rispondere perfettamente ai parametri del nuovo paradigma dell'economia circolare, risponde ai principi della corporate social responsibility (CSR) perché contribuisce di fatto alla sostenibilità ambientale, mantenendo l'equilibrio tra rispetto dell'ambiente e progresso socio-economico (Aura, 2022). Il modello è perfettamente in sintonia con l'SDG 11 "Rendere le città e gli insediamenti umani inclusivi, sicuri, duraturi e sostenibili" e l'SDG 7 "Garantire a tutti l'accesso a un'energia conveniente, affidabile, sostenibile e moderna". Esse creano valore sul territorio in cui sono ubicate attraverso la costruzione di un ecosistema sostenibile, in cui varie categorie di stakeholder (in particolare i cittadini) sono coinvolti nella programmazione. Sono dinamiche in cui gli abitanti di una comunità partecipano,

interpretano, co-progettano, e sono coinvolti nell'identificazione delle risorse locali, assumendo un ruolo attivo da protagonisti nella definizione e gestione del processo di transizione dei propri territori verso una prospettiva di auto-sostenibilità (Bolognesi & Magnaghi, 2020). Fondamentale, infatti, è il contributo che queste realtà potranno dare al processo di decarbonizzazione (Eroe, 2023).

Alcuni studi sul modello italiano delle CER (società "Aria Diana", che vede coinvolto il Comune di Roseto Valfortore e l'azienda Fortore Energia di Lucera entrambi in provincia di Foggia) che prevedono la partecipazione dell'ente pubblico, in rappresenta della collettività, dimostrano come sia possibile "redistribuire indirettamente i vantaggi economici di una produzione territorialmente prossima ai possibili beneficiari, incamerando nel bilancio parte dei proventi dell'impianto e usandoli per gli scopi della collettività" (Magnani e Scotti, 2024). Altri studi sempre focalizzati su casi italiani (Candelise e Ruggieri, 2022; De Santi et al., 2022), mettono in risalto il potenziale nesso che potrebbe esserci tra i modelli di "governance partecipativa" e il grado di promozione di modelli di consumo più sostenibili.

3. Metodologia

L'analisi è condotta attraverso un duplice aspetto: prima è stata effettuata una revisione narrativa della letteratura nell'ambito CER in PPP e creazione di valore pubblico locale, combinata con un approccio ti tipo qualitativo: il caso studio. Una metodologia molto utilizzata nell'ambito degli studi aziendali e che, per le sue peculiarità, si rivela necessaria quando si intende approfondire le dinamiche nelle quali si sviluppa una specifica esperienza. Il caso studio permette infatti di osservare il fenomeno attraverso l'analisi del contesto nel quale si colloca e di ottenere un'ampia fonte di dati grazie alla molteplicità delle tecniche di raccolta ed analisi dei dati.

Pertanto, l'impianto di indagine è stato articolato in due parti. La prima parte ha riguardato l'analisi della letteratura di riferimento con una particolare attenzione a quei contributi scientifici che hanno approfondito il ruolo strategico delle CER in PPP nella valorizzazione del territorio e nella promozione e creazione di valore pubblico sostenibile sul territorio. Per agevolare e rendere più analitico lo studio, sono state formulate alcune domande di ricerca, per definire l'ambito della ricerca e guidare il processo di revisione.

La seconda parte ha inteso approfondire l'oggetto di studio attraverso l'osservazione e l'analisi del primo caso di Comunità Energetica Rinnovabile (CER) in Italia ad operare con un partenariato pubblico-privato (PPP). Si tratta della CER ubicata in Provincia di Lecco; successivamente sono analizzate le 4 CER della Regione Calabria ubicate in 3 province diverse: Vibo Valentia, Catanzaro e Cosenza. Infine si è passati ad analizzare le ragioni che motivano la nascita e la distribuzione delle CER prevalentemente al Nord della penisola italiana. Nello specifico si sta valutando se l'evidenza alla base della localizzazione al nord piuttosto che al sud è correlata ad aspetti di carattere morfologico, economico o legislativo, considerando che purtroppo dal punto di vista normativo in Italia la situazione non è stata eccelsa. Un grande contribuito a questa mancanza è stato dato dal l'entrata in vigore, il 24 gennaio 2024, del cosiddetto "Decreto CER" 14 , che ha previsto nuovi strumenti di sostegno economico e incentivi mirati per stimolare l'adesione dei cittadini, delle imprese e delle amministrazioni locali a progetti di energia condivisa. Si tratta di un passaggio cruciale che testimonia la volontà del legislatore di consolidare il ruolo delle CER come attori centrali della transizione energetica italiana. In tal guisa si rafforzano le basi normative per la diffusione delle comunità energetiche sul territorio nazionale.

4. Risultati

Nella prima fase dell'analisi condotta mediante l' analisi della letteratura emerge chiaramente un quadro approssimativo, che configura uno stato dell'arte molto carente; gli studi che viaggiano in questa direzione sono essenzialmente pochissimi e frammentati.

Nella seconda fase della ricerca ancora in fase di sviluppo, dopo aver analizzato il primo esemplare di CER in PPP italiano e i casi di CER presenti nel territorio calabrese, il lavoro giunge alle sue conclusioni.

Successivamente previa ricostruzione di un chiaro framework teorico di riferimento, si passa all'identificazione di alcuni elementi che devono necessariamente contraddistinguere auspicabili modelli di CER in PPP, affinché gli stessi possano assumere un ruolo centrale nei processi creazione e di sviluppo sostenibile locale . Se da un lato il modello delle comunità energetiche a struttura pubblico privata rappresenta un volano per la creazione di valore dall'altro fa emergere una serie di questioni legate alla compatibilità normativa e operativa.

Dall'analisi svolta ci si è resi conto della necessità di considerare che, la partecipazione di un soggetto pubblico ad una CER, impone di prestare attenzione alle conseguenze che tale partecipazione genera sulle possibili attività della CER. Tale considerazione emerge in ragione della speciale disciplina amministrativa che pervade l'attività delle Pubbliche Amministrazioni e dei soggetti ad esse equiparati. Nello specifico tre sembrano gli aspetti che necessitano di una maggiore considerazione:

- prima di tutto, nel caso di una CER costituita sul modello del PPP, è necessario chiedersi "dove" si ponga il pubblico e "dove" si ponga il privato. In particolare prevedere un ente pubblico all'interno di una CER significa introdurre nel modello norme relative a quel settore, che di fatto introdurrebbero elementi di rigidità che mal si conciliano con le esigenze di flessibilità cui sono improntate le CER.
- Altra questione potrebbe essere rappresentata dalla soggettività giuridica autonoma delle CER che porta con sé una serie di sfide molto complesse, se posta in relazione diretta con le caratteristiche proprie del Partenariato Pubblico Privato.
- Ultima criticità da considerare ma non per importanza è la possibile allocazione del rischio fra pubblico e privato. In effetti nei progetti di CER la capacità di utilizzare efficacemente l'energia prodotta è abbastanza rilevante, per cui il rischio di domanda diventa un aspetto non indifferente.

Altre considerazioni legate agli effetti che determinano una maggior densità delle CER in PPP nella zona settentrionale del territorio italiano, sono in via di definizione e ultimazione.

5. Implicazioni Manageriali

Il presente articolo si propone di integrare la letteratura esistente e di contribuire a stimolare il dibattito sulla necessità di rafforzare sinergie e partecipazione attiva tra cittadini, enti pubblici e privati nella produzione, condivisione e autoconsumo di energia da fonti rinnovabili, perseguendo altresì finalità ambientali, sociali e di redistribuzione economica, senza perseguire profitti finanziari come scopo primario. In particolare rivestono il ruolo di attori principali nel contribuire concretamente, al raggiungimento progressivo di obiettivi ESG (Obiettivi Ambientali, Sociali e di Governance) degli stakeholders di territori che le stanno implementando, in diversi modi. Le CER richiedono modelli di "governance partecipativa", dove i membri (privati, imprese, enti pubblici, cittadini) hanno voce in capitolo e come tali si vengono a creare profonde implicazioni manageriali per i medesimi attori coinvolti per cui sarebbe necessario:

- creare adeguate strutture di coordinamento (es. cooperative, consorzi, PMI);
- effettuare una chiara definizione dei ruoli degli attori (produttore, consumatore, prosumer);
- prevedere una gestione democratica e trasparente dei processi decisionali.

Inoltre poiché le CER spingono verso modelli economici basati su valore condiviso e autoconsumo collettivo, per cui a livello manageriale dovrebbe essere utile:

- elaborare strategie per richiamare e fidelizzare nuovi membri della comunità;
- implementare adeguati meccanismi di condivisione dei benefici economici.

Infine le CER oltre ad essere organizzazioni che beneficiano di incentivi pubblici (come ad esempio forme di detrazioni o tariffe incentivanti), esse necessitano anche di cospicui investimenti iniziali, per cui tale necessità fa sorgere a livello manageriale altre questioni importanti, come:

- la necessità di una pianificazione finanziaria a lungo termine;
- il bisogno di effettuare un'adeguata analisi costi-benefici per gli investimenti in impianti rinnovabili, utili alla struttura;
- valide ed elevate competenze di natura tecnica, finanziaria, amministrativa e giuridica nella gestione di fondi europei, PNRR, ecc.

Public Value Creation Mechanisms in Municipal Elderly Services: A Multi-Level Analysis of Organizational Practices and Wellbeing Experiences

Magda Touti[1], Fabiola Sfodera[2], Luca Dezi[3]

1. Introduction

The global population is experiencing unprecedented demographic aging, with projections indicating that by 2050, the number of individuals aged 65 and over will double to 2.1 billion, while those aged 80 and above will triple to 426 million (WHO, 2025). This significant increase in life expectancy has shifted attention toward promoting ecosystems aimed not only at extending lifespan but also at fostering healthy, inclusive, and fulfilling existence (Domaszewska et al., 2022). According to the literature, physical and cognitive changes associated with aging can generate feelings of emotional distress and social exclusion among elderly people, making them particularly vulnerable to isolation and marginalization, a phenomenon most evident in so-called "super-aged societies" (Hu et al., 2023).

Italy represents one such society, being the oldest country in the European Union (ISTAT, 2024). Over the past two decades, Italy has faced emerging healthcare, pension, and social needs related to demographic aging. In response, the role of local authorities has been redefined, evolving from administrative units to proximity social infrastructures capable of alleviating pressure on the national healthcare system and coordinating elderly care networks (Maino & Ferrera, 2023). In this context, characterized by progressive population aging and growing interdependence between technologies, public actors, and local communities, the traditional conception of public services based on administrative efficiency and outcome measurement appears increasingly inadequate for interpreting the complexity of elderly wellbeing. Understanding how public entities create and sustain such wellbeing requires theoretical models capable of moving beyond an instrumental logic of service delivery, orienting instead toward perspectives that consider value as a co-generated experience between institutions, citizens, and social contexts.

Despite the growing body of research in this area, particularly following Osborne's (2017) seminal work, important gaps remain. First, as Osborne (2017) himself states, Public Service Organizations "do not create value for citizens; they can only offer a public service. It is how the citizen uses this offer and how it interacts with their life experiences that creates value." Consistent with this reflection, Ongaro et al. (2025) have argued that existing studies present gaps as they have focused predominantly on normative or institutional conceptions of the "public good," neglecting the relational and affective dimensions that mediate citizen engagement in public services. On one hand, Virtanen and Jalonen (2024) have highlighted how Public Service Logic has effectively emphasized the importance of interactions between providers and beneficiaries, without sufficiently exploring the underlying mechanisms that facilitate value

creation. On the other hand, Ongaro et al. (2025) have noted that PSL literature has neglected the affective, relational, and experiential dimensions of public value creation. Therefore, the first gap concerns the lack of studies on the psychological and experiential mechanisms through which individuals perceive, internalize, and benefit from public services.

A further limitation concerns context. PSL research has thus far neglected the specific context of elderly care services. For instance, Lindqvist & Westrup (2020) focused on refugee children's learning experiences, Black & Gallan (2015) on patient participation in healthcare networks, and Engen et al. (2021) on citizen interaction with tax agencies, overlooking how value is created in the context of demographic aging and elderly wellbeing. The present research represents one of the first attempts to specifically apply the Public Service Logic framework to the context of services for the elderly.

2. Research questions

Through a qualitative case study in an Italian context, this research explores how municipal services for the elderly generate public value and experiential wellbeing, integrating PSL with the PERMA model from Positive Psychology. The study aims to answer the following research questions:

RQ1: What service delivery model configurations adopted by municipal social services are most effective in maximizing public value perceived by the elderly?

RQ2: How does participation in municipal services translate into value from the elderly's perspective, and how does this value articulate across its functional, social, emotional, and cognitive dimensions?

3. Theoretical background

3.1. Public service logic andvValue creation mechanisms

Public Service Logic (PSL) is a recent research stream that integrates principles from Service-Dominant Logic (SDL) and Public Value Theory, proposing a shift toward public value generation within public service ecosystems (Osborne et al., 2022; Ojasalo & Kauppinen, 2024). "Public value creation" refers to a relational and interactive process originating from daily interaction dynamics between institutions, professionals, and citizens (Osborne, 2018; Sønderskov & Rønning, 2021; Eriksson & Andersson, 2023). This theoretical perspective responds to the need to adapt public service research paradigms to the growing complexity of the contemporary public sector, called to address new and increasingly numerous challenges, such as population aging (Jenhaug, 2021).

Abandoning both the Public Administration perspective and the New Public Management paradigm, PSL shifts toward a governance paradigm where users and citizens are considered active partners in public value generation, and the effectiveness of public services depends not only on organizational efficiency but also on the quality of interactions and relationships between ecosystem actors (Hardyman et al., 2015; Osborne, 2018). According to this perspective, local authorities act not only as service providers but also as facilitators of value creation flows, mechanisms that connect policy objectives, service delivery processes, and social outcomes at both institutional and individual levels.

Building on this relational interpretation, Virtanen and Jalonen (2024) expanded the PSL framework by introducing the concept of public value creation mechanisms, four mechanisms that facilitate the emergence of public value:

- Expected service utility: This aspect emphasizes the importance of developing services that meet users' specific needs, thus generating satisfaction and potential benefits for society. The underlying thesis is that services intentionally designed to meet specific social needs promote

public value by improving living standards, strengthening community bonds, and encouraging equitable distribution of resources and opportunities.

- Public leadership: Considering the diversity of interests and the often complex and controversial nature of public policy issues, the leadership function assumes a central role in inspiring profound change by promoting a culture that values accountability and performance.
- Human-centered co-design and co-creation practices: By adopting a user-centered approach and encouraging active participation from diverse actors, public services can promote inclusivity and responsiveness to community needs and expectations.
- Value-in-use: Value does not derive exclusively from the service provider but from the interaction between provider and user. The perception of value is subjective and depends on the user's unique experiences, preferences, and interpretations.

These authors place such mechanisms within a broader structure of "public value creation flows," defined as the flows through which value is generated, transferred, and realized through relationships at multiple levels of the public service ecosystem. In this perspective, public value does not coincide with the interaction process but represents its emergent outcome. This means that public value creation is a relational and dynamic process that develops along interaction flows between actors, while public value constitutes the collective result of this process, the social and institutional impact deriving from citizens' value-in-use experiences.

These flows clearly describe where and how value takes shape in the public system and are distinguished into: 1) Policy objectives for public service delivery, indicating that value is created at the political level, where institutions define the purposes, priorities, and objectives of public services; 2) Implementation of public service delivery, indicating that value is then translated into practice through organization, leadership, and collaboration among actors delivering services; 3) Value-in-use for service users, where value manifests in users' concrete experience, what is useful, meaningful, and capable of generating wellbeing for them; 4) Social public value: public value is finally realized in its impact on the community, in terms of equity, social cohesion, and improvement of overall social wellbeing.

Together, mechanisms and flows form a dynamic and continuous process in which leadership, user experience, and collaboration guide the transformation of initial policy objectives into use value and, ultimately, into public value at the social level. In other words, flows indicate where value emerges, while mechanisms describe how it takes shape through interactions between public actors, citizens, and partner organizations. In the specific field of elderly care, this model highlights the interdependence between institutional design and relational practice, where the effectiveness of municipal services depends as much on empathy, dialogue, and continuity as on procedural efficiency.

3.2. Positive psychology and the PERMA model

Although PSL has effectively sought to describe the structural mechanisms through which value is produced within ecosystems, it tends to neglect the psychological and experiential dimensions that influence how citizens perceive, interpret, and benefit from public services in their daily lives (Ongaro et al., 2025), resulting in a limited understanding of how value is generated.

To identify the experiential and affective dimensions of public value generation, this study draws on insights from Positive Psychology (PP), which focuses on factors that enable individuals and communities to thrive (Seligman & Csikszentmihalyi, 2000; Seligman, 2011). The field of Positive Psychology focuses on studying positive experiences, character traits, and emotions, with the goal of understanding and improving individual wellbeing and prosperity. Its intent is to shift traditional psychology's attention from an approach exclusively focused on mental illness and pathologies toward study and promotion of positive aspects of human functioning.

Since its introduction (Seligman & Csikszentmihalyi, 2000), research in Positive Psychology has extended to various fields, including education, workplace, therapy, public policy, business, and marketing (Okeke et al., 2022). In Public Administration, Douglas et al. (2019) advocated for "Positive Public Administration," calling for a shift from diagnosing failures to understanding conditions under which public organizations promote prosperity, meaning, and democratic value.

In this theoretical context, Seligman's (2011) PERMA model offers a solid conceptual framework for examining public value creation at the micro level of public service ecosystems. Based on wellbeing theory, PERMA is an acronym identifying five elements of wellbeing that, when combined, promote human flourishing (Rossetti et al., 2024). These elements are: (1) Positive emotions, including happiness, life satisfaction, hope, pride, wellbeing, contentment, and joy; (2) Engagement, meaning a deep level of absorption and concentration; (3) Relationships, in terms of bonds, connections, and social integration; (4) Meaning, referring to motivations, identity, sense of purpose, personal value, and the feeling of being part of something greater; and (5) Accomplishment, including growth, success, autonomy, competence, and goal achievement.

The integration of Positive Psychology into the PSL framework thus expands understanding of value creation, connecting institutional service delivery processes to affective, motivational, and relational outcomes that underpin both individual and collective wellbeing.

4. Methodology

4.1. Case selection

The study adopts a multi-phase qualitative approach based on a single case study (Creswell, 2009; Yin, 2014) aimed at exploring how public value is created, experienced, and perceived within municipal services for the elderly. The research is based on a pragmatic-interpretive epistemology (Ravasi, 2024), which assumes that social reality is constructed through actors' interpretations and that the researcher's role is to reveal how these interpretations give meaning to organizational practices.

The case study comprises Municipality VIII of Rome, chosen for its particular socio-demographic characteristics that make it a relevant context for analyzing services for the elderly. Rome, with a population of 2,813,544 inhabitants as of December 31, 2022, is experiencing progressive demographic aging, with average age increasing from 44.6 years in 2013 to 46.6 in 2022. With an aging index of 233.8 (approximately 233.8 people over 65 for every 100 young people aged 0-14), Municipality VIII, despite being one of the least populated, has one of the highest concentrations of elderly in the city.

Given these characteristics, Municipality VIII was selected as a critical case, as it represents a context where the phenomenon of demographic aging and related challenges of social service management manifest particularly intensely. This configuration makes it a privileged analytical terrain for investigating public value creation mechanisms in municipal services for the elderly population, while offering transferable insights to other urban contexts characterized by similar dynamics.

4.2. Data selection

Data collection occurred between June 2024 and September 2025 and integrated primary and secondary sources to ensure data triangulation and information depth (Yin, 2009). Secondary data were provided by Municipality VIII and collected from the website and social media pages of Roma Capitale and Municipality VIII. Primary data were collected through three consecutive and interconnected phases (Stake, 1995; Malhotra et al., 2017). The entire primary data collection process was based on intentional and progressive sampling logic, consistent with the sequential qualitative design adopted (Creswell, 2009; Stake, 1995).

Phase 1: Focus group

The first phase involved conducting a focus group (8 participants) with staff from the Municipality VIII department responsible for managing, activating, and monitoring services for the elderly. This phase aimed to map services for citizens over 65 and identify networks of institutional and third-sector actors involved, as well as relational dynamics underlying identified services. The focus group lasted approximately 2 hours and was recorded with participants' consent. During the session, participants worked together to reconstruct the service delivery framework for citizens over 65, identifying main actors involved, contact points, and interaction flows.

Phase 2: In-depth interviews with operators

The second phase conducted 19 semi-structured in-depth interviews with key figures from Municipality VIII. Interview objectives were to deepen analysis of organizational and service management methods, explore the logic behind coordination between public and private actors, and identify perceived obstacles and improvement opportunities. Interviewees were selected through purposive sampling by role and function, including managers, social workers, and third-sector representatives. Each interview lasted between 60 and 80 minutes and was conducted in person at municipal offices. Interviews were structured based on the four value creation flows identified by Virtanen and Jalonen (2024): expected service utility for users, public leadership practice in public services context, human-centered co-design and co-creation practices, and value-in-use perspective.

Phase 3: In-depth interviews with elderly users

The third phase included users over 65 attending Municipality VIII social centers. The choice to focus on this user type was motivated by accessibility, autonomy, and communicative capacity criteria, which made it possible to conduct in-depth interviews. Elderly interview participants were selected through simple random sampling among center members who met eligibility criteria: age $\geq$ 65 years, regular attendance (at least twice weekly), ability to participate in qualitative interview, and informed consent to participation. The final number of interviews (n=22) was determined according to interpretive saturation principle, reached when reported experiences and meanings repeated consistently with respect to PERMA model analytical dimensions.

4.3. Data analysis

Data analysis followed a hybrid deductive-inductive approach, inspired by Grounded Theory principles but guided by pre-existing theoretical concepts considered as sensitizing concepts (Blumer, 1954; Bowen, 2006; Charmaz, 2006). Consistent with the pragmatic-interpretive epistemology adopted, such concepts were not used as rigid or a priori categories but as flexible interpretive lenses guiding empirical exploration, allowing constant dialogue between theory and data (Strauss & Corbin, 1998). Specifically, the models of Virtanen and Jalonen (2024) and Seligman (2011) were employed to orient analytical reflection on public value creation mechanisms and experiential wellbeing dimensions, respectively, without constraining the coding process to predefined schemes.

Analysis involved three coding cycles: first-order codes, second-order themes, aggregate dimensions (Gioia, Corley & Hamilton, 2013). The first phase (first-order codes) involved decomposing qualitative data into distinct components, careful examination, and comparison to identify similarities and differences (Saldaña, 2013). This study used in vivo coding (participants' language) to preserve meaning attributed by interviewees. Subsequently, the second phase

(second-order themes) aimed to establish an organized framework at categorical, thematic, conceptual, and/or theoretical level based on the initial set of first-cycle codes. Finally, categories were further analyzed and systematized to elicit main themes (aggregate dimensions). To enhance reliability, coding was performed with Atlas.ti (Sinkovics et al., 2008). Two researchers coded data independently and subsequently shared their coding structure, discussing until reaching agreement on final codebook structure.

5. Preliminary findings

The thematic analysis reveals a coherent and interconnected picture of how public value is generated and experienced within elderly services in Municipality VIII. From the organizational perspective, municipal services appear to rely on four core mechanisms that structure the way value is produced. A first mechanism, Relational Proximity, reflects the capacity of services to cultivate stable and meaningful human bonds with elderly users. Operators describe intentional relational practices, trust-building, continuous presence, emotional availability, and recognition of the person and their life story, which they consider not as ancillary, but as a constitutive element of service delivery. Closely connected to this is Functional Support for Daily Life, referring to the concrete and personalized assistance that facilitates autonomy and alleviates the practical burdens of everyday living. This includes support in accessing services, flexible interventions, and efforts to reduce daily strains.

A third mechanism concerns Care Ecosystem Coordination, where the Municipality assumes the role of orchestrator within a complex network of territorial actors involved in elderly care. This coordination involves intercepting needs, fostering shared governance arrangements, and sustaining a collaborative care infrastructure. Finally, Fragility Prevention and Social Activation captures proactive strategies aimed at preventing psycho-physical deterioration and promoting active engagement among the elderly through monitoring, social participation, and recognition of social identity and role.

These organizational mechanisms resonate strongly with what emerges from the user experience perspective. Elderly participants describe a wellbeing experience shaped by five interrelated themes. Emotional Wellbeing is expressed through feelings of joy, gratitude, and serenity, nurtured by the perception of being in a protected and caring environment. Motivation and Activation reflects the energizing effect of services, which stimulate participation and counter forms of passivity and isolation through daily motivation and physical-cognitive engagement. Social Relationships stands out as a transversal theme: users emphasize the importance of new friendships, reciprocal support, and the capacity of services to act as an antidote to loneliness. This relational dimension extends into a broader Sense of Belonging to Community, articulated through social recognition, shared identity, and territorial rootedness. Finally, experiences of Accomplishment emerge from feelings of self-efficacy, personal progress, and continuous learning fostered through participation.

Taken together, these findings suggest a cascade effect in which organizational mechanisms shape the conditions that enable individual wellbeing outcomes. While the theoretical integration of these levels is still under development, the preliminary evidence indicates a clear alignment between how services are structured and how they are experienced, reinforcing the centrality of relational, motivational, and social factors in public value creation for the elderly.

6. Expected theoretical and managerial contributions

This work-in-progress aims to make several theoretical and practical contributions. Theoretically, the research seeks to provide empirical validation and psychological micro-foundation to the Public Service Ecosystem approach. While PSL literature, particularly the model proposed by Osborne et al. (2022), has outlined the multi-level architecture of value

creation, this study aims to highlight its functioning at the sub-micro level, that of subjective experience and individuals' psychological wellbeing. This provides a concrete response to the gap identified by Virtanen and Jalonen (2024) and Ongaro et al. (2025), connecting organizational practices of public services to individuals' psychological wellbeing outcomes. The research also proposes a contextual extension of PSL, validating the framework in a Mediterranean context characterized by Italian welfare cultural specificities that differ significantly from Nordic and Anglo-Saxon contexts where the theory was originally developed. This contributes to the debate on theoretical model portability across different institutional and cultural contexts.

From a managerial perspective, the study suggests the importance of investing in the relational dimension of services, recognizing that operators perform a role beyond functional assistance requiring specific relational and emotional competencies. The awareness that many elderly primarily need companionship and listening should orient organizational practices toward models that value time dedicated to interaction, resisting pressure from purely quantitative metrics. This could involve revising operators' workloads, reducing bureaucratic burdens to free time for direct user interaction, and redefining performance evaluation criteria to include qualitative dimensions related to user wellbeing.

Ecosystem coordination emerges as a strategic competence for local authorities, requiring proactive mobilization of territorial networks and connection of various community resources. The identified preventive dimension contributes to debate on public institutions' emerging role as enabling platforms, suggesting that municipal social services could represent an investment with indirect returns on the healthcare system, reducing future costs through prevention of cognitive decline and social isolation.

7. Limitations and future research directions

As work-in-progress, this study presents limitations. Research focuses on a single municipal context; therefore, results are analytically transferable to urban welfare ecosystems with similar characteristics but not statistically generalizable to other contexts with different institutional, cultural, or demographic configurations. Reliance on self-reported experiences may introduce subjectivity elements, though triangulation between operators and users mitigates this bias and enriches results' interpretive validity. Additionally, PERMA framework captures only part of elderly people's complex lived experience, requiring cautious result interpretation and recognition that other wellbeing dimensions beyond those identified may be relevant. The study focuses on elderly regularly attending social centers, potentially excluding more isolated or fragile individuals who could most benefit from these services but face barriers to participation.

Future research directions include: comparative studies among different municipal contexts to better understand how cultural specificities influence value creation mechanisms, potentially extending analysis to other European countries with different welfare traditions to test framework transferability; longitudinal exploration of elderly wellbeing evolution over time to better understand long-term service participation effects and identify critical moments in aging trajectories where interventions could be most effective; investigating modalities for reaching elderly not attending social centers, developing inclusion strategies extending service benefits to broader populations, particularly most isolated and vulnerable who may face mobility, cognitive, or motivational barriers; analyzing economic sustainability of identified service models, examining PSL mechanism implementation costs and their returns in individual wellbeing and health system savings terms, potentially demonstrating prevention's economic viability through reduced hospitalization and long-term care costs; and quantitative validation of emerging constructs to enhance generalizability and develop standardized measurement instruments for PERMA dimensions in public service contexts, enabling broader assessment and comparison across different settings.

Integrating Public Sector Accounting and Public Value: Evidence from Public Housing Systems

Alessandro Furnari[1], Eugenia Miraglia[2], Eleonora Perobelli[3], Raffaella Saporito[4]

1. Purpose

Public sector accounting (PSA) has long been criticized for its narrow focus on efficiency and financial stewardship, often neglecting the multidimensional nature of public value. In this study, we explore how PSA systems can be reframed to integrate economic and social sustainability, thus enhancing the capacity of public service organizations to generate public value through inter-institutional collaboration. Drawing on a case study of public housing management in Italy, this research examines how control systems and measurement practices can evolve to account for PV, supporting a more equitable and sustainable approach to public service delivery. Specifically, the paper investigates how PSA systems can foster coordination between institutions (public housing providers and municipalities), enabling decisions that balance financial constraints with social objectives. By operationalizing the concept of public value in an accounting framework, the study contributes to ongoing debates about how measurement systems shape both the perception and the realization of social outcomes in public management. Thus, this study contributes to PSA theory by identifying interdependence as a mechanism through which accounting systems incorporate public value dimensions, thereby extending the understanding of control as an enabling infrastructure.

2. Theoretical background

Recent scholarship has urged a rethinking of PSA as a relational, rather than purely technical, system of accountability (Barbera et al., 2024). Traditional PSA systems—anchored in financial performance indicators—have been described as monological tools that fail to capture the often conflicting values underpinning public service delivery (Vollmer et al., 2024). This perspective aligns with broader debates on public values (Bryson et al., 2017; Osborne, 2020), suggesting that accounting can play a generative role in shaping dialogue and cooperation across organizational boundaries.

The integration of PSA and public value (PV) frameworks opens a new line of inquiry in public management research. Scholars such as Grossi et al. (2023) have proposed that accounting systems can serve as enabling conditions for PV creation, supporting the alignment between financial sustainability, social equity, and institutional trust. Building on this theoretical framework and conceptualizing PSA systems as packages (Bedford, 2020), the study shows how

[1] Assistant Professor of Practice, ECON-06/A, SDA Bocconi School of Management; alessandro.furnari@unibocconi.it – corresponding author

[4] Associate Professor of Practice, ECON-06/A, SDA Bocconi School of Management; raffaella.saporito@sdabocconi.it

they vary in their degree of interdependence between financial and non-financial components. The more interdependent these systems are, the greater their potential to integrate diverse values and guide decision-making toward collective outcomes. In brief, this study extends PSA theory by identifying interdependence as the mechanism through which accounting systems incorporate public value dimensions.

PSA systems aimed at public value creation can thus be viewed as packages in which financial and non-financial controls interact with varying degrees of interdependence. When these components remain loosely connected—as in traditional PSA focused on stewardship—accounting tends to emphasize compliance and cost containment, limiting its capacity to inform broader social outcomes. Conversely, higher levels of interdependence allow control elements to reinforce or enable one another, creating the conditions under which public value considerations can meaningfully shape decision-making.

3. Methods

This study adopts an exploratory case study design (Yin, 2018) in the context of the public housing sector of the Umbria region, Italy. The selected public organization manages affordable housing for approximately 20,000 residents, offering a unique empirical setting to observe how PSA systems mediate between economic constraints and social missions.

A mixed-methods approach (Mele & Belardinelli, 2018) was used to capture both qualitative and quantitative dimensions of value creation. Data collection occurred between April and December 2024 and involved:

- Document analysis of accounting reports, budgets, and performance dashboards;
- Five focus groups (81 pages of transcripts) with institutional stakeholders, housing managers, and service users to inductively explore perceptions of "what counts as value";
- A survey (44-item questionnaire, 6-point Likert scale, N=406, 5% response rate) designed to operationalize value dimensions and measure their perceived relevance;
- Quantitative analysis combining financial data with tenants' and housing characteristics to examine the relationship between public organizations in terms of financial and non-financial dimensions.

This methodology allowed the research team to identify key public value dimensions and translate them into measurable indicators within the PSA framework.

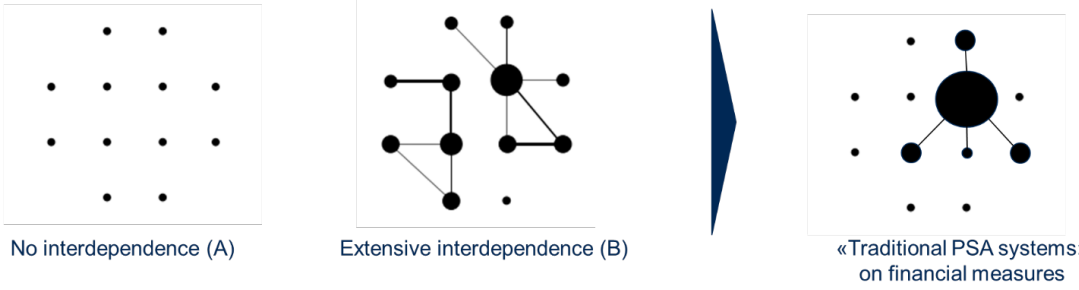

Figure 1. Conceptual framework of PSA packages and internal "value" interdependence

4. Findings

4.1. Defining and measuring public value

Osborne et al.'s (2022) introduced a framework for value analysis which offers a multistage approach to explore how value is manifested at different levels of the Public Service Ecosystem

along the design, production, and consumption/use processes, including: value-in-production, i.e., derived from being involved in co-design/co-production; value-in-use, i.e., derived from experiencing public services, both in the short/medium run and user's whole-life experience; value-in-context, i.e., derived from how a public service impacts upon the needs of a user, in relation to his/her life experiences; value-in-society, i.e., related to how public services contribute to the fulfillment of public/democratic values. In this view, users are co-producers of the service itself, contributing to the creation of value, which reflects the impact that services have for users, stakeholders and society as a whole. The shift in the users' role - from co-producers to co-creators - overcomes the linear, producer-dominant process of users' involvement implied in co-production, recognizing their pivotal role in co-creating the value within services, which results from the interaction between the PSO offering and users' life experiences. Adopting this framework, the analysis identified ten dimensions of public value, including accessibility, fairness, responsiveness, trust, and sustainability. These dimensions were grouped into three clusters reflecting the perspectives of key stakeholders. The results show that "value" is not only derived from the efficiency of resource use but also from the relational capacity of public organizations to generate institutional trust and mutual accountability. Table 1 shows the dimensions of public value identified for each ecosystem level. Specifically, the model assesses how public value is generated across macro, meso, and micro levels within the Umbria region. At the macro level, the focus is on the broader regional context and the strategic role of public institutions in shaping territorial development. In Umbria, public value emerges through three main dimensions: addressing housing needs for vulnerable populations, contributing to the socio-economic development of regional areas, and strengthening the region's capacity to attract and efficiently manage public resources. These functions establish the structural conditions that guide long-term social protection and regional resilience.At the meso level, the model examines inter-organizational actors—municipalities, public agencies, third-sector organisations, and housing institutions—whose coordinated actions translate regional objectives into operational practices. In the Umbrian case, public value is generated through support for the economic and social sustainability of municipalities, through the enabling role played in fostering third-sector initiatives, and through the proactive management of regional public housing assets as a lever for social protection. This level highlights how collaborative governance and shared resource management reinforce territorial cohesion and service quality.At the micro level, the model focuses on tenants and their lived experiences within the housing ecosystem. Here, public value is expressed through enhanced security of tenure, strengthened dignity, improved social inclusion, and a deeper sense of belonging for individuals and families.

Overall, the model shows that in the case study under analysis, public value is co-produced through the interaction of regional strategies, organizational cooperation, and the concrete benefits experienced by residents. It highlights how each level reinforces the others, creating a virtuous cycle in which institutional capacity, collaborative practices, and individual wellbeing mutually strengthen one another. By aligning policy, governance, and daily lived experiences, the ecosystem not only addresses immediate social needs but also contributes to long-term territorial sustainability, social cohesion, and a more inclusive regional development trajectory.

Ecosystem level	Dimensions of public value
Macro-level Regional context	- Addressing housing needs in vulnerable populations - Contributing to the socio-economic development of the regionale area - Enhancing the capacity to attract and efficiently manage public resources
Meso-level Inter-organizational actors	- Support for the economic and social sustainability of municipalities - Enabling function in support of third sector initiatives - Proactive management of regional public housing assets as a lever for social protection
Micro-level Tenants	- Security of tenure - Dignity - Social inclusion - Sense of belonging

Table 1. Ecosystem levels and public value dimensions for public housing systems

4.2. Integrating PSA systems with value dimensions

The study confirms that public housing "agencies" traditionally prioritize financial performance indicators—such as rent collection rates or arrears reduction—that often lead to inequitable outcomes (Kavanagh & Kowalski, 2021; McDonald & McCandless, 2023). However, when PSA systems were redesigned to include social indicators, such as avoided evictions, tenant recovery plans, and community stability metrics, the inter-institutional decision-making process shifted.

The avoided eviction measure proved particularly powerful in demonstrating both social and economic sustainability in an inter-organizational perspective. Avoiding a single eviction generated an estimated cost saving of €8,500 per year for single-member households (and up to €18,000 for families of two), preventing additional burdens on municipal budgets associated with emergency housing and social services. By adopting an extended public service perspective and the logic of differential costs, the system saves 2.4 million euros... ensuring that families with at least 2 members do not lose their homes. This differential cost analysis provided tangible evidence of how socially oriented actions can produce collective economic benefits.

Figure 2. The adoption of an extended public service perspective: economic and social municipalities

4.3. Reframing PSA as an integrative control system

By conceptualizing PSA systems as interdependent packages, the study reveals how accounting can become a connective infrastructure that bridges organizations, enabling shared understanding of public value creation. The empirical evidence suggests that hybrid systems—combining financial metrics with participatory indicators derived from stakeholder engagement—

are more effective in fostering coordination and sustaining trust between public housing "agencies" and municipalities. In summary, evidence from stakeholder discussions suggested that the integration of social indicators enhanced mutual understanding and trust between housing agencies and municipalities.

5. Discussion and implications

The findings contribute to the broader literature on PSA and public management by illustrating how accounting systems can be enabling rather than constraining. Integrating public value into PSA frameworks offers three key implications:

- Reconceptualizing control as collaboration: Traditional PSA systems reinforce silos accountability structures focused on internal efficiency. In contrast, value-oriented systems encourage joint accountability across organizational boundaries, emphasizing shared outcomes such as social equity and resilience.
- Expanding the scope of measurement: The introduction of social indicators like avoided evictions demonstrates how PSA can move beyond cost containment to measure the relational and distributive effects of policy actions. This aligns with recent calls to reembed accounting in its societal context (Barbera et al., 2024).
- Enhancing legitimacy and trust: By making visible the social impact of financial decisions, integrated PSA systems can strengthen the legitimacy of public organizations, reinforcing citizen trust and engagement in times of social strain.

More broadly, this research supports a paradigmatic shift from internal value chains to external value creation (Osborne et al., 2022). Public sector accounting, when reimagined as a relational system, can act as a bridge between financial rationality and social responsibility, helping public institutions balance efficiency with equity, and performance with purpose. In this sense, different forms exist through which interdependencies operate, compensating, reinforcing, or enabling, each illuminating how PSA components can collaborate to integrate PV dimensions. Social indicators may compensate for the blind spots of financial measures, counterbalancing their tendency to prioritize short-term efficiencies. Participatory or user-centered metrics can enable financial indicators to be interpreted within a broader public value frame, reducing the risk that fiscal pressures produce inequitable outcomes. These dynamics resonate strongly with public housing systems, where organizations must reconcile affordability, sustainability, and fairness.

Systems with greater interdependence are more resilient in complex environments, as they facilitate coordinated rather than piecemeal adjustments. This reinforces the theoretical linkage between PSA and PV by framing accounting not as a static reporting device, but as an evolving infrastructure capable of sustaining collective value creation across institutional boundaries.

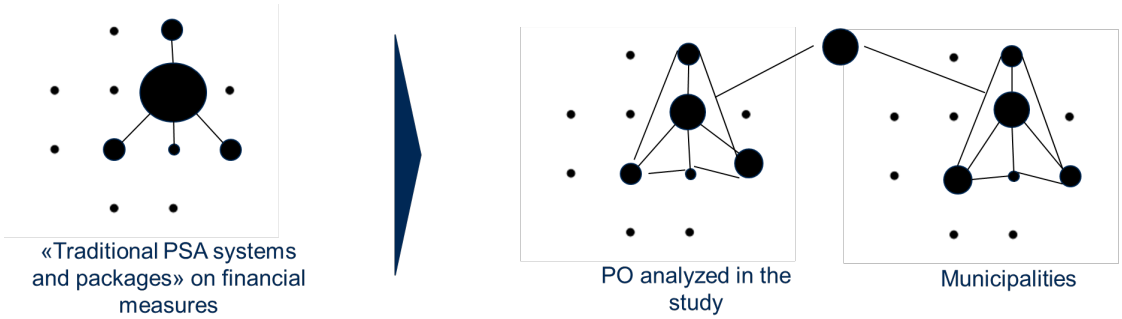

Figure 3. Integration of PSA and PV systems for social and economic sustainability

By introducing hybrid indicators (financial + social), PSA systems create a shared interpretive framework, which in turn facilitates deliberation, coordinated budgeting, and trust

among institutions. The observed integration dynamics may depend on institutional density, policy autonomy, and leadership continuity—factors that warrant further cross-case exploration.

6. Originality

This research contributes to the emerging dialogue on the relational nature of accounting by demonstrating, empirically, how PSA systems can evolve into tools for public value co-creation. It provides a rare illustration of how value can be embedded within control systems, offering both conceptual and practical advancements:

- Conceptual: It extends PSA theory by proposing an interdependence model linking financial and non-financial accounting mechanisms, thus addressing the critique of monological control systems.
- Empirical: It provides a detailed, mixed-method analysis of how an expanded PSA system operates in practice, showing how it integrates social and economic logics through the case of public housing.
- Practical: It offers actionable insights for policymakers and practitioners aiming to reform budgeting and performance systems in line with social equity and sustainability goals.

By linking accounting practices to the co-production of value, the study moves beyond the dichotomy of "efficiency versus equity," suggesting that well-designed PSA systems can serve as both measurement tools and vehicles of public inter-organizational integration. In doing so, it bridges ongoing debates in the literature on public value, social equity, and the future of public sector accounting. Thus, by conceptualizing PSA systems as interdependent infrastructures that embed public value dimensions, this study reconceptualizes control from a mechanism of compliance to one of collective value creation.

Governance of services for minors and sustainable public value: an analysis of the foster care system in Italy

Andrea D'Andreamatteo[1], Katia Giusepponi[2], Gianluca Antonucci[3]

1. Introduction

Public childcare and protection services are unique due to their complexity, the vulnerability of those involved, and their governance challenges. This complexity is linked to numerous factors, not least the number and typologies of involved stakeholders (various professional profiles and different types of public administrations, private entities, and family networks) and service process, which involve a variety of phases and actions with never sure outcomes. Furthermore, the vulnerability extends not only to the minor, who is the primary recipient of the service, but also to their family of origin, which finds itself temporarily or permanently unable to meet the child's needs.

Foster care is one such service that has recently been subject of in-depth academic and policy-making reflection, which has led, in Italy, to the updating of the national guidelines for foster care, approved by the State-Regions Conference (February 8, 2024).

The topic is also closely intertwined with the more general issue of public service governance (Rhodes, 1997; Cepiku, 2013; Osborne, 2016), and consequently of the complex of mechanisms, rules, procedures, bodies, and decision-making and control mechanisms that serve to manage the provision of services of collective interest to a wide range of stakeholders, given not anymore the heritage of the monolithic management of these services by the State. Governance thus occurs on multiple levels — within the organisation, among different public bodies, and between these and third parties — and is, at the same time, oriented towards solutions that foster the highest value, while also being sustainable over time.

Data on foster care services, among other things, highlight a phenomenon far from being marginal: for instance, in Italy, in 2023, approximately 15,000 minors were reported as placed in foster families and approximately 18,000 as placed in residential communities (Ministry of Labor and Social Policies and Istituto degli Innocenti, 2024a). These numbers do not consider unaccompanied foreign minors; including them, the figures for 2023 would be approximately 16,000 and 26,000, respectively.

The current exploratory research aims to investigate the current critical issues in the governance and collaboration model of public foster care services for minors and how they impact the creation of sustainable public value within the Italian childcare and protection system.

Given that the Italian foster care system is highly multi-actor (local authorities, local health authorities, juvenile courts, third sector organisations, foster families, residential communities) and multi-level (central government, regional government, and local services), the chosen approach was qualitative. This aimed to capture processes, logics, routines, and collaborative

dynamics not intelligible if using only quantitative data, and, above all, to correlate them to the entire value chain.

To help identify critical issues and define improvement measures in the specific context of foster care, this study analyzes the voices of key players to investigate factors that hinder and elements that promote the flow of value and virtuous collaboration among relevant stakeholders. As stated, the study employs qualitative methods, including conducting and analysing interviews with key players in the foster care process (families, juvenile courts, child and adolescent ombudsmen, non-profit organizations, local authorities, health authorities) to gather opinions on areas for improvement with a view to co-creating value in the best interest of the child.

This extended abstract is organized as follows: the next section provides a brief overview of the organization of foster care services in Italy, as well as notes on the size and allocation of funds, including some references to the limited business management literature on the topic; section 3 delves into the research method; section 4 summarizes the preliminary results of the data analysis. The abstract ends with a conclusive section, primarily aimed at illustrating the subsequent phases of the ongoing research.

2. Literature and context

In Italy, the number of children in foster care is increasing overall. According to official data from the Ministry of Labor and Social Policies, in 2023 there were 42,002 children in foster care, with a foster family or in residential care (including unaccompanied foreign minors), compared to 41,683 in 2022 (Ministry of Labor and Social Policies and Istituto degli Innocenti, 2024b:10). However, excluding unaccompanied foreign minors, since generally placed in other support programs, the figure drops to 33,310, that is, to a level substantially unchanged from 2022 (33,299) (Ibidem). Further limiting the observation to minors in residential care and minors in foster family care for no less than five nights per week (and excluding unaccompanied foreign minors), the figure drops to 30,936, showing an increase compared to 2022 (30,588) (Ibidem; Ministry of Labor and Social Policies and Istituto degli Innocenti, 2024a:11). However, there are significant differences between the recourse to foster family care and to residential care: the former is decreasing, while the latter is increasing. These trends result in significant lost opportunities for creating human, social, and economic value.

In 2023, there were 15,992 minors in foster family care, including unaccompanied foreign minors, with a 2.4% decrease compared to 2022; excluding unaccompanied foreign minors, there were 15,006, with a 1.4% decrease compared to 2022; considering only foster care for at least 5 days, net of unaccompanied foreign minors, there were 12,632 foster family placements, with a 1% increase compared to 2022, when there were 12,507, but a decrease compared to 2021 and 2020 (Ministry of Labor and Social Policies and Istituto degli Innocenti, 2024b:14; 2024a:13). In 2023, there were 26,010 minors in residential care, with a 2.8% increase compared to 2022, when there were 25,301. Excluding unaccompanied foreign minors, there were 18,304 minors in residential care; this figure shows a 1.2% increase compared to 2022, when the minors were 18,081, more than in previous surveys (Ministry of Labor and Social Policies and Istituto degli Innocenti, 2024b:40-41; 2024a:35).

With this problematic scenario in the background, Bill 1866, containing “Provisions on foster children”, was presented to the Chamber of Deputies on May 13, 2024, approved by the Chamber on October 21, 2025, and then sent to the Senate for review. The bill (Article 1) provides for the establishment of a national register of foster families, family-type communities, and public and private care institutions at the Department for Family Policies of the Presidency of the Council of Ministers, and the establishment of a register of minors placed with foster families or in family-type communities or public or private care institutions at each juvenile court and ordinary court. The purpose of the national register is to monitor the existence of conditions for foster care,

to protect the "best interests of minors who are temporarily deprived of a suitable family environment, avoiding situations of inappropriate placement". To carry out this monitoring function, the Department for Family Policies of the Presidency of the Council of Ministers draws on information held by the regions and local authorities (as parties to the foster care process) that is relevant in this regard. The register of children in foster care, established at each juvenile court and each ordinary court, on the other hand, dedicates a specific chapter to each child in the foster care process, with detailed notes concerning, for example, the details of the foster care order, the name of the foster carer, any special needs of the child, and so on (Italian Parliament, Chamber of Deputies, 2025).

The bill (article 2) also provides for the establishment, within the Department for Family Policies, of a National Observatory on public and private care institutions, family-type communities, and foster families to analyze data from the national register of public and private care institutions, family-type communities, and foster families, report to the competent authorities, promote inspections and site visits, and submit an annual report. The legislative approach is to promote, through the system of registers and the observatory, transparency, traceability, and detailed monitoring of the foster care process, allowing for the identification of critical issues and the definition of measures to resolve them, thus also supporting foster families, always in the best interests of the child.

While the specialized literature about social work, pedagogy, developmental psychology, and juvenile justice is well developed (e.g., Buehler et al, 2000; Lawrence et al, 2006; Giordano et al., 2021; Mortari and Sità, 2021), studies that delve into the phenomenon from a business administration perspective are rare. One exception is the 2006 study conducted by Cergas Bocconi, which focused on municipal spending on minors in need (Gugiatti, 2006). The study clearly showed that the gap between the cost per child housed in reception facilities and that of foster care was approximately €8,000, highlighting how the ethical imperative of reducing the need for institutionalization of minors in need was combined with efficiency parameters.

The economic dimension is indeed significant, and it was confirmed in the aftermath of the 2001 reform, which amended Law No. 184 of 1983, which introduced new regulations on the adoption and foster care of minors. Indeed article 5, paragraph 4, provides that: "The State, the regions, and local authorities, within the scope of their respective powers and within the limits of their respective budgets, shall intervene with support and financial assistance measures for foster families". A simple reading of this provision alone highlights how, given the enormous territorial disparities in terms of resource availability that characterize the Italian State, the actual enforceability of minors' right to grow up in a family is already strongly influenced.

Undoubtedly, the issue of good governance of public services is essential to ensuring valuable services and efficient resource use (Borgonovi et al., 2021). With explicit reference to social welfare, it appears distant from needs, even with regard to broader childcare services (Longo and Maino, 2022), as well as lagging behind in promoting the dissemination of appropriate governance mechanisms (Bertolo et al., 2021). Other dimensions worthy of investigation and refinement include the role of private institutions and families, which has been considered strategic since the promulgation of Law 184 of 1993 (VV. A.A., 1984), the Third Sector in general (Tonizzo and Nova Micucci, 2023; Zamagni, 2025), and the dimension of co-production and co-planning (Osborne et al, 2016; Zamagni, 2025).

Given the conceptual premises and the research question that motivated our study, our interest in this initial phase has been precisely to understand the current critical issues that impede the smooth governance of public services for minors in need. The following paragraph delves into the methodological aspects of the study.

3. Method

To investigate the current critical issues in the governance and collaboration model of public foster care services for minors and how they impact the creation of sustainable public value within the Italian childcare and protection system, we decided to adopt a qualitative approach (Van Thiel, 2014) throughout three steps.

Within a larger and still ongoing study, we first conducted a desk analysis to gather all relevant legislation and policies concerning family foster care and residential childcare in Italy.

We then choose to extract data from three different regional systems to grasp the variegate situation of Italian foster care programs.

At this stage, we have also completed a first set of semi-structured interviews concerning child support processes, including both adoption and foster care. We conducted these interviews with key stakeholders, both public and private, at national and local level (State, Regions, local authorities such as municipalities, local health authorities, local juvenile courts, accredited third sector organisations). Questions concerned criticalities in foster care services and related governance mechanisms. Table 1 lists the interviews that have already been transcribed and analysed.

Finally, after sharing the transcription with the interviewees to gather any further information and be sure of the content, we extracted the main themes (Van Thiel, 2014). Finally, we shared the analysis results to agree on the extracted themes and improve reliability.

Findings are briefly introduced in the next section.

Intervieews	**Region**	**Date (dd/mm/yyyy)**

4. Preliminary results

The documentary analysis and the initial set of interviews conducted so far, as part of our broader research on the topic, have highlighted how foster care is a complex public policy, requiring a high level of coordination, a sophisticated information system, highly specialized professional skills, and accountability measures. In other words, the public value of foster care services depends not only on the actions of single operators — a social worker, a judge, a foster family, or each single institution, such as the court, a foster home, or a network of foster families — but rather, on the creation of a true organizational ecosystem capable of learning, collaborating, and monitoring in a structural manner.

The new Italian National Guidelines for Family Foster Care (2024) and for the Reception of Minors in Residential Services (2024), updating the previous 2012 policies, emphasize the need to strengthen the local integration among municipal, healthcare, and judicial authorities, as well as with other stakeholders (e.g., educational communities and residential facilities). Furthermore, as a cornerstone of the new guidelines, the outcome monitoring system is included among the mandatory elements of the interventions. Moreover, formally, foster care is recognized as a public service with a high level of governance. Essentially, the guidelines require local services to undergo a paradigm shift, requiring them to adapt their institutional capacity to structure processes, manage data in an integrated manner, and systematically and continuously evaluate outcomes.

Although many of these elements were already present in previous guidelines, the interviews raised, since the first phase, a variety of critical issues regarding human capital, the ineffectiveness of interventions, and the level of trust among providers, which prevented the achievement of the policy's planned objectives. The Italian context has also been characterized by a continuous decline in families available for foster care.

On the first front, issues emerged related to the high turnover of providers and the precariousness of contracts, which impedes stability and continuity of the offered public service. The ineffectiveness of the intervention is naturally related to the failure of the foster care system, both in terms of the child's failure to reunite with his/her family of origin and in terms of the programme of induction in foster families or residential services. Ineffectiveness should also be assessed in relation to the allocation of financial resources, which appears to be biased toward residential facilities rather than, for instance, support for families of origin through early interventions. Another element that emerges from the interviews is the difficulty in building relationships of trust between professionals and foster carers, as well as the rapid loss of trust even for organizational reasons (transparency of processes, plainness in decision-making, and provider/professional operational continuity).

Despite the urgent need to strengthen collaboration between all relevant levels (central, regional, and local) and among the various involved stakeholders, including foster families and private social services, current governance mechanisms (such as coordination committees or memoranda of understanding) appear to have limited effectiveness.

5. Conclusion

Minors' foster care is a service that cannot be interpreted solely within traditional administrative categories. It creates value only when its transformative potential is unlocked to the involved stakeholders: first and foremost the minor, to whom is returned stability and emotional continuity; the family of origin, possibly and hopefully, when they overcome their difficult times; and the community as a whole, which, through a foster family or a referral center, mobilizes its own resources to support the most vulnerable and develops greater local solidarity. The previous section, however, highlighted how the creation of conditions of sustainable public value depends heavily, for the context we analysed, on collaborative governance models, as well as on interventions aimed at human capital and the need to make public action accountable.

Indeed, the work highlights areas of risk in terms of lack of access to foster care, due to gaps in information or training and awareness on the part of potential foster parents, and in terms of foster care failure, in the sense of early termination or termination of the human relationship at the natural end of the foster care period, due to discomfort or lack of awareness that characterized the process. Based on the survey results, the study thus discusses actionable levers and relevant reference practices to limit these risks and improve processes, experiences, and impacts on individuals and society.

As the literature on co-production has, however, already emphasized (Nabatchi et al.; Cepiku et al. 2022), the "how to" approach, to developing co-produced services is a dimension just as important as recognizing their value, especially in a multi-level governance context (Sicilia et al. 2016). What we analysed in this study is precisely an emblematic case of multi-level governance in which it is not a given that everyone is aligned and inspired by the same logic, nor that public managers are effectively capable of listening to the community and individuals, nor that the role of the Third Sector is effectively valued and as such in the different Italian regions.

Eventually our work aims to develop an interpretative framework, supported by the survey carried out, which could be a helpful reference to enhance collaborative governance and systematically direct actors towards awareness-raising tools and facilitating pathways, with a view to promoting, with the support of foster family care, the co-creation of value that is primarily human and social, and therefore economic. As the literature has pointed out, a strategic issue is how to involve citizens and other stakeholders (Bryson et al, 2017; Ansell, Torfing, 2021; Nasi et al. 2024) in the design, delivery, and evaluation of public services, an issue that is far from simple in the context of minors in difficulty.

The Development of IPSAS 46: Public Sector Measurement

Francesco Capalbo[1], Nicoletta Mottola[2], Alessia Rotili[3], David Watkins[4]

1. Introduction

Accounting plays a key role in promoting effective, sustainable, and future-oriented governance of scarce public resources. Within the public sector, the increasing role of stakeholders in shaping accounting practices is essential to reinforcing the credibility of the information produced and to contributing to more informed, participatory, and legitimate democratic processes (Dabbicco et al., 2025; Carnegie and West, 2005). Public sector measurement is also a critical component of accounting, serving as a co-architect of the common good by providing information that supports both accountability and decision-making (Grossi and Argento, 2022; Kaur and Lodhia, 2018).

Since measurement provides a way to describe resources and obligations in monetary terms, the measurement method employed impacts our perception of an entity's past performance and financial position at a given point in time. Well aware of the measurement's potential to influence an entity's value, both accounting researchers and standard-setting bodies have devoted considerable attention to its theoretical and practical implications.

For private sector entities, the initial and subsequent measurement of assets and liabilities are well-established practices whose implications have long been examined through extensive academic research. An example is the ongoing debate over the dualistic approach to historical cost and current value accounting models (Laux and Leuz, 2010; Sterling, 1981). Unlike the private sector, the public sector's distinct nature and characteristics have remained largely unexplored until the spread of New Public Management (NPM) reforms. One of the key innovations brought forward by such reforms is the adoption of accrual accounting systems, as "a method of recording expenses as they are incurred and income as it is earned during an accounting period" (Connolly and Hyndman, 2006, 272). Historically, instead, governments worldwide employed budgetary and cash-based accounting systems, recording financial transactions only when cash was exchanged. The shift from cash to accrual accounting has been widely advocated to promote sustainable socioeconomic development and to respond to pressures for better, more standardised public sector financial management systems (Azhar et al., 2022).

However, accrual accounting implementation also has profound effects on accounting practices, offering both politicians and citizens a more comprehensive picture of a public sector organisation's wealth, which is the sum of both its financial and non-financial assets and liabilities. While measuring the change in an asset's value over time is an essential part of accrual accounting, valuing non-financial resources in the public sector is one of the main challenges public sector entities still face. When transposing measurement methods designed for private

sector organisations to public sector entities, there is a risk that public value is not properly considered. Heritage assets, for instance, are non-financial assets that governments have a duty to conserve and maintain on behalf of current and future generations and that are difficult to measure in practice due to their social, cultural, and/or historical significance (Woon et. al., 2019; Biondi and Lapsley, 2014). Considering the nature, purpose, and essence of the public sector organisations and assets when developing accounting valuation methods is therefore essential not only to comply with accountability and transparency requirements but also to accurately reflect public value (Pallot, 1992).

Real-world measurement challenges highlighted the limitations in existing approaches, and gaps in solutions soon emerged in both academic and standard-setting literature. At the International Public Sector Accounting Standards Board (IPSASB) level, in particular, there has long been no comprehensive approach to measurement in financial reporting. Measurement bases were scattered across multiple International Public Sector Accounting Standards (IPSAS), and, eventually, they were not always aligned with the measurement principles included in the 2014 Conceptual Framework (IPSASB, 2014). Practical difficulties also emerged when dealing with transaction and borrowing costs, as they required a more coherent accounting treatment, and with the approval of IFRS 13 in 2011, because the adoption of a new definition of fair value that included reference to the "highest and best use" raised questions about its application in the public sector[5].

Against this background, the IPSASB launched a dedicated Measurement Project in 2015, though active discussion did not begin until 2017. Since then, the public sector measurement project's task force and the Board have committed significant time and effort to enhancing the quality and consistency of measurement practices. Until, in 2023 a suite of three pronouncement transpired: 1) the IPSAS 46 - Measurement, the main component of the project that brought together the high-level guidance on measurement; 2) the updated Chapter 7 - Measurement of Assets and Liabilities in Financial Statements, reflecting changes occurred in the conceptual framework since its conception; 3) the IPSAS 45 - Property, Plant and Equipment, which replaces the original issue of accounting for heritage and infrastructure assets. Nevertheless, the measurement project has been extended to include an application phase, which concluded in 2025.

2. Purpose

This research (work-in-progress) delves into the process that informed the development and issuance of the public sector measurement standard, IPSAS 46. Specifically, it explores the key measurement decisions' underlying rationale, with particular focus on how the board's final position took shape in the public sector standard-setting context.

For each key measurement decision identified, we aim to explain, using an internal approach, why the solution was ultimately chosen and why any alternatives considered were excluded, extending beyond what is stated in the basis for conclusions. In terms of the IPSASB due process, this research retraces the measurement project's pathway by looking at why the project was undertaken through a consultation paper (CP), how the transition from the consultation paper (CP) to the development of exposure drafts (EDs) 76 and 77 unfold and how the evolution of exposure drafts (EDs) 76 and 77 result in IPSAS 46, Measurement.

3. Methodology

[5] Under IFRS 13 § 27, a fair value measurement of a non-financial asset takes into account a market participant's ability to generate economic benefits by using the asset in its highest and best use or by selling it to another market participant that would use the asset in its highest and best use (IASB, 2011).

The methodology primarily employs a qualitative approach, with an intrinsic case study carried out according to Stake's (1995) proposal. Case study-based research is generally adopted in the social sciences to provide a holistic understanding of complex phenomena. The intrinsic case study is considered well-suited to investigating measurement within the IPSASB context for several reasons.

Because the case under consideration is of particular interest for both its unique features and significance, this methodology enables a deeper understanding of the dynamics at play in these specific circumstances. The author's specific interest and direct involvement in the project's development may also contribute to a more informed account of how the measurement case evolved within the IPSASB standard-setting process with an internal lens. Studies that build on this methodology typically employ multiple data sources to develop a nuanced understanding of the case under investigation. This strategy, which improves data credibility and supports a clearer interpretation of the overall case, is considered particularly valuable for standard-setting, where some information may remain undisclosed or only partially documented in a single public record (Kim et al., 2023; Handley et al., 2020). Therefore, this study's outcome is not intended to be projected outward but rather to help readers gain deeper insights into the specific case under consideration.

In line with the case study methodology, data triangulation deploys three primary sources. An in-depth analysis of existing IPSASB measurement-related documents from 2019 to 2025 is conducted. This suite includes measurement agenda papers, board minutes, comment letters, consultation paper, and exposure drafts. A semi-structured questionnaire is distributed to reach all those involved in the measurement project within the IPSASB (including board members, technical advisors, staff, and observers) and to ensure that our research captures more effectively why and how different ideas traveled throughout the project's development. The questionnaire has been refined based on input from interviews with available board members and staff. Participant and direct observation at the IPSASB measurement meetings are combined.

4. Preliminary Findings

Initially, we outline the primary factors that led the IPSASB to address public sector measurement challenges, specifically through a CP (IPSASB, 2019). From a high-level perspective, the key factors identified at this stage are those that more broadly led to the commencement of a measurement project. Despite fair value is being considered as one of the main driver to adopt a strategic approach to the issue, a preliminary analysis of responses to the questionnaire suggests two more factors were essential to be address in the CP, namely: (i) providing more detailed guidance on the implementation of historical cost, replacement cost, fulfillment cost, and fair value, and the circumstances under which these measurement bases will be used; and (ii) issuing amended IPSAS with revised requirements for measurement at initial recognition, subsequent measurement, and measurement-related disclosure.

When studying the transition from the CP to EDs, we instead consider whether there was a significant change in direction during the transitions from the CP to EDs 76 and 77 (IPSASB 2021a, 2021b), why it occurred, and how it has been documented. Our initial analysis, supported by questionnaire respondents, helped identify what is perhaps the most relevant change across the entire measurement project: the development of a public sector-specific measurement basis, current operational value (COV)[6]. COV is considered a key measurement decision worth analysing, particularly given the contrasting stakeholders' opinions on its development, definition, and practical implications. In line with the IPSASB literature, we intend to investigate the

[6] Current Operational Value (COV), as defined in IPSAS 46 § 6, is the amount the entity would pay for the remaining service potential of an asset at the measurement date (IPSASB, 2023a).

rationale behind the COV in light of its counterpart, fair value (FV). ED 77 is a core document for both COV and FV, as it introduces generic guidance on fair value for the first time and proposes COV to address stakeholder views that a new measurement basis is required as an alternative to fair value for assets held for their operational capacity rather than financial capacity. In the public sector, in fact, assets are primarily held to provide public services rather than to generate cash flows (i.e., to produce future economic benefits) (Anessi-Pessina et al., 2022).

In addition to FV and COV, the IPSASB made significant progress by proposing a measurement hierarchy (now referred to as the subsequent measurement framework and the relationship between the three levels) in ED 76 to guide the development of standard-level valuation guidance and to help stakeholders apply the principles in practice. In contrast to the initial measurement, the IPSASB distinguished among models, bases, and techniques in the subsequent measurement (IPSASB, 2023b).

Ultimately, during the transition to the measurement standard, we reflect on stakeholders' comments on ED 76 and ED 77 and how they helped shape the new measurement standard, IPSAS 46. Specifically, we will consider whether there was a consensus, alternative views, and significant changes in direction from the EDs to IPSAS 46. One of the main concerns identified during the transition, which we believe warrants a clearer explanation of the rationale, relates to the exclusion of the income approach as a measurement technique for estimating COV. From a bird's-eye view, respondents' feedback on this point is highly diverse, suggesting careful examination of this specific matter.

5. Research Contribution

This research contributes to both streams of research on accounting standard-setting processes and public sector measurement. Literature on IPSASB standard-setting is extensive and covers a range of aspects, such as the legitimacy, transparency, quality, and adoption of IPSAS standards (Christiaens et al., 2015; Grossi and Soverchia, 2011), the structure and internal organization of the standard setter (Polzer et. al., 2021), as well as stakeholder participation in the due process (De Wolf and Christiaens, 2023; Conrath-Hargreaves et. al., 2021; Kidwell and Lowensohn, 2019). While most studies focus on constituents' feedback at a single stage of the process (e.g., comment letters received on single-exposure drafts), our ongoing research traces, through an internal lens, how the measurement issue evolved across the entire process, from the CP to IPSAS 46. Meanwhile, by discussing how key measurement decisions are made within the IPSASB, this research sheds light on salient valuation issues relevant to public sector entities reporting under accrual accounting, thereby contributing to the literature on measurement in financial reporting.

Both the measurement and standard-setting processes are complex topics that, at the IPSASB level, have evolved through continuous feedback and interactions. Hence, by retracing the standard-setting process from the issuance of the measurement consultation paper (CP) to the measurement standard (IPSAS 46), this study aims to make a dual contribution to readers. First, it will enable a more comprehensive understanding of the main public sector measurement issues the IPSASB addressed. Because the measurement accounting standard is highly technical, its implementation may be complex and lead to divergent interpretations. To avoid this potential confusion, understanding the rationale for including or excluding specific elements from the measurement guidance at each project stage is essential. Such insight is further necessary given the unpredictability of situations that may arise, thus, to support public sector entities in complying with the standard more consistently and effectively while taking their own case into account. By analysing key factors shaping the evolution of measurement, we also expect to obtain preliminary indications of whether the solutions proposed during the work stage are satisfactory for public sector entities in achieving accountability and decision-making objectives. A potential

way forward to gain a more in-depth understanding of stakeholders' perspectives is to conduct semi-structured interviews with users of the measurement accounting standard.

Second, it clarifies who contributes to drafting public sector accounting standards and how decisions are justified in the presence of alternative conceptions, using measurement as a case. Academic literature increasingly emphasises both the role of IPSAS in the European context and the process that informs accounting standard-setting for matters prone to high levels of discretion (Ajekwe, 2022; Biondi et al., 2021; Adam et al., 2020; Kidwell and Lowensohn, 2019). This ongoing study, which focuses on the underlying reasons for the IPSASB's approach to developing the measurement standard, responds to renewed interest among academics, practitioners, and policymakers. Besides analysing the subject itself, it shed light on the contrast between initial expectations and the outcome, as ideas envisioned at the outset of the project evolved through stakeholders' proposals. Thus, it extends beyond Caruana's (2021) work, which critically examines the project's initial stages.

Because IPSAS 46 is a newly issued accounting standard, limited research has so far explored public sector measurement in light of its updated guidance. Moreover, since its effective date is 1 January 2025, its practical implementation remains an emerging issue (Caruana, 2025). Ultimately, the authors' close connection with the IPSASB community will enrich the study with first-hand insights while fostering the relationship between the IPSASB and the academic community.

Exploring Transformative Approaches to Sustainability Management in Italian Local Governments

Luca Bartocci[1], Alberto Burchi[2]

1. Introduction

The integration of the United Nations Sustainable Development Goals (SDGs) into sub-national governance represents one of the most significant institutional challenges of the 2030 Agenda (Meuleman and Niestroy, 2015). While national governments bear primary responsibility for voluntary national reviews and reporting, the achievement of most SDG targets ultimately depends on decisions taken at the municipal level, including urban planning, public services, infrastructure investment, and community engagement. The SDSN Italy SDGs City Index (Ottobrini et al., 2024) confirms that Italian provincial capitals have, on average, achieved only 53.9% of SDG targets, with substantial heterogeneity across geographic areas and municipality sizes.

A growing body of literature has examined how local governments adopt and disclose sustainability-related commitments (Guarini et al., 2021 and 2022; Mori, 2024; Bartocci and Burchi, 2025; Raimo et al., 2025). However, the field still lacks systematic frameworks for distinguishing symbolic adoption, in which SDG language appears in planning documents without structural integration, from transformative management, in which sustainability capabilities are embedded throughout the full planning, programming, and control cycle. This distinction is theoretically and practically important because local planning processes often remain fragmented across administrative silos, weakly supported by measurement systems, and unevenly shaped by differences in organizational capacity across municipalities (Zeemering, 2018). Under these conditions, sustainability commitments may satisfy reporting or reputational expectations while amounting to little more than rhetorical relabelling of existing policies, leaving underlying governance patterns largely unchanged.

This work addresses this gap by applying the Transformative Sustainability Management (TSM) framework developed by Bhatia et al. (2024) to the Italian municipal context. TSM identifies four organizational capabilities that characterize genuine sustainability integration: strategy formulation, operationalization and measurement, collaboration, and reflexive capability. We operationalize these capabilities through a computational content analysis of the two principal planning documents that Italian municipalities are required to produce: the DUP (Documento Unico di Programmazione), a multi-year strategic planning instrument, and the PIAO (Piano Integrato di Attivita e Organizzazione), the annual operational plan that should translate DUP objectives into concrete actions.

The study makes three contributions, with an explicit focus on the quality of the public planning process. First, it reframes SDG localization from a question of whether sustainability is mentioned in plans to whether it is embedded as a high-quality planning and control cycle (i.e., a coherent set of capabilities that connects strategic intent, operational translation, measurement, collaboration, and organizational learning). Second, it operationalizes the TSM framework in the context of Italy's legally mandated instruments (DUP and PIAO), showing how these documents can be used to diagnose where the planning cycle breaks down (e.g., strong discourse but weak

[1] Full professor, ECON-06/A, University of Perugia; luca.bartocci@unipg.it – corresponding author

[2] Associate Professor, ECON-08/B, University of Perugia; alberto.burchi@unipg.it

operationalization and measurement; weak DUP–PIAO alignment; limited feedback loops). Third, it offers actionable implications for public managers and policymakers by identifying capability gaps that can be targeted to improve planning quality – such as strengthening KPI architectures (baseline/targets), ensuring cross-unit coherence between DUP and PIAO, and institutionalizing reflexive routines – thereby reducing the risk of symbolic compliance and supporting substantive sustainability integration.

The remainder of the manuscript is structured as follows. Section 2 reviews the literature on SDG localization and sustainability management in local government. Section 3 presents the TSM theoretical framework. Section 4 describes the research questions, design and methodology. Section 5 presents the sample and data. Section 6 details the operationalization of TSM capabilities into measurable variables. Section 7 concludes by outlining the expected results and the research's potential contributions.

2. Literature review

2.1. SDG localization in Italy

The localization of the SDGs has attracted increasing scholarly attention over time. Research consistently shows that local governments are pivotal actors in SDG implementation, given that at least 65% of the 169 SDG targets require sub-national action (OECD, 2020). In the Italian context, the SDSN Italy SDGs City Index series (2018, 2020, 2022, 2024) has established a longitudinal baseline for tracking municipal SDG performance across the provincial capitals (Cavalli and Farnia, 2018).

A parallel stream of research has examined how municipalities disclose sustainability commitments. Guarini et al. (2021) show that embedding SDGs in city strategic planning requires not merely formal adoption, but managerial integration across the planning cycle. Mori (2024) documents the prevalence of symbolic compliance in Italian municipalities, where SDG references appear in strategic documents without corresponding operational translation. Recent evidence further deepens this picture. Bartocci and Burchi (2025) analyse the 2023–2025 DUP of 109 Italian provincial capitals through a combination of human content analysis and automated text analysis, showing that sustainability language is unevenly distributed and often remains nominal rather than substantively embedded in local planning. Their findings also suggest that, even where SDG-related language is present, municipalities frequently fail to connect it to gap analysis, indicators, and monitoring systems, pointing to a still fragile managerial internalization of sustainability in local programming. Raimo et al. (2025) identify population size and geographic location as significant predictors of SDG performance, with northern municipalities systematically outperforming southern ones.

2.2. Sustainability management in public organizations

The public management literature has progressively moved beyond compliance-oriented frameworks to examine sustainability as an organizational capability. New Public Governance perspectives highlight the role of inter-organizational collaboration and adaptive learning in sustainability transitions (Osborne, 2006). In local government contexts, this translates into requirements for cross-departmental coordination, stakeholder engagement, and iterative monitoring, capabilities that go well beyond what annual reporting exercises demand (Zeemering, 2018). These challenges are further compounded by the fact that SDG localization is inherently context-specific and requires knowledge, resources, and data that are themselves localized (Weitz et al., 2018; Allen et al., 2019; Grossi and Trunova, 2021; Grossi and Welinder, 2024). While Agenda 21 had already promoted a multisectoral, multilevel, and multi-actor approach to sustainability (Meadowcroft, 2011; Meuleman and Niestroy, 2015), the 2030 Agenda provides limited guidance on how global and local goals should be interconnected or prioritized in urban

settings (Grossi and Trunova, 2021; Sinervo et al., 2024). As a result, municipalities enjoy considerable autonomy in resource allocation, strategic planning, and the implementation of sustainability objectives, but they do so under highly uneven institutional and technical conditions (Guarini et al., 2022; Muiderman et al., 2023).

More recently, the literature has increasingly distinguished between formalistic and substantive sustainability integration. From this perspective, Da Ponte et al. (2020) show that sustainability may be formally acknowledged in public procurement documents while remaining only weakly embedded in evaluation and decision-making processes. Their findings suggest that the presence of sustainability language does not necessarily translate into substantive organizational integration. Evidence from Italian municipalities points in the same direction: sustainability appears to be more developed in strategic visions and general objectives than in gap analysis, operational programming, and especially in measurement and control systems. Particularly, Bartocci and Burchi (2025) report that sustainability is more frequently embedded in strategic vision and general objectives than in gap analysis, operational programming, and, above all, measurement and control systems. Their findings suggest that the core challenge is not merely the rhetorical acknowledgement of sustainability, but the development of organizational capabilities required to translate sustainability goals into coordinated action, indicators, and monitoring routines. This is especially relevant in a context where cities differ significantly in their access to funding, technical expertise, and data infrastructures, and where the absence of detailed shared guidelines may encourage fragmented approaches or forms of reporting decoupled from programming and implementation (Guarini et al., 2022; Muiderman et al., 2023; Bisogno et al., 2024; Manes Rossi, 2024; Cappellieri et al., 2025). Bhatia et al.'s (2024) TSM framework provides the most operationally developed account of what transformative integration requires at the organizational level.

2.3. Content analysis in public sector research

Content analysis has a long tradition in public administration and accounting research as a method for assessing voluntary disclosure (Beattie and Thomson, 2007; Tregidga et al., 2014). The combination of hermeneutic and automated approaches - increasingly referred to as mixed-method content analysis - allows researchers to maintain theoretical fidelity in dictionary construction while achieving scalability in application (Loughran and McDonald, 2016; Gentzkow et al., 2019). Recent methodological advances have extended automated text analysis to the SDG domain. In particular, Bebbington and Unerman (2020) call for accounting scholarship to develop rigorous empirical approaches capable of capturing how organizations engage with the SDGs beyond surface-level disclosure. In this direction, cosine similarity techniques have been applied to measure the semantic proximity between organizational documents and SDG reference texts, for instance, to map the interlinkages among SDG targets through vector-based comparison of goal descriptions (Song and Jang, 2023). Building on this methodological strand and on standard information-retrieval approaches to text similarity, we apply TF–IDF vectorization and cosine similarity to assess the degree to which DUP and PIAO documents are aligned with each of the 17 SDG reference texts (Salton and Buckley, 1988; Manning et al., 2008; Jurafsky and Martin, 2024). We treat similarity scores as interpretable proximity measures and triangulate them with dictionary-based indicators and robustness checks on thresholds.

3. Theoretical framework: Transformative Sustainability Management

Bhatia et al. (2024) define Transformative Sustainability Management (TSM) as the set of organizational capabilities that enable public administrations to embed sustainability not as a formal compliance exercise, but as a structural principle of governance. Unlike instrumental approaches, which treat sustainability as an external constraint to be managed, TSM requires that

sustainability values permeate the entire organizational logic, from political vision formation through operational programming to performance monitoring and institutional learning.

The framework articulates four interconnected capabilities, each corresponding to a distinct phase of the strategic management cycle.

3.1. Strategy formulation capability

Strategy formulation is the capacity to translate global sustainability objectives (the SDGs) and political values into a coherent local vision explicitly connected to the 2030 Agenda. A municipality with strong strategy formulation capability will not merely cite the SDGs as a formal reference, but will map local priorities across multiple sustainability dimensions, establish connections between global targets and local conditions, and communicate a clear narrative of direction and ambition. Critically, this capability requires distributional balance: a municipality that reduces sustainability to environmental management has a weak strategy formulation capability, even if its environmental commitments are robust.

3.2. Operationalization and measurement capability

Operationalization and measurement is the capacity to render the sustainability vision actionable through concrete objectives, quantifiable key performance indicators, financial allocations, and chronological programming. This capability bridges the gap between strategic ambition and administrative reality. A municipality with strong opperationalization capability will attach specific KPIs and financial resources to each sustainability objective, thereby enabling accountability and progress tracking. The absence of this capability – strategically ambitious documents without measurable targets or budgetary commitments – is a hallmark of symbolic adoption.

3.3. Collaboration capability

Collaboration is the capacity to build coherence both horizontally (across departments and with external stakeholders) and vertically (across governance levels and across planning instruments). In the Italian institutional context, the most directly measurable dimension of this capability is the alignment between the DUP and the PIAO: the degree to which operational commitments in the PIAO reflect and translate the strategic objectives articulated in the DUP. Participatory processes and multi-stakeholder engagement provide additional indicators. Low DUP-PIAO alignment is a structural indicator of governance fragmentation, regardless of the quality of individual documents.

3.4. Reflexive capability

Reflexive Capability is the capacity for institutional self-assessment and adaptive learning: the ability to monitor results, identify gaps between plans and outcomes, feed these findings back into future planning cycles, and communicate transparently with stakeholders. Operationally, this capability manifests in monitoring systems, dashboards, public reporting, and the presence of genuine gap analysis in planning documents - that is, the explicit acknowledgement of where the municipality currently stands relative to SDG targets and how much distance remains to be covered.

4. Research questions, design and methodology

Building on the TSM perspective and on the distinction between symbolic and transformative sustainability integration in public organizations, this study addresses three questions.

RQ1: To what extent do Italian provincial-capital municipalities embed the SDGs across the full planning and control cycle (from strategic intent to operationalization and measurement) as documented in DUP and PIAO?

RQ2: How do the four TSM capability dimensions (strategy formulation, operationalization and measurement, collaboration, and reflexive capability) vary across municipalities when measured through a document-based text analytics pipeline?

RQ3: Are higher TSM capability scores associated with better sustainability outcomes and do "best vs worst" municipalities exhibit systematically different capability profiles?

4.1. Overall approach: mixed-method content analysis

We adopt a mixed-method content analysis design that combines Hermeneutic Text Analysis (HTA) for theoretical grounding with Automated Text Analysis (ATA) for systematic application across the sample. HTA informs the construction of coding dictionaries and the operationalization logic - that is, the mapping from theoretical constructs to textual indicators. ATA, implemented through a custom Python pipeline, applies these dictionaries consistently across all 18 municipal document pairs (DUP + PIAO) while also computing semantic similarity measures that go beyond keyword matching.

This approach follows the methodological tradition of mixed content analysis in accounting and public management research (Beattie and Thomson, 2007; Krippendorff, 2018), adapted for the computational analysis of long-form public documents. The two types of analysis are complementary rather than sequential: HTA-informed dictionaries are iteratively refined against the corpus, while ATA results are interpreted in light of the theoretical framework established through HTA.

4.2. Document selection: DUP and PIAO

The DUP (Documento Unico di Programmazione) is the principal multi-year strategic planning instrument for Italian municipalities under Legislative Decree 267/2000 and subsequent TUEL provisions. It articulates the municipality's strategic objectives over a three-year horizon, organized by mission and programme, and constitutes the formal basis for budget allocation. The PIAO (Piano Integrato di Attivita e Organizzazione), introduced by Decree-Law 80/2021, integrates previously separate planning instruments and covers the annual cycle of activities, performance targets, and organizational management.

The DUP-PIAO pair provides a uniquely revealing window into the gap between strategic intention and operational implementation. A municipality that articulates sustainability commitments in its DUP but fails to translate them into PIAO performance objectives reveals a deficit in Collaboration and Reflexive Capability, regardless of the quality of its strategic discourse. Conversely, a municipality with modest DUP language but strong PIAO-level operationalization may exhibit greater effective capability than its strategic document alone would suggest.

4.3. Computational pipeline

The automated analysis pipeline processes each municipality's PDF documents through the following stages: (1) text extraction via pdfplumber; (2) preprocessing - lowercasing, whitespace normalization, and removal of non-alphanumeric characters; (3) sentence segmentation using punctuation and newline markers, retaining only sentences of more than 20 characters; and (4)

application of six analytical modules producing the variable groups described in Section 6. The pipeline produces per-municipality Excel reports and a consolidated dataset across the sample. To mitigate document-length (verbosity) bias, occurrence-based indicators are normalized by total words.

5. Sample and data

5.1. Population and stratification strategy

The population of interest consists of the 109 Italian provincial capitals for which both DUP and PIAO documents are publicly available. We adopt a stratified purposive sampling design intended to maximize variation across the two principal dimensions of heterogeneity identified in the literature: geographic location and municipality size.

Geographic stratification follows the ISTAT classification of Italian macro-regions: North, Centre, and South and Islands. The size stratification identifies three classes: large municipalities (more than 250,000 inhabitants), medium-sized municipalities (between 50,000 and 250,000 inhabitants), and small municipalities (fewer than 50,000 inhabitants).Within each of the nine cells of the 3x3 stratification matrix, we select two municipalities: the best performer and the worst performer on the SDSN Italy SDGs City Index 2024 composite score. This extreme-case selection strategy maximizes within-cell variation in sustainability outcomes, ensuring that the TSM analysis is conducted on units spanning the full range of SDG performance in each stratum. The result is a sample of 18 municipalities:

Municipality	***Zone***	***Size Class***	***SDG Role***	***SDSN 2024 Score***
Bologna	North	Large	Best	64.7%
Genova	North	Large	Worst	56.0%
Trento	North	Medium	Best	71.5%
Alessandria	North	Medium	Worst	50.8%
Lecco	North	Small	Best	65.5%
Verbania	North	Small	Worst	50.5%
Firenze	Centre	Large	Best	58.0%
Roma	Centre	Large	Worst	55.2%
Ancona	Centre	Medium	Best	61.0%
Pistoia	Centre	Medium	Worst	43.1%
Macerata	Centre	Small	Best	61.2%
Frosinone	Centre	Small	Worst	49.9%
Cagliari	South/Islands	Large	Best	60.8%
Catania	South/Islands	Large	Worst	34.4%
L'Aquila	South/Islands	Medium	Best	55.4%
Crotone	South/Islands	Medium	Worst	34.5%
Nuoro	South/Islands	Small	Best	55.7%
Isernia	South/Islands	Small	Worst	37.3%

Table 1. Sample composition

5.2. External validity benchmark: SDSN City Index 2024

The SDSN Italy SDGs City Index (Ottobrini et al., 2024), produced by Fondazione Eni Enrico Mattei within the SDSN Italy network, provides the most methodologically rigorous and academically cited measure of SDG performance for Italian municipal capitals. Now in its fourth edition (2018, 2020, 2022, 2024), the Index covers the provincial capitals across 42 elementary indicators distributed across 16 of the 17 SDGs (SDG 14 is excluded for internal comparability reasons). Target normalization is based on the average performance of the top five municipalities per indicator, thereby providing a peer-referenced benchmark rather than an absolute threshold.

We use SDSN City Index 2024 scores in two ways: (1) as the stratification criterion for sample selection (Section 5.1); and (2) as an external outcome variable for cross-validation - testing whether municipalities with higher TSM capability scores, as measured by our computational pipeline, also exhibit higher SDG performance outcomes.

6. Operationalization of TSM capabilities

To operationalize the four TSM capabilities in the Italian municipal context, we adapt the analytical scheme developed in our earlier work and align it with the DUP-PIAO document pair used in this study. Table 2 summarizes the capability dimensions, their observable characteristics, and the main variables, data sources, and suggested indicators used to identify transformative sustainability management in planning documents. For each capability, we compute a standardized score by aggregating normalized indicators (per 10,000 words where relevant and z-standardized across municipalities). We assess robustness using alternative weighting schemes and threshold values for similarity-based indicators.

Capabilities	***Characteristics***	***Variables, data sources, and suggested indicators***
Strategy formulation	Integration of sustainability into the political vision	- No. of occurrences in the DUP associated with the "political vision" phase - Cosine analysis between the DUP and the SDG declarations - Share (%) of text in the DUP tagged to sustainability themes - Explicit link between the mayor's programme and at least one SDG target (binary 0/1)
	Understanding of external and internal conditions	- No. of occurrences in the DUP associated with the "gap analysis" phase - Use of SWOT analysis, PEST analysis, benchmarking, BSC, etc. documented in the DUP (0-4 score)
	Defining significant macro-objectives	- No. of occurrences in the DUP associated with the "identification of objectives" phase - Use of SDG/BEST targets documented in the DUP - No. of macro-objectives that map onto at least one SDG indicator / total macro-objectives (ratio)

Capabilities	***Characteristics***	***Variables, data sources, and suggested indicators***
	Using participatory processes	- Use of participatory tools documented in the DUP - Stakeholder events per 10 000 inhabitants in the plan cycle
Operationalization and measurement	Definition of specific programs	- No. of occurrences in the DUP associated with the "setting a SDG agenda" phase
	Use of trackable indicators at managerial level	- Use of KPIs documented in the PIAO - % KPIs with baseline and target
	Implementation of monitoring systems	- Use of dashboards documented in the DUP and PIAO - Public access to dashboard (0/1)
Collaboration	Aligning units and objectives with the strategy	- Comparison between the DUP and the PIAO - Cosine similarity between the wording of DUP objectives and PIAO KPIs (0/1) - No. of PIAO actions that cite the DUP objective code
	Defining cross-cutting objectives	- Definition of cross-sectoral or cross-unit objectives in the PIAO
	Promoting collaborative practices	- Use of inclusive and participatory tools documented in the DUP - Budget allocation (EUR) for collaborative projects
	Focusing on outcomes	- Analysis of outcomes indicators in the DUP and PIAO - Citizens' satisfaction survey published in last 2 years (0/1)
Reflexivity	Creating information feed-back loops	- Longitudinal comparison of KPIs in the DUP and PIAO - % of KPIs with three or more yearly data points (time-series depth) - Existence of a lessons-learned report per cycle (0/1)

Table 2. TSM capability-based analytical framework. Source: our elaboration based on Bhatia et al. (2024, p. 1189) and Bartocci and Burchi (2025)

7. Concluding remarks

The expected findings are the following. First, we anticipate marked heterogeneity in how Italian municipalities embed the SDGs across the planning and control cycle, with "best performers" exhibiting a more complete bundle of TSM capabilities rather than stronger SDG rhetoric alone. In particular, stronger SDSN outcomes should be associated with: (i) strategy formulation that moves from generic SDG references to explicit gap analysis and SDG-linked macro-objectives; (ii) operationalization and measurement evidenced by the presence of trackable KPIs with baselines/targets and monitoring systems (e.g., dashboards); (iii) collaboration

capability reflected in higher DUP–PIAO alignment (strategic objectives translated into operational actions and KPIs) and cross-cutting objectives; and (iv) reflexive capability signaled by feedback loops, longitudinal KPI tracking, and explicit learning mechanisms (e.g., lessons-learned reporting). Second, we expect capability complementarities: high strategy formulation without operationalization, collaboration, and reflexive mechanisms will be indicative of symbolic adoption, whereas substantive sustainability integration will require coherence across the four capability dimensions. Third, we expect territorial and size-related differences to manifest primarily through the operationalization/collaboration/reflexive dimensions—capabilities that depend more directly on organizational infrastructure and managerial systems than on strategic discourse.

The study aims to contribute to public management and SDG localization research by (1) shifting the empirical focus from the presence of SDG language to the capability architecture underpinning sustainability integration; (2) offering a replicable, document-based measurement approach that operationalizes TSM in a legally mandated planning setting (DUP/PIAO); and (3) providing an external-validity check by relating capability scores to observed SDG performance. Practically, the capability scorecard produced by the pipeline can help public managers diagnose whether weaknesses lie in strategic framing, measurement infrastructure, cross-unit alignment, or institutional learning, thereby supporting targeted interventions to close specific capability gaps and reduce the risk of symbolic compliance.

Creating Public Value Through Digital Twin Enactment: Institutional Conditions and Climate Resilience Governance in London

Besjon Tanuzi[1], Angelo Paletta[2], Genc Alimehmeti[3]

1. Introduction

Compared to previous waves of transformations in public administration, the digital transformation (DT) of the last two decades marks a significant shift, demanding a reimagining of many government operations (Manny et al., 2021). For many years, gradual digitalization has been one of the added-value domains, improving the efficiency and effectiveness of the public sector processes (Alford & O'Flynn, 2009; Cordella & Bonina, 2012). Beyond just digitization and digitalization, digital transformation involves thoroughly reconfiguring organizational structures, decision-making procedures, and value creation mechanisms rather than merely automating current bureaucratic processes (Mergel et al., 2019). This shift affects how public sector organizations define their missions, engage with the public, and address traditional and emerging issues.

Cities across the world are investing heavily in digital twins as instruments of urban climate resilience. These systems combine real-time data integration, dynamic simulation, and scenario-based decision support in ways that promise to move urban governance from reactive crisis management toward more anticipatory, coordinated approaches (Batty, 2017; West et al., 2021; White et al., 2021). The policy appeal is especially visible in climate governance, where flooding, heat stress, infrastructure disruption, and cascading failures pose cross-sectoral, spatially differentiated challenges that exceed the capacities of siloed administrative systems.

However, technology adoption proves far more complex than only technical implementation. Cities deploy a large amount of funding and resources in digital technologies and platforms, which turn out to be underutilized, lacking integration with decision-making, and not delivering the value intended (Ferré-Bigorra et al., 2022; Mazzetto, 2024; Trencher & Karvonen, 2019). Therefore, there is an interesting puzzle considering that cities can get almost identical systems from the same vendors, access similar data sources, and work on almost equivalent processing infrastructure. If technology is not the main differentiator between cities, then what is it?

We argue that digital twins do not generate public value solely through technical capabilities. Much of the institutional and organizational conditions shape how digital twins are enacted in practice, and therefore, different enactments produce different configurations of public value. The core research question is: How do institutional and organizational conditions shape the enactment of digital twins and the creation of public value in climate resilience governance? In addition, we propose four guiding questions that can shape the empirical investigation: (1) What institutional-organizational conditions characterize climate-relevant digital twin initiatives in London? (2) How are digital twins enacted across organizations and use domains? (3) What public value configurations and trade-offs emerge from these enactments? (4) Through what mechanisms do institutional-organizational conditions shape enactment and value outcomes over time?

Overall, digital initiatives in public administration have generated public value by enhancing the effectiveness, transparency, and quality of public services across various sectors (Desai & Manoharan, 2024; Volodina & Grossi, 2025). They have enabled the public sector to adapt to societal needs, facilitating shifts in social and public values, and helping governments serve their citizens better, while overcoming technological and institutional changes (Bannister & Connolly, 2014; Lindgren & Van Veenstra, 2018). Within this domain, this paper is relevant because it examines how public organizations can leverage the power of digital tools, particularly digital twins, to address key sustainability challenges. Climate resilience is arguably the most important goal for sustainability, requiring long-term thinking, systems integration, and adaptive governance. Second, the research focuses on public value and the common good beyond efficiency metrics to examine how digital twin enactment provides resilience, legitimacy, accountability, equity, and adaptive learning capacities. Third, focusing on institutional arrangements and governance, the research contributes to understanding how organizational design and management capacity enable or constrain digital transformation in public contexts. A question that is becoming increasingly important as artificial intelligence and automation are reshaping public administration.

The paper proceeds as follows. Section 2 develops the theoretical framework. Section 3 presents a three-layer conceptual model. Section 4 describes the research design. Section 5 offers preliminary insights from initial document analysis. Section 6 states the expected contributions.

2. Theoretical Framework

2.1. Technology Enactment Framework

Fountain's (2001) Technology Enactment Framework (TEF) provides a fundamental understanding of how technologies are not impartial instruments with inherent effects. Instead, they are shaped by the institutional context in which they are integrated. Therefore, objective technology, referring to the raw technical capabilities available in the market, passes through an "institutional filter" comprising cognitive, structural, and organizational arrangements, producing "enacted technology." Enacted technology refers to how systems are actually designed, implemented, and utilized in specific organizational contexts. Subsequent authors have extended TEF into digital government contexts. (Cordella & Iannacci, 2010) demonstrate that policy drivers and institutional contexts shape the design and use of public information systems. (Gil-Garcia, 2012) shows that organizational capabilities, institutional arrangements, and environmental conditions jointly explain variation in e-government outcomes. These extensions confirm that enactment-based approaches remain well-suited to complex, data-intensive public-sector technologies.

In this case, TEF is especially appropriate for digital twins because they are not stand-alone tools but integrative, data-dependent infrastructures that require coordination across multiple actors, systems, and organizational boundaries. This paper takes TEF a step further by laying out five key institutional and organizational factors that come before everything else in the analysis. Initiating from the original concepts of the framework, first, cognitive frames shape how actors define climate risks, interpret digital twin capabilities, and prioritize governance problems, thereby shaping which uses are seen as legitimate and valuable. Structural arrangements concern the formal rules governing authority, accountability, procurement, and compliance, and determine who is authorized to invest in and act on digital twin outputs. Organizational forms, including coordination arrangements, cover departmental structures, inter-organizational routines, and coordinating roles that determine whether digital twin outputs travel across sectoral and jurisdictional boundaries. In addition, we introduced:

- Data Governance Institutions. The rules, protocols, and procedures that regulate data ownership, sharing, quality standards, and ethical use. This is an important dimension of institutions because the efficacy of digital twins relies on the ongoing integration of data

beyond one organization, making data governance central to the enactment of the technology (Janssen et al., 2020).
- Boundary-spanning expertise refers to the actors and practices that translate between technical, managerial, and policy domains, converting technically sophisticated outputs into actionable governance decisions (Guston, 2014; Star & Griesemer, 1989).

2.2. Public Value as the Outcome Lens

The paper positions public value as the lens for evaluating the consequences of enactment, rather than as a coequal causal framework alongside TEF. Building on Moore's (1995, 2013), public value foundations and their digital government applications (Cordella & Bonina, 2012; Panagiotopoulos et al., 2019; Twizeyimana & Andersson, 2019), the paper operationalizes public value through four grounded and empirically traceable outcome dimensions that are normatively substantively relevant to climate resilience governance.

Starting with resilience effectiveness that refers to the extent to which digital twin enactment strengthens anticipatory, adaptive, or transformative governance capacities that lead to improved forecasting, better cross-organizational coordination, more targeted infrastructure interventions, or more informed adaptation planning. Democratic legitimacy and accountability refer to transparency, explainability, oversight, and the degree to which digital twin use remains contestable and publicly accountable; data-intensive systems may improve analysis while simultaneously reducing democratic scrutiny, making this dimension analytically non-trivial. Equity and rights protection refers to inclusion, distributional fairness, privacy, and data rights, recognizing that public value is compromised when benefits are unevenly distributed or when data governance erodes fundamental rights (Bannister & Connolly, 2014; Haraguchi et al., 2024). Next, adaptive learning refers to whether digital twin enactment strengthens institutional reflection, cross-organizational learning, and the capacity of governance systems to revise practices over time. This is a dimension particularly important under the persistent uncertainty of climate governance.

Together, these dimensions operationalize public value as outcomes that can be assessed as products of enactment rather than preconditions for it. Following (Weigl et al., 2024)Public values are treated as potentially conflicting configurations rather than a unitary good, which is especially important in multi-actor, multi-jurisdictional metropolitan governance settings.

2.3. Mechanisms Linking Conditions, Enactment, and Public Value

In this paper, we specify six mechanisms linking the conditions, enactment, and public value. The framing mechanism connects cognitive frames to the governance purposes for which digital twins are designed and the forms of evidence considered legitimate. The coordination mechanism links organizational forms to whether digital twin outputs cross departmental and inter-organizational boundaries. The data mechanism connects governance arrangements to interoperability and trustworthiness. The translation mechanism connects boundary-spanning expertise to the conversion of technical outputs into actionable decisions. The authorization mechanism connects structural support to whether digital twin initiatives remain pilots or become institutionalized. The learning mechanism connects enactment experiences and feedback to subsequent institutional adjustment. These mechanisms are consistent with scholarship showing that governance outcomes depend on socio-technical alignment rather than technical sophistication alone (Nochta et al., 2021; Richter et al., 2025).

3. Conceptual Framework

Figure 1 presents the analytical model, which can be explained in three layers. The first layer specifies the five institutional and organizational conditions as predecessors of enactment. The second layer captures enactment of the digital twin on its direct functional use (what the twin is actually used for), its impact on decision integration (whether outputs influence public decisions), its organizational embedding (whether use is routinized or episodic), and cross-boundary integration (whether the twin connects datasets and decision arenas across organizations). The third layer assesses public value outcomes across the four dimensions described above. Feedback loops from the outcome of enactment back to institutional conditions capture learning and adaptation processes over time. The mechanisms described above operate across these layers to explain how specific institutional configurations produce specific enactment patterns and value configurations.

The core proposition is that the same objective technology can produce substantively different governance outcomes depending on the institutional environment through which it is enacted.

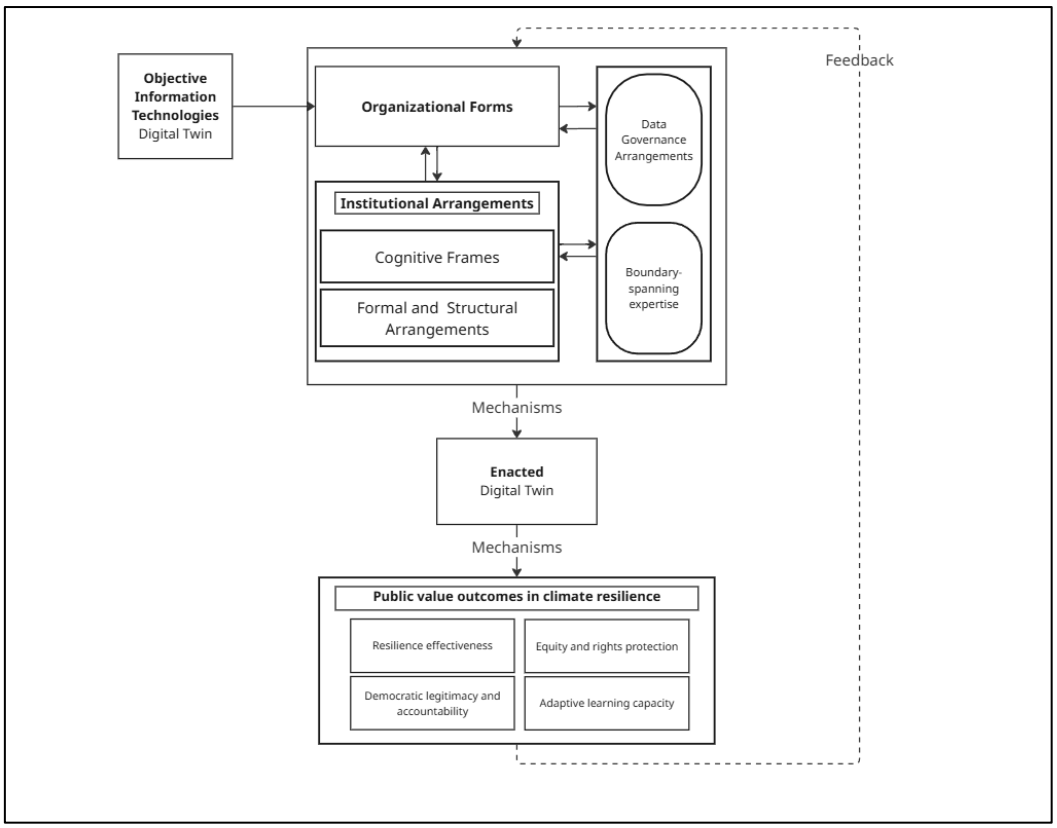

Figure 1. Conceptual Framework

4. Research Design

In this research, we will use an intensive single-case study approach to examine London's digital twin for climate resilience. Acknowledging the drawbacks of using a single case study instead of a comparative approach, case studies are suitable when: (1) the case is essential for theoretical testing, (2) the case is atypical or enlightening, (3) the case allows for thorough observation and analysis, or (4) the case exhibits considerable within-case variety that facilitates comparative reasoning (Yin, 2018). From this perspective, for the stage of digital twins' development and implementation, and the complex institutional arrangement, London meets a number of requirements.

First, London represents a most likely case for digital twin success: well-resourced, technologically advanced, and politically committed to both digital governance and climate action. If institutional conditions produce meaningful variation in enactment and public value within London, this strengthens the claim that institutions matter more than technology. Second, London has several partially integrated operational digital twins and data infrastructure, enabling evaluation of actual governance use rather than anticipated effects. Third, London's complex multi-level governance structure with the Greater London Authority (GLA), 32 borough councils, national agencies, and major infrastructure operators, including Transport for London and Thames Water, generates substantial within-case variation in institutional arrangements across a single metropolitan area. Fourth, London's digital governance and resilience investments have sufficient temporal depth to permit analysis of institutional learning and adaptation over time.

London is therefore conceptualized not as a single unified digital twin but as a metropolitan ecosystem of partially connected digital twins and data initiatives relevant to climate resilience governance, with a framing that better reflects the distributed reality of metropolitan governance.

Data Collection and Analysis

The study combines three main evidence sources. Semi-structured interviews (approximately 15–20) will be conducted with public managers, technical specialists, climate and resilience officers, and governance intermediaries involved in digital twin initiatives. Interviews prioritize concrete decision episodes, focusing on moments when digital twin outputs did or did not influence planning, coordination, emergency response, or governance change. Document analysis covers climate adaptation strategies, digital twin specifications, governance frameworks, and data policies. Observational material will be collected where feasible. Fieldwork is planned for 2026. Analysis proceeds in two stages: within-subcase process narratives tracing mechanisms, followed by structured cross-subcase comparison matrices examining how variation in conditions corresponds to variation in enactment and public value configurations.

5. Preliminary Insights

London's climate governance context has been significantly shaped by two recent shocks: flash floods in July 2021 and a 40°C heatwave in July 2022. These events prompted the Mayor to commission an independent review, published as the London Climate Resilience Review in July 2024, which produced 50 strategic and operational recommendations directed at the GLA, the UK government, 32 borough councils, and major infrastructure operators (G.L.A., 2024). The Review reflects a governance landscape characterized by distributed responsibilities, fragmented data flows, and significant coordination challenges despite London's technical sophistication and resource base.

Digital twin and data governance initiatives operate within this complex setting. At the national level, the UK National Digital Twin Program established the Gemini Principles as an information management framework for connected digital twins in the built environment, providing the interoperability architecture within which London public sector bodies develop their own initiatives (CDBB, 2022). At the metropolitan level, the GLA has produced London-wide climate risk maps with Bloomberg Associates and is piloting a decision-making tool to incorporate climate considerations into major investment decisions. At the operational level, digital twin applications for flood risk management, drainage monitoring, and infrastructure resilience are being developed across boroughs and infrastructure operators, with varying degrees of institutional embedding.

Three preliminary patterns emerge from this initial mapping. First, institutional complexity appears to constrain enactment even where technical capacity is strong: boundary-crossing data integration remains problematic despite formal sharing agreements and standardized interfaces.

Second, enactment appears more developed and better integrated in emergency management contexts where the imperative for real-time coordination is unambiguous than in strategic planning and adaptation, where governance arrangements are more contested. Third, boundary-spanning roles of actors combining technical literacy with governance and policy knowledge appear disproportionately important in making digital twin outputs actionable, a pattern consistent with recent empirical findings on digital twin implementation challenges in public administration (Richter et al., 2025). These patterns will be developed and tested through the planned fieldwork.

6. Expected Contributions

This paper contributes to three strands of literature. First, it advances digital twin research in public administration by shifting the analytical focus from technical potential to institutional enactment, providing an explanation for why technically comparable systems produce divergent governance outcomes. This extends recent scholarship showing that digital twins tend to falter at the transition from research and demonstration into routine public decision-making (Nochta et al., 2021; Richter et al., 2025).

Second, it refines the theoretical relationship between technology enactment and public value scholarship by establishing a clear analytical architecture: TEF explains how institutional conditions shape enacted technologies; public value scholarship provides the evaluative vocabulary for assessing what those enactments produce. This clarification directly addresses a conceptual conflation that recurs in the digital government literature, where enabling conditions are sometimes treated as value outcomes.

Third, the paper contributes to climate resilience governance research by identifying specific mechanisms through which digital twin enactment may strengthen or compromise governance capacities for anticipation, coordination, accountability, inclusion, and institutional learning in a complex metropolitan setting. By treating public value trade-offs rather than a unitary public good as the expected outcome of enactment, the paper is better positioned to capture the contested and distributed nature of value creation in multi-level urban governance.

7. Limitations of the research

As a work in progress, several limits need to be recognized. The one case design facilitates comprehensive description and mechanism identification while constraining generalizability. Findings constitute indicative theoretical propositions that warrant validation across larger samples. The context-specific insights might limit transferability to developing nations or non-democratic regimes. Because the technology environment is dynamic, some digital twin features may change, while problems with institutional governance are likely to change more slowly. However, notwithstanding these constraints, the research tackles significant deficiencies at the convergence of digital transformation, public value generation, and climate governance, which is an area that is becoming increasingly vital for public management scholarship and practice as technological development transforms opportunities and challenges for public entities dedicated to the common good.

Rethinking Sport in Public Governance: Policy Challenges and Accountability Perspectives

Gianluca Antonucci[1], Elio Borgonovi[2], Hiroko Kudo[3], Elisabetta Trinchero[4]

1. Background and aim

A report by KPMG Australia Sport Consulting (Zubrik, Miranda and Gardiner, 2021) emphasized as COVID-19 showed, among the others, the impact that sport activities have on our wellbeing, suggesting that sport should be part of governments' social agenda. The report highlighted that, apart from the well-known health benefits of sport (eg: reduced risk of chronic disease; improved mental health and wellbeing; improved education and employment outcomes) there are other factors to be considered and quantified such as increased levels of trust; urban renewal; reduced anti-social behaviour; increased community pride and identity creation; increased social connectedness and inclusion.

Indeed, at a policy level, the social value of sport has been widely recognised in the last decades. The White Paper on Sport of the EU Commission (European Commission, 2007) has a specific chapter, entitled "The Societal Role of Sport", in which it is highlighted the role of sport even in the process of EU identification. At government level there are several reports and documents indicating the social impacts of sport (eg: Taylor et al., 2015; Sport NZ, 2017; Australian Government, 2018). Also several national sport federations have been issuing analysis and reports emphasising this further role of sport (eg: Aronsson, 2008; Moss et al., 2016; CONI, 2018). Even in the field of consulting (apart from the above cited one by KPMG) reports and publications are nowadays highlighting these aspects (e.g.: EY, 2015; Ajadi, 222; KPMG Ireland, 2023; PWC, 2025).

At an academic level, several studies and researches have been dealing with these aspects in the last years. Particularly investigating the role of sport for social inclusion and community wellbeing, seen in different fields and contexts.

In a sociological perspective the issue has been studied upon different perspectives. It has been highlighted its capacity to contribute in tackling social exclusion faced in different areas of life (Collins and Kay, 2014; Kingsley and Spencer-Ca valiere, 2015). They have been analysed the barriers to be tackled for avoiding exclusion (Kingsley, Spencer-Cavaliere and Tink, 2017). It has been investigated its capacity to foster youngster inclusion (Holt, 2016; Ekholm and Dahlstedt, 2017) as well as in tackling youngsters' anti-social behaviours, (Haudenhuyse, 2017). The common line in these researches is the assumption that sport must be considered a social institution in almost every society, because it combines characteristics found in any institution with a peculiar appeal in relation to the processes of socialization and social change (Frey and Eitzen, 1991).

In terms of policy studies, apart from the well-known importance of fostering sport practice as health preventive therapy and important tool for youth growth (WHO, 2018, 2020; UNESCO,

[1] Associate Professor, ECON-06/A, Università d'Annunzio di Chieti-Pescara; gianluca.antonucci@unich.it – corresponding author

[2] Emeritus Professor, ECON-06/A, Università Bocconi di Milano; elio.borgonovi@unibocconi.it

[3] Full Professor, ECON-06/A, Chuo University di Tokyo; hirokokd@tamacc.chuo-u.ac.jp

[4] Associate Professor, ECON-06/A, Università Bocconi di Milano; elisabetta.trinchero@unibocconi.it

2021) it has been depicted also its capacity to improve people and community wellbeing (Porro, Martelli and Testa, 2020); its relevance as a tool for welfare (Heinemann, 2005; Ekholm, 2016) and even its applicability as a means of crime prevention (Ekholm, 2013).

In urban and development studies, apart from the well-known construct of urban redesign through main sport events (eg: Campbell Jr, 1999; Chalkley and Essex, 1999; Burbank, Andranovich and Heying, 2002), sport has been investigated also as a tool for urban development (eg: Austrian and Rosentraub, 2002; Kozma, Teperics and Radics, 2014) and renewal of suburbs, thus improving citizens daily life (eg: Spirou and Bennett, 2002; Smith, 2010). Last but not least, in recent years, they started investigating sport potentials for eco-green development and creation of environmentally sustainable infrastructures (eg: Kim and Chung, 2018; Millington and Darnell, 2019).

Whitin managerial studies, sport has been considered for its specific core aspects on competition and the business developed around events with massive participation. It has been indeed investigated in terms of its relevance both in elite sport events management (Smith and Stewart, 2010) as well as in its relevance with sponsorship development (Morgan, Taylor and Adair, 2020) and its interaction with participants and fans as main stakeholders (Smith and Stewart, 2010). Recently some scholars are reflecting if it is the case of depicting sport peculiarities highlighting that commonly accepted theories would need modification in the sport context, even arriving at a unique aspect of sport through an empirical or theoretical/conceptual approach (Andrew, Grady and Kim, 2021).

When coming to public management studies, several aspects have been analysed. An investigated issue has been the relation between national sport organizations and central government agencies, drafting their roles in terms of elite and grassroots sport (Sam, 2009). It has been highlighted the difficulty in measuring the qualitative nature of the public value of sport for the greater good within the organization (Brookes and Wiggan, 2009; Byers, Hayday and Pappous, 2020) and then the legacy of Olympic Games (Gillett and Tennent, 2022). It has been investigated also its value in terms of enhancing volunteering commitment (Girginov, Peshin and Belousov, 2017) as well as community engagement and the relations with third sector organisations (Bostock et al., 2020). An emerging issue regards the relation between local administrations and non-profit organisations in managing sport facilities in time of austerity (Iversen, 2018; Parnell et al., 2019; Cocco, Mayer and Montanaro, 2023).

Nevertheless the different investigated aspects, the role of sport as means of public value remains an item of interest for public management studies without any specific general framework and/or references, but most of all without sistamatic investigation. Indeed, in the past, it has been seen its value in terms of Social Return on Investment but mostly for sport facilities (King, 2014). It has been also experimented balanced scorecard for evaluating local sport development programmes identifying some problems of “quantification” for such a peculiar field (Walmsley, 2012), but still, these initiatives remained in some sense disconnected, still considering the different relevant aspects of public value of sport separately (Hoye and Parent, 2016).

Therefore, although the increased consideration, in the last years, of the importance of sport for public wellbeing and the relevance of the relations between sport and public bodies (from national to local) there is not yet a systematic investigation and no reference framework for considering the different multi-faceted components which contributes to the generation of public value through the different components of sport.

Starting from the above considerations, this extended abstract reports about an ongoing research activity which, (starting from the analysis, at academic level, of the Italian situation) aims, first of all to shed light on the matter in order to lay the foundation for a different approach both at academic level and at policy one.

2. Analysis of the context

Finding that the study of the interaction between sport and the public sector has not yet found its unequivocal place, we also considered that, from a political and administrative perspective, sport continues to be considered a corollary of other areas of public interest, rarely linked to healthcare, being primarily framed within departments that deal with very different fields, from culture to education or youth policies, all the way to tourism. These aspects, while confirming the importance of sports policy, also highlight its fragility.

The failure to identify a univocal place for sport, given its multidimensionality and complexity, is evident not only among practitioners but also at the academic level, where several topics are gaining relevance and deserve further exploration.

Moreover we also reflected on the fact that, in Italy, recent legislative developments – first of all an amendment of the Constitution recognising the value of sport and the enactment of a comprehensive Sports Reform – have laid the foundation for a new approach to the management and valorisation of sport, able to give awareness of its vital role in society. Furthermore, the Italian context also takes on particular significance with respect to investments and public-private partnerships related to the Milan-Cortina Winter Olympic Games of 2026.

The economic and business aspects of sport and the public-private interaction in public value creation therefore deserve, by our point of view, further investigation, especially in terms of policy, governance, regulations, and specific reporting of the various entities within the "sports system".

Now the point is that if at policy level there are several aspects which deserve a specific reflection, the role of the Academia should be more proactive in promoting, both as research and as third mission, a different conceptualisation of sport to address the necessity of its consideration in terms of public value creation.

The point is that, at Academic level, when talking about sport there is a kind of dichotomy between sport sciences and management and accountability ones, where academics from the first side engage research in public policy while the second rarely consider sport as a core topic. Recent researches (e.g. Dowling et al., 2018; Ouyang et al., 2023) show that, since 1990, research on sports policies has gained academic attention, focusing on elite sports, physical education, and sport for all. Through a systematic literature reviews it was found that nearly half of the research on these issue concentrates on organizational analyses at the meso level, referring to theories related to governance, the Sports Policy Factors Leading to International Sporting Success model, advocacy coalition framework, and network theories to understanding political dynamics, having an emphasis more on policy formation and implementation rather than evaluation. In other words, the research reflected the shift from sport management towards management governance and accountability fields rather than being a specific field within policy studies.

3. A starting point: the Italian current situation within AccountabilityAcademia

As a preliminary stage of investigation, in order to pose a different reflection upon the recognition of the public value of sport both at academic and policy level, we decided to collect data within the Italian Academia asking to the members of the Italian Accountability Association (SIDREA) which devoted an interest on the issue[5] information about their research interests,

[5] Within the Italian Academic Accountability Association (SIDREA), using the tools they made available, we could communicate the initiative to all its members thus establishing a dedicated Study Group. We also took advantage by the opportunity to use specific conferences and congresses to share the aims of the initiative we were about to undertake. The promotion of the group's goals and subsequent membership requests began in the summer of 2024, and in September 2024, a specific presentation meeting was held within the SIDREA National Congress. In December 2024, the membership period ended achieving a total of 59 adherents. There have been then organised – since the first one in December 2024, where the

scholarly activities, teaching responsibilities, and professional networks, organized across distinct areas of inquiry. The requests were made through the use of Qualtrics thus giving us the possibility to collect data and elaborate a dataset.

These preliminary results reveal a diverse and interdisciplinary landscape of scholarly engagement within the Sport Policy and Sport Management themes. Its content enables the identification of shared research areas, significant scholarly outputs, teaching contributions, collaborative networks, and emerging lines of inquiry. Taken together, these elements effectively capture the intellectual profile and research capacity of several Italian researchers, offering a solid foundation for thinking about the creation of a shared framework and method to give shape and substance to the depiction and measurement of the public value of sport. We briefly report, hereafter the main aspects.

3.1. Emerging Research Themes

A set of recurring and interconnected thematic clusters emerges, characterizing the current focus of several Italian researchers and collectively reflecting a multidimensional understanding of sport as a social, economic, cultural, and institutional phenomenon. The scholarly dialogue reveals an increasingly interdisciplinary approach, informed by both long-standing research traditions and contemporary transformations in sport systems. The following integrated themes define the current research landscape:

Conceptual Foundations and Definitions of Sport. A central concern which came out is the evolving definition and conceptual boundaries of sport. Colleagues emphasized the need to interrogate what constitutes "sport" in contemporary societies, examining its formal and informal manifestations, the rise of new practices, and the implications for governance, participation, and policy development, thus providing the foundation for subsequent debates on inclusion, measurement, and institutional responsibilities.

Measurement of Social, Economic, and Community Impact. Assessment of sport's multifaceted impact represents another core theme. Discussions underscored the methodological complexity of capturing economic, social, cultural, and educational contributions and highlighted the necessity of robust, multidimensional models capable of evaluating community benefits, organizational performance, and long-term societal outcomes. Scholars stressed the importance of integrating qualitative and quantitative approaches within comprehensive impact frameworks.

Risk Management and Sustainability. Risk and sustainability emerged as key concerns across organizational levels. Exchanges highlighted the growing pressures on sport institutions to adopt sustainable practices, manage operational and reputational risks, and comply with evolving regulatory standards. This theme intersects with broader issues of ethical governance, environmental responsibility, and the long-term viability of sport organizations.

Economic Dimensions and Business Models. The economic architecture of sport and the diversity of organizational forms constitute another possible significant area of inquiry. Conversations explored financial models, economic impacts, and regulatory oversight, particularly within professional sport. Moreover, alternative business models — such as cooperatives, associations, and community-based initiatives — have been found as needing further examination looking at their potential to support sustainable governance and democratized participation.

Sport and Education Across Learning Contexts. The educational role of sport emerged as a recurrent topic, with scholars highlighting how sport should be studied in its ability to foster personal development, civic learning, and social integration. Discussions focused on pedagogical

operational foundations for the work to be undertaken were laid, sharing objectives and methods – several online plenary meetings during 2025, where specific aspects were gradually refined.

approaches, curricular inclusion, and the need for educators who combine managerial competencies with socio-pedagogical perspectives.

Violence, Safety, and Ethical Responsibility. Issues of violence, safeguarding, and ethical conduct appear also prominent. Several scholars stressed the need for policies and organizational practices that protect both physical and psychological well-being, emphasizing preventive strategies, accountability mechanisms, and the ethical responsibilities of governing bodies.

Cultural and Social Dimensions of Sport. The cultural significance of sport — as a site of identity formation, symbolic expression, and community cohesion — figured prominently with several scholars highlighting how sport can simultaneously foster inclusion and reproduce inequalities, linking these dynamics to broader debates on representation, belonging, and social cohesion.

Disability, Inclusion, and Access. Inclusion, particularly regarding disability, emerged as a foundational principle in contemporary sport management. Particularly the need to address accessibility, adaptive sport models, and governance frameworks that promote equitable participation, underscoring the value of cross-sector collaboration in building inclusive sport ecosystems.

Governance and Regulatory Evolution. Governance served as a unifying theme across discussions, with researchers highlighting the necessity to examine how sport organizations — from grassroots associations to national federations — navigate regulatory challenges, stakeholder expectations, and structural reforms. Key issues include transparency, accountability, institutional autonomy, and the implications of policy changes for organizational effectiveness.

3.2. Relevant Bibliographic Foundations

The analysis of the data collected through the Qualtrics allowed us also to depict the fact that it does already exist an established scholarly traditions and simultaneously emerging challenges in sport policy and management. In other words, the present scenario reveals a sustained scholarly interest in financial regulation, organizational structures, and social accountability within the sports sector. Key reference domains in this sense include: 1) Governance studies in sport organizations; 2) Impact assessment and measurement frameworks; 3) Literature on management control and accountability in sport; 4) Studies on business models and reforms in the sports system.

3.3. Research Projects and networks

Another relevant issue regards the fact that many Italian scholars in accountability are already working on research projects, even at international level, particularly in the following aspects: 1) Impact measurement and evaluation; 2) Sustainability and risk management in sport; 3) Governance structures and regulatory dynamics; 4) Educational and inclusive approaches to sport participation.

A very interesting further aspect regards the fact that most of the involved scholars are already engaged in a range of networks at national and especially international level, underscoring a strong embeddedness within wider scholarly and professional communities.

3.4. Ongoing challenges

Another reflection, we enucleated from the collected data and information, regards the ongoing debate and the current challenges the Accountability Academia should face to depict the public value of sport.

A preliminary one concerns the definition of sport and the construction of conceptual and taxonomic frameworks capable of capturing its diverse forms, from amateur to professional

practice, and involving heterogeneous target groups and organizational settings. Parallel to this, there is the theme of sport as a vehicle for social inclusion which, first of all, should (through systematic reviews, case studies, and empirical analyses) give a basis to clearly illustrate its importance in public value creation through community integration, youth development, and the design of inclusive ecosystems.

A strictly related aspects is, in this regard, the elaboration of frameworks for assessing social impact across organizations, events, and urban regeneration initiatives. Indeed, it has been stressed the fact that current literature reviews highlight gaps in existing evaluation tools and call for the development of multidimensional, comparable, and theory-informed models capable of capturing sport's societal outcomes.

Consequently, a further strand focuses on the measurement of sport's economic and social impact, with researchers which should examine accounting systems, reporting tools, SROI methodologies, and the role of organizations as agents within wider socio-economic ecosystems. Complementary it ought to be addressed financial controls, anti-doping systems, and the evolving regulatory architecture governing professional and amateur sport.

The theme of sport policy ought to be similarly oriented toward understanding how regulatory reforms — from grassroots to elite levels — shape the development of specific disciplines, organizational models, and athlete careers, including the socio-economic implications of recent legislative changes.

Governance thus remains a central cross-cutting concern, to be studied at multiple levels: international bodies, national systems, federations, clubs, and mega-events. This claims to investigating co-governance challenges, mechanisms of accountability, stakeholder-inclusive business models, and the performance implications of good governance practices.

Another emerging issue deals with risk and sustainability management, examining both mega-events and sport clubs through perspectives that include regulatory frameworks, organizational resilience, environmental considerations, and innovative conceptual lenses such as the U-Theory.

A peculiar one emphasises the cultural and creative value of sport, and its synergies with broader "Made in Italy" industries highlighting sport's function as a cultural catalyst and as a strategic node within wider value networks.

A final critical research trajectory considers the need of tackling possible "disvalue". It regards violence and safety in sport, raising the need to analyse systemic responses to hooliganism, antisocial behaviour, and stadium security, especially during important major events which in the last years are linked to the necessity to implement measures to prevent any possible terrorist attack.

4. Conclusive remarks for an agenda to depict the public value of sport

The dialogue initiated among the Italian Accountability Academic Association reveals that already exists a rich and interconnected set of research directions – on which several scholars have already started working – that collectively might advance the understanding of sport as a complex social, economic, and cultural institution and thus depict its public value. But the relevant point is that these themes, ranging from conceptual foundations to governance and inclusion, are not articulated yet to form a coherent agenda for future inquiry and underline the multidimensional nature of contemporary sport policy and sport management within a dynamic and interdisciplinary scholarly community committed to advancing conceptual clarity, methodological rigor, and policy-relevant insights across the sport sector. At the same time, our initial investigation of the status quo in the Accountability Academia reveals a potential rich and multifaceted research agenda at the intersection of sport policy, management, governance, and societal impact. Therefore academic discussions across different thematic clusters might underscore a shared effort to theorize and systematize the complexity of the sport sector, while

advancing innovative analytical and methodological approaches to depict and measure its public value.

Keywords: Sport; public value; governance; accountability; social Impact

I controlli informali come leve della responsabilità sociale nel settore pubblico

Domenico Raucci[1], Manuela Paolini[2]

1. Background teorico e obiettivi della ricerca

L'intensificarsi delle istanze volte a favorire la diffusione di modelli di sviluppo sempre più equi e sostenibili, provenienti dalla società civile, dagli organismi nazionali e sovranazionali e dai diversi stakeholders, stanno spingendo le aziende, sia private che pubbliche, ad accrescere il proprio impegno verso una più consapevole e matura integrazione dei principi di responsabilità sociale (RS). Tale impegno non si riflette soltanto nel soddisfacimento delle esigenze di accountability e di rendicontazione esterna (Raucci et al., 2020), ma investe anche i meccanismi di funzionamento dei sistemi direzionali. In questa prospettiva interna, le funzioni e gli impieghi dei sistemi di controllo di gestione (SCG) risultano particolarmente rilevanti nel supportare una più profonda integrazione degli approcci di RS sia a livello strategico che operativo (Johnstone, 2019; Laguir et al., 2019), promuovendo e plasmando dall'interno l'incorporazione della cultura e dei valori della sostenibilità sociale (Bebbington, 2007; D'Onza, 2022).

Recenti studi sul ruolo dei SCG come leve per una efficace integrazione dei principi di RS nei contesti organizzativi hanno evidenziato i possibili percorsi di sviluppo di meccanismi di 'sustainability control', capaci di indurre comportamenti individuali coerenti con gli obiettivi di RS e opportunamente bilanciati con quelli economico-finanziari (Burritt e Schaltegger, 2010; Gond, 2012; Castellano e Felden, 2021; Schaltegger et al., 2022). Infatti, i SCG, sia nei loro meccanismi formali di funzionamento, ispirati a logiche codificate e di cybernetic control, sia in quelli informali, riguardanti i processi di comunicazione non proceduralizzati e le interazioni tra gli attori organizzativi, hanno come obiettivo finalistico quello di accrescere i livelli di goal congruence tra l'azienda e i suoi attori interni (Malmi e Brown, 2008; Tessier e Otley, 2012; Marchi et al., 2018). In particolare, Merchant e Van der Stede (2007) teorizzano quattro tipologie di controllo in base all'oggetto a cui fanno riferimento. Essi distinguono i controlli sui risultati e sulle azioni, basati su meccanismi formalizzati di funzionamento e di impiego manageriale, e i controlli del personale e della cultura interna, che agiscono secondo meccanismi informali. Nel dettaglio, i controlli sui risultati indirizzano i comportamenti dei dipendenti stabilendo ex-ante gli obiettivi da raggiungere e verificando ex-post i risultati raggiunti, mentre i controlli sulle azioni prescrivono o limitano direttamente le azioni che i dipendenti devono compiere (o evitare), per assicurare che il loro comportamento sia conforme agli obiettivi aziendali. Per altro verso, i controlli del personale impiegano i diversi meccanismi di gestione dei dipendenti, dalla selezione iniziale, ai percorsi di formazione, apprendimento e sviluppo della carriera, per renderli capaci, motivabili, auto-regolati nello svolgere i compiti e per tale via consapevoli dei comportamenti da tenere per perseguire gli obiettivi. I controlli culturali, invece, si sostanziano in quell'insieme di meccanismi attraverso cui l'azienda orienta i comportamenti dei dipendenti, veicolando valori, principi, norme, convinzioni e aspettative condivise. Queste dimensioni culturali sono impiegate come strumenti per indirizzare le persone nell'adozione di comportamenti desiderati senza

[1] Professore associato, ECON-06/A, Università degli Studi 'G. d'Annunzio' Chieti-Pescara; domenico.raucci@unich.it

[2] Ricercatrice, ECON-08/A, Università degli Studi dell'Aquila; manuela.paolini@univaq.it – corresponding author

necessità di controlli diretti o formali. Le evidenze empiriche sottolineano come sia i controlli del personale che i controlli culturali, pur nella loro valenza informale, possono risultare efficaci, almeno quanto quelli formali, nell'influenzare gli esiti aziendali (Laguir et al., 2019). Essi, quindi, opportunamente impiegati, possono costituire importanti strumenti organizzativi con cui modellare anche i processi di condivisione dei principi e dei valori organizzativi di RS tra i dipendenti.

In particolare, le positive percezioni dei dipendenti riguardo ad usi manageriali dei controlli culturale e del personale coerenti con la promozione dei principi di RS possono indurre negli stessi processi di interiorizzazione di tali principi agendo sui bisogni individuali secondo le dinamiche concettualizzate della Self-Determination Theory (Ryan e Deci, 2000; Gagné e Deci, 2005). Tale teoria, infatti, evidenzia come tra i bisogni fondamentali che ciascun individuo tende a soddisfare assumono particolare rilievo la competenza, intesa come la percezione di avere opportunità di sviluppo e di realizzazione di sé, l'autonomia decisionale, e la relazionalità, quale espressione del senso e del significato soggettivo dell'appartenenza ad una comunità di riferimento. Nel bisogno di relazionalità rientra anche l'esigenza dei dipendenti di sentirsi parte della propria organizzazione e degli scambi interpersonali al suo interno. Il soddisfacimento di tale bisogno facilita l'identificazione degli individui con gli obiettivi e i valori dell'organizzazione in cui operano (Ryan e Deci, 2000), tra questi vi sono anche quelli legati alla RS. In queste prospettive di analisi, gli studi sulle dimensioni affettivo-relazionali della RS, compresi quelli nel contesto pubblico (D'Aprile e Talò, 2014; Hammon et al., 2023), sottolineano come le modalità in cui i dipendenti percepiscono che la propria azienda adotti approcci che rispecchiano e soddisfano le loro aspettative di RS, sia all'interno che nei confronti degli stakeholders esterni (Ng et al., 2019), possono indurre in loro risposte comportamentali coerenti con le finalità di RS che l'azienda mira a promuovere.

Questi processi di operazionalizzazione dei principi di RS costituiscono un argomento di rinnovata importanza soprattutto nel settore pubblico (Albareda et al., 2008; Hammon et al., 2023). Ciò in ragione dello stretto legame che intercorre tra tali principi e i tradizionali valori, responsabilità e finalità istituzionali che dovrebbero ispirare e guidare l'azione delle organizzazioni pubbliche nella creazione di valore pubblico (Abdelmotaleb e Saha, 2019; Bracci et al., 2019; Amici e Cepiku, 2020). In tal senso, come sottolineato dalle ricerche sulla RS nel contesto pubblico (Aguilera et al., 2007; D'Aprile e Talò, 2014; Abdelmotaleb e Saha, 2019), la promozione dei principi di RS dovrebbe andare a "rinvigorire" la forza dei valori insiti nei fini e nell'operato delle organizzazioni pubbliche, come quelli dell'accountability, della giustizia ed equità, della solidarietà, dell'inclusione sociale. Per tali organizzazioni, quindi, le potenzialità dei controlli culturali e del personale nello stimolare positive esperienze di RS a livello individuale può rivelarsi una leva particolarmente importante (Van der Kolk et al., 2019; Hammon et al., 2023).

Tuttavia, gli effetti dei SCG in termini di incorporazione dei principi di RS sul piano individuale costituiscono una tematica ancora poco esplorata nel settore pubblico. Soprattutto, si sa relativamente poco su come i dipendenti pubblici senza incarichi manageriali reagiscono all'impiego manageriale dei controlli culturale e del personale in queste prospettive di studio. Difatti, la letteratura sui SCG ha assunto come principale prospettiva di investigazione quella dei manager e delle loro "intenzioni di controllo", essendo i principali utilizzatori di tali sistemi (Tessier e Otley, 2012; Cepiku et al., 2017; Raucci e Paolini, 2022), mentre gli usi informali dei SCG da parte dei manager sono scarsamente esplorati nelle prospettive percettive del controllo da parte dei loro subordinati (Tessier e Otley, 2012; Van der Kolk et al., 2019; Van der Merwe e Botha, 2019), sebbene l'uso manageriale dei SCG possa veicolare in questi ultimi precise percezioni e cognizioni del valore della RS per l'organizzazione e dell'agire dei suoi manager secondo logiche coerenti con tali principi.

Su queste basi, adottando un approccio tendente ad integrare l'impiego informale dei SCG con le prospettive di incorporazione della RS nel settore pubblico, il presente lavoro si propone

di esplorare il ruolo dei controlli culturale e del personale nell'accrescere le percezioni di RS da parte dei dipendenti pubblici senza ruoli manageriali.

2. Metodologia di ricerca

Per perseguire gli scopi della ricerca, è in corso un'analisi empirica su un campione di Comuni italiani. Una survey è impiegata per raccogliere i dati tra i dipendenti senza incarichi manageriali operanti all'interno di Comuni con popolazione compresa tra 20.000 e 59.999 abitanti. Tale fascia demografica, infatti, in base ai dati Istat riflette una significativa quota di Comuni italiani. Al fine di misurare i costrutti di interesse, nel questionario somministrato ai dipendenti comunali sono state inserite domande mutuate dalla letteratura di riferimento, leggermente adattate al contesto delle municipalità in cui lo studio in oggetto si inquadra. In particolare, i controlli culturale e del personale sono stati misurati ciascuno da una scala a 5 items mutuata dal lavoro di Merchant e Van der Stede (2007), come adottata da Van der Kolk et al. (2019). Si tratta di scale di tipo Likert a 5 punti che esplorano le percezioni dei dipendenti riguardo ai controlli informali implementati dalle rispettive organizzazioni. Le percezioni di RS sono state misurate mediante la scala di Turker (2009), come già applicata al settore pubblico (Hammon et al., 2023). La validità delle scale di misurazione è stata testata mediante un'analisi fattoriale esplorativa; i factor loadings superiori alla soglia di 0,50 per tutti gli items hanno permesso di verificare la validità convergente di tutte le scale; parimenti, l'assenza di significativi major cross loadings ne ha confermato la validità discriminante. Sulla base dei dati raccolti attraverso la somministrazione del questionario, vengono quindi condotte analisi inferenziali per verificare l'influenza dei controlli informali sulle percezioni di CSR.

3. Risultati e contributi della ricerca

Le risultanze dell'indagine statistica rivelano che sia il controllo culturale che quello del personale hanno un significativo impatto positivo sulle percezioni di RS dei dipendenti pubblici. Tali risultati sono in linea con i precedenti studi sull'efficacia dei controlli informali nel facilitare la condivisione e l'identificazione con i valori aziendali, che includono quelli relativi alla responsabilità sociale (Abdelmotaleb e Saha, 2019; Bracci et al., 2019). Lo sviluppo delle percezioni di RS da parte dei dipendenti pubblici senza ruoli manageriali costituisce un risultato importante, in quanto le stesse sono a loro volta capaci di influenzare le attitudini e i risultati lavorativi dei soggetti che le sperimentano. In particolare, le percezioni di un orientamento aziendale attento alle relazioni interpersonali interne e socialmente responsabile per il tramite dei suoi manager e delle relative modalità di impiego informale dei SCG possono indurre nei dipendenti schemi interpretativi e comportamentali che li inducono a fare propri e a replicare simili principi nello svolgimento delle loro performance individuali.

In questa prospettiva, il presente lavoro intende contribuire alla ricerca sull'integrazione dei SCG con le c. d. micro-foundations della RS all'interno del settore pubblico (Bracci et al., 2019; Johnstone, 2019). In particolare, il lavoro si propone di aggiungere nuove rilevanti evidenze sull'importanza degli usi manageriali dei controlli informali per rafforzare, 'dall'interno', l'impegno delle aziende pubbliche nelle pratiche di RS (Johnstone, 2019). Attraverso lo studio di simili impieghi dei SCG, il lavoro contribuisce altresì agli emergenti studi di 'micro-RS', esplorando i fattori abilitanti le percezioni di RS (Aguilera et al., 2007; Albareda et al., 2008; Hammon et al., 2023). In quest'ottica, lo studio integra i risultati esistenti basati sulle percezioni dei SCG da parte del management con ulteriori evidenze basate sulle spesso trascurate percezioni di controllo dei dipendenti senza incarichi manageriali (Tessier e Otley, 2012).

Lo studio suggerisce al management pubblico e ai policy maker di valorizzare la dimensione relazionale legata ai controlli culturale e del personale all'interno della struttura meccanicistica dei SCG, anche se questi controlli, in quanto informali, risultano meno visibili e in genere non

costituiscono uno strumento deliberatamente progettato per focalizzare l'attenzione dei dipendenti sugli obiettivi organizzativi. Tale maggiore valorizzazione e gli effetti che da questa ne conseguirebbero renderebbero infatti possibile sviluppare una forza lavoro più allineata con gli obiettivi organizzativi, e, nello specifico, più coinvolta nella gestione 'socialmente responsabile' del servizio pubblico. Inoltre, la promozione dei principi di inclusione sociale e di pari opportunità trai i dipendenti consentirebbe la costruzione di modelli organizzativi più equi e sostenibili, garantendo così il perseguimento di quei valori e obiettivi pubblici più ampi che le organizzazioni pubbliche incarnano from within (Aguinis e Glavas, 2012; Burns e Jollands, 2020).

Tuttavia, allo stato attuale lo studio presenta una serie di limitazioni che saranno superate con il successivo sviluppo della ricerca. Le evidenze si basano su un ristretto numero di osservazioni. Considerata la soggettività dei dati utilizzati, che, in quanto tali, sono influenzati dal contesto organizzativo e dalla relativa interpretazione soggettiva, l'ampliamento – in corso - del campione di questa indagine consentirà di estendere la generalizzabilità dei risultati ottenuti. Inoltre, negli sviluppi futuri della ricerca si intenderà esplorare il ruolo di ulteriori variabili intervenienti all'interno del modello causale osservato, così come gli impatti delle percezioni di RS sul piano attitudinale, comportamentale e di in-role and extra-role performance dei dipendenti pubblici.

Parole chiave: Controlli informali; responsabilità sociale; public management

Digital Twin urbani e creazione di valore pubblico. Analisi multicase dei processi di programmazione e sostenibilità nelle città italiane

Giuseppe Maria Bifulco[1], Rubina Michela Galeotti[2]

1. Introduzione

Negli ultimi anni le amministrazioni pubbliche sono state chiamate a confrontarsi con sfide sempre più complesse, generate dalla sovrapposizione di crisi economiche, sociali, ambientali e sanitarie che hanno segnato gli ultimi decenni. L'intreccio di questi fenomeni ha messo in evidenza la fragilità dei modelli manageriali tradizionali, spesso orientati al breve periodo e caratterizzati da risposte emergenziali piuttosto che da una pianificazione strategica di lungo respiro (Giovanelli L., 2024). A lungo, infatti, il settore pubblico ha fatto ricorso a misure quali tagli lineari alla spesa, processi di ottimizzazione non strutturale e approcci decisionali esclusivamente reattivi, che se da un lato permettono di affrontare l'immediato, dall'altro non garantiscono sostenibilità e resilienza nel medio-lungo termine (Cepiku, D., et al., 2019). Questo scenario ha reso evidente la necessità di ripensare i modelli di governo aziendale, dotandoli di strumenti capaci di gestire la complessità crescente e di anticipare gli effetti di fenomeni globali e locali (Veronesi, G. et al.,2023).La parola Governare è un concetto che può assumere diverse interpretazioni, trae la sua radice più profonda e originaria dal significato di «reggere il timone»: cioè mantenere saldamente il controllo dello strumento che permette di condurre una nave verso una destinazione precisa. In questo senso, governare significa guidare con attenzione e consapevolezza, manovrare con fermezza, tenere sotto controllo e prendersi cura del percorso per assicurarsi che si arrivi al traguardo prefissato (Bertini, U., 2013; Giovannelli 2024). Tuttavia, affinché questa guida sia effettiva e significativa, è necessario considerare un orizzonte temporale sufficientemente ampio. Se infatti l'attenzione si limita al breve periodo o all'immediato, non è possibile formulare strategie lungimiranti né valutare adeguatamente le conseguenze delle decisioni. Senza uno sguardo esteso nel tempo, molte riflessioni sulla sostenibilità, sulla resilienza e sul valore pubblico rischiano di restare astratte, perché mancano le basi per un governo che sappia realmente anticipare e gestire la complessità. Di conseguenza, governare in modo efficace significa prima di tutto saper estendere lo sguardo oltre l'oggi, immaginare e pianificare percorsi a lungo termine, con la capacità di adattarsi e correggere la rotta in base ai cambiamenti che si manifestano nel tempo. Nel contesto della gestione pubblica, il termine "governare" viene comunemente inteso come la responsabilità di guidare e amministrare uno Stato, sia sotto il profilo politico che amministrativo. Il concetto di governo, invece, si declina in diversi modi: può riferirsi alla forma politica assunta da uno Stato oppure rappresentare il potere esecutivo incaricato di applicare le leggi e rispondere ai bisogni collettivi. Inoltre, il termine identifica anche l'organo esecutivo stesso, come nel caso del sistema costituzionale italiano, in cui il Governo è composto dal Presidente del Consiglio e dai Ministri, e detiene il compito decisionale di indirizzare e coordinare l'amministrazione pubblica (Giovanelli L., 2024).

In questo contesto di crescente complessità e necessità di visione a lungo termine, le amministrazioni pubbliche si trovano a dover adottare nuovi strumenti e approcci in grado di

migliorare la capacità di pianificazione e gestione, sfruttando le potenzialità offerte dall'innovazione tecnologica.

Parallelamente, l'evoluzione tecnologica ha messo a disposizione delle amministrazioni pubbliche un insieme sempre più articolato di soluzioni innovative in grado di trasformare in profondità il modo in cui vengono pianificati, gestiti e valutati i servizi pubblici. La crescente disponibilità di dati, l'affinamento delle tecniche di intelligenza artificiale e lo sviluppo di piattaforme integrate hanno favorito la nascita di nuovi strumenti di supporto alle decisioni. Tra questi, i digital twin urbani rappresentano una delle innovazioni con il maggiore potenziale trasformativo. Essi consistono in modelli digitali dinamici e interattivi, continuamente aggiornati grazie a flussi di dati provenienti da sensori, sistemi informativi urbani, reti di monitoraggio e infrastrutture digitali distribuite. Attraverso tali modelli, è possibile riprodurre, simulare e analizzare il funzionamento di una città in tempo reale, valutando le interazioni tra elementi fisici, ambientali, tecnologici e sociali.

L'utilizzo dei digital twin consente alle amministrazioni non solo di osservare ciò che accade nella città, ma anche di prevedere scenari futuri, di valutare l'impatto potenziale delle politiche pubbliche e di sperimentare virtualmente soluzioni alternative prima di implementarle nel mondo reale. Questa capacità di simulazione e previsione rappresenta una leva fondamentale per migliorare la qualità delle decisioni pubbliche, aumentandone trasparenza, efficacia e capacità di risposta. Inoltre, tali strumenti favoriscono una maggiore integrazione tra le diverse dimensioni della sostenibilità — economica, ambientale e sociale — che costituiscono il cuore delle politiche orientate al valore comune e ai principi dell'amministrazione responsabile.

In Italia, l'interesse verso i digital twin è cresciuto in parallelo alle trasformazioni introdotte dal PNRR, che ha promosso investimenti significativi in digitalizzazione, interoperabilità dei dati e sistemi intelligenti. Alcune grandi città, come Torino, Milano e Bologna, hanno avviato sperimentazioni di modelli digitali urbani che integrano simulazioni relative alla mobilità, alla qualità dell'aria, alla gestione energetica, alla sicurezza urbana e alla pianificazione territoriale. Nonostante queste iniziative rappresentino un primo passo verso l'adozione sistematica dei digital twin, esse risultano ancora eterogenee per approccio tecnologico, obiettivi, governance dei dati e maturità organizzativa. Ciò mette in luce la necessità di sviluppare analisi più approfondite e comparabili, che permettano di comprendere in che modo tali strumenti possano contribuire in modo concreto alla generazione di valore pubblico e al miglioramento dei processi decisionali.

A fronte di tali dinamiche, emerge con forza l'esigenza di interrogarsi su come e in quale misura i digital twin urbani possano diventare veri e propri strumenti per governare in maniera innovativa, capaci di orientare la pubblica amministrazione verso decisioni più consapevoli, partecipate e sostenibili. Il loro contributo potenziale non si esaurisce nella dimensione tecnologica, ma riguarda anche aspetti organizzativi, culturali e metodologici: dall'evoluzione delle competenze interne alla capacità di costruire ecosistemi collaborativi, dall'integrazione nei processi programmatori alla definizione di nuovi modelli di monitoraggio e valutazione.

La presente ricerca si inserisce in questo contesto, con l'obiettivo di arricchire il dibattito scientifico e manageriale sul ruolo delle tecnologie emergenti nella creazione di valore pubblico, esplorando il potenziale dei digital twin come leve per migliorare la programmazione integrata e contribuire al raggiungimento degli obiettivi di sostenibilità urbana.

2. Analisi della letteratura

Negli ultimi anni, il concetto di digital twin urbano si è progressivamente affermato come uno degli strumenti più promettenti per affrontare la crescente complessità della governance delle città. La letteratura scientifica evidenzia come i modelli tradizionali di pianificazione e gestione urbana, prevalentemente reattivi e settoriali, risultino sempre meno adeguati di fronte a sfide sistemiche quali il cambiamento climatico, la pressione demografica, la transizione ecologica e la necessità di creare valore pubblico sostenibile (Deng et al., 2021). Tale discrasia trova maggiore

enfasi in un contesto sociale in cui si sta affermando, in maniera quantomeno preponderante, l'uso dell'intelligenza artificiale che porta con se nuove sfida, ma anche nuovi strumenti di gestione della cosa pubblica.

In questo contesto, Deng et al. (2021) propongono il concetto di Digital Twin City come nuovo paradigma di governance urbana, fondato sull'integrazione continua tra mondo fisico e digitale. Attraverso una revisione sistematica della letteratura, gli autori mostrano come i digital twin permettano di superare una governance frammentata, favorendo un approccio proattivo e sistemico basato su simulazione, previsione e supporto alle decisioni. Il digital twin non è quindi inteso come semplice strumento tecnologico, ma come infrastruttura cognitiva a supporto delle politiche pubbliche.

Questa visione trova riscontro in numerosi casi studio applicativi, che dimostrano come i digital twin possano incidere concretamente sui processi decisionali. Un esempio significativo è rappresentato da IPPODAMO, sviluppato nell'area metropolitana di Bologna (Bujari et al., 2021). In questo caso, il digital twin è utilizzato per la gestione delle infrastrutture urbane e per la programmazione della manutenzione, tradizionalmente caratterizzata da una forte frammentazione tra attori pubblici e privati. Il sistema consente di costruire una visione unificata e predittiva del territorio, migliorando coordinamento, trasparenza e capacità di pianificazione, elementi centrali per una governance urbana orientata al valore pubblico.

Un approccio analogo emerge anche nel caso di Matera, dove il digital twin è sviluppato secondo il paradigma della Urban Intelligence (De Benedictis et al., 2025). Qui, l'integrazione di dati morfologici, sensori IoT, modelli di simulazione e contributi partecipativi consente di supportare non solo la pianificazione urbana ordinaria, ma anche la gestione delle emergenze e l'ottimizzazione dei servizi. Il caso di Matera evidenzia come il digital twin possa diventare uno spazio di apprendimento collettivo e uno strumento di governance collaborativa, capace di coinvolgere amministrazioni, stakeholder e cittadini.

Altri contributi (Gholami et al., 2022) si concentrano sull'uso dei digital twin come strumenti di supporto alle politiche di sostenibilità e benessere urbano. Lo studio condotto a Imola dimostra come un digital twin tridimensionale possa essere utilizzato per valutare il comfort termico e progettare reti pedonali verdi, supportando decisioni basate su simulazioni microclimatiche validate con dati reali. In questo caso, il digital twin rafforza la capacità delle amministrazioni di anticipare gli effetti delle scelte progettuali, riducendo l'incertezza decisionale.

La dimensione partecipativa e collaborativa della governance emerge con forza anche nel progetto di Torino, analizzato da Boccardo et al. (2024). Il digital twin urbano torinese è concepito come piattaforma condivisa, capace di integrare GIS, modelli 3D e tecnologie immersive per favorire il dialogo tra amministrazioni, tecnici e cittadini. Tuttavia, gli autori sottolineano come il successo di tali strumenti dipenda dalla capacità di rappresentare la complessità urbana e di superare barriere organizzative e culturali.

Un caso emblematico di applicazione del digital twin alla pianificazione urbanistica è quello di Zurigo, analizzato da Barresi (2023). Qui, il digital twin è utilizzato come strumento predittivo per supportare decisioni di lungo periodo orientate alla sostenibilità. Allo stesso tempo, l'autrice evidenzia criticità rilevanti, tra cui il rischio di approcci eccessivamente tecnocratici e la dipendenza da infrastrutture tecnologiche complesse, richiamando l'attenzione sulla necessità di una governance consapevole dei dati e dei processi decisionali.

Il tema della trasparenza e dell'accessibilità è centrale nel framework Snap4City, applicato al caso studio di Firenze (Adreani et al., 2024). La piattaforma open-source consente l'integrazione di dati in tempo reale e la loro diffusione attraverso interfacce 3D accessibili anche ai cittadini. Questo approccio rafforza la dimensione democratica della governance urbana, favorendo processi decisionali più inclusivi e informati.

Infine, una prospettiva critica e sistematica è offerta da Caprari et al. (2022), che collocano i digital twin nel contesto delle politiche europee del Green Deal. Gli autori evidenziano come, nonostante il forte potenziale, i digital twin siano ancora in una fase sperimentale, con un gap

significativo tra sviluppo tecnologico e reale integrazione nei processi di governance e programmazione urbana. Analogamente, il caso di Bologna analizzato da Benedetti et al. (2022) mostra come la digitalizzazione e i digital twin possano supportare strategie di rigenerazione urbana ed economia circolare, ma richiedano modelli decisionali strutturati e competenze adeguate al fine di generare valore pubblico duraturo.

Come visto, la letteratura di riferimento identifica i digital twin urbani come strumenti ad alto potenziale per trasformare la governance urbana, spostandola da una logica reattiva a una logica predittiva, integrata e orientata alla sostenibilità. Ad ogni buon conto, emerge chiaramente che il valore di tali strumenti non risiede esclusivamente nella tecnologia, ma nella loro capacità di essere integrati nei processi decisionali, organizzativi e partecipativi delle amministrazioni pubbliche.

Sebbene i digital twin stiano emergendo come tema di grande interesse a livello internazionale, diversi aspetti rimangono ancora poco esplorati, soprattutto nell'ambito del management pubblico. Gran parte delle ricerche disponibili si concentra principalmente su questioni tecniche, ingegneristiche e informatiche, approfondendo architetture, algoritmi e integrazione dei dati. Poco spazio è invece dedicato alla prospettiva manageriale: manca cioè un'analisi che consideri i digital twin come strumenti di governance e di programmazione, capaci di migliorare concretamente la qualità delle decisioni e di generare valore pubblico.

Un'altra lacuna riguarda l'assenza di modelli consolidati per valutare l'impatto dei digital twin sui processi decisionali e sulla sostenibilità delle politiche urbane. Non esistono ancora framework chiari che consentano di misurare in modo sistematico quanto questi strumenti possano influenzare la qualità della pianificazione e l'efficacia delle azioni amministrative.

Il contesto italiano rappresenta un caso particolarmente interessante, sia per le opportunità offerte dal PNRR sia per le specificità istituzionali delle amministrazioni locali, ma allo stesso tempo manca una mappatura sistematica delle esperienze in corso. Non esiste un confronto comparato tra città che possa portare all'identificazione di buone pratiche replicabili e modelli organizzativi efficaci.

Inoltre, l'adozione dei digital twin richiede competenze avanzate in analisi dei dati, intelligenza artificiale e modellazione, così come una governance dei dati efficace. Nonostante ciò, la letteratura ha finora dedicato poca attenzione a questi aspetti, così come al potenziale dei digital twin di supportare la sostenibilità urbana e la resilienza sociale e ambientale.

La presente ricerca nasce proprio con l'obiettivo di affrontare queste lacune, offrendo un contributo sia teorico sia operativo per comprendere come i digital twin possano diventare strumenti di innovazione nella gestione pubblica.

3. Domanda di ricerca e sviluppo delle ipotesi

Alla luce del contesto descritto, la ricerca si pone l'obiettivo centrale di rispondere a una domanda fondamentale: in che modo l'adozione dei digital twin urbani può realmente contribuire a migliorare i processi di programmazione integrata, la capacità previsionale e la creazione di valore pubblico all'interno delle amministrazioni locali italiane? Questa domanda guida rappresenta il fulcro di un'indagine approfondita che mira a esplorare il potenziale innovativo di una tecnologia emergente nel campo della governance pubblica, cercando di comprendere se e come essa possa incidere positivamente sulla qualità delle decisioni e sulla gestione delle città.

Da questa domanda principale derivano una serie di sotto-interrogativi specifici, che permettono di articolare il percorso di ricerca in modo più dettagliato e sistematico. Il primo di questi riguarda le condizioni necessarie affinché i digital twin possano essere efficacemente integrati nella programmazione pubblica: quali sono, infatti, le caratteristiche tecnologiche, organizzative e culturali che favoriscono o ostacolano l'adozione di questi strumenti? Questo aspetto è cruciale per capire quali elementi devono essere presenti all'interno delle amministrazioni per trarre il massimo vantaggio da questa innovazione.

Un secondo interrogativo si concentra sull'impatto che i digital twin hanno sulla capacità delle amministrazioni di sviluppare strategie a lungo termine. In un contesto caratterizzato da sfide complesse e spesso imprevedibili, saper guardare avanti e anticipare scenari futuri diventa fondamentale per una governance efficace e sostenibile.

La ricerca si propone inoltre di indagare quali dimensioni del valore pubblico – ambientale, sociale, economica o organizzativa – risultano maggiormente influenzate dall'utilizzo dei digital twin. Questo permette di comprendere in modo più preciso dove l'impatto tecnologico si traduce in benefici concreti per la collettività e per l'efficienza dell'azione amministrativa.

Infine, un aspetto non meno importante riguarda i rischi e le criticità che possono emergere dall'adozione di tali tecnologie. La ricerca si propone di identificarli con attenzione, individuando anche possibili strategie per mitigarli, al fine di garantire un utilizzo responsabile e sostenibile dei digital twin.

Questa indagine vuole valutare se i digital twin rappresentino una reale opportunità per rafforzare l'efficacia dell'azione pubblica, contribuendo a delineare un nuovo paradigma manageriale, più resiliente, sostenibile e orientato all'impatto. Si tratta dunque di un contributo significativo, che intende far luce su come l'innovazione tecnologica possa diventare un fattore chiave nella trasformazione delle amministrazioni locali italiane, migliorandone la capacità di rispondere alle sfide attuali e future.

Sulla base del quadro teorico e dei gap individuati, la ricerca propone alcune ipotesi volte a esplorare il ruolo dei digital twin nel miglioramento della governance urbana e nella creazione di valore pubblico. In primo luogo, si ipotizza che l'adozione dei digital twin possa aumentare significativamente la capacità delle amministrazioni di prevedere scenari futuri e di analizzare in maniera più accurata le implicazioni delle scelte politiche. Questo potenziamento della capacità previsionale è ritenuto fondamentale per rafforzare la pianificazione di lungo periodo e per ridurre la natura reattiva dei processi decisionali tradizionali.

In secondo luogo, si ipotizza che l'uso dei digital twin migliori la qualità della programmazione integrata, facilitando l'allineamento tra i diversi strumenti i piani programmatori, i piani urbanistici e i piani ambientali. Una maggiore integrazione favorirebbe coerenza, trasparenza e capacità di coordinamento tra settori e uffici, contribuendo a rendere più efficiente l'azione amministrativa.

In terzo luogo, la ricerca considera il contributo dei digital twin alla creazione di valore pubblico nelle dimensioni ambientale, sociale ed economica. Ciò include la possibilità di ridurre emissioni e consumi energetici, promuovere mobilità sostenibile, garantire inclusione sociale e equità territoriale, aumentare l'efficienza delle risorse e favorire la trasparenza e la partecipazione dei cittadini.

Un'ulteriore ipotesi riguarda i fattori abilitanti: si ritiene che l'efficacia dei digital twin dipenda dal possesso di competenze digitali adeguate, da una governance dei dati solida e interoperabile, da una cultura organizzativa orientata all'innovazione e dalla collaborazione con università, imprese e cittadini.

Infine, la ricerca considera i rischi potenziali derivanti dall'assenza di tali fattori, come opacità decisionale, interpretazioni errate dei dati, esclusione sociale di gruppi vulnerabili, dipendenza da fornitori esterni e inefficacia degli investimenti. Queste ipotesi guideranno l'analisi empirica volta a comprendere come i digital twin possano essere strumenti digitali efficaci di innovazione nella pubblica amministrazione.

4. Metodologia

La ricerca si basa su un approccio qualitativo di tipo esplorativo, fondato sull'analisi di casi studio multipli, con l'obiettivo di comprendere in profondità come i digital twin urbani vengano adottati e utilizzati dalle amministrazioni locali italiane come strumenti di supporto alla governance, alla programmazione integrata e ai processi decisionali. La scelta di un disegno

qualitativo risulta coerente con la natura della domanda di ricerca, che mira a indagare fenomeni complessi, ancora in fase di sviluppo, e difficilmente riducibili a variabili misurabili attraverso indicatori standardizzati.

L'approccio dei casi studio consente infatti di analizzare il fenomeno dei digital twin nel suo contesto reale, tenendo conto delle interazioni tra fattori tecnologici, organizzativi, istituzionali e culturali. In particolare, l'adozione di un disegno a casi multipli permette di rafforzare la validità analitica della ricerca, favorendo il confronto tra esperienze differenti e l'individuazione di pattern ricorrenti, nonché di specificità legate ai contesti territoriali e amministrativi.

La selezione dei casi è avvenuta attraverso un campionamento intenzionale, coerente con le finalità esplorative e interpretative della ricerca. Sono state individuate tre città italiane, Torino, Bologna e Brescia, che rappresentano contesti particolarmente significativi per l'analisi dei digital twin urbani, pur presentando caratteristiche differenti in termini di dimensione urbana, assetto istituzionale e maturità dei processi di digitalizzazione.

I criteri adottati per la selezione dei casi sono tre. In primo luogo, la presenza di iniziative strutturate di digital twin urbano, già avviate o in fase avanzata di sviluppo, che consentano di analizzare non solo la progettazione, ma anche le modalità di utilizzo e integrazione nei processi amministrativi. In secondo luogo, la disponibilità e accessibilità di fonti documentali e materiali informativi, elemento essenziale per garantire la trasparenza dell'analisi e la possibilità di ricostruire in modo accurato le scelte strategiche e operative adottate dalle amministrazioni. In terzo luogo, la diversità territoriale e organizzativa dei contesti selezionati, al fine di osservare differenti modelli di governance, approcci alla gestione dei dati e ambiti di applicazione dei digital twin.

Torino e Bologna rappresentano due casi emblematici di grandi città metropolitane con una lunga tradizione di innovazione urbana e sperimentazione digitale, mentre Brescia costituisce un esempio particolarmente interessante di città di dimensioni medio-grandi, caratterizzata da un forte orientamento alla sostenibilità ambientale e all'integrazione tra politiche industriali, energetiche e urbane. Questa combinazione consente di esplorare il fenomeno dei digital twin in contesti non omogenei, aumentando la capacità della ricerca di individuare elementi trasferibili e buone pratiche replicabili.

La raccolta dei dati è stata condotta attraverso l'analisi di fonti secondarie, selezionate al fine di ricostruire in modo coerente e comparabile i percorsi di sviluppo e implementazione dei digital twin urbani nei casi di studio considerati. In particolare, l'attività di raccolta si è concentrata su materiali pubblicamente disponibili, che consentono di osservare come le amministrazioni locali descrivono, strutturano e utilizzano tali strumenti all'interno dei propri processi di pianificazione e governance.

Una prima tipologia di fonti riguarda la documentazione istituzionale prodotta dalle amministrazioni comunali coinvolte. Sono stati esaminati contenuti reperibili sui siti web ufficiali dei Comuni e degli enti ad essi collegati, inclusi documenti di programmazione strategica, materiali informativi relativi ai progetti di digital twin, atti amministrativi, presentazioni pubbliche e comunicazioni istituzionali. Tali fonti hanno permesso di ricostruire il quadro strategico e organizzativo entro cui i digital twin sono stati sviluppati, nonché gli obiettivi dichiarati e gli ambiti di applicazione previsti.

Una seconda tipologia di fonti è costituita dalla letteratura scientifica e dai contributi accademici relativi ai casi analizzati. Questi materiali hanno consentito di integrare la prospettiva istituzionale con un'analisi critica di tipo teorico e applicativo, offrendo elementi utili per comprendere il ruolo dei digital twin nei processi decisionali e nella governance urbana.

Accanto a tali fonti, sono stati analizzati anche documenti di carattere divulgativo e tecnico, quali report di progetto, descrizioni delle piattaforme digitali, materiali prodotti da partner tecnologici e contributi pubblicati su riviste specialistiche e portali dedicati all'innovazione urbana. Pur non avendo finalità scientifiche in senso stretto, queste fonti risultano utili per

comprendere il funzionamento generale dei digital twin, le principali funzionalità dichiarate e il livello di maturità delle soluzioni adottate.

Nel complesso, l'utilizzo combinato di fonti istituzionali, accademiche e tecnico-divulgative ha permesso di raccogliere informazioni sufficientemente articolate per analizzare il fenomeno dei digital twin urbani in relazione agli obiettivi della ricerca, mantenendo al contempo un livello di astrazione adeguato alla natura esplorativa dello studio. La triangolazione delle fonti ha inoltre contribuito a rafforzare la coerenza interna dell'analisi, riducendo il rischio di una lettura parziale o esclusivamente descrittiva delle esperienze considerate.

5. Risultati

L'analisi dei casi studio di Torino, Bologna e Brescia consente di evidenziare come i digital twin urbani, pur condividendo alcuni elementi tecnologici di base, vengano sviluppati e utilizzati secondo logiche differenti, strettamente connesse alle priorità strategiche, alle caratteristiche territoriali e al grado di maturità organizzativa delle amministrazioni locali. Nei tre casi analizzati, il digital twin non emerge come semplice strumento di rappresentazione della città, ma come infrastruttura digitale a supporto di specifici obiettivi di governo urbano, legati alla pianificazione, alla gestione operativa e alla sostenibilità.

Nel complesso, i risultati mostrano come i digital twin si configurino come strumenti progressivamente orientati alla previsione e al supporto decisionale, sebbene con livelli diversi di integrazione nei processi amministrativi. Torino, Bologna e Brescia rappresentano tre modalità distinte di sviluppo: rispettivamente un approccio fortemente basato sulla conoscenza fisica e morfologica del territorio, un modello sistemico e predittivo orientato alla sostenibilità e alla partecipazione, e una strategia data-driven finalizzata alla costruzione di una piattaforma integrata per la governance urbana.

5.1. Il digital twin di Torino: conoscenza puntuale del territorio e supporto alla gestione urbana

Nel caso di Torino, il digital twin urbano nasce principalmente dall'esigenza di colmare un deficit conoscitivo nella rappresentazione e gestione del territorio urbano. Il progetto si fonda su un'imponente attività di acquisizione e integrazione di dati tridimensionali ad alta risoluzione, ottenuti attraverso tecniche fotogrammetriche e scansioni LiDAR, che consentono di costruire un modello estremamente accurato della città. Questa scelta riflette una chiara priorità: dotare l'amministrazione di una base informativa omogenea, aggiornata e condivisa, capace di restituire una visione unitaria della realtà urbana.

Il digital twin torinese è sviluppato come strumento operativo a supporto della gestione del territorio, con applicazioni inizialmente concentrate su ambiti considerati strategici, quali la manutenzione del verde urbano, la gestione delle infrastrutture viarie e la pianificazione degli interventi per l'eliminazione delle barriere architettoniche. In questo senso, il modello digitale consente di individuare criticità puntuali, stabilire priorità di intervento e migliorare il coordinamento tra settori amministrativi, contribuendo a rendere più efficienti i processi decisionali e allocativi.

Un elemento rilevante che emerge dal caso torinese è il ruolo del digital twin come strumento di razionalizzazione e integrazione delle informazioni, più che come piattaforma predittiva avanzata. Sebbene siano già presenti applicazioni orientate alla valutazione del potenziale energetico e all'efficienza degli edifici, il valore principale risiede nella capacità del modello di fornire una base conoscitiva solida e condivisa, funzionale a decisioni più rapide, informate e coerenti. Il digital twin si inserisce dunque all'interno di una strategia più ampia di modernizzazione della gestione urbana, orientata all'efficientamento dei processi e al miglioramento del servizio pubblico.

5.2. Il digital twin di Bologna: piattaforma predittiva e governance orientata alla sostenibilità

Il caso di Bologna si distingue per un approccio più sistemico e orientato alla previsione, in cui il digital twin viene concepito come infrastruttura cognitiva a supporto della pianificazione strategica e della transizione ecologica. Il progetto di Civic Digital Twin si fonda sull'integrazione di dati eterogenei provenienti da sensori ambientali, sistemi di monitoraggio urbano, fonti amministrative e contributi derivanti dall'analisi dei comportamenti urbani. Tale integrazione è finalizzata alla costruzione di un modello dinamico, in grado di simulare scenari futuri e valutare l'impatto delle politiche pubbliche prima della loro implementazione.

A differenza del caso torinese, il digital twin bolognese non si concentra esclusivamente sulla rappresentazione fisica della città, ma include dimensioni ambientali, energetiche e sociali. L'obiettivo è supportare decisioni complesse in ambiti quali la mobilità sostenibile, la qualità dell'aria, la mitigazione delle isole di calore e l'adattamento ai cambiamenti climatici. In questo contesto, il digital twin diventa uno strumento di sperimentazione virtuale, capace di ridurre l'incertezza decisionale e di orientare le politiche urbane verso obiettivi di sostenibilità e resilienza.

Un aspetto particolarmente significativo del caso bolognese è l'estensione del paradigma del digital twin anche a elementi puntuali del patrimonio urbano, come dimostra l'esperienza del gemello digitale della Torre Garisenda. Questo progetto evidenzia come il digital twin possa essere utilizzato non solo per la pianificazione urbana, ma anche per la tutela e la gestione del patrimonio storico e culturale, attraverso simulazioni predittive basate su dati ambientali e strutturali. Tale integrazione rafforza il ruolo del digital twin come strumento trasversale, applicabile a scale e ambiti differenti, e capace di connettere esigenze di conservazione, sicurezza e valorizzazione.

Nel complesso, il caso di Bologna mostra un utilizzo del digital twin fortemente orientato alla governance predittiva, in cui la tecnologia diventa leva per politiche pubbliche basate su evidenze scientifiche, integrazione dei dati e coinvolgimento degli stakeholder.

5.3. Il digital twin di Brescia: una strategia data-driven per la smart city

Il caso di Brescia si colloca in una fase diversa del percorso di sviluppo dei digital twin urbani, caratterizzata da una forte enfasi sulla costruzione delle infrastrutture digitali di base necessarie a una governance data-driven. Il progetto di digital twin è esplicitamente inserito nelle linee programmatiche di mandato dell'amministrazione comunale e viene concepito come piattaforma strategica per supportare la trasformazione della città in chiave smart.

Elemento centrale del modello bresciano è la realizzazione di un data lake urbano, pensato come archivio unico e integrato dei dati della città. Questa scelta riflette l'esigenza di superare la frammentazione informativa e di creare un patrimonio digitale strutturato, su cui innestare successivamente modelli di analisi, simulazione e previsione. Il digital twin, in questo contesto, assume il ruolo di strumento di integrazione, correlazione e modellazione dei dati, piuttosto che di simulazione avanzata immediatamente operativa.

Le finalità dichiarate del digital twin di Brescia riguardano un ampio spettro di ambiti, dalla gestione del traffico alla sicurezza urbana, dall'efficienza energetica alla pianificazione urbanistica. Tuttavia, ciò che emerge con maggiore chiarezza è l'orientamento alla costruzione di una piattaforma abilitante, destinata a supportare nel tempo decisioni più informate e coordinate. Il rispetto delle normative sulla privacy e la gestione di dati anonimi e minimizzati rappresentano ulteriori elementi qualificanti, che indicano una particolare attenzione alla governance dei dati come prerequisito per un utilizzo responsabile della tecnologia.

Nel caso di Brescia, il digital twin appare dunque come un investimento strategico di medio-lungo periodo, volto a creare le condizioni organizzative e tecnologiche per una governance urbana più efficace, piuttosto che come strumento già pienamente integrato nei processi decisionali quotidiani.

6. Conclusioni

Il presente studio ha analizzato il ruolo dei digital twin urbani come strumenti emergenti di supporto alla governance pubblica e alla creazione di valore pubblico, collocandosi all'intersezione tra public management, innovazione digitale e studi urbani. Muovendo dalla constatazione dei limiti strutturali dei modelli tradizionali di gestione pubblica (spesso caratterizzati da approcci reattivi, settoriali e orientati al breve periodo) la ricerca ha messo in evidenza come i digital twin possano rappresentare una leva strategica per rafforzare la capacità delle amministrazioni locali di governare la complessità urbana in una prospettiva di lungo termine.

L'analisi congiunta della letteratura e dei casi studio di Torino, Bologna e Brescia ha mostrato come i digital twin non debbano essere interpretati esclusivamente come soluzioni tecnologiche avanzate, bensì come infrastrutture cognitive, organizzative e decisionali, capaci di integrare dati eterogenei, supportare processi di simulazione e previsione e migliorare la qualità delle decisioni pubbliche. I risultati evidenziano che il valore dei digital twin non risiede tanto nella sofisticazione tecnica in sé, quanto nella loro integrazione nei processi di programmazione, coordinamento e valutazione delle politiche urbane.

Il confronto tra i casi analizzati mette in luce differenti traiettorie di sviluppo del digital twin urbano. Torino evidenzia il ruolo del digital twin come strumento di ricostruzione e razionalizzazione della conoscenza territoriale, funzionale a migliorare la gestione operativa e il coordinamento interno. Bologna rappresenta un'evoluzione verso un uso maggiormente predittivo e strategico, in cui il digital twin diventa un laboratorio virtuale per la sperimentazione di politiche orientate alla sostenibilità e alla resilienza urbana. Brescia, infine, mostra come la costruzione di solide infrastrutture di governance dei dati costituisca una condizione abilitante fondamentale per lo sviluppo futuro di una governance urbana data-driven. Nel loro insieme, questi casi suggeriscono una progressione concettuale che va dalla gestione del presente alla pianificazione del futuro, passando per la costruzione delle capacità organizzative necessarie.

Dal punto di vista teorico, la ricerca contribuisce ad arricchire il dibattito sul valore pubblico introducendo una prospettiva che integra in modo sistematico l'innovazione digitale all'interno delle teorie della governance pubblica. In particolare, lo studio propone il concetto di digital twin governance come paradigma emergente, inteso non solo come insieme di strumenti tecnologici, ma come configurazione di pratiche organizzative, culturali e strategiche che ridefiniscono il modo in cui le amministrazioni pianificano, controllano e valutano l'azione pubblica. Questo approccio consente di superare una visione tecnocentrica dell'innovazione, mettendo in evidenza il carattere socio-tecnico dei digital twin e il loro potenziale nel favorire politiche urbane più sostenibili, inclusive e orientate all'impatto.

Dal punto di vista pratico, la ricerca offre indicazioni rilevanti per le amministrazioni pubbliche interessate ad adottare o sviluppare digital twin urbani. I risultati suggeriscono che l'efficacia di tali strumenti dipende in larga misura dallo sviluppo di competenze interne, da assetti organizzativi adeguati e da modelli di governance dei dati chiari e interoperabili. L'adozione dei digital twin non può quindi essere considerata come un semplice investimento tecnologico, ma come un processo di cambiamento organizzativo che richiede visione strategica e capacità di integrazione nei processi decisionali esistenti. In questo senso, il framework interpretativo proposto può supportare le amministrazioni anche nella valutazione ex ante ed ex post degli investimenti digitali, contribuendo a misurarne l'efficacia e a orientarne l'evoluzione nel tempo.

Per i policy maker a livello nazionale ed europeo, emergono inoltre alcune indicazioni strategiche. In particolare, la necessità di definire standard tecnici comuni per i digital twin urbani, al fine di garantire interoperabilità, qualità dei dati e possibilità di confronto tra esperienze diverse. Parallelamente, appare cruciale sviluppare politiche pubbliche dedicate alla governance

dei dati urbani, capaci di bilanciare esigenze di sicurezza, trasparenza, tutela della privacy e partecipazione dei cittadini.

Come ogni studio qualitativo basato su casi studio, la presente ricerca presenta alcune limitazioni che è opportuno esplicitare. In primo luogo, il numero limitato di casi analizzati non consente generalizzazioni di tipo statistico. Tuttavia, l'obiettivo dello studio è quello di produrre generalizzazioni analitiche, utili a comprendere meccanismi, dinamiche e condizioni abilitanti rilevanti anche per altre amministrazioni locali. In secondo luogo, l'analisi si basa prevalentemente su fonti documentali e materiali secondari, il che può limitare la capacità di cogliere pienamente le dinamiche informali e i processi decisionali interni alle amministrazioni. Inoltre, la natura ancora sperimentale di molti progetti di digital twin rende complessa una valutazione completa degli impatti di lungo periodo sulla qualità delle decisioni pubbliche e sulla creazione di valore pubblico misurabile. Infine, la ricerca privilegia la prospettiva istituzionale delle amministrazioni, lasciando in secondo piano il punto di vista di cittadini e stakeholder esterni, che rappresenta una dimensione cruciale per valutare inclusività e legittimità dei processi decisionali supportati dai digital twin.

Queste limitazioni aprono interessanti direzioni per ricerche future. Studi quantitativi potrebbero approfondire la misurazione degli impatti dei digital twin sulle performance amministrative, sugli esiti delle politiche urbane e sulla creazione di valore pubblico nel medio-lungo periodo. Ulteriori ricerche potrebbero inoltre esplorare il ruolo dei cittadini e degli stakeholder nei processi decisionali supportati dai digital twin, analizzando in che misura tali strumenti favoriscano effettivamente partecipazione, trasparenza e fiducia nelle istituzioni. Infine, un confronto comparato a livello europeo potrebbe contribuire a identificare modelli di digital twin governance replicabili e adattabili a contesti istituzionali differenti, rafforzando il contributo della ricerca al dibattito internazionale sulla trasformazione digitale della pubblica amministrazione.

Parole chiave: Digital twin urbani; governance urbana; valore pubblico, trasformazione digitale; pianificazione integrata; sostenibilità urbana

Internally Generated Intangible Assets and the Prudence-Conservatism Debate: A Systematic Literature Review

Raffaele Morrone[1], Pietro Fera[2]

1. Introduction

In recent decades, modern economies have undergone a profound structural transformation, which has been widely interpreted as a shift from a "tangible-based" paradigm to a "knowledge-based" or, more precisely, an "intangible-based" paradigm (Brynjolfsson & Hitt, 2000; Lev, 2000; Corrado et al., 2005). This transition signifies a substantial shift in the underlying mechanisms by which value is created. Firms' competitiveness increasingly depends less on their stock of traditional physical assets and more on intangible assets (Lev & Zarowin, 1999; Beattie & Smith, 2013). The growing centrality of intangible assets shows that these resources have become one of the main drivers of competitiveness and value creation today (Peters & Taylor, 2017). Suppose a growing proportion of the value generated is attributable to intangible assets that are challenging to observe, measure, or trade. In that case, there is an increased risk that financial statements prepared in accordance with conventionally "tangible-oriented" logics may appear deficient or, on occasion, misleading to users of accounting information (Lev & Gu 2016; Barth & McClure, 2023). This phenomenon gives rise to a true informational paradox: the very resources that are most strategic for value creation risk being the least represented in the firm's information system. (Lev, 2018; IASB, 2024; Hussinki et al., 2024). At the conceptual level, this necessitates the definition, classification, and measurement of resources that are non-physical in nature, frequently inseparable from the firm, and characterised by elevated uncertainty regarding their future economic benefits. From a regulatory perspective, the recognition of intangibles poses significant challenges, particularly in determining the conditions for balance sheet recognition, the criteria for their inclusion, and the methods employed for their valuation (Barker et al., 2022). Although international accounting standards provide a structured regulatory framework for addressing these issues, the present study focuses specifically on one category of intangibles: those that are internally generated. These assets are critical resources for a firm's competitive advantage; yet, in most cases, they do not meet the strict recognition criteria set by accounting standards and are therefore excluded from the balance sheet (Oswald & Zarowin, 2007). This study examines the recognition of internally generated intangibles within the broader theoretical Framework of prudence or conservatism, whose application today may conflict with the dynamics of value creation in the modern economy. Although part of the academic literature uses 'prudence' and 'conservatism' as synonyms, it is worth noting that in the international standard-setting process, the term 'prudence' is referenced exclusively (Basu, 1997; Watts, 2003; Barker, 2015) This terminological distinction serves as the starting point for understanding the evolution of the concept of prudence within the IASB's Conceptual Framework. In the 2010 revision of the Conceptual Framework, prudence was explicitly removed as a qualitative characteristic of financial information. The decision was primarily motivated by the IASB's objective to emphasize

the principle of neutrality, which is regarded as a fundamental component of faithful financial reporting (IASB, 2010; Pelger, 2020). In its traditional sense, prudence is characterized by an asymmetric approach to recognizing gains and losses. Consequently, it was perceived as potentially conflicting to portray economic reality without bias. As clarified by the IASB any deliberate asymmetry in the estimation of accounting values could undermine faithful representation, making prudence conceptually incompatible with neutrality (IASB, 2010). However, following intense debate both in academic and within the standard-setting bodies, prudence was reintroduced in 2018. The new Framework defines it as "the exercise of caution when making judgements under conditions of uncertainty. The exercise of prudence means that assets and income are not overstated. Liabilities and expenses are not understated" (IASB, 2018). The IASB justified the reintroduction of prudence, offering two principal arguments in support of this decision (IASB, 2018; Pelger, 2020). On the one hand, the IASB acknowledges the existence of a "natural tendency for management to be optimistic," which may result in overly favourable assessments. Prudence, in this sense, serves as a corrective mechanism, thereby strengthening the discipline of professional judgement (IASB, 2018). Conversely, the principle of prudence provides a foundation for the IASB in developing standards intended to mitigate the risk of managerial bias (IASB, 2018). From this perspective, cautious prudence is not intended to produce systematically understated economic values, but rather to mitigate the risk that subjective estimates might lead to unrealistically optimistic financial statements (Mora & Walker, 2015). Cautious prudence, therefore, serves the goal of achieving neutrality and faithful representation. Moreover, the 2018 Framework clarifies that asymmetric prudence is not considered a qualitative characteristic of financial information. However, the IASB concedes that future standards may, in some instances, incorporate asymmetric accounting treatments. Such choices must be based on an overall assessment of relevance and faithful representation, rather than on the application of an asymmetric prudence principle (IASB, 2018). Supporting this view, the IASB notes that "not all asymmetry is inconsistent with neutrality" (IASB, 2018). This results in an approach to prudence that, while nuanced, introduces elements of discretion which may reduce the theoretical consistency of the Framework (Orthaus et al., 2023). In the academic literature, the concept of prudence is interpreted in a broader and more nuanced way, as it is often associated with and at times conflated with the term conservatism, giving rise to two distinct strands of interpretation (Watts, 2003; Ruch & Taylor, 2015). The first line of research, dominant until the early 2000s, treats prudence and conservatism as synonyms. Studies on the IASB's Framework explicitly assume this synonymy, recalling how prudence has historically been used as an alternative label for conservatism in standard-setting documents (Barker, 2015). Other authors refer to "prudence-conservatism" and define it as a higher threshold of verifiability for recognising gains compared to losses (Măciucă et al., 2015). The second, more recent and conceptually refined, advocates a clear distinction between prudence and conservatism, criticizing their interchangeable use and highlighting the implications this distinction holds for the conceptual Framework and the neutrality of accounting information (Orthaus et al., 2023). Conservatism is defined as any accounting method that leads to book values being lower than the corresponding economic values (Beaver & Ryan, 2005). It interprets prudence as a specific form of conservatism justified by a cautious response to uncertainty (Barker, 2015). That conditional conservatism is more accurately seen as a specific form of asymmetry characterised by the earlier recognition of losses compared to gains. Finally, other authors highlight how the terminological overlap has led to confusion and argue for a more precise taxonomy distinguishing between a qualitative concept (prudence) and an observable positive phenomenon (conservatism) (André et al., 2015). Within the second line, academic debate introduces a further refinement by distinguishing between conditional and unconditional conservatism, which represent fundamentally different applications. Conditional conservatism is expressed as the asymmetric recognition of economic outcomes, resulting in greater timeliness in recognising losses than gains. In this case, accounting reactions are triggered by unfavourable informational events (bad news) and involve a higher threshold of verifiability

for recognising profits, as formalised in Basu's (1997) model. In practice, conditional conservatism closely resembles the notion of asymmetric prudence. Unconditional conservatism, on the other hand, refers to the application of systematically prudent valuation criteria set ex ante, which lead to book values being lower than fair value regardless of the emergence of new economic information (Watts, 2003). This form of conservatism stems from measurement choices embedded in accounting policies, resulting in a structural, non-responsive distortion relative to changes in the firm's prospects (Beaver & Ryan, 2005). The extant literature presents a fragmented picture, and this plurality of definitions has instead created an uneven landscape, in which the analytical categories used by scholars often diverge from those adopted by the international standard setter. At the same time, the evolution of the IASB's Conceptual Framework has contributed to the exacerbation of this disparity. The removal of prudence in 2010, motivated by concerns that it might compromise neutrality, and its subsequent reintroduction in 2018 in the form of cautious prudence, explicitly distinguished from the asymmetric prudence of traditional accounting, outlines a regulatory framework that does not align with the prevailing definitions found in empirical research. While the Framework under discussion here emphasizes a form of prudence that is compatible with faithful representation and free from systematic bias, much of the existing literature continues to ground its models in conservatism, especially in its conditional form, namely, in the differing timeliness of loss versus gain recognition. This working paper aims to investigate the apparent disconnection between the IASB's conceptual stance, rooted in neutrality, and the academic view, which characterizes accounting behavior as structurally prudent. This theoretical divide assumes particular significance in the analysis of intangible assets, and even more so in the case of those that are internally generated. These are a crucial category of resources in an increasingly knowledge-intensive economy, and simultaneously one of the most challenging to represent in accounting terms. The challenges associated with identifying, separating, and measuring such resources, in conjunction with the high uncertainty surrounding their future economic benefits, have resulted in their systematic exclusion from recognition under IFRS standards. However, this exclusion is not solely the result of formal recognition criteria; it also risks implicitly reflecting prudential logics that lack explicit grounding in the 2018 Framework. The existing literature on intangibles has thoroughly examined the limitations of IFRS recognition criteria. However, it has rarely explored how the tension between cautious prudence and conditional conservatism affects the way these assets are represented. Moreover, there is a need for further research into the impact of this tension on the ability of financial statements to accurately capture the processes involved in generating intangible assets. Through a systematic literature review, the objective is to present a comprehensive reconstruction of the conceptual evolution of prudence and conservatism in the accounting literature domain. At the same time, another aim of this paper is to highlight the growing misalignment between these theoretical developments and the regulatory choices embedded in the IFRS framework. Furthermore, despite the extensive academic debate on conservatism, little attention has been devoted to understanding how the conceptual ambiguity surrounding prudence may translate into practical consequences for innovative firms. Specifically, the valuation of internally generated intangibles, including R&D, organisational capabilities, software, brand development, and data-related assets, is subject to significant interpretation by managerial judgement. It is therefore essential to provide a more precise conceptual framing of prudence to assess whether the current accounting model unintentionally penalises innovation-intensive firms by systematically understating their economic potential. Moreover, it is acknowledged that the rules for intangibles under IFRS were designed mainly during a period when knowledge-intensive business models were less prevalent. This study posits that the emerging misalignment between economic reality and accounting representation cannot be addressed without a thorough examination of the conceptual foundations that underpin standard setting. In this respect, prudence becomes a lens through which to understand why certain assets remain unrecognised, how managerial judgement is constrained, and whether

neutrality, as currently interpreted, can still serve the informational needs of capital markets. The systematic literature review facilitates a structured analysis of a highly fragmented body of studies, in which the terms 'prudence' and 'conservatism' have been used as synonyms, at times as distinct concepts, and occasionally as only partially overlapping interpretive tools. In this review, internal intangibles are considered a proxy for a firm's innovative capacity, enabling an investigation into how prudence and conservatism affect the extent of underreporting of intangible investments and the ability of financial statements to capture value creation processes. From this starting point, the review examines the theoretical, informational, and policy implications of the current conceptual discontinuity. On the one hand, elucidating the function of prudence enables an assessment of whether and to what extent cautious prudence maintains informational neutrality or, conversely, impedes a more comprehensive representation of created economic value. On the other hand, the analysis underscores how inconsistencies between IFRS prudence and conservatism may influence standard-setting decisions, potentially leading to a revaluation of the criteria established in IAS 38. Finally, the study emphasises the necessity for a reinvigorated conceptual discourse between academic research and accounting standard-setting. It is imperative to bridge this divide to enhance the coherence of the Conceptual Framework and to ensure that financial reporting evolves in a manner consistent with the structural transformation of modern economies. By clarifying the conceptual foundations of prudence and evaluating their implications for recognizing internally generated intangibles, this paper contributes to ongoing discussions on how accounting can better capture the drivers of value creation in an increasingly intangible-based economic landscape.

Keywords: Conservatism; prudence; systematic literature review

Female Leadership and the Dynamics of Generational Succession in Family Firms: A Multi- Case Qualitative Analysis

Gabriella Bosco[1], Diana Ferullo[2], Natalia Aversano[3], Paolo Tartaglia Polcini[4]

1. Introduction

Family businesses are highly developed worldwide and play a fundamental role in global economies (Miroshnychenko et al., 2021). Over the last two decades, several studies have analysed the strengths and weaknesses of family firms, highlighting both their resilience and vulnerabilities (Harms, 2014; López-Pérez et al., 2018). Family businesses contribute substantially to employment, innovation, and long-term value creation, and they have recently shown particular attention to sustainability and responsible governance (Olson et al., 2003). At the same time, they have responded to recent shocks, such as the COVID-19 pandemic, by accelerating digitalisation and adopting new business models (Saura et al., 2023). In this context, increasing attention is being devoted to the role of women in family businesses, particularly during generational transitions, where leadership dynamics and gender-related factors may significantly shape succession processes and outcomes.

Despite these strengths, succession remains one of the most critical and risky moments in the life of family firms. A large body of research shows that survival rates decline sharply at each generational handover and that only a minority of family businesses successfully reach the third or fourth generation (Moreno-Gené & Gallizo., 2021). However, generational transition in family businesses can also represent an opportunity for innovation, especially when successors seek to introduce strategic and organizational changes during the handover (Hauck & Prügl., 2015). Studies on succession have identified a variety of factors that influence the success or failure of generational transitions, including planning, governance, communication, and the preparation of successors (Handler, 1994; Le Breton-Miller et al., 2004; Gallucci & Gentile, 2006; De Massis et al., 2008; Bennedsen et al., 2007). These contributions show that succession is not a single event but a complex process involving preparation, transition, integration, and consolidation phases, each of which can be shaped by the family's influence on relationships, organisational processes, and strategic choices.

At the same time, there is growing recognition that family influence can be both a resource and a constraint. On the one hand, the overlap between family and business can generate strong commitment, long-term orientation, and patient capital (Olson et al., 2003). On the other hand, it can also create agency-related tensions, emotional attachment, and intra-family conflicts that complicate leadership transitions (Schulze et al., 2003; Chrisman et al., 2004). An important implication of this literature is that we still need to understand better how specific family dynamics shape succession processes in practice and how successors navigate the tension between continuity and change.

Within this broader debate, the role of women in family businesses has attracted increasing attention.

Previous studies have shown that women often play important, but sometimes invisible or undervalued, roles in family firms and succession processes (Curimbaba, 2002; Hougaz, 2015). Although research on women's roles in family businesses has expanded over the past decade, studies specifically addressing female leadership in succession processes remain fragmented and heterogeneous. Prior research has examined how female successors negotiate their leadership roles within family firms (Xian et al., 2020), identified gender-related factors shaping succession outcomes (Kubíček & Machek, 2019), and explored issues of visibility and legitimacy faced by women next-generation leaders, particularly in male-dominated succession contexts (Brophy et al., 2023). While these contributions offer valuable insights, they tend to focus on specific dimensions of succession rather than adopting a holistic, process-based perspective. This study builds on this literature by integrating gender and leadership theories with a processual view of generational transition, thereby clarifying how female leadership shapes succession dynamics across different phases.

At the same time, leadership and psychology research suggests that women tend to display higher levels of transactional leadership behaviours and emotional intelligence, which are associated with effective management of complex and emotionally charged situations (Bass et al., 1996; Hackman et al., 1992; Salovey & Mayer, 1990; Sanchez-Núñez et al., 2008).

This creates an unresolved puzzle for family business research. On the one hand, numerous studies show that women tend to display leadership resources such as adaptability, the ability to combine firmness with empathy, and strong emotional competence, which can be particularly valuable in managing complex organisational change and people-intensive processes like succession (Singh et al., 2023; Hsu et al., 2022). On the other hand, the literature has broadly examined separately, first, the role of women and female leadership in family firms and the specific challenges and opportunities faced by daughters and other female successors (Floris, 2021; Boukhabza & Ouhadi, 2024) and, second, the factors that influence family business succession processes more generally (Morris et al., 1996; Baltazar et al., 2023). What is still missing is systematic studies examining how female leadership shapes the generational transition in small and medium-sized family businesses and whether the presence of a female successor increases the likelihood of a successful handover.

To address this gap, the present study focuses on the following research question: RQ: How does female leadership shape the management and outcomes of the generational transition in small and medium-sized family firms?

Building on a process-based view of succession, this study conceptualises generational transition as a multi-phase phenomenon comprising preparation, transition, integration, and consolidation (Handler, 1994; Le Breton-Miller et al., 2004). Within this perspective, female leadership is expected to influence the generational transition in different ways across its phases. During the preparation phase, women tend to engage in relational work and informal coordination among family members; during the transition phase, they facilitate role clarification and help contain emotional tensions; during the integration phase, they support cultural alignment while introducing managerial and strategic changes; and during the consolidation phase, they contribute to post-transition monitoring and the gradual stabilisation of the new leadership, drawing on transactional leadership and emotional intelligence (Bass et al., 1996; Salovey & Mayer, 1990). This paper addresses these unresolved questions by positioning itself at the intersection of three streams of family business research: (1) studies on succession and generational transition processes (Handler, 1994; Le Breton-Miller et al., 2004; De Massis et al., 2008), (2) research on the consequences of family involvement and agency-related dynamics (Schulze et al., 2003; Chrisman et al., 2004; Olson et al., 2003), and (3) the emerging literature on gender and women's roles in family firms (Curimbaba, 2002; Hougaz, 2015). Recent studies have increasingly focused on succession as a dynamic and processual phenomenon (Baltazar et al., 2023; Singh et al., 2023),

on the evolving role of family influence and socioemotional dynamics in shaping leadership transitions (Miroshnychenko et al., 2021; Moreno-Gené & Gallizo, 2021), and on gender and leadership in family firms, particularly with regard to daughters' involvement and female succession (Floris & Dettori, 2021; Boukhabza & Ouhadi, 2023). By engaging with these recent contributions, this study positions itself within contemporary debates in the family business literature and extends them by adopting a gendered and process-based perspective on generational transition .

By drawing on transactional leadership and emotional intelligence theories (Bass et al., 1996; Salovey & Mayer, 1990) and connecting them to succession process models, the study seeks to illuminate how female leadership contributes to and is shaped by family influence in small- and medium-sized family businesses.

Specifically, the present paper aims to determine whether the generational transition within small and medium-sized family enterprises is easier to manage and more likely to succeed when a woman represents the next generation, and to understand through which relational, organisational, and strategic mechanisms this occurs. To address this aim, the study employs a qualitative multiple-case study design, based on semi-structured interviews with male and female successors in Italian family

firms. This qualitative approach is particularly suited to exploring paradoxical and not yet fully understood phenomena, such as the interplay between family influence, gendered leadership behaviours, and the dynamics of generational transition (De Massis & Kotlar, 2014; Reinecke et al., 2016).

Empirically, the study shows that, in the six Italian small and medium-sized family firms analysed, generational transitions led by female successors tend to be easier to manage and more likely to result in a successful handover than those led by male successors. Female leaders are better able to balance respect for the founder's legacy with the introduction of strategic and organizational changes, to manage relationships with family and non-family stakeholders, and to use emotional intelligence to contain conflict across the different phases of the transition. From a practical standpoint, the findings suggest that owners and advisers should deliberately involve daughters and other women in succession planning, design multi-stage transition paths that leverage their relational and emotional skills, and invest in developing these competences across generations. In terms of originality, the paper offers one of the first process-based and gendered analyses of generational transition in small and medium-sized family firms, tracing how female leadership and family influence jointly shape the dynamics and outcomes of succession.

The paper is structured as follows: after this introduction, the next section develops the theoretical background and articulates the unresolved puzzle that guides the study. The subsequent section presents the research methodology. The fourth section discusses the empirical findings and their implications. The final section concludes by outlining theoretical contributions, managerial implications, limitations, and directions for future research.

2. Theoretical background

Defining what constitutes a family business is difficult, and the literature presents many, sometimes opposing, viewpoints. Chua et al. (1999), for example, propose a behavioural definition that emphasises a family's intention to shape and pursue a shared vision for the firm over time. Westhead and Cowling (1998) show that different operational criteria based on ownership, management, and succession identify very different populations of family firms, underlining how sensitive empirical results are to the definition adopted. Similarly, Astrachan and Shanker (2003) distinguish broad, intermediate, and narrow definitions of family businesses depending on the degree of family involvement and the intention to maintain family control across generations.

In this line, Harms (2014) defines a family business as "a company […] closely identified with at least two generations of a family and where this link has had a mutual influence on company policy and the interests and

objectives of the family" (p. 248), thus explicitly highlighting the importance of generational transition.

The definition of family business adopted in this paper follows Anderson and Reeb (2003), who characterise family firms as companies in which founding family members hold a significant ownership stake and at least one family representative sits on the board of directors. Despite the variety of definitions, family businesses share some common characteristics. First, they are organizations in which members of the same family are directly involved in ownership and are often responsible for managing the firm. Second, family members tend to share a distinctive mentality and culture, which can facilitate rapid decision-making and long-term orientation (Bigliardi & Dormio, 2009).

Against this background, the theoretical literature on family firms can be organised into three main streams of research. A first stream focuses on succession and generational transition processes, conceptualising succession as a multi-stage process shaped by preparation, governance, communication and the development of successors (Handler, 1994; Le Breton-Miller et al., 2004; De Massis et al., 2008). This literature shows how the quality of the relationship between founder and successor, the degree of formal planning and the possible involvement of external managers critically influence survival and renewal across generation.

A second stream examines how family involvement can operate both as a resource and as a potential source of failure in generational transitions. This literature highlights how family ownership, emotional bonds and intra-family relationships shape succession planning, leadership development, governance structures and, ultimately, the likelihood that the phases of preparation, transition, integration and consolidation will be successfully completed (Olson et al., 2003; Gallucci & Gentile, 2006; De Massis et al., 2008; Bennedsen et al., 2007; Ibrahim et al., 2001). On the one hand, shared values, a long-term orientation and patient capital can support investments in successors and foster continuity across generations; on the other hand, resistance to change, inadequate training, family conflicts and strong emotional attachment can weaken the process, generating agency-related tensions and making it difficult to transfer authority from one generation to the next (Schulze et al., 2003; Chrisman et al., 2004; Dyck et al., 2002; Sharma et al., 2003). A third, more recent stream connects studies on gender and women's roles in family firms with theories of leadership and emotional intelligence, exploring how female successors influence the generational transition. Research on women in family firms shows that daughters and other female family members often make substantial, yet only partially visible, contributions to the coordination of family relationships, support for the founder and the management of day-to-day operations (Curimbaba, 2002; Hougaz, 2015; Campopiano et al., 2017; Floris & Dettori, 2021). At the same time, leadership studies suggest that women, more than men, tend to display transactional leadership behaviours – alternating firmness and support as circumstances change – and higher levels of emotional intelligence, which help them manage conflict, navigate change and maintain relationships in emotionally charged contexts such as succession (Bass et al., 1996; Hackman et al., 1992; Salovey & Mayer, 1990; Sanchez-Núñez et al., 2008; Abdullah et al., 2019; Panda & Banik, 2019; Hsu et al., 2022). Taken together, this body of work provides the basis for examining whether and how female leadership can transform family influence into a resource for successful generational transition, particularly in small and medium- sized family firms.

2.1. Elements of success and failure in a generational change in the family business

Family businesses are a significant component of the global economy, profoundly influencing job creation, wealth generation, and economic stability across many nations. Although their importance varies from country to country, family businesses generally form a

predominant part of business activity Worldwide (Sharma et al., 2012). Family businesses contribute substantially to their countries' Gross Domestic Product (GDP). According to a 2018 Credit Suisse report (Global Wealth Report, 2018), family businesses are often more profitable and resilient than non-family businesses, contributing significantly to economic growth. An estimated 70-90% of global businesses are under family control, ranging from small to large conglomerates. These businesses are significant employers. For example, in the United States, family businesses employ 60% of the workforce and generate 78% of all new jobs. Their ability to create and maintain jobs is critical to economic stability. Despite the perception that they may be conservative in their business practices, many family businesses are at the forefront of innovation. Their long-term vision allows them to invest substantially in research and development, often valuing long-term benefits over short-term gains. The generational transition represents one of the most critical moments for family businesses, with survival rates decreasing significantly with each transition. Studies (Moreno-Genè et al., 2021; Nwke et al., 2020) indicate that only about 30% of family businesses transition to the second generation, while 12% remain in family hands until the third generation, and only 3% survive the fourth generation. Family businesses have been the subject of research for some years. Various aspects of this type of business have been analysed. It has been found that they are companies that pay particular attention to sustainability (Olson et al., 2003). Furthermore, in recent years, they have demonstrated particular responsiveness to digitalization, often ahead of trends (Zapata- Cantu et al., 2023). This is highlighted by some studies (Ward, 2016).

The process of generational transition in family businesses is challenging, and effective planning can alleviate many of these difficulties. While many studies have examined generational transitions within family enterprises, several aspects remain unclear and warrant further research (Sharma et al., 2003; Bennedsen et al., 2007; De Massis et al., 2008). As previously discussed, the generational handover is a critical phase in a family business's lifespan, often jeopardising its very survival. Therefore, strategically planning this transition is crucial to significantly enhancing the business's prospects for continued success. (Gallucci et al., 2006). It would seem that there are phases that should precede successful generational transitions.

Table 1 highlights the phases (such as preparation, transition, integration, and consolidation phases) that precede a successful generational transition and the behaviors that characterize an unsuccessful one.

Phases for successful generational change transition	The reason why generational transition failure
PREPARATION PHASE:	**Resistance to Change** **Inadequate Training and Development: Family Conflicts** **Lack of Strategic Vision Lack of Succession Planning** **Emotional attachment and identity issues**
Succession Planning **Leadership development** **Governance Structures**	
TRANSITION PHASE:	
Role Classification **Communication** **Legal and Financial Considerations**	
INTEGRATION PHASE:	
Cultural Alignment	

Strategic Planning Professionalization	
CONSOLIDATION PHASE:	
Performance monitoring **Continuous Learning** **Legacy Preservation**	

Table 1. Phases of success and common failure behaviors in the generational transition process

The Preparation phase is further divided into three specific stages: Succession Planning, which involves early and detailed planning to identify and prepare potential successors; Leadership Development, which focuses on offering education, training, and mentorship to the upcoming leaders; and Governance Structures, which include setting up formal bodies like family councils and boards of directors to support decision-making and resolve conflicts.

The Transition Phase is further divided into three stages: Role Clarification, which involves clearly defining the responsibilities of outgoing and incoming family members to avoid overlap and conflict; Communication, which emphasizes maintaining open and transparent dialogue among family members to manage expectations and address concerns; and Legal and Financial Considerations, which covers aspects like ownership transfer, tax implications, and estate planning.

The Integration Phase includes three main stages: Cultural Alignment, which ensures the new generation respects the company's history and values while bringing new ideas; Strategic Planning, involving new leadership in aligning their vision with the company's future objectives; and Professionalisation, focused on adopting professional management practices for efficient operations and preparing for future challenges.

The Consolidation Phase is also segmented into three sub-phases: Performance Monitoring, which involves regularly evaluating the new leadership and business performance to ensure alignment with established goals; Continuous Learning, which promotes ongoing adaptation to evolving business trends and practices; and Legacy Preservation, which focuses on safeguarding the family's legacy while encouraging growth and innovation.

When evaluating the factors that influence a successful generational transition in family businesses, it is also crucial to identify factors that may lead to failure during this process. Research often highlights the most common reasons for unsuccessful generational transfers, particularly in small businesses (Ibrahim et al., 2001). The main causes of failure in these transitions include:

- Lack of succession planning: which involves the absence of a clear and structured succession plan, can lead to confusion and conflict during the transition process. Family businesses often delay succession planning due to emotional attachments and the complexity of family dynamics.
- Resistance to change: The older generation may resist new ideas and changes proposed by the younger generation, leading to a clash of visions and strategies. This resistance can stem from a fear of losing control or believing that traditional methods are best (Dyck et al., 2002; Sharma et al., 2003).
- Inadequate training and development: It refers to the failure to prepare the next generation properly through education, training, and gradual responsibility transfer, which can result in unprepared successors lacking the necessary skills and knowledge to lead the business successfully (Le Breton-Miller et al., 2004; Word, 2016).

- Family conflicts: refer to interpersonal conflicts within the family, such as sibling rivalry or disputes between generations, which can significantly disrupt the transition process. These conflicts often originate from issues related to power distribution, role allocation, and wealth-sharing.
- Lack of strategic vision: Without a shared strategic vision for the future of the business, the transition process can become aimless and prone to disagreements over the company's direction and goals.
- Emotional attachment and identity issues: It concerns the founder's or current leader's emotional attachment to the business, and the difficulty in separating personal identity from the business role can hinder the process of letting go and transferring leadership to the next generation.

Considering the research's contribution to understanding the factors that make the generational transition within family businesses a moment of success or failure, it is possible to investigate the positive impact that female leadership can have on this delicate moment.

2.2. Female Influence in Small and Medium-Sized Businesses during periods of generational Transition

Based on previous studies, the female propensity, as a character trait, can act positively even in a delicate moment, such as the generational transition within a small- and medium-sized business. (Ward, 2016; Carlok & Ward, 2001).

The first theory to consider is the transactional leadership theory. This theory was developed between the 1970s and 1980s, and its two foremost exponents are Bernard M. Bass and Bruce J. Avolio (Bass et al.,1996).

These authors identify "transnationality" as a fundamental element for a successful leader. This term refers to the ability of those in positions of responsibility to quickly shift from a harsher to a softer, more understanding leadership style. (Bass et al., 20023).

In-depth studies (Bass et al., 1996; Bono et al., 2004; Maher et al., 1997;; Hackman et al., 1992) on transactional theory have shown that this characteristic is more prevalent in women than in men. In this case, a second theory worth highlighting is emotional intelligence. This theory, which originated in the 1990s, was proposed by Salovey et al. (1990). These researchers described emotional intelligence as the ability to process information based on one's emotions and those of others, using them to guide thinking and behaviour.

Emotional intelligence is crucial in managing a company because it enables you to understand, use, and manage emotions effectively to promote high individual and team performance. It helps leaders

motivate employees, navigate conflicts, communicate effectively, and create a positive work environment, thereby increasing job satisfaction, employee loyalty, and business performance. (Salovey et al.,2003).

A leader with emotional intelligence would better navigate complex, delicate moments within the company, such as the generational transition.

Some studies (Sanchez-Nunez et al.,2008), (Abdullah, 2019), (Panda et al.,2019) highlight how emotional intelligence is a characteristic mainly of women. They use it excellently both in their professional and private lives.

Given the points highlighted above, three main insights emerge from the literature. First, succession in family firms is not a single event but a complex process that unfolds through preparation, transition, integration and consolidation phases, each of which can be critically affected by the influence of the family (Handler, 1994; Le Breton-Miller et al., 2004; Gallucci & Gentile, 2006; De Massis et al., 2008). Second, family involvement can act both as a valuable resource – by providing long-term orientation, social capital, and patient capital – and as a source of tensions, emotional attachment and intra-family conflicts that complicate leadership transitions

(Olson et al., 2003; Miller et al., 2007; Schulze et al., 2003; Chrisman et al., 2004). Third, research on gender and leadership suggests that women are often associated with transactional leadership behaviours and emotional intelligence, which appear beneficial for managing conflict, navigating change and maintaining relationships (Bass et al., 1996; Hackman et al., 1992; Salovey & Mayer, 1990; Sanchez-Núñez et al., 2008; Abdullah et al., 2019; Panda & Banik, 2019). Taken together, these streams of research suggest a paradox that has yet to be fully explored. Suppose female successors are more likely to adopt leadership behaviours and emotional competencies that should help them cope with the emotional, relational, and strategic challenges of generational transition. Why do we still know so little about how they actually manage these processes in practice, especially in small- and medium-sized family businesses? Moreover, how does the influence of the family, in terms of legacy, control, monitoring and expectations, shape the way female successors relate to other family members, reorganise internal processes and pursue strategic renewal, and how do these dynamics differ from those observed when male successors take over (Bennedsen et al., 2007; Ibrahim et al., 2001; Dyck et al., 2002; Morris et al., 1997)

Although some studies have examined the presence of women in family firms and emphasised their positive contribution (Curimbaba, 2002; Hougaz, 2015), we still lack a detailed understanding of how female leadership interacts with family influence throughout the different phases of generational transition. In particular, there is a need for in-depth qualitative research that traces how family values, emotional bonds, and intra-family power relations shape successors' leadership behaviours and, in turn, how successors' actions feed back into family relationships, organisational processes, and strategic trajectories. The present study addresses this gap by using a qualitative multiple case study of Italian small and medium-sized family businesses to explore the following overarching research question: How does female leadership, in interaction with family influence, shape relationships, organisational processes, and strategic change during the generational transition, and how does this differ from male leadership?

From a theoretical perspective, this study argues that female leadership influences generational transition not directly, but through specific underlying mechanisms. Drawing on transactional leadership theory and emotional intelligence (Bass et al., 1996; Salovey & Mayer, 1990), we suggest that female successors are more likely to engage in emotional regulation, relational mediation, and adaptive leadership behaviours that are particularly relevant in emotionally charged and relationally complex contexts such as family business succession (Sanchez-Núñez et al., 2008; Hsu et al., 2022). These mechanisms help contain intra-family tensions, facilitate the gradual transfer of authority, and balance continuity with change across the different phases of the generational transition.

3. Methodology

The methodology used to answer the research question is qualitative and follows a multiple-case study design. In line with recommendations for qualitative research in family business studies (De Massis et al., 2014; Reinecke et al., 2016), we adopt a primarily inductive, theory-building approach to develop a richer understanding of how female leadership shapes generational transitions in practice. Qualitative methodology is particularly suited to exploring complex, not yet fully understood, and potentially paradoxical phenomena, such as the interplay between family influence, gendered leadership behaviours, and the dynamics of succession, because it relies on in-depth accounts of participants' experiences rather than numerical data (Berríos & Lucca, 2006). The multiple case study focuses on analyzing multiple cases to highlight similarities and differences among them (Yin, 2009; Yin ., 2012). The difference between the single case study and the multiple case study is that, in the multiple case approach, there is the potential to obtain more information on the phenomenon and generalise the results more quickly.

In this study, we conducted interviews with male and female protagonists of the generational transition in small and medium-sized family businesses to explore how they approached this

delicate moment in their companies and how they perceived the influence of their gender and of family dynamics on the process. Rather than testing predefined hypotheses about gender differences, we aimed to build an empirically grounded understanding of how women and men describe their experiences of succession and to identify recurring patterns in how female successors, in particular, navigate the tensions between continuity and change.

4. Data collection: Interviews carried out

The data were collected through interviews using a semi-structured questionnaire. The study adopts a qualitative multiple-case study design aimed at developing an in-depth and processual understanding of generational transition dynamics. Data were collected through semi-structured interviews and analysed using an interpretive approach based on iterative coding and comparison. Specifically, interview transcripts were examined through within-case analysis to capture each succession experience, followed by cross-case comparison to identify recurring patterns related to leadership behaviours, family influence, and succession phases. This approach is consistent with qualitative research in family business studies and is particularly suitable for exploring complex and under-researched phenomena.

The questions were chosen based on the literature on generational transition management. As indicated in Table 2, six people were interviewed. Those interviewed were all protagonists in the first person of a generational change within their family businesses.

Participant	Gender	Position	Interview Duration (minutes)	Company
A	Female	CEO	21	Blu Plast - Italy
B	Male	Marketing Director	19	Blu Plast - Italy
C	Male	Export Director	25	Arbiter - Italy
D	Female	Board component	17	Arbiter-Italy
E	Male	CEO	22	Svas-Italy
F	Female	R&S Director	30	CoopCulture-Italy

5. Results and discussion

In this section, the empirical evidence is interpreted in light of the theoretical frameworks discussed above: the process models of generational transition, the perspectives on family influence and the theories of transactional leadership and emotional intelligence.

The interviews were conducted face-to-face, and the content was listened to by three individuals to compare interpretations. In all three cases, the listeners highlighted a difference in the approach to generational transition between men and women. Women showed a greater propensity for change and were better prepared for the moment of generational change, even when they had not been adequately prepared.

In this section, the empirical evidence is interpreted in light of the theoretical frameworks discussed above: the process models of generational transition, the perspectives on family influence, and the theories of transactional leadership and emotional intelligence. The interviews

were conducted face- to-face, and the content was listened to by three individuals to compare interpretations. In all three cases, the listeners highlighted a difference in the approach to generational transition between men and women. Women showed a greater propensity for change and were better prepared for the moment of generational change, even when they had not been adequately prepared.

Subject D indeed stated: "Even though the generational transition within the company was sudden, I immediately faced a new challenge, taking into account the legacy of my grandfather and my father, but I changed some things in the management, considering my ideas and the work experience I had abroad."

The interviews also revealed that women are more versatile in management methodologies than men. For instance, subject A stated: "Since my father stepped back and handed me the company's reins, I have tried to appear confident with the collaborators and to alternate moments of group gratification with moments when it was necessary to be tough. This has led the collaborators to recognize me as a leader soon. I cannot say they respect me as much as they respected my father, but we are on the right track."

Although men were enthusiastic about their generational transition experience, they found it more difficult to abandon ideas, even if obsolete, that were carried forward by their fathers and, more often, by their grandfathers.

Subject E stated: "Even though I knew that some practices used by my grandfather were outdated, my bond with him was so strong that it took me months to say: 'We should not do this anymore.' I felt bound; changing things, he devised, made me feel like I was disrespecting him." He continued: "I had a great deal of difficulty being recognized by the collaborators as the leader; for a long time, and perhaps even today, my father's way of doing business remained deeply ingrained in them."

In all cases, the women highlighted that the previous generation monitored them periodically after the generational transition in which they were involved. This monitoring had already been considered when planning the generational transition (where such planning had been carried out). On the other hand, men require monitoring by previous generations, but not regularly; monitoring occurs only when a decision is made, which makes them feel less responsible.

In particular, subject C stated: "I still cannot make decisions without my father's and my uncles' approval; I still feel very insecure."

In each case examined, particularly in each interview conducted, a connection was found between the experience of generational change and the phases described in Table 1.

Regarding positive generational change experiences, especially those in which women represented the second generation, interviewees stated that the preparation phase for the generational transition and the consolidation phase, particularly regarding post-transition performance monitoring, were essential to ensuring this delicate process was positive for the company and did not compromise its stability.

Conversely, interviewees who found the generational change challenging indicated that poor preparation for the transition, family conflicts, and the absence of post-transition monitoring (reasons for the transition's failure, as shown in Table 1) made the integration process arduous. In general, women have a positive impact on the generational transition due to their patience and versatility, which are fundamental to its success.

From a theoretical perspective, these findings can be read in continuity with the process models of generational transition and with the theories of family influence, transactional leadership, and emotional intelligence discussed in the theoretical background. The emphasis that female successors place on preparation and on post-transition performance monitoring is consistent with process views of succession that underline the importance of the preparation and consolidation phases for ensuring continuity and stability (Gallucci & Gentile, 2006; Le Breton-Miller et al., 2004). At the same time, women's ability to combine respect for the founder's legacy with the introduction of managerial and strategic changes reflects a leadership style that alternates

firmness and support, in line with the notion of transactional leadership (Bass et al., 1996) and with the idea that emotionally intelligent leaders are better equipped to manage complex, emotionally charged transitions (Salovey & Mayer, 1990; Sanchez-Núñez et al., 2008). By contrast, the difficulties reported by male successors in abandoning obsolete practices and in taking autonomous decisions illustrate how strong emotional attachment and intra-family dependency can generate agency-related frictions and resistance to change, as suggested by studies on family influence and agency issues in family firms (Schulze et al., 2003; Chrisman et al., 2004). Overall, the cases suggest that female leadership can act as a mechanism through which family influence is channelled into constructive relational, organisational, and strategic change during the generational transition, rather than becoming a source of blockage or conflict.

6. Conclusions, Limitations, and Future Research

This study analyses for the first time the impact of female leadership on a particularly critical moment in the life of family businesses: the generational transition. The findings highlight the positive contribution of women to generational succession within family firms. The interviews revealed that women demonstrate considerable adaptability and a tendency towards transactional and dynamic behaviours, which have proven crucial for successful generational transition. In this regard, our results align with previous research (Bass et al., 1996; Bono et al., 2004; Maher et al., 1997; Hackman et al., 1992), which underlines the significance of transactional leadership and defines such character traits as essential for effective business management.

Taken together, these findings offer several theoretical contributions to family business research. First, they extend existing succession studies by demonstrating that the gender of the successor is not a neutral attribute, but can shape how preparation, transition, integration, and consolidation phases unfold in practice. Second, they deepen agency-based perspectives on family firms by showing how female successors' emotional intelligence and transactional leadership behaviours can mitigate intra- family tensions and facilitate the transfer of control while preserving the firm's legacy. Third, by linking micro-level leadership behaviours to process outcomes, the study encourages future research to move beyond the simple distinction between successful and unsuccessful succession and to examine how different leadership styles – and in particular female leadership – affect the quality and sustainability of generational transitions over time.

From a practical standpoint, the findings enrich the existing body of research and offer valuable insights for family businesses facing similar challenges, such as the strategic placement of women in critical roles. Encouraging and facilitating a more active role for women in generational succession could promote organisational stability and innovation and advance greater gender equity in the sector.

Despite its contributions, this study has several limitations. The empirical analysis focuses exclusively on companies operating in Italy, and the number of cases is necessarily limited. These aspects restrict the generalisability of the results but also open up opportunities for future research. Subsequent studies could investigate the impact of women on generational succession in family businesses worldwide, compare different institutional and cultural contexts, and adopt longitudinal designs to capture how female leadership influences generational transitions over time.

Cybersecurity Expenditures and Intangible Assets: The IAS 38 Control Criterion under the DORA Framework

Marco Venuti[1], Sabrina Pucci[2]

1. Introduction

In recent years, cyber risk has become a structural driver of operational vulnerability in the financial sector, exposing institutions to severe disruptions, reputational damage and significant remediation costs (Anderson et al., 2013; Bouveret, 2018). At the same time, the growing digitalisation of financial services has deepened financial institutions' dependence on complex ICT infrastructures, cloud services and interconnected digital supply chains, amplifying the potential impact of cyber incidents on system wide stability (FSB, 2020; ESMA, 2022). Against this backdrop, the EU Digital Operational Resilience Act (DORA) establishes a comprehensive and binding framework for managing ICT risks, mandating systematic investments in digital operational resilience and introducing a dedicated oversight regime for critical ICT third party providers supporting core financial functions (European Commission, 2020; EIOPA, 2024).

DORA requires financial entities to map and classify critical ICT assets and services, implement robust controls for incident prevention and response, and manage ICT third party risk through stringent contractual, governance and monitoring arrangements (European Commission, 2020; EBA, 2022). As a result, financial institutions make significant and recurring expenditures in cybersecurity capabilities, resilience testing, business continuity solutions, data and system recovery arrangements, and ICT outsourcing relationships. These expenditures are not merely operational costs, but strategic investments in the preservation of going concern value, the continuity of revenue generating activities and the protection of customer trust (Gordon et al., 2018; PwC, 2023).

From a financial reporting perspective, DORA driven expenditures interact in a complex way with the recognition criteria for intangible assets under IAS 38, which require the existence of an identifiable resource controlled by the entity and capable of generating future economic benefits (IASB, 2004; IFRS Foundation, 2024). In particular, IAS 38 conceptualises control as the power to obtain future economic benefits from an underlying resource and to restrict others' access to those benefits, a notion traditionally anchored in legal rights, enforceable contracts and exclusive availability (IASB, 2004). However, DORA's emphasis on interdependence with critical ICT third party providers and on resilience obligations embedded in contractual and regulatory arrangements challenges the conventional view of control as individually held, exclusive dominion over an asset, especially where resilience outcomes are co produced along extended digital supply chains (Noerr, 2024; FMA, 2025).

This evolving regulatory and technological landscape raises the question of whether the current accounting treatment of cybersecurity and digital resilience expenditures – typically expensed as incurred and accompanied by limited, high level disclosures – provides a faithful representation of the underlying economic phenomena in the financial statements of regulated entities (Lev, 2018; IFRS Foundation, 2024). Moreover, the existence of a binding and permanent regulatory framework such as DORA suggests that these expenditures are not contingent or episodic outlays, but recurring components of a digitally dependent business model, with potential

[1] Associate Professor, ECON-06/A, University Mercatorum; marco.venuti@unimercatorum.it

[2] Full Professor, ECON-06/A, University Roma Tre; sabrina.pucci@uniroma3.it

structural implications for how control and future economic benefits are conceptualised in accounting.

2. Literature review

The accounting literature has long highlighted the challenges associated with recognising and measuring intangible assets, particularly in knowledge and technology intensive sectors (Lev, 2001; Wyatt, 2005). Several studies document a widening gap between the economic relevance of internally generated intangibles and their visibility in financial statements, due to strict recognition criteria and conservatism in standard setting (Oswald & Zarowin, 2007; Li & Liu, 2012; IFRS Foundation, 2024). The control criterion in IAS 38 has attracted specific attention, as it effectively limits recognition to situations in which legal or contractual rights provide clear evidence that the entity can obtain future economic benefits and restrict others' access (IASB, 2004; Ramanna, 2008).

Recent literature on digitalisation and intangibles suggests that emerging forms of value creation – such as platforms, data ecosystems and networked infrastructures – often rely on shared or distributed control, making the application of existing accounting concepts increasingly problematic (Cañibano & García Ayuso, 2013; Andon et al., 2020). In parallel, research on cybersecurity and accounting has begun to explore how cyber incidents, security investments and data related risks affect financial reporting, risk disclosures and valuation (Melone et al., 2019; Richardson et al., 2019; Audit Analytics, (2022). However, most contributions treat cybersecurity expenditures as risk management or compliance costs rather than as candidates for recognition as intangible assets.

On the regulatory side, an emerging strand of literature examines the implications of DORA and related digital resilience initiatives for financial stability, risk governance and ICT outsourcing practices (FSB, 2020; European Commission, 2020; EIOPA, 2024). These studies emphasise the centrality of third party dependencies and the creation of critical ICT infrastructures that are effectively shared across multiple financial institutions. Yet, the intersection between DORA driven digital resilience obligations and the accounting treatment of related expenditures under IAS 38 remains largely unexplored. In particular, while recent studies have focused on the effects of single cyber events or breach disclosures on market prices and risk perceptions, event based approaches such as Janvrin and Wang (2022) concentrate on discrete episodes rather than on the ongoing, regulation driven nature of digital resilience investments, leaving open the question of how such investments should be conceptually framed within the intangibles reporting framework.

This paper aims to fill this gap by bridging three streams of research:

- the debate on the recognition and measurement of intangible assets and the limitations of the control criterion in IAS 38;
- the evolving literature on cybersecurity and digital operational resilience in financial institutions; and
- the regulatory analysis of DORA with particular focus on ICT third party risk and oversight.

By doing so, it offers a novel perspective on the conceptual and practical challenges of representing DORA related cybersecurity investments in financial reporting and differentiates itself from event based approaches by placing prudential regulation as a structural and continuous investment context, rather than focusing solely on the accounting consequences of isolated incidents.

3. Purpose

This study examines the extent to which the Digital Operational Resilience Act (DORA) can be regarded as a catalyst for a critical reassessment of the control criterion in IAS 38 for cybersecurity related intangible investments. Specifically, it investigates how mandatory investments in Digital Operational Resilience and the stringent oversight of critical ICT third party providers challenge the traditional understanding of control as the "ability to obtain future economic benefits" and the "power to restrict others' access", revealing conceptual and practical tensions that are not adequately addressed by current accounting standards and the existing literature (IASB, 2004; IFRS Foundation, 2024; Lev, 2018).

By focusing on the under explored intersection between prudential digital resilience regulation and financial reporting, the paper seeks to identify whether a qualitative reframing of control is needed to ensure a faithful representation of DORA driven digital resilience investments in the financial statements of regulated financial institutions. The study also explores how current practice – which typically routes DORA related expenditures through the income statement without capitalisation and provides only generic narrative disclosures under sustainability and risk reporting frameworks – compares with the conceptual ambitions of IAS 38 and recent calls for improved transparency on intangibles (IFRS Foundation, 2024; EFRAG, 2021). In doing so, the analysis not only assesses the technical appropriateness of the prevailing accounting treatment, but also considers its informational implications for users, in light of the evolving regulatory landscape and ongoing debates on intangibles reporting and the value relevance of non financial information.

4. Design/methodology/approach

The research adopts an exploratory, qualitative multiple case study design based on semi structured interviews with senior managers from two banks and one insurance company subject to DORA requirements (Yin, 2014; Eisenhardt et al., 2016). The cases were selected to capture variation in business models and ICT outsourcing strategies while remaining within the same regulatory perimeter, thus allowing for analytical rather than statistical generalisation.

The interview protocol elicits participants' views on:

- the nature, scope and drivers of DORA related cybersecurity and digital resilience investments;
- the perceived locus of control over key digital assets and resilience capabilities in the presence of critical ICT third party providers; and
- the challenges encountered when mapping these investments onto existing IAS 38 recognition and measurement criteria.

Interviews focus on both current practices (e.g. expensing vs capitalisation, internal vs external reporting) and perceived tensions between regulatory expectations, internal risk management narratives and financial reporting outcomes. To enhance the reliability of the findings, the design also incorporates triangulation between interview evidence and internal documentation made available by the institutions (ICT policies, risk management frameworks, extracts from financial statements and non financial reporting), anchoring managers' perceptions in concrete organisational and accounting artefacts.

The resulting material is analysed through iterative thematic coding, combining deductive codes derived from the IAS 38 framework and the DORA regulatory architecture with inductive codes emerging from managers' narratives (Gioia et al., 2013). This process leads to the identification of macro themes for the discussion and findings section, including: emerging configurations of shared or networked control along digital supply chains; the distinction between expenditure perceived as "compliance cost" versus "strategic intangible investment"; and perceived gaps or ambiguities in accounting guidance for representing digital operational resilience in financial statements. Short verbatim excerpts from the interviews are used to

illustrate these macro themes, showing how managers concretely articulate the tension between regulatory language, risk management logics and the constraints of the IAS 38 framework.

5. Discussion and findings

The analysis of the three cases reveals, first, that DORA related cybersecurity and digital resilience expenditures are almost uniformly recognised as period expenses in the income statement, with no systematic attempt to assess them against the recognition criteria for intangible assets under IAS 38 (IASB, 2004; IFRS Foundation, 2024). Managers in both banks and the insurance company tend to frame these outlays as "regulatory compliance costs", tightly linked to meeting supervisory expectations and avoiding sanctions, despite acknowledging that they contribute to the long term preservation of service continuity, customer trust and franchise value. This framing blurs the boundary between pure operating expense and strategic investment in digital resilience capabilities, reinforcing a conservative accounting treatment that may understate the stock of internally generated intangibles related to cyber resilience (Lev, 2018; Gordon et al., 2018). In some interviews, for example, ICT heads describe DORA initiatives as necessary "tickets to play" for remaining in the market, while at the same time recognising that they durably strengthen continuity and incident management capabilities.

Second, the cases suggest the emergence of "networked" or "shared" control configurations, in which the resilience outcomes sought by DORA are co produced with critical ICT third party providers through contractual, technical and governance arrangements (European Commission, 2020; Noerr, 2024). Managers describe a situation in which internal resources (e.g. security teams, incident response processes, governance structures) are tightly coupled with external infrastructures (e.g. cloud platforms, security as a service, managed detection and response), making it difficult to attribute exclusive control over the underlying digital resilience capabilities to a single entity. In this context, they report difficulties in mapping their practical understanding of control – which is distributed across internal and external actors – onto the IAS 38 notion of control as the power to obtain future economic benefits from a resource and to restrict others' access, a notion largely conceived with individually held or legally enforceable rights in mind (IASB, 2004; Ramanna, 2008). This conceptual misalignment contributes to a de facto bias towards immediate expensing, even where the underlying resilience capabilities exhibit characteristics typically associated with intangible assets, such as identifiability, future economic benefit and a multi period horizon (IFRS Foundation, 2024). At the same time, the regulatory requirement to map and classify critical ICT assets and to formalise stringent contractual clauses with critical ICT third party providers provides structured evidence on resource boundaries and usage and governance rights, which could at least partially serve as documentary support for satisfying the IAS 38 identifiability requirement.

Third, the study finds a systematic disclosure gap. While financial entities provide narrative information on cybersecurity and operational resilience mainly in the context of sustainability, governance and risk reporting – often under the umbrella of broader ESG and sustainability reporting frameworks – they offer very limited, if any, specific disclosures linking DORA driven expenditures to the recognition, measurement or presentation of intangible assets (EFRAG, 2021; ESMA, 2022).

The resulting reporting practice is characterised by a sharp separation between financial statements, where DORA related expenditures are treated as undifferentiated operating expenses, and sustainability oriented reports, where resilience investments are discussed in high level qualitative terms without a clear connection to the accounting treatment prescribed by IAS 38. This separation reduces users' ability to understand how digital resilience investments affect both current performance and the build up of longer term capabilities, and suggests that existing disclosure regimes do not fully capture the economic substance of cybersecurity related intangibles (Lev, 2018; IFRS Foundation, 2024).

However, the mandatory regulatory requirement to map and classify critical ICT assets and services and impose stringent contractual arrangements on critical ICT third-party providers (CTPPs) arguably provides the necessary rigorous evidence of resource boundary and enforceable rights to satisfy the identifiability criterion of IAS 38.

Collectively, these macro themes indicate that DORA functions as a catalyst exposing the limitations of the current control criterion for capturing digital resilience investments, and point to the need for a qualitative reframing of control – and possibly of related disclosure requirements – to ensure a more faithful representation of such investments in the financial reporting of regulated financial institutions. The findings also hint at potential avenues for standard-setting, including clarifying how control may be evidenced in settings where economic benefits and resilience outcomes are generated within shared or networked arrangements, and how narrative disclosures can better bridge the gap between prudential digital resilience regulation and accounting representations. In this respect, the paper suggests that a better alignment between financial and sustainability reporting could be achieved by explicitly linking risk-management and ESG sections to the recognition and classification choices applied to digital resilience expenditures in the financial statements.

6. Originality, value and limitations

This study contributes to the emerging debate at the intersection of digital resilience regulation and financial reporting by proposing DORA as a critical test case for reassessing the control criterion in IAS 38, with specific reference to cybersecurity and digital operational resilience investments. Unlike prior work that has largely treated cyber and resilience expenditures as operational risk management issues or has examined them under the umbrella of sustainability and risk disclosures, the paper explicitly interrogates their accounting treatment as potential intangible assets, highlighting how DORA induced obligations and ICT third party oversight expose conceptual blind spots in the current standard setting framework (Lev, 2018; IFRS Foundation, 2024). Compared to studies centred on specific data breach events or market reaction analyses, the approach adopted here privileges a regulatory and conceptual perspective, focusing on recurring and systemic investments in digital operational resilience rather than on isolated incidents, and showing how such investments interact with the definition of control and with IAS 38 recognition criteria.

The paper offers value for both standard setters and practitioners by articulating how networked configurations of control, co produced with critical ICT third party providers, challenge traditional, entity centric notions of control and by documenting the resulting accounting and disclosure practices in banks and insurance companies subject to DORA. For financial institutions, the findings clarify the implicit assumptions underpinning the prevailing expensing approach and the separation between financial statements and sustainability oriented reporting, thereby informing more transparent and conceptually grounded policy choices on recognition and disclosure of digital resilience investments. For standard setters and regulators, the study provides empirically grounded insights into how current notions of control and disclosure requirements operate in practice when confronted with DORA driven digital resilience obligations.

The research is subject to several limitations. First, the evidence is based on a small number of qualitative case studies (two banks and one insurer) and relies on some limited managers' perceptions due to a regulatory context that is still in the initial stages of application (the data of the mandatory application was the 17th of January 2025 with D.LGS. 10 March 2025, n.23), which constrains statistical generalisability but is appropriate for theory building in a novel domain (Yin, 2014; Eisenhardt et al., 2016). Second, the study focuses on the IAS 38 control criterion and does not undertake a full measurement or valuation analysis of cybersecurity related intangibles, leaving scope for future research to develop quantitative models and to explore cross

country differences in reporting practices under varying supervisory expectations. Third, the empirical analysis is limited to the perspective of supervised financial institutions and does not include the views of regulators or auditors, which could provide further insight into interpretive expectations on control and disclosure. Fourth, the paper does not examine in detail the interaction between DORA and emerging sustainability related reporting standards (such as ESRS), which may further shape the narrative and quantitative disclosures on digital resilience in the future.

Keywords: Cybersecurity costs; digital operational resilience Act (DORA); IAS 38; intangible assets; control; financial reporting; ICT risk

L'intelligenza artificiale nei sistemi di early warning contabili: verso un nuovo modello di rilevazione della crisi d'impresa

Marco Lacchini [1], Benedetta Cuozzo [2], Florinda Petrecca [3], Salvatore Vallefuoco [4], Maria Schimperna[5]

1. Introduzione

La crisi d'impresa è una tema che tocca da vicino sempre più imprese. I numeri del fenomeno sono, infatti, preoccupanti: si registra un incremento delle aziende in crisi in modo ininterrotto da 4 anni. Nel 2022 l'avvio di nuove procedure è salito di oltre il 61%, toccando +29% nei primi sei mesi del 2025. Le liquidazioni giudiziali sono l'iter più utilizzato (Il Sole 24 Ore, 2025), affiancate dallo strumento stragiudiziale della composizione negoziata con quasi 600 istanze presentate nel 2023, 1.089 nel corso dell'anno 2024 ed 834 solo nel primo semestre del 2025 (Unioncamere, 2025). In questo preoccupante contesto, il presente studio si interroga se le nuove tecnologie possano supportare le aziende a prevenire fenomeni di crisi d'impresa, cogliendo i primi segnali agli albori delle difficoltà aziendali, permettendo un migliore processo di risanamento. Pertanto, il presente lavoro analizza il potenziale delle nuove tecnologie e in particolare dell'intelligenza artificiale (IA) nei sistemi contabili di early warning per la rilevazione della crisi d'impresa.

L'interesse di studiosi e società verso l'individuazione ed emersione precoce dei sintomi di crisi deriva dalla consapevolezza che una comprensione tardiva del fenomeno può cagionare effetti irreversibili sullo stato di salute aziendale, pregiudicando definitivamente il suo stato vitale, sino a condurre l'impresa verso la liquidazione e dunque all'uscita dal mercato. Viceversa, la tempestiva emersione e gestione della crisi aziendale genera plurimi benefici, apprezzabili dall'impresa che sperimenta la crisi, dai suoi interlocutori negoziali (cd. stakeholders) e dal sistema economico nel suo complesso (Brodi, 2018).

Tale prospettazione ha indotto la dottrina economico aziendalistica ad elaborare, nel corso degli anni, metodi di previsione della crisi atti ad anticipare l'individuazione e l'emersione dei sintomi di crisi. Le attenzioni poste dalla letteratura in materia risultano avvalorate principalmente dalle seguenti considerazioni: (i) la crisi d'impresa non deve essere interpretata come un fenomeno episodico ma sistemico ed in quanto tale affrontata, (ii) le crisi aziendali producono effetti dannosi sull'intera economia nazionale e non soltanto sugli stakeholder direttamente interessati, (iii) l'individuazione precoce delle crisi e quindi la prevenzione delle stesse consente

di aumentare le possibilità di ritorno in bonis o, in alternativa, l'uscita dal mercato con un minor sacrificio da parte di tutti i soggetti coinvolti.

È possibile distinguere, a seconda del livello di complessità e sofisticazione, metodi di previsione della crisi fondati sugli indici e metodi fondati sui modelli (Guatri, 1986). I primi sono rappresentati da rapporti (ratios) tra grandezze di bilancio, che possono assumere natura patrimoniale, economica o finanziaria. I secondi forniscono, invece, una visione sistemica sulla complessiva condizione aziendale attraverso la considerazione congiunta di una pluralità di indicatori. Nell'approccio di previsione della crisi basato sugli indici manca una visione integrata che metta in correlazione tutti gli indicatori, in modo da fornire un quadro di sistema sulla complessiva situazione aziendale; per siffatta ragione risulta maggiormente opportuno rifarsi a metodologie di previsione basate su modelli, i quali sono in grado di tener conto di una pluralità di indicatori.

La dottrina ha dunque elaborato, nel tempo, diversi modelli che consentono di prevenire la crisi attraverso una sua individuazione tempestiva. Le prime forme embrionali di modelli predittivi vennero concepite ed elaborate negli anni Trenta, nel periodo immediatamente successivo alla grande depressione del 1929. Tali strumenti erano ottenuti prevalentemente dall'opportuna combinazione delle tradizionali analisi di bilancio e di particolari metodiche matematico-statistiche.

È però dagli anni '60 dello scorso secolo che le ricerche accademiche hanno iniziato a concentrarsi su questa tematica, elaborando alcuni tra i principali modelli per la previsione delle crisi aziendali (Altman, 1968; Deakin, 1972; Ohlson, 1980; Zmijweski, 1984).

Il principale autore che si è occupato di modelli di previsione della crisi aziendale è Altman, il cui più importante contributo è rappresentato dal modello Z-score (Altman, 1968). Nonostante il lavoro condotto da Altman sia pioneristico nell'ambito dell'implementazione di modelli di previsione della crisi aziendale, lo Z–score rappresenta ancora oggi un modello riconosciuto, valido e sempre centrale nelle indagini nell'ambito della previsione della crisi. Infatti, il contributo di Altman (1968) è stato fonte di ispirazione per numerosi studi successivi sull'argomento: nel tempo ricercatori e professionisti hanno sviluppato metodi e tecniche di previsione delle crisi che vanno oltre i tradizionali modelli matematici e statistici, con l'obiettivo di prevedere il fallimento delle imprese in modo più rapido e accurato (Barboza et al., 2017).

Al fine di semplificare la tassonomia dei diversi modelli forniti dalla letteratura, questi possono idealmente essere raggruppati in tre classi, a seconda del metodo di classificazione utilizzato. La maggior parte di essi utilizza metodi di classificazione statistica parametrica: analisi discriminanti – siano esse lineari (Altman, 1968) o quadratiche (Lachenbruch et al., 1973) – e tecniche econometriche su dati qualitativi (Ohlson, 1980; Zmijewski, 1984). Altri studi utilizzano metodi statistici non parametrici come il partizionamento ricorsivo (Frydman et al., 1985) e gli stimatori del kernel (Calia e Ganuci, 1997). Più recentemente sono state sviluppate analisi ispirate all'IA, come le reti neurali (Altman et al., 1994; Bardos & Zhu, 1997) o gli algoritmi genetici (Varetto, 1998).

Il principio delle reti neurali consiste nello sviluppo di un cosiddetto algoritmo di apprendimento che imita l'elaborazione delle informazioni da parte del sistema neurologico umano. Ogni neurone risiede in una cosiddetta "funzione di trasferimento", che elabora un insieme di informazioni (input) per ottenere un risultato (output). I diversi modelli di previsione del fallimento che utilizzano le reti neurali si distinguono per la complessità della rete (cioè il suo numero di strati e il numero di neuroni per strato) e per la funzione di trasferimento utilizzata (Atiya, 2001; Charalambous et al., 2023; du Jardin, 2023; Dube et al., 2023; Jabeur et al., 2020; Kim et al., 2022; Mai et al., 2019; Tsai & Wu, 2008). Varetto (1998) e Barney et al. (1999) sono stati i primi Autori a considerare un altro metodo, anch'esso relativo all'IA: gli algoritmi genetici. Il funzionamento è simile a quello delle reti neurali: un algoritmo elabora le informazioni disponibili, i rapporti contabili selezionati e la situazione di ciascuna società (in crisi e sana).

L'algoritmo, per iterazioni successive, deduce regolarità e regole generali del processo di crisi che può poi applicare ad altre società.

La consolidata consapevolezza dell'importanza del fenomeno e della sua indagine, nell'ambito della dottrina economico aziendalistica, ha indotto ad una crescente comprensione del legislatore europeo e nazionale circa la diretta correlazione tra emersione precoce della crisi e possibilità di interventi di turnaround atti ad un ritorno in bonis delle imprese. L'importanza di una precoce rilevazione della crisi d'impresa ha assunto dunque negli ultimi anni una rilevanza sempre maggiore che ha condotto il legislatore, nell'ambito della complessiva riforma del diritto concorsuale, ad introdurre nel nuovo Codice della crisi d'impresa e dell'insolvenza (D.Lgs. n. 14 del 2019) il principio dell'early worning, il quale funge da principio ispiratore dei comportamenti degli attori operanti nell'ambito della crisi d'impresa e delle procedure stesse. L'introduzione di obblighi di rilevazione precoce è avvenuta attraverso la modifica dell'art. 2086 del Codice civile che, nella sua attuale versione, prevede l'obbligo per l'imprenditore di istituire un assetto organizzativo, amministrativo e contabile adeguato alla natura e alle dimensioni dell'impresa, anche in funzione della rilevazione tempestiva della crisi. Nonché attraverso l'introduzione nell'ambito del Codice della crisi di obblighi di rilevazione precoce dei segnali di crisi: l'art. 3 del Codice prevede infatti che l'imprenditore, sia individuale che collettivo, deve adottare misure idonee a rilevare tempestivamente lo stato di crisi e fornisce taluni "segnali" sintomatici della stessa (riguardanti i debiti per retribuzioni, verso fornitori, verso banche e intermediari finanziari e verso creditori pubblici qualificati, rappresentati dagli Enti fiscali e previdenziali). Le previsioni del legislatore in materia di emersione precoce della crisi, da un lato, dunque, rimandano al soggetto economico in merito alla più idonea predisposizione di assetti per la rilevazione tempestiva della crisi, dall'altro forniscono talune specifiche previsioni sintomatiche della stessa. Pertanto, gli imprenditori (e gli organi di controllo per le specifiche funzioni che il legislatore stesso affida loro) dovranno implementare sistemi di prevenzione e previsione della crisi in grado di rilevare una sua eventuale emersione, adattando gli stessi alle peculiarità dell'impresa, non bastando, evidentemente, i limitati indicatori esplicitamente forniti dal legislatore, i quali non forniscono un'ottica complessiva dello stato di salute aziendale.

È proprio in tale contesto nazionale che appare opportuno indagare sulla possibilità di introdurre l'IA per migliorare i meccanismi di previsione della crisi sin d'ora elaborati attraverso le tradizionali tecniche contabili e parzialmente adottati dal Legislatore. Tra le tecnologie abilitanti emergono i big data, la blockchain e l'IA (Trequattrini et al., 2021; Lombardi et al., 2022). Negli ultimi anni quest'ultima sta assumendo un ruolo centrale, diffondendosi sia tra le persone, che nelle aziende pubbliche e private, rivoluzionando sia la vita delle persone che i processi aziendali (Wirtz et al., 2019; Arduni e Beck, 2025). L'IA imita, infatti, quanto più possibile, per mezzo di macchine normalmente elettroniche, l'attività mentale dell'uomo (Boden, 2019; Mitchell et al., 2013; Trequattrini & Schimperna, 2023). Impatti cominciano a rilevarsi anche nei processi di accounting (Khaled AlKoheji e Al-Sartawi, 2022; Fasano et al., 2025). In particolare, l'impatto dell'IA sulla contabilità è particolarmente evidente nell'area dell'acquisizione e dell'elaborazione dei dati (estrazione, confronto e convalida dei dati), poiché le tecnologie basate sull'IA sono in grado di individuare le informazioni rilevanti, estrarle dai documenti e metterle a disposizione dei contabili o dei revisori, che possono così dedicare più tempo alle aree che richiedono un livello di giudizio più elevato (Brennan et al., 2017; Jin et al., 2022).

Inoltre, se da un lato l'IA sembra essere un fattore potenziante il capitale umano (Trequattrini et al., 202l), dall'altro, la sua introduzione ha portato con sé cambiamenti significativi nel modo in cui le organizzazioni gestiscono le attività e nella natura degli stessi posti di lavoro (Kaplan, 2016). Tale tecnologia potenzia il capitale umano grazie alla capacità di processare grandi quantità di dati in modo generalmente più accurato dell'uomo e soprattutto in modo più celere, permettendo di ottenere in poco tempo analisi spazio-temporale molto approfondite (Duan et al., 2019) .

Un crescente interesse per tale tematica e un gap in letteratura emerge da una ricerca sul database scientifico Scopus il 03 dicembre 2025 con le seguenti parole chiave, "artificial intelligence" OR "AI" and "business* crisis*" OR "corporate crisis*" OR "bankruptcy" dalla quale sono emersi 82 documenti relativi all'area "Business, Management and Accounting", con 16 articoli nel 2025.

Molti di questi studi hanno, però, analizzato le cause finanziarie e non finanziarie del fallimento, in quanto fenomeno multidimensionale (Ooghe e De Sofie, 2008), altri hanno concentrato l'attenzione sul processo che porta le imprese al fallimento (Levratto, 2013). In questa prospettiva la nostra domanda di ricerca (RQ) è la seguente:

RQ: Gli algoritmi di IA possono migliorare la capacità predittiva degli indicatori contabili tradizionali di crisi d'impresa?

A partire dai limiti degli indicatori tradizionali previsti dal D.Lgs. 14/2019, lo studio si propone di analizzare come le tecniche di machine learning possano essere applicate nella previsione precoce della crisi d'impresa. Attraverso un metodo qualitativo (Hair Jr. et al., 2003; Krippendorff, 2013) si cercherà di raggiungere gli obiettivi di ricerca prefissati. Tale scelta è appropriata dato che il metodo qualitativo permette ai ricercatori di raggiungere i propri obiettivi di ricerca in determinate situazioni "Situations in which qualitative research is likely to be the preferred method include 1) which little known about a research problem or opportunity, 2) where previous research only partially on incompletely explains the research question, 3) when current knowledge involves subconscious, psychological, or cultural material that is not accessible using survey and experiments, and 4) if the primary purpose of the research is to propose new ideas and hypotheses that can eventually be tested with quantitative research. (Haier et al. p. 276)".

Nel primo step della ricerca è stato creato un campione di imprese italiane per le quali erano disponibili informazioni sullo stato di attività/crisi e per le quali erano disponibili i dati economico/finanziari. Il focus sul contesto italiano è essenziale in questa prima fase per assicurare la robustezza dei risultati, essendo la normativa sulla crisi d'impresa strettamente nazionale. Nel secondo step, sono state raccolti attraverso la banca dati AIDA i dati economico-finanziari necessari all'implementazione del modello di previsione classico e quello tramite IA. Nel terzo step, sono state confrontate le evidenze dei modelli statistici classici e la previsione effettuata attraverso algoritmi di IA nel prevedere situazioni di insolvenza o perdita della continuità aziendale.

I risultati preliminari evidenziano una maggiore capacità dell'IA di individuare tempestivamente i segnali di crisi, pur richiedendo un'interpretazione professionale per garantire trasparenza e affidabilità del giudizio. Il professionista contabile dovrà, però, in tale ottica acquisire nuove competenze, come quelle tipiche del data analyst e di interpretazione dei risultati dell'IA. Inoltre, l'integrazione delle pratiche professionali classiche con quelle derivanti dalle nuove tecnologie abilitanti apre anche questioni etiche e normative, tra cui la responsabilità nei processi decisionali e la trasparenza degli algoritmi. In questa prospettiva, i risultati sembrerebbero mostrare la necessità di sviluppo di explainable AI per la contabilità, al fine di permettere al professionista di poter correttamente interpretare i risultati dell'AI.

Il paper offre implicazioni teoriche e pratiche. Nella prima prospettiva, risponde a molte call, tra cui quella del XLI Convegno AIDEA, e colma un gap in letteratura su come l'IA possa superare i limiti dei modelli predittivi della crisi classici. Contribuisce, dunque, al filone di ricerca sull' importanza di individuazione dei segnali di crisi d'impresa (Altman, 1968; Deakin, 1972; Ohlson, 1980; Zmijweski, 1984; Brodi, 2018) sul ruolo delle nuove tecnologie nei processi di accounting (Khaled AlKoheji & Al-Sartawi, 2022; Trequattrini & Schimperna, 2023; Fasano et al., 2025). Nella seconda prospettiva, i risultati ottenuti sono rilevanti per la professione contabile, per i revisori, gli organi di controllo, i CFO e i commercialisti, e per la progettazione di sistemi di controllo interni integrati con tecnologie predittive, contribuendo al dibattito sull'evoluzione digitale dell'accounting.

Questo studio presenta alcune limitazioni, dovute alla focalizzazione esclusivamente al contesto italiano, all'analisi su un unico anno e all'applicazione di un metodo esclusivamente qualitativo. Tuttavia, questo è solo un primo studio sul tema, con la normativa sulla crisi d'impresa cambiata da poco tempo; una volta trascorso più tempo dall'introduzione del nuovo Codice della Crisi d'impresa sarà possibile effettuare analisi più approfondite e con confronti spazio-temporali. Sarà utile nelle future ricerche anche effettuare questionari a professionisti contabili esperti sul tema.

Parole chiave: Accounting; controllo; IA applicata alla prevenzione della crisi

Le aree di bilancio maggiormente interessate da condotte illecite: red flags ed evidenze empirico-giurisprudenziali dalle pronunce della Cassazione

Francesco Capalbo[1], Nicoletta Mottola[2], Alessia Rotili[3], Margherita Smarra[4]

1. Sviluppo concettuale e inquadramento teorico

Il financial accounting è chiamato a rappresentare in modo fedele e attendibile la situazione economico-finanziaria dell'impresa a supporto e beneficio delle decisioni di investimento, di credito e di regolazione dei mercati (Ball & Brown, 1968; Beaver, 1968; OIC 11, 2018; IASB, 2018; FASB, 2024). Nel tempo, il ruolo del financial reporting si è ampliato oltre la sola decision usefulness per gli investitori, includendo in modo crescente le funzioni di stewardship e di accountability verso la collettività. L'informazione finanziaria deve quindi garantire trasparenza, responsabilità e una allocazione efficiente delle risorse, al servizio dell'interesse pubblico e della stabilità di lungo periodo.

In un contesto così delineato, l'attendibilità della rappresentazione contabile, nonché la qualità dell'informativa finanziaria, sono divenute temi centrali tanto nella letteratura accademica quanto nell'ambito regolatorio. Gli strumenti di early warning per la prevenzione delle manipolazioni assumono quindi una valenza che va oltre la tutela del singolo soggetto, alimentando l'attenzione attorno al fenomeno della alterazione dei dati contabili.

La redazione del bilancio d'esercizio implica per sua natura un fisiologico margine di discrezionalità. Del resto, come ampiamente evidenziato in letteratura, il bilancio è prevalentemente il risultato di stime e congetture (Azzini, 1957; Ferrero, 1965; Masini, 1979; Onida, 1971; Provasoli, 1974; Zappa, 1957). Tale discrezionalità, seppur inevitabile e in parte necessaria per la rappresentazione della realtà economica (Capalbo, 2016), non può trasformarsi in mero arbitrio (Giunta & Pisani, 2008), in quanto esiste un "limite di ragionevolezza" oltre il quale le valutazioni si traducono in una rappresentazione alterata della realtà (Cass. civ., Sez. I, 12/05/2022, n. 15087). Se da un lato infatti si può sostenere che l'esercizio consapevole della discrezionalità, quando avvenga entro i limiti fissati dall'ordinamento e dai principi contabili, debba presumersi ragionevole, d'altro canto sarebbe ugualmente sbagliato ritenere che il mero rispetto della regolarità formale ne implichi di per sé un uso corretto e che quindi, non si sia giunti ad una rappresentazione di fatti non rispondenti al vero (Cass. pen., Sez. V, 15/05/2014, n. 20738).

Per quanto la dottrina classica di economia aziendale abbia riconosciuto negli anni l'importanza di tale margine decisionale agli amministratori nelle valutazioni di bilancio, è altrettanto evidente che questo porti con sé il rischio di essere utilizzato non per migliorare la qualità informativa del bilancio, ma per finalità opportunistiche.

La letteratura su earnings management e earnings quality ha infatti ampiamente documentato che l'eccessivo arbitrio nei processi valutativi e stimativi del bilancio può risultare in una

alterazione della qualità dell'informazione finanziaria, influenzando le decisioni di investitori, creditori e altri stakeholder e distorcendo l'allocazione delle risorse.

La dottrina distingue, pur evidenziandone la continuità, tra earnings management e frode di bilancio. Numerose e talvolta differenti sono le definizioni di "gestione degli utili" fornite negli anni (ex multis: Beneish, 2001; Healy & Wahlen, 1999; Ronen & Yaari, 2008; Schipper, 1989) divenendo un termine di uso comune nelle sue sfaccettature (e.g. earnings management, manage earnings, managing earnings, management of earnings) quando ci si riferisce alla gestione del bilancio in generale. Tanto spiega come non esista necessariamente una tendenza a migliorare o a peggiorare i risultati ma piuttosto ad adattarli, volta per volta, alle specifiche esigenze degli amministratori (Capalbo, 2003). Ulteriori studi invece lo considerano come predittivo di frode (Ettredge et al., 2010; Perols & Lougee, 2011) e avente natura informativa (Guay et al., 1996; Subramanyam, 1996). Ciò che accomuna tali condotte sono tuttavia le conseguenze che vanno ben oltre la singola impresa. Sebbene con intensità differenti, gli impatti infatti possono coinvolgere dipendenti, settori, ambiente e famiglie, creando distorsioni di mercato e innescando effetti negativi indiretti più ampi che si estendono alla società in generale (Adut, 2008; Greve et al., 2010; Perols & Lougee, 2011).

Tanto premesso, in questo scenario si colloca il concetto di red flags, intesi come segnali di allarme, finanziari e non finanziari, che indicano condizioni, eventi o combinazioni di indicatori associati a un elevato rischio di manipolazione o di frode (Romney et al., 1980). La maggior parte della ricerca sui red flags è stata condotta dal punto di vista della professione di revisore contabile (Pincus, 1989; Albrecht & Romney, 1986; Munteanu et al., 2024) e la letteratura evidenzia come questi non siano prove di frode, ma condizioni frequentemente presenti nei casi di irregolarità, utili come meccanismo di allerta precoce (Robertson, 1997; Romney et al., 1980).

Numerosi contributi hanno indagato l'individuazione delle anomalie di bilancio. Si vedano, ad esempio, Bell & Carcello (2000); Beneish (1999); Herawati (2015); Kaminski et al. (2004); Lee et al. (1999) e Malgwi & Morgan (2017), solo per citarne alcuni. Dal punto di vista metodologico, negli anni si sono affermati numerosi modelli basati su accruals anomali (Jones, 1991; Dechow et al., 1995), indici sintetici di rischio di manipolazione (Beneish, 1999; Beneish et al., 2013), score di previsione di errori significativi (Dechow et al., 2011) e tecniche di data mining. Sebbene tali contributi abbiano prodotto strumenti ampiamente utilizzati, spesso si collocano al di fuori di ciò che gli utilizzatori non specialisti o le altre parti interessate possono osservare o misurare. È inoltre necessario che si fondino su indicatori trasparenti, interpretabili e ancorati a evidenze empiriche robuste richiedendo una conoscenza accurata delle aree di bilancio a maggiore vulnerabilità. Rimane pertanto meno indagata la dimensione realmente prospettica di questi segnali di allarme (i.e. red flags) e meno frequente è anche la verifica longitudinale della capacità effettiva di anticipare comportamenti manipolativi in contesti reali.

Il presente lavoro (work in progress) si colloca pertanto in questo filone di ricerca proponendo un approccio empirico per una mappatura delle aree di bilancio maggiormente oggetto di contestazione, basato sulle pronunce della Corte di Cassazione italiana.

2. Obiettivi della ricerca

Nello scenario sopra descritto, il presente contributo intende perseguire due obiettivi principali:

- mappare empiricamente, tramite un'analisi quali-quantitativa di una popolazione di pronunce della Cassazione, le voci di bilancio più frequentemente oggetto di contestazione. Il fine è individuare le aree a maggior rischio di condotte illecite e identificare contestualmente i principali red flags per i cluster ricorrenti;
- verificare la presenza di red flags negli esercizi precedenti al primo anno di bilancio contestato, con lo scopo di valutarne anche la capacità anticipatoria, e individuare eventuali

segnali integrativi attraverso un'analisi longitudinale dei bilanci delle società oggetto di contestazione.

La ricerca, al suo livello attuale, presenta i risultati già conseguiti in relazione al primo obiettivo con una parziale costruzione concettuale dei red flags. La validazione empirica di tali indicatori su bilanci societari costituirà invece la fase successiva del progetto.

3. Metodologia

L'impostazione metodologica per il primo obiettivo di ricerca è stata strutturata sulla raccolta di una popolazione significativa di pronunce civili e penali della Cassazione italiana. L'approccio adottato combina la classificazione quantitativa dei dati, ovvero delle voci di bilancio individuate quali oggetto di contestazione, con una analisi qualitativa del contenuto delle sentenze e delle ordinanze prese in esame, al fine di integrare le informazioni contabili con le motivazioni e le tipologie di condotte.

Da questa prima indagine, orientata anche a definire i principali cluster delle aree maggiormente esposte, saranno individuate nella fase successiva, ancora da realizzare, le società coinvolte nelle pronunce esaminate. Lo studio empirico di questo campione di aziende, con i rispettivi prospetti di bilancio, è condotto sui dati disponibili in AIDA, banca dati sviluppata da Bureau van Dijk, che fornisce informazioni economico-finanziarie e societarie sulle imprese italiane. Mediante una analisi longitudinale dei bilanci degli 1–3 anni precedenti il primo anno oggetto di contestazione (orizzonte temporale ritenuto idoneo e confermato in letteratura: Ettredge et al., 2010; Munteanu et al., 2024), si andrà infine a verificare la presenza o meno dei red flags quantitativi e qualitativi individuati, anche con lo scopo di valutarne la capacità anticipatoria.

Ai fini di questo lavoro di ricerca, le pronunce di legittimità si sono rivelate particolarmente utili poiché rappresentano l'esito finale del processo, momento in cui le questioni di fatto e le condotte vengono valutate in modo definitivo, salvo i limitati casi in cui la pronuncia della Cassazione stabilisce un rinvio in Corte d'Appello. Peraltro, la scelta di utilizzare le pronunce della cassazione deriva anche dalla possibilità di utilizzare un database unitario su base nazionale.

Inoltre, sono state incluse le decisioni sia penali che civili in quanto il focus del lavoro è l'elemento oggettivo[5] del falso in bilancio. Escludendo infatti il profilo soggettivo, anche la giurisprudenza civile fornisce un contributo essenziale per l'analisi. L'integrazione delle due sezioni permette poi di verificare la validità dei risultati a più livelli: se ad esempio una certa area contabile emerge spesso in entrambi i contesti, la sua classificazione come "area a rischio" diventa più solida e significativa. Sebbene all'interno del lavoro le due sezioni siano state analizzate separatamente, ciò fatto per chiarezza e trasparenza metodologica, il presente contributo mira a superare la tradizionale dicotomia tra ambito penale e civilistico, valorizzando l'analisi tecnico-contabile in quanto tale.

Le decisioni sono state individuate mediante il portale ItalgiureWeb, piattaforma ufficiale del Centro Elettronico di Documentazione (CED) della Corte, che consente di combinare filtri testuali, normativi e cronologici sulle sezioni "SNPEN" (Penale) e "SNCIV" (Civile) con accesso integrale alle decisioni. Per entrambe le sezioni, la ricerca è stata delimitata al periodo "2020–2025"[6], selezionando tutte le pronunce depositate.

[5] Per meglio specificare, l'art. 2621 c.c., così come modificato dall'art. 9 della legge 69/2015 individua la componente oggettiva del reato in una duplice configurazione: (i) la esposizione di "fatti materiali rilevanti non rispondenti al vero" intesa come condotta attiva; (ii) la omissione di "fatti materiali rilevanti la cui comunicazione è imposta dalla legge" intesa come condotta omissiva.

[6] Per la sezione civile, ultima rilevazione effettuata in data 2 ottobre 2025; per la sezione penale, in data 30 settembre 2025.

L'orizzonte temporale scelto, seppur relativamente recente, si è rivelato il più idoneo per bilanciare due esigenze: da un lato, permette di cogliere l'evoluzione giurisprudenziale e contabile più attuale; dall'altro, tiene conto dei tempi fisiologici del processo, generalmente lunghi, ed è frequente che i fatti di bilancio esaminati risalgano anche a dieci o quindici anni prima del deposito della decisione. Per tale motivo, nel database sono stati individuati anche gli anni dei bilanci oggetto di contestazione, laddove disponibili, fornendo informazioni utili per (i) una contestualizzazione temporale maggiormente precisa, (ii) una lettura diacronica dei risultati e (iii) soprattutto per l'identificazione dei bilanci necessari per la successiva analisi dei red flags.

Per la sezione penale, il criterio di ricerca che si è rivelato più efficace è dato dalla combinazione dell'espressione "false comunicazioni sociali" con il filtro temporale "2020–2025", così da intercettare i procedimenti in cui il reato di falso in bilancio costituiva l'oggetto specifico del giudizio. Per la sezione civile invece, la selezione è stata ancorata all'art. 2423 c.c., privilegiando un approccio volto a individuare tutte le pronunce in cui la clausola generale di chiarezza, verità e correttezza del bilancio funge da parametro di legittimità.[7]

Il corpus iniziale così ottenuto è stato sottoposto a una revisione qualitativa manuale allo scopo di escludere i casi "fuori tema" (decisioni in cui le irregolarità di bilancio non costituivano il nucleo della controversia). Complessivamente quindi, per il periodo 2020–2025, sono state individuate 104 decisioni penali e 75 civili, per un totale di 179 pronunce valide con le quali è stato costruito un database in formato Excel ai fini della mappatura delle aree più frequentemente contestate[8].

Per ciascuna sentenza, sono state sistematicamente rilevate le informazioni identificative principali (e.g. sezione, numero e registro generale, data di udienza e deposito), l'anno o gli anni dei bilanci oggetto di contestazione nonché le società coinvolte (laddove presenti), le voci di bilancio interessate, la tipologia di condotta accertata e l'esito del giudizio. Le voci di bilancio considerate sono state derivate dagli schemi civilistici di Stato Patrimoniale (art. 2424 c.c.) e Conto Economico (art. 2425 c.c.), utilizzati come riferimento iniziale per la classificazione[9]. In particolare, sono state distinte: Immobilizzazioni immateriali, materiali e finanziarie; Rimanenze (con evidenza dei lavori in corso su ordinazione); Crediti; Fondi; Debiti; Costi inesistenti; Fatture da emettere e da ricevere.

È indubbio che l'alterazione di una singola voce può naturalmente essere letta da una duplice prospettiva poiché ad esempio, una appostazione di crediti inesistenti produce di conseguenza effetti anche sui ricavi. Al fine di evitare una sovrastima artificiale dell'incidenza di specifiche aree di bilancio, nell'analisi delle pronunce le voci sono state pertanto classificate in base alla contestazione effettivamente formulata. Inoltre, una medesima pronuncia può ricomprendere più alterazioni contabili, riflettendo la natura spesso combinata delle condotte. Mutuando quindi dal corpus di pronunce individuate, la popolazione oggetto di analisi è costituita dall'insieme delle alterazioni contestate.

Considerato infine che l'elemento oggettivo in materia di false comunicazioni sociali, focus del presente lavoro, si articola lungo quattro pilastri della rendicontazione, recognition,

[7] In una prima fase di sperimentazione, l'inserimento di ulteriori riferimenti normativi (e.g. artt. 2424 ss. c.c.), comportava un eccessivo restringimento dei risultati e la conseguente esclusione di numerose decisioni di rilievo.

[8] Nell'insieme di pronunce considerato rientrano anche le decisioni che giungono a conclusioni non definitive (e.g. rinvio o parziale rinvio). Tale scelta segue la logica e lo scopo dell'indagine, che non mira ad accertare la responsabilità o il reato, bensì a identificare le aree di bilancio maggiormente esposte. La rilevanza di una voce non dipende quindi dall'esito finale del giudizio, ma dal fatto stesso che sia stata oggetto di contestazione.

[9] L'analisi delle prime sentenze ha tuttavia suggerito degli adattamenti, aggregando alcune voci e introducendo ulteriori sottocategorie nei casi in cui le motivazioni delle pronunce fornivano un maggior dettaglio di informazioni e soprattutto per le contestazioni ricorrenti.

measurement, presentation e disclosure, questo studio approfondisce in particolare le contestazioni di carattere quantitativo, sebbene queste risultino frequentemente correlate a profili di natura qualitativa.

Sul piano analitico, la ricerca combina quindi (a) una analisi delle frequenze di contestazione per area di bilancio; (b) una analisi delle co-occorrenze tra voci, mediante matrici con probabilità condizionate per identificare cluster ricorrenti; (c) una analisi qualitativa delle motivazioni giurisprudenziali, per ricostruire le logiche economico-aziendali e le tecniche contabili sottostanti.

4. Risultati preliminari

I risultati preliminari suggeriscono che le contestazioni per frode tendono a concentrarsi in specifiche aree di bilancio che comportano un elevato grado di discrezionalità e che le tecniche solitamente utilizzate rientrano in un numero limitato di categorie. L'analisi evidenzia inoltre che i comportamenti fraudolenti si verificano spesso attraverso combinazioni di pratiche, riflettendo la natura intrinsecamente integrata del bilancio.

In riferimento all'analisi giurisprudenziale delle pronunce della Cassazione nella sezione penale sono state identificate 206 contestazioni totali, di cui 204 di carattere quantitativo, oggetto di indagine. Le frequenze per area di bilancio[10] (Figura 1) evidenziano una concentrazione su crediti (circa 28,7%) e debiti (24%), cui si affiancano, con incidenze minori ma significative, le immobilizzazioni materiali (12,4%) e immateriali (8,8%).

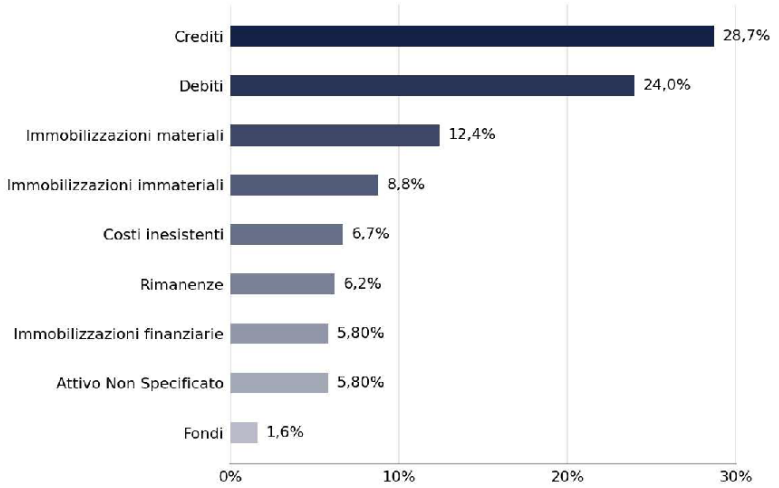

Figura 1. Cassazione Penale: voci contestate per area di bilancio espresse in percentuali (2020-2025)

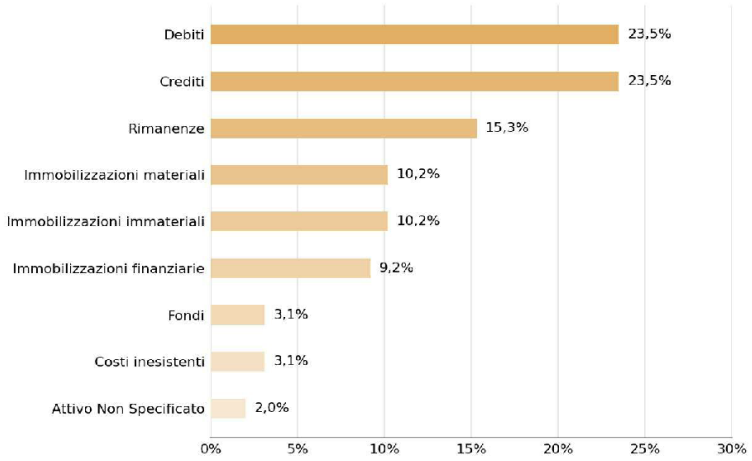
Per le pronunce civili, sono state rilevate 110 alterazioni totali, di cui 98 quantitative distribuite così come mostrato in Figura 2. Le aree maggiormente contestate risultano Crediti (23,5%) e Debiti (23,5%) che, seppur presenti in egual misura percentuale, non risultano altrettanto frequentemente alterati insieme, situazione che accade invece per le sentenze penali. Seguono poi le Rimanenze (15,3%) e le Immobilizzazioni, Materiali e Immateriali (10,2%) e Finanziare (9,2%).

[10] Le percentuali riportate esprimono le frequenze relative delle voci contestate.



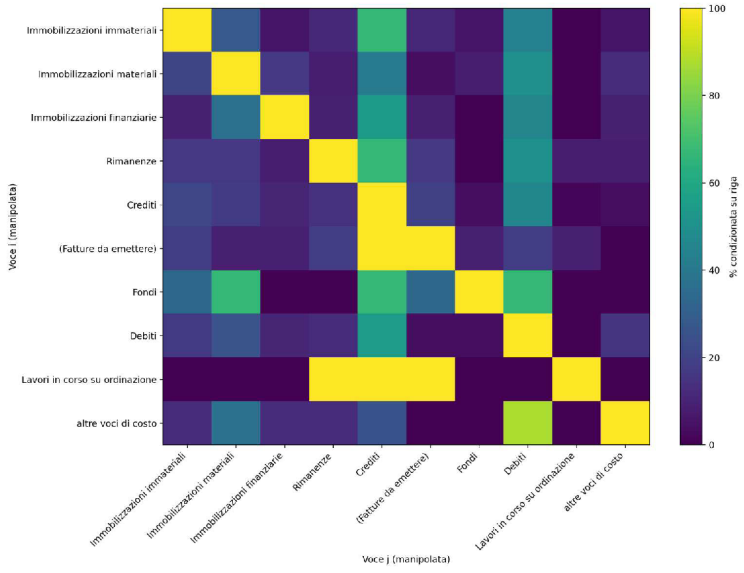


Figura 2. Cassazione Civile: voci contestate per area di bilancio espresse in percentuali (2020-2025)

Le matrici di co-occorrenza[11], costruite per entrambe le sezioni, mostrano come le condotte contestate si manifestino raramente in forma isolata, ma tendano a coinvolgere congiuntamente più voci di bilancio. Dal punto di vista metodologico, la normalizzazione per riga rende le matrici adatte a leggere relazioni (i.e. dato *i* manipolata, quanto spesso compare *j*), ma impone cautela interpretativa sulle voci a bassa frequenza (e.g. fondi, lavori in corso).

Nella sezione penale (Figura 3) la matrice suggerisce che le alterazioni contabili interessano frequentemente più poste collegate. In particolare, si evidenzia una forte compresenza tra Crediti e Debiti, sia in termini relativi che assoluti. Emergono legami significativi anche con le Rimanenze che co-occorrono spesso con Crediti e Debiti; lo stesso accade per le Immobilizzazioni Immateriali e Materiali. Questi *pattern* sono coerenti con condotte in cui la manipolazione non riguarda solo poste di fine esercizio, ma coinvolge anche aree di capitalizzazione e valutazione dell'attivo, in modo da sostenere la rappresentazione complessiva di solidità e performance.

[11] Espresse in percentuali condizionate per evitare l'effetto distorsivo dovuto alla numerosità delle voci (e.g. è evidente che i crediti si manifestano in valore assoluto più di altre poste) e individua le relazioni anche tra voci meno frequenti.

Figura 3. Cassazione Penale: co-occorrenze delle voci di bilancio contestate (2020-2025)

Nella sezione civile (Figura 4) si osserva una struttura meno interconnessa rispetto a quella penale. Anche in questo caso, le voci più ricorrenti risultano Crediti e Debiti ma la loro co-alterazione è moderata, suggerendo che molte controversie restino focalizzate su singole aree di valutazione e rappresentazione piuttosto che su schemi coordinati di poste di bilancio. Tra le immobilizzazioni, quelle materiali co-occorrono maggiormente con Crediti e Debiti, mentre le Rimanenze mostrano legami più moderati.

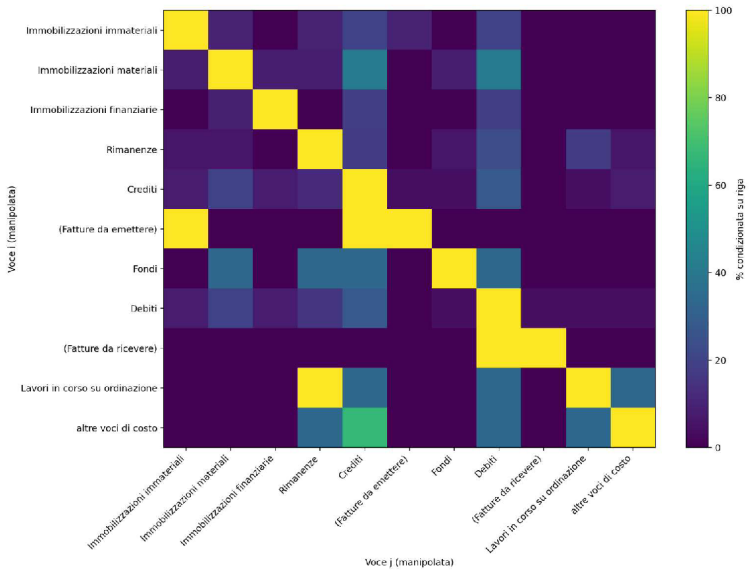

Figura 4. Cassazione Civile: co-occorrenze delle voci di bilancio contestate (2020-2025)

La lettura qualitativa delle motivazioni tratte dalle pronunce consente poi di tradurre tali pattern in schemi di condotta ricorrenti. Tra i più rilevanti:

- anticipazione o omessa rilevazione di ricavi, talvolta con contratti simulati, uso strumentale dei conti "Fatture da emettere" (e più raramente "Fatture da ricevere") e creazione di proventi straordinari fittizi (Cass. pen., Sez. V, 10/06/2016, n. 24402; Cass. civ., Sez. Trib., n. 2613/2024; Cass. civ., Sez. V, n. 27647/2020; Cass. civ., Sez. Trib., n. 4398/2020; Cass. civ., Sez. Trib., n. 14538/2025);
- iscrizione e mantenimento di crediti inesistenti o inesigibili, fondi svalutazione inadeguati e registrazione di falsi crediti IVA; al contrario con svalutazioni arbitrarie o omissioni di crediti certi ed esigibili (Cass. pen., Sez. V, n. 23168/2020; Cass. civ., Sez. I, n. 17297/2024; Cass. civ., Sez. I, n. 12687/2023);
- capitalizzazione impropria di costi, iscrizione di avviamenti privi di fondamento economico, sopravvalutazione di immobilizzazioni e mancato allineamento degli ammortamenti alla reale vita utile (Cass. civ., Sez. Trib., n. 27935/2022; Cass. civ., Sez. Trib., n. 29342/2022);
- valutazioni errate di magazzino e differenze sistematiche tra giacenze fisiche e rimanenze; nei casi in cui sono coinvolti i Lavori in corso su ordinazione si riscontrano valori senza fondamento negoziale o imputazioni arbitrarie (Cass. civ., Sez. I, 12/07/2017, n. 17350; Cass. pen., Sez. V, 16/12/2010, n. 49252; Cass. civ., Sez. Trib., n. 6433/2021, Cass. civ., Sez. Trib., n. 3273/2024; Cass. civ., Sez. Trib., n. 26650/2020; Cass. pen., Sez. V, 10/01/2011, n. 251);

- operazioni infragruppo o transazioni correlate a condizioni non di mercato: conferimenti e cessioni di rami d'azienda a valori incongrui e trasferimenti simulati con registrazioni di ricavi privi di sostanza economica (Cass. civ., Sez. Trib., n. 14014/2024; Cass. civ., Sez. V, n. 14872/2020);
- occultamento di debiti (anche fiscali e previdenziali) e mancata iscrizione di fondi rischi e oneri, specie in presenza di contenziosi prevedibili o passività potenziali (Cass. civ., Sez. I, n. 10873/2024; Cass. civ., Sez. I, n. 17297/2024; Cass. civ., Sez. I, n. 7433/2023; Cass. civ., Sez. I, n. 12687/2023), unitamente a carenze sistematiche dell'informativa in nota integrativa.

Mutuando quindi dai risultati della analisi empirico-giurisprudenziale, le aree di bilancio maggiormente coinvolte in contestazioni sono state raggruppate in 4 cluster principali in modo da poter identificare per ciascuno i potenziali red flags:

- Crediti: iscrizioni o tenuta in contabilità senza prospettive di recuperabilità e fondi svalutazione inadeguati;
- Immobilizzazioni, con capitalizzazioni non lecite e sopravvalutazioni che si riflettono in modo speculare sugli ammortamenti;
- Rimanenze, comprendendo anche i lavori in corso su ordinazione, con errate valutazioni di fine esercizio o imputazioni arbitrarie;
- Debiti e Fondi, con omissioni, mancate iscrizioni e sottoesposizioni.

Da una disamina della letteratura sul tema, è stato possibile derivare un insieme di red flags, non esaustivo ma coerente con i pattern emersi dalle decisioni. A titolo esemplificativo, si riportano: incremento della vita media degli incassi (rapporto crediti/fatturato); crescita dei crediti a un ritmo superiore all'aumento delle vendite; prolungamento della vita utile delle immobilizzazioni o riduzione del tasso medio di ammortamento; incrementi significativi di attività immateriali in riferimento al totale attivo e agli anni precedenti; miglioramenti improvvisi dei margini lordi o operativi non spiegati da cambiamenti nel modello di business; incoerenza tra variazione delle rimanenze e costo del venduto, con incrementi delle scorte non in linea con i margini industriali o con l'andamento dei volumi; strutture di finanziamento sbilanciate, con rapporti anomali tra patrimonio netto, immobilizzazioni e indebitamento di lungo termine, letti in combinazione con indicatori di redditività e liquidità (Brennan & McGrath, 2007; Ettredge et al., 2010; Singleton, 2010; Perols & Lougee, 2011; du Toit et al., 2015; Schilit et al., 2018; Munteanu et al., 2024; du Toit, 2024).

Anche nella prassi è quindi evidente che gli strumenti solitamente impiegati per manipolare un bilancio siano alla fine riconducibili a un numero ristretto di categorie. D'altro canto, ogni alternazione ha sempre un impatto più ampio, specialmente quando si protrae nel tempo; pertanto, una prima condotta spesso innesca un processo progressivo e integrato che conduce inevitabilmente ad altre. Come inoltre dimostrato anche dai risultati empirici di questa analisi, ogni tentativo di dissimulare l'impatto reale dei fatti di gestione, genera ripercussioni nell'assetto complessivo e nel tempo, data la natura stessa del bilancio e delle relazioni che intercorrono tra le sue componenti. Basti pensare ad esempio alla scelta di intervenire in sede di assestamento con una sovrastima o sottostima delle rimanenze: questa impatterà necessariamente sull'esercizio successivo realizzando degli effetti a catena. Infine, un elemento ricorrente, emerso in modo convergente sia dalle pronunce giurisprudenziali sia dalla letteratura, è che i red flags non possono e non devono essere interpretati singolarmente. Nessun indicatore è di per sé sufficiente. Piuttosto, è la combinazione dei segnali a costituire una base analitica solida per formulare un giudizio di rischio.

5. Valore scientifico potenziale e sviluppi futuri

Alla luce delle evidenze discusse, il lavoro intende offrire contributi potenziali sul piano accademico e applicativo. La rassegna delle pronunce della Cassazione, assunta come base conoscitiva per derivare pattern ricorrenti di irregolarità, senza alcuna pretesa di esaurire la

complessità del fenomeno, consente di costruire un osservatorio privilegiato sui comportamenti concretamente riscontrati nei contesti reali. Tale prospettiva propone da un lato una classificazione empiricamente fondata delle aree di bilancio più vulnerabili; dall'altro, fornisce una base per la concettualizzazione dei red flags realmente rappresentativi integrando gli approcci dominanti nella letteratura tradizionale.

Sul piano applicativo, una possibile implicazione risiede nello sviluppo di linee guida contabili operative. Lo studio identifica infatti le aree di bilancio più esposte al rischio di manipolazione e che pertanto richiedono una guida rafforzata.

Rimangono tuttavia necessari, per una valutazione più solida, sviluppi ulteriori per identificare sistemi di early warning maggiormente interpretabili e integrabili, anche nell'ottica della verifica longitudinale dei red flags nei bilanci delle imprese coinvolte, prevista nella fase successiva del lavoro.

In tema di proseguimento della ricerca, la lettura delle condotte sarà ulteriormente arricchita considerando il contesto aziendale in cui esse emergono, con particolare riferimento a situazioni di crisi o di deterioramento economico-finanziario. Tale prospettiva consentirà di collegare più chiaramente le scelte di bilancio e i red flags individuati alle motivazioni sottostanti le condotte illecite.

D'altronde, nel dibattito sul ruolo del financial accounting come elemento di fiducia per gli stakeholder e per la tutela del bene comune, strumenti informativi capaci di rafforzare l'affidabilità, la trasparenza e la prevedibilità dei comportamenti d'impresa assumono una valenza anche istituzionale.

The Role of Personality in Shaping Managerial Engagement with Artificial Intelligence in Accounting Research

Francesca di Donato[1], Alice Pennesi[2], Sara Trucco[3]

1. Introduction

The aim of our research is fourfold. First, we seek to explore how the need for verification and error analysis affect managerial trust in Artificial Intelligence (AI) systems. Second, we aim to investigate the extent to which AI acts as a catalyst for original thinking and is perceived as a driver of success and innovation by managers. Third, we intend to assess how AI supports interpersonal functions and contributes to organizational efficiency in managerial work. Fourth, we aim to explore managerial behavior in using AI for corporate disclosure and reporting. By addressing these objectives, our study provides a comprehensive perspective on the cognitive, relational, and practical aspects of using AI in accounting.

Despite the growing body of research on competences, decision-making processes, structures, and AI governance (Arkhipova et al., 2024), the literature does not systematically examine managers' personality profiles nor test typological models as antecedents of AI trust, usage, and purpose. Recent studies on AI and governance focus primarily on board roles, capabilities, and oversight (e.g., transparency, auditability, AI committees) and some authors highlight the need for further research to deepen our understanding of the relationships and interconnections between Artificial Intelligence and accounting, including new mappings of empirical experiences (Sutton et al. 2016).

This study addresses a significant theoretical and empirical gap by integrating Holland's person– environment fit perspective into the analysis of managerial engagement with AI (Holland 1973). Moreover, given the scarcity of research examining accounting issues through a personality lens, we aim to contribute to this underexplored area of the literature (Taggar & Parkinson, 2007; Cewińska et al., 2017).

Building on Holland's Model of Occupational Choice (HMOC), we extended the framework by incorporating generational cohorts to capture the diversity of managerial perspectives (Holland 1973). Specifically, we considered Baby Boomers, Generation X, Millennials, and Generation Z as key demographic dimensions influencing attitudes toward innovation and AI adoption (Kpmg 2017; Eger et al. 2021). This integration allows us to analyze personality traits among managers and also how generational differences shape managerial behaviors, decision-making styles, and the way in which managers use AI.

To strengthen the interpretive power of our framework, we intertwined Holland's Model of Occupational Choice (HMOC) not only with generational cohorts but also with the managerial positions held by the respondents.

[3] Full Professor, ECON-06/A, Università delgi Studi Internazionali di ROMA, sara.trucco@unint.eu

Therefore, we answer the following research question: "How do managerial personality profiles and generational cohorts influence trust in, usage of, and perceived purposes for AI systems in accounting and corporate reporting?"

The study collected data from an online survey from accounting managers working in firms and organizations of various sizes and sectors across Italy. Furthermore, the next step will be to carry out in depth-interviews. Qualitative data were analyzed using thematic analysis, while quantitative data were examined through descriptive statistics.

2. Literature review

2.1. The Application of Holland's Theory in Accounting Research

Artificial intelligence (AI) is recognized as one of the most transformative digital technologies, characterized by a wide range of applications involving multiple stakeholders (Esposito et al., 2021; Lo Piano, 2020; Shaffer et al., 2020; Odonkor et al. 2024). In recent years, interest in its potential, its impacts, and its limitations has grown in both academic and professional contexts (The Economist, 2020; Zemánková, 2019; Al-Okaily, M. 2025, Khan and Gupta 2025). In particular, scholars and practitioners are increasingly examining the outcomes and organizational experiences stemming from the adoption of new algorithms and AI-based systems (Al-Sayyed et al., 2021; Sutton et al., 2016). To date, much of the research suggests that the human being represents the weakest component in the decision-making process and that automation constitutes the solution for overcoming limitations in training and human capabilities (Sutton et al., 2018). However, human expertise must be developed and promoted so that individuals can contribute unique capabilities to decision-making environments—not to compete with AI, but to complement it within a collaborative human–machine decision process (Calandra 2023).

Accounting is currently at a turning point, where data analytics and AI are reshaping the very nature of professional judgment and expertise (Sutton et al., 2016). One of the earliest significant contributions in this field is the study by Birnberg and Shields (1984), considered pioneering for introducing AI-based cognitive models into the verification of financial and economic information. More recently, the literature has increasingly focused on automated functions within accounting, auditing, and reporting processes (Yang, and Zhou, N. 2025; Johri 2025). Faccia et al. (2019) analyze the potential of these technologies and identify future research opportunities, while Al-Sayyed et al. (2021), adopting a theoretical perspective, show how accounting professionals may benefit from AI in tasks such as automated posting of accounts receivable and payable (through invoice and payment categorization), payroll processing, automated bank reconciliation, and automated auditing activities (Al-Sayyed et al. 2021).

Despite the widespread interest in automation and AI, the assessment of their actual applications and effectiveness remains an open research question across multiple sectors (Losbichler & Lehner, 2021). Furthermore, significant questions persist regarding the relationship between technology and

accounting (Sutton et al., 2016). Given the relative "youth" of this research stream, several scholars highlight the need for further, more detailed investigation (Moll & Yigitbasioglu, 2019; Bakarich & O'Brien, 2020).

Digital technologies are significantly reshaping the management accounting profession and, more broadly, managerial roles (Quattrone, 2016; Moll & Yigitbasioglu, 2019; Möller et al., 2020). These technologies improve the work of management accountants by enabling real time data availability and increasing the automation of low value-added tasks (Bhimani & Willcocks, 2014; Guthrie & Parker, 2016; Badia & Donato, 2022). AI shifts the core of work toward cognitive and relational competencies, while automating repetitive tasks and requiring interpretive and supervisory capabilities (sensemaking) in a logic of human–machine integration rather than linear substitution (Calandra, 2023).

These developments also introduce organizational challenges: they require adaptations to established techniques and reshape interactions between management accountants and other functions, generating new forms of responsibility and accountability (Fenwick & Edwards, 2016; Visani, 2017; Rikhardsson and Yigitbasioglu, 2018; Montemari and Nielsen, 2021). This transformation of expertise and accountability raises questions about the future role of management accountants in digital contexts (Oesterreich & Teuteberg, 2019; Knudsen, 2020).

2.2. AI Applications in Accounting

Artificial intelligence (AI) is recognized as one of the most transformative digital technologies, characterized by a wide range of applications involving multiple stakeholders (Esposito et al., 2021; Lo Piano, 2020; Shaffer et al., 2020; Odonkor et al. 2024). In recent years, interest in its potential, its impacts, and its limitations has grown in both academic and professional contexts (The Economist, 2020; Zemánková, 2019; Al-Okaily, M. 2025, Khan and Gupta 2025). In particular, scholars and practitioners are increasingly examining the outcomes and organizational experiences stemming from the adoption of new algorithms and AI-based systems (Al-Sayyed et al., 2021; Sutton et al., 2016).

To date, much of the research suggests that the human being represents the weakest component in the decision-making process and that automation constitutes the solution for overcoming limitations in training and human capabilities (Sutton et al., 2018). However, human expertise must be developed and promoted so that individuals can contribute unique capabilities to decision-making environments—not to compete with AI, but to complement it within a collaborative human–machine decision process (Calandra 2023).

Accounting is currently at a turning point, where data analytics and AI are reshaping the very nature of professional judgment and expertise (Sutton et al., 2016). One of the earliest significant contributions in this field is the study by Birnberg and Shields (1984), considered pioneering for introducing AI-based cognitive models into the verification of financial and economic information. More recently, the literature has increasingly focused on automated functions within accounting, auditing, and reporting processes (Yang, and Zhou, N. 2025; Johri 2025). Faccia et al. (2019) analyze the potential of these technologies and identify future research opportunities, while Al-Sayyed et al. (2021), adopting a theoretical perspective, show how accounting professionals may benefit from AI in tasks such as automated posting of accounts receivable and payable (through invoice and payment categorization), payroll processing, automated bank reconciliation, and automated auditing activities (Al-Sayyed et al. 2021).

Despite the widespread interest in automation and AI, the assessment of their actual applications and effectiveness remains an open research question across multiple sectors (Losbichler & Lehner, 2021). Furthermore, significant questions persist regarding the relationship between technology and accounting (Sutton et al., 2016). Given the relative “youth” of this research stream, several scholars highlight the need for further, more detailed investigation (Moll & Yigitbasioglu, 2019; Bakarich & O’Brien, 2020).

Digital technologies are significantly reshaping the management accounting profession and, more broadly, managerial roles (Quattrone, 2016; Moll & Yigitbasioglu, 2019; Möller et al., 2020). These technologies improve the work of management accountants by enabling real time data availability and increasing the automation of low value-added tasks (Bhimani & Willcocks, 2014; Guthrie & Parker, 2016; Badia & Donato, 2022). AI shifts the core of work toward cognitive and relational competencies, while automating repetitive tasks and requiring interpretive and supervisory capabilities (sensemaking) in a logic of human–machine integration rather than linear substitution (Calandra, 2023).

These developments also introduce organizational challenges: they require adaptations to established techniques and reshape interactions between management accountants and other functions, generating new forms of responsibility and accountability (Fenwick & Edwards, 2016;

Visani, 2017; Rikhardsson and Yigitbasioglu, 2018; Montemari and Nielsen, 2021). This transformation of expertise and accountability raises questions about the future role of management accountants in digital contexts (Oesterreich & Teuteberg, 2019; Knudsen, 2020).

3. Research design

3.1. Holland model and Generational Cohort Theory

To frame our investigation, we adopted Holland's Model of Occupational Choice (HMOC) as a conceptual theoretical framework. The HMOC organizes six occupational personality types (RIASEC) in a hexagonal structure: Realistic, Investigative, Artistic, Social, Enterprising, and Conventional (see Figure 1). The proximity of categories reflects their psychological similarity, while opposite positions indicate greater differences in characteristics and preferences (Holland 1979; Chen et al. 2012). Building on this framework, we extended the model by integrating generational cohorts—such as Baby Boomers, Generation X, Millennials, and Generation Z—into the analysis. According to Generational Cohort Theory, individuals can be grouped into distinct generations based on the time period in which they were born (Eger et al. 2021). This classification is based on the notion that people born within the same time period and geographic region often share similar values, beliefs, and life experiences, which in turn shape their attitudes, behaviors, and preferences (Parment 2013; Nwobodo, S., & Weissmann, M. A. 2024).

This integration allows us to capture not only the personality-based orientation of managerial work but also the influence of generational diversity on attitudes toward innovation and AI adoption. By combining these dimensions, our approach provides a richer lens for understanding how occupational typologies and generational characteristics jointly shape managerial behavior in contemporary organizations.

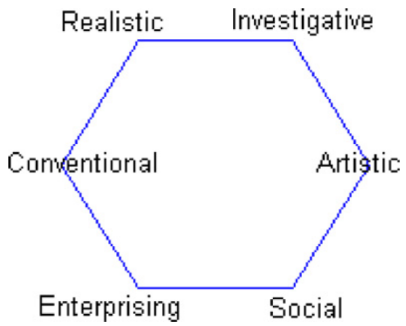

Figure 1. HMOC hexagon (Holland, 1979 and Chen et al. 2012, p. 374)

To capture the diversity of managerial perspectives, we integrated generational differences into our framework. According to KPMG (2017) the main cohorts analyzed are: Baby Boomers (born approximately 1946 - 1964) (Johnson, and Thompson 2025); Generation X (born approximately 1965 - 1979), (Johnson, and Thompson 2025); Millennials (born approximately 1980 - 1995), (Ahmad et al. 2024); and Generation Z (born approximately 1996 - 2010) (Imjai et al 2024). While these categories are not exact, they generally correspond with findings from previous studies (Durocher et al., 2016; Baudot et al., 2022; Dermarkar, et al. 2024).

By considering these cohorts, the study examines how age-related values and experiences intersect with managerial roles and influence attitudes toward AI adoption and organizational transformation.

3.2. Research method

The aim of our research is to: (a) explore how the need for verification and error analysis influences managerial trust in AI; (b) investigate how AI stimulates original thinking and is perceived as a driver of success and innovation; (c) assess how AI supports interpersonal functions and enhances organizational efficiency in managerial work; d) understand the way in which managers use AI in corporate disclosure.

To achieve these objectives, we conducted an online survey of Italian managers in 2025 (Gassen, J., and Schwedler, K. 2010; Damerji, H., and Salimi, A. 2021). The items of the questionnaire were designed ad-hoc to the objectives of this exploratory study, on the basis of the prior literature (Chen et al. 2012). Survey research is a widely used research method in accounting studies to assess managers' perceptions and behaviors (e.g. Vo Van, H. et al. 2024; Jackson and Allen 2024; Al-Okaily, M. 2025).

For most questions, participants were asked to express their views using a seven-point Likert scale as suggested by previous studies (Gassen, J., & Schwedler, K. 2010). The online survey was pre-tested on seven individuals, all of whom have academic backgrounds and expertise in accounting. Following feedback from the pre-test group, the questionnaire was slightly revised to address their concerns. The online survey link was shared with the selected participants via email, accompanied by a message from the participating organizations outlining the study's purpose and significance. To enhance the response rate, the deadline was extended twice and two reminder messages were circulated through the organizations' networks. All responses were automatically stored in a database. To ensure accurate response tracking and prevent duplicate participation, respondents' IP addresses were encrypted in one direction and paired with a cookie identifier. The survey period started in October 2025. The sampling procedure followed a random strategy: Italian companies were contacted by email and professional networks without applying sectoral or dimensional filters in advance. The participation was entirely on a voluntary basis. The survey consisted of a 15-question questionnaire, completed by 106 executives, directors and managers from companies operating in Italy.

In addition, we are going to conduct in-depth interviews with Italian managers to explore emerging dynamics in the adoption of AI in managerial work and to validate the trends identified through the survey and to understand managerial behavior in using AI for corporate disclosure and reporting.

4. Results

Preliminary findings from this study answer the following RQ "How do managerial personality profiles and generational cohorts influence trust in, usage of, and perceived purposes for AI systems in accounting and corporate reporting?" and are summarized in Figure 2 and in Figure 3. In particular, Figure 2 presents the mapping of managerial attitudes toward Artificial Intelligence (AI), interpreted through the lens of Holland's RIASEC model. This framework is therefore used to illustrate how different personality types, Realistic, Conventional, Investigative, Social, Enterprising, and Artistic, engage with AI in the workplace by managers at different levels. Each profile is associated with the corresponding generational cohort and the approach adopted by managers in using AI in accounting. For example, Realistic profiles are mainly associated with Generation X and Baby Boomers; "they generally like to work with things more than with people. The R type is described as conforming, frank, genuine, hardheaded, honest, humble, materialistic, modest, natural, normal, persistent, practical, shy, and thrifty" (Chen et al 2012, p. 375). Conventional profiles, mainly represented by Generation X; "the Conventional (C) type generally likes to follow orderly routines and meet clear standards, avoiding work that does not have clear directions. The C type is described as conforming, conscientious, careful, efficient, inhibited, obedient, orderly, persistent, practical, thrifty, and unimaginative" (Chen et al 2012, p. 375).

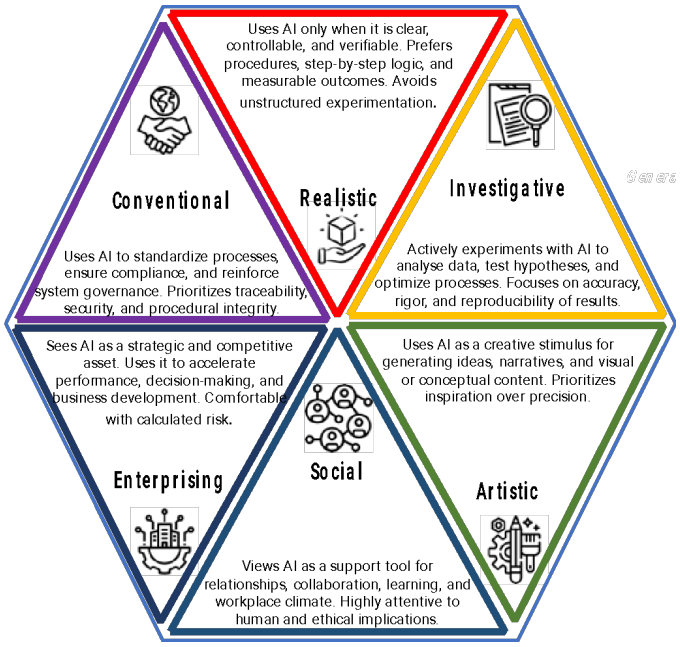

Figure 2. Mapping of managerial attitudes toward Artificial Intelligence (AI)

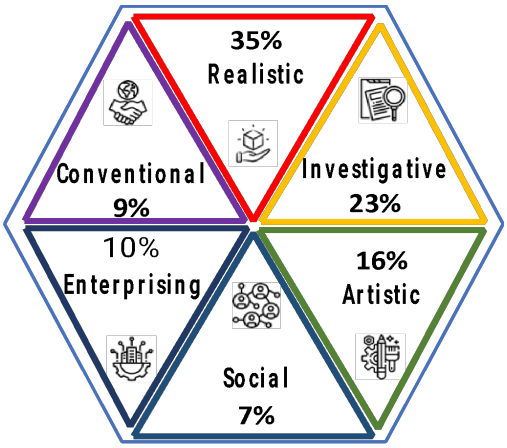

Figure 3. Percentage Distribution of Managerial Attitudes toward Artificial Intelligence (AI)

Conversely, Artistic profiles are more common among Millennials and Generation Z; "the Artistic (A) type generally likes to work with creative ideas and self-expression more than routines and rules. The A type is described as complicated, disorderly, emotional, expressive, idealistic, imaginative, impractical, impulsive, independent, introspective, intuitive, nonconforming, open, and original" (Chen et al 2012, p. 375). Investigative profiles are prevalent among Millennials, "the Investigative (I) type generally likes to explore and understand things or events, rather than persuade others or sell them things. The I type is described as analytical, cautious, complex, critical, curious, independent, intellectual, introverted, methodical, modest, pessimistic, precise, rational, and reserved" (Chen et al 2012, p. 375). Social profiles are mainly found among Generation X and Millennials, "the Social (S) type generally likes to help, teach, and counsel people more than engage in mechanical or technical activity. The S type is described

as convincing, cooperative, friendly, generous, helpful, idealistic, kind, patient, responsible, social, sympathetic, tactful, understanding, and warm" (Chen et al 2012, p. 375). Finally, Enterprising profiles are typical of Millennials; "the Enterprising (E) type generally likes to persuade or direct others more than work on scientific or complicated topics. The E type is described as acquisitive, adventurous, agreeable, ambitious, attention-getting, domineering, energetic, extroverted, impulsive, optimistic, pleasure-seeking, popular, self-confident, and sociable" (Chen et al 2012, p. 375).

Preliminary data collected by our survey reinforces these distinctions among profiles (Figure 3). In particular, we can notice that the Realistic profile dominates (35%); Investigative (23%) and Artistic (16%) follow. Finally we found a lower representation of Social (7%), Conventional (9%); and Enterprising (10%) profiles.

Furthermore, the survey results were analyzed using Python, as described below.

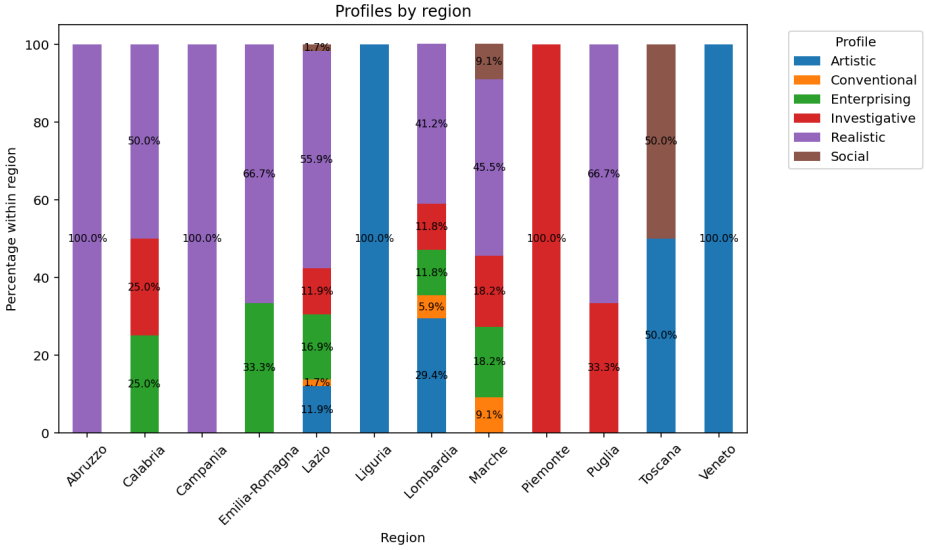

Table 1. Regional distribution of profiles

The distribution of Holland profiles varies across regions (Table 1). Several regions are characterized by the predominance of a single profile: for example, in Abruzzo and Campania, only the Realistic profile is present. Similarly, in Liguria and Veneto, the sole profile found is Artistic. Finally, in Piemonte, we identified only the Investigative profile. Other regions, such as Lazio, Lombardia and Marche, show a more diversified composition. Overall, the pattern indicates strong territorial heterogeneity, with some regions displaying homogeneous profile structures and others characterised by more balanced distributions.

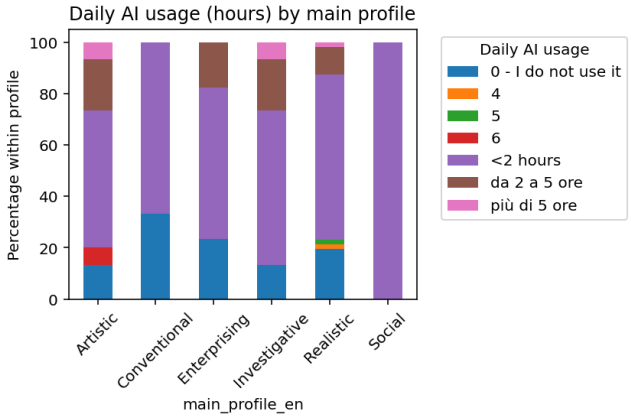

Table 2. Daily AI usage by profile

Across all profiles, the majority of respondents report using AI for less than two hours per day (Table 2). This pattern is particularly evident in Social profiles. Profiles such as Artistic and Investigative present the highest shares of respondents reporting between two and five hours, or more than five hours, of daily AI use. However, extended use remains a minority behaviour across all groups. The results suggest that daily AI engagement is generally low, with only modest variation between profiles.

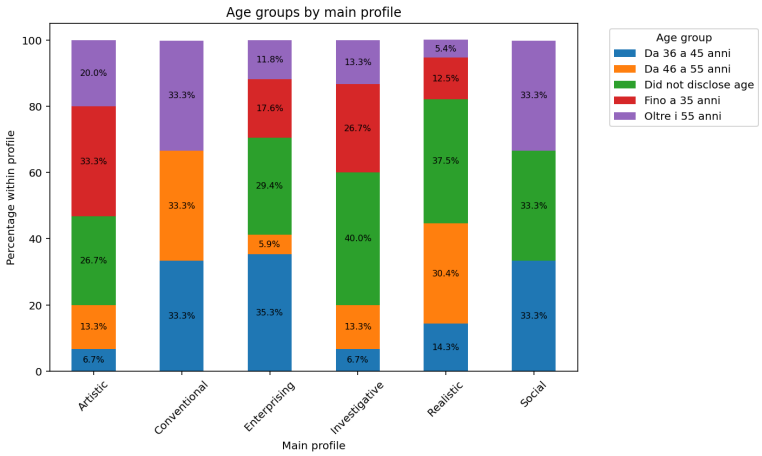

Table 3. Age composition by profile

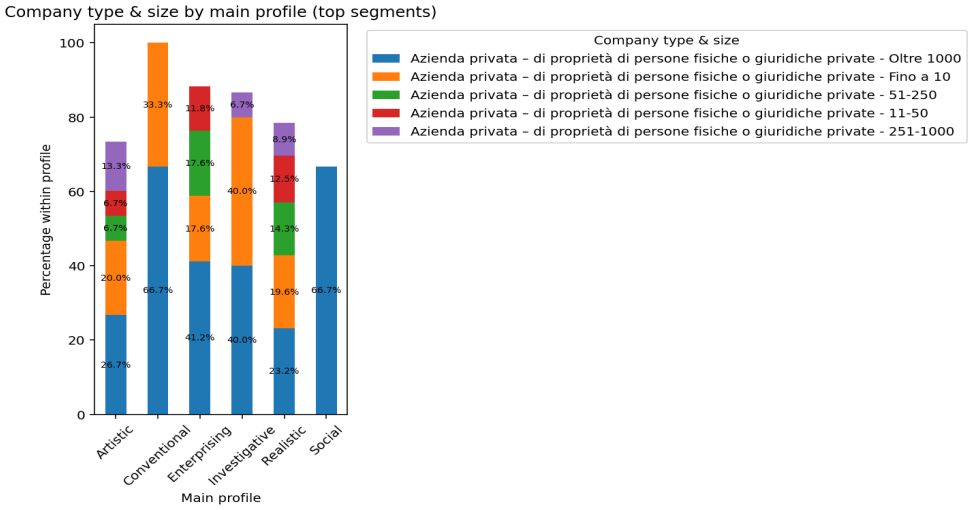
Age distributions differ across the six profiles, though no single pattern appears dominant (Table 3). The Artistic profile includes the highest share of younger respondents (up to 35 years old). The Conventional profile is more represented in the 36–45 and 46–55 age groups. The Social profile shows a comparatively higher concentration of respondents over 55. Several profiles, including Investigative and Realistic, include sizeable proportions of respondents who did not disclose their age. Overall, the profiles display mixed and heterogeneous age structures.



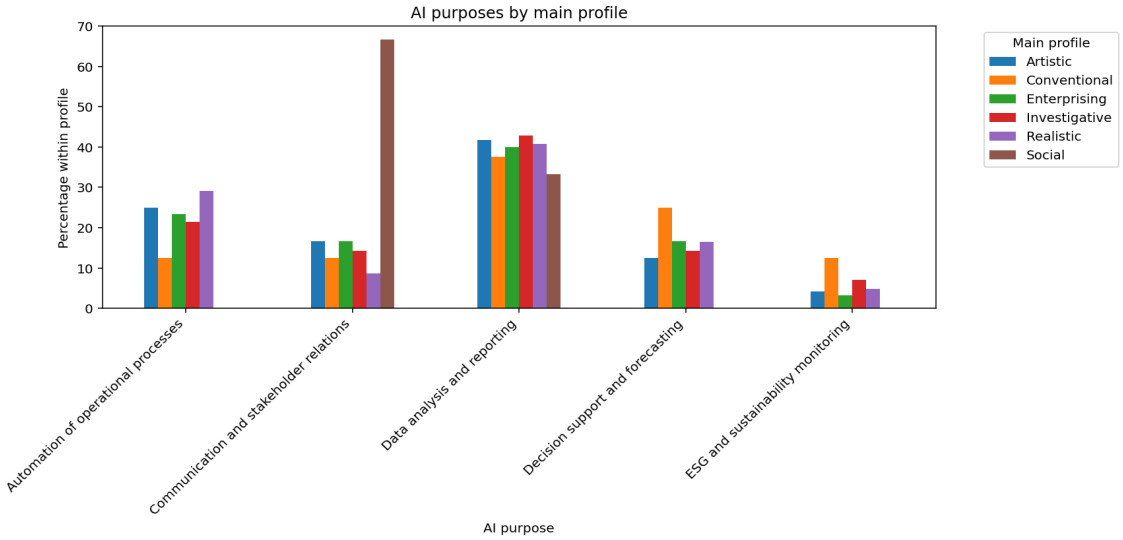


Table 4. Company type and size by profile

An additional analysis explores the interaction between company type (public vs. private) and organisational size (number of employees) (Table 4). Given the composition of the sample, the most frequent categories correspond to private organisations across different size groups. For all profiles, the largest proportion of respondents work in small private firms (up to 10 employees), with shares exceeding 60 per cent for the Conventional, Realistic and Social profiles. Medium-sized private organisations (11–50 and 51–250 employees) appear more frequently among the Enterprising and Investigative profiles. Larger organisations (>1000 employees), although less common, are present in profiles such as Artistic and Social. Public organisations do not appear among the most represented segments. Overall, the results suggest that organisational size is more variable across profiles than organisational type, with respondents predominantly concentrated in small private firms regardless of profile.

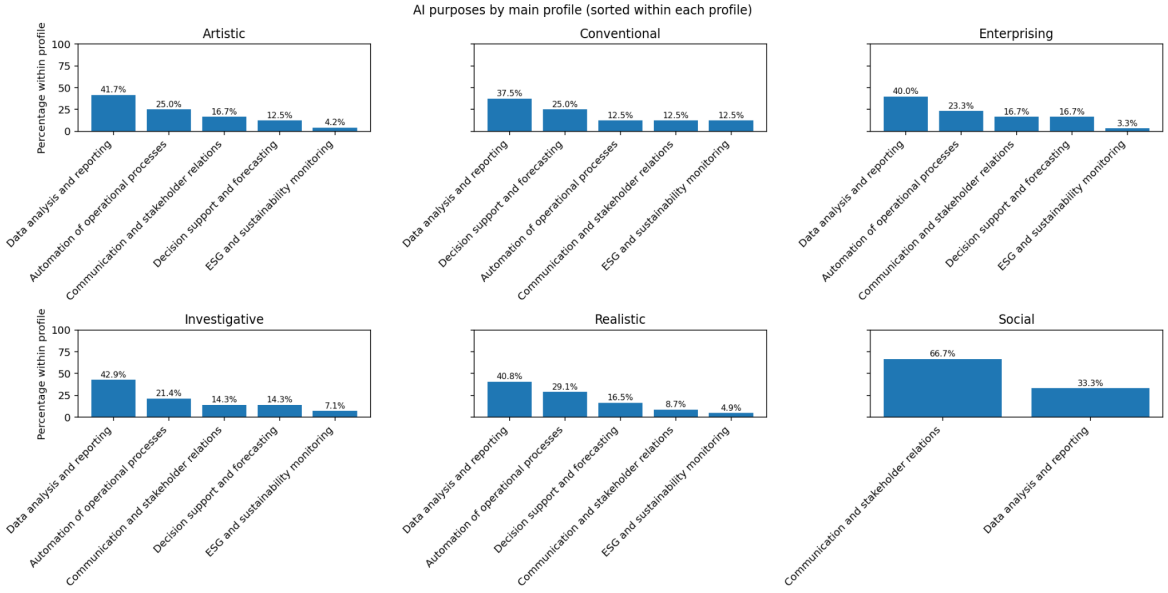

Table 5. AI purposes by main profile (sorted within each profile)

The comparative analysis of the profiles reveals differentiated patterns in the adoption of AI in professional activities (Table 5). The Artistic, Enterprising, Investigative, and Realistic profiles exhibit a homogeneous structure of use, with Data analysis and reporting representing the predominant purpose, followed by Automation of operational processes. This indicates a common orientation toward employing AI as a technical-operational instrument aimed at increasing efficiency and productivity. The Conventional profile, while sharing the same dominant purpose, demonstrates a more diversified distribution across categories such as Decision support and forecasting, communication-related activities, and ESG monitoring, reflecting the profile's propensity to manage structured and multi-dimensional tasks. The Social profile constitutes the most notable exception, displaying a strong concentration of AI use in Communication and stakeholder relations, suggesting that AI is primarily perceived as a relational support tool rather than an analytical or operational one. Collectively, these findings show that AI adoption is not uniform but varies systematically according to the attitudinal characteristics of each profile, indicating that cognitive predispositions and professional orientations play a significant role in shaping how AI is perceived and utilised.

5. Conclusion

Our study has some theoretical contributions. First, this study contributes to the theoretical development of Holland's RIASEC model by extending its application to the domain of managerial behavior in the context of AI adoption (Holland, 1973). Second, it contributes to that stream of literature that analyzes the technological acceptance of AI among managers (Norzelan, et al. 2024), offering a nuanced perspective grounded in psychological typologies. Third, the study contributes to the growing stream of literature that examines the use of AI in accounting practices (Bui and Jaradat 2020). This perspective complements existing research focused on technical capabilities and organizational factors, by emphasizing the role of individual dispositions and cognitive styles in shaping the practical use of AI tools within accounting environments (Khan and Gupta 2025). Fourth, it contributes to that stream of literature that highlights the implications of AI for the board of directors and the use of AI in corporate disclosure (Agnese et al. 2025).

From a managerial viewpoint, findings from this study offer valuable insights into how generational and personality-based differences shape the adoption of AI by managers in different

types of firms. The broader, long-term objective is to foster research that responds to prior scholars' call for further inquiry, focusing on identifying and disseminating alternatives to the HMOC that more accurately reflect the dynamic and investigative nature of modern accounting practice (Chen et al. 2012).

Future research is needed to extend the empirical base of this study by collecting additional data through the online survey and by conducting in-depth interviews among managers using the questionnaire provided in Annex 1. In this way, we can validate the proposed model, allowing for a more robust understanding of the psychological features influencing AI adoption in managerial work and in producing the corporate disclosure. Moreover, this study will investigate the degree of overlap or divergence among the identified profiles by examining their relative positions within Holland's hexagonal model; this will help determine whether the theoretical proximity of profiles is confirmed by empirical evidence. The research will also explore differences across managerial levels, namely Chief Executive Officers (CEOs), General Managers, Functional Directors, and Middle Managers, as well as across different types of firms (private, public, and third sector).

Keywords: Holland's theory; artificial intelligence; accounting research; online survey; in depth-interview; decision-making; managerial engagement; manager stereotypes

Digital Orientation and Young-Female Governance for Sustainable Performance in Innovative SMEs

Ludovica Antenozio[1], Francesco Appio[2]

1. Introduction

Nowadays, digitalization and sustainability have become two of the most critical drivers of business development. To achieve a sustainable competitive advantage in an increasingly dynamic environment, firms must pursue these objectives jointly, integrating digital transformation with environmental and social responsibility. Digital orientation (DO) has emerged as a crucial strategic posture that enables firms to recognize and exploit opportunities offered by digital technologies to achieve competitive advantage (Antenozio et al., 2026; Ardito et al., 2021; Kindermann et al., 2021, 2024; Mishra et al., 2024; Ranjan, 2024). It reflects s a firm's overall digital mindset, as its willingness to adopt, integrate, and strategically leverage digital tools and resources across operations, innovations, and stakeholder relations (Kindermann et al., 2024; Quinton et al., 2018).

Literature conceptualizes DO as a multidimensional construct encompassing technological and organizational capabilities, as well as the firm's ability to coordinate both internal and external actors (Kindermann et al., 2021). Specifically, it involves four interrelated dimensions, as digital technology scope, digital capabilities, digital ecosystem coordination and digital architecture configuration. Digital technology scope refers to a set of digital technologies adopted, including cloud computing, big data, artificial intelligence that allow firms to achieve strategic growth. Digital capabilities delineate the human and organizational competences that enable firms to embed digital technologies effectively into workflows, enhancing and optimizing productivity and efficiency. Digital ecosystem coordination captures the ability to collaborate and interact with stakeholders in open technological ecosystems. Finally, digital architecture configuration concerns the IT infrastructure and systems configuration that better support scalability, integration and digital processes reliability (Kindermann et al., 2021). In this sense, DO represent a new form of managerial intelligence, a strategic orientation that guides how firms deeper engage with technological opportunities (Teece, 2016).

Sustainability, in turn, has become an indispensable component of competitive strategy (Qin et al., 2024), as global challenges increasingly demand a balance between economic growth and social-environmental responsibility (Gorgels et al., 2022). Corporate sustainability extends beyond regulatory compliance to encompass the integration of environmental and social objectives into business model and governance structures, with the aim of improving economic, ecological and social performance (Bendig et al., 2023; Bos-Brouwers, 2010). As highlighted by Bos-Beouwers (2010), sustainability in small and medium-sized enterprises (SMEs) manifests through innovation processes that reconcile efficiency with responsibility where eco-innovation, waste reduction, and stakeholder inclusivity become central mechanisms for achieving long-term viability. Building on this view, sustainable competitiveness arises when firms align digital transformation with environmental responsibility, leveraging digital technologies to optimize

[1] Research Fellow, ECON-07/A, Scuola Superiore Sant'Anna, Center of Advance Studies – Interdisciplinary Center for Sustainability and Climate (CISC); ludovica.antenozio@santannapisa.it – corresponding author

[2] Full Professor, Paris School of Business; f.appio@psbedu.paris

resource use, reduce emissions, and improve traceability across value chains (Lin et al., 2024). Digital orientation plays a catalytic role in this alignment. Firms that strategically commit to digitalization, through integrated use of ICT, data analytics, and automation, enhance their capacity to innovate while simultaneously strengthening their environmental performance and innovation capabilities, establishing sustainability as a by-product of digital maturity (Ardito et al., 2021; Zahoor & Lew, 2022). Zahoor and Lew (2022) show that strategic orientation characterized by digital proactiveness and learning foster dynamic capabilities to sustain superior environmental and social outcomes in international context. Similarly, Ardito et al. (Ardito et al., 2021), highlight that when digital and environmental orientations are coherently pursued, they mutually reinforce each other, positively affect SMEs' innovation and sustainability performance by enabling eco-innovations and improving access to knowledge resources. Digital tools act as enablers for environmental initiatives by facilitating data integration, stakeholder collaboration, and transparency, key drivers of sustainable performance. Conversely when digital and environmental initiatives are fragmented or complete for limited managerial attention, their complementarity may weaken (Linde et al., 2021), highlighting the need for coherent strategic alignment.

Focusing on SMEs is particularly relevant in this debate as they constitute the backbone of most economies (Katsinis et al., 2024), and their smallness constitutes the key factors of their capacity to innovate and adapt to digital and environmental transformation (Sabando-Vera et al., 2025) that is fundamental to sustainable growth (Passaro et al., 2023). Although SMEs face structural constraints, such as limited financial and human resources, that may hinder large-scale sustainability initiatives (Blackburn et al., 2013; Jiang et al., 2023), they benefit from flexibility, entrepreneurial culture, and the proximity of decision-making proximity. This organizational agility allows them to more rapidly adopt new technologies and integrate sustainability into operational practices (Parasotskaya et al., 2021). Whitin this group, innovative SMEs, those investing systematically in research, development, and digitalization, offer an especially rich context to investigate how digital orientation translates into sustainability outcomes. These firms are typically more technologically embedded, and open to change than traditional SMEs (Antenozio et al., 2026; Di Berardino & Antenozio, 2025; Hervas-Oliver et al., 2016). They provide an ideal setting to study how different forms of managerial intelligences interact to generate sustainable competitiveness (Merín-Rodrigáñez et al., 2025).

Governance within innovative SMEs also plays a decisive role in shaping the effectiveness of digital orientation. Without appropriate governance structures capable of embracing digital transformation, adopting a long-term perspective, and remaining open to change, innovative SMEs struggle to fully capitalize on the benefits of digital orientation. In SMEs, ownership, leadership, and management roles often overlap making demographic characteristics of top managers especially influential in determining strategic direction (Bannò & Filippi, 2024; Di Berardino & Antenozio, 2025; Hambrick & Mason, 1984). Compared with large companies, board and top management teams in innovative SMEs tend to be younger, more entrepreneurial, and technologically oriented (Collevecchio et al., 2024). These demographics traits foster openness to experimentation, higher risk-taking, and a greater inclination to embed sustainability into digital strategies. Among these demographic factors, gender and age diversity has attracted increasing scholarly attention (Aslanbeigui et al., 2025; Bannò & Filippi, 2024; Chen et al., 2023; Fernández-Temprano & Tejerina-Gaite, 2020; Lückerath-Rovers, 2013; Tejerina-Gaite & Fernández-Temprano, 2021). Female board members contribute collaborative and inclusive leadership styles (Torchia et al., 2011; Xie et al., 2020), a heightened sensitivity to stakeholder relationships (Bannò et al., 2023), and a long-term orientation that prioritizes sustainable growth (Javed et al., 2023; Nair, 2020). Younger members, in turn, bring digital fluency, adaptability, and proactive engagement with technological innovation (Fernández-Temprano & Tejerina-Gaite, 2020; He et al., 2023) and they are more typically exposed to social and environmental change (Collevecchio et al., 2024). Young-female directors combine these attributes being both

digitally literate and environmental responsibility (Collevecchio et al., 2024; Nadeem et al., 2020; Xie et al., 2020). Their dual perspective positions them as a catalyst capable of aligning digital orientation with sustainability objectives, especially within innovative SMEs where the boundaries between leadership and operations are fluid and managerial influence is direct.

Empirical studies suggest that gender-diverse boards tend to emphasize ethical behaviour, stakeholder dialogue, and environmental accountability (Bannò & Filippi, 2024; Torchia et al., 2011), while younger members promote innovation and dynamic change (Collevecchio et al., 2024). Together, these demographic traits strengthen the firm's ability to develop strategic complementarities between digitalization and sustainability. The combination of female leadership and youth thus represent a unique governance configuration capable of translating digital resources into long-term sustainable competitiveness.

Building on these considerations, this study conceptualizes digital orientation as a critical enabler of sustainability in innovative SMEs and positions governance diversity as a relevant mechanism that enhances the firm's ability to pursue long-term environmental and sustainable objectives. Accordingly, the research address two main research questions: RQ1 "How does digital orientation influence sustainability in innovative SMEs?" and RQ2 "How young-female board members guide digital orientations toward sustainable competitiveness?"

2. Purpose of the research

The objective of this study is to investigate how digital orientation affect sustainability of innovative SMEs, and how this relationship is shaped by governance diversity, particularly the presence of young and female board members. Despite the growing attention to digital transformation and sustainability, the literature still lacks an integrated understanding of how DO contributes to sustainable competitiveness, especially in the context of SMEs where resource constraints and strategic flexibility coexist.

While existing research has extensively explored the effects of DO on financial and innovation performance among SMEs (Ardito et al., 2021; Escoz Barragan & Becker, 2025; Kindermann et al., 2024; Ranjan, 2024), few studies have examined its influence on environmental and social outcomes. Yet, as digitalization reshapes corporate processes, it also provides powerful instruments to enhance sustainability through data-driven decision-making, energy optimization, and stakeholder transparency (Bendig et al., 2023; Lin et al., 2024). The potential of DO to foster sustainability thus depends not only on the deployment of digital technologies but also on the managerial intelligences that guides their strategic use. This paper responds to this gap to conceptualize sustainable competitiveness as the outcome of an interaction between digital and managerial intelligences.

By focusing on a diverse sample of innovative SMEs, this research provides a more granular understanding of how DO shapes sustainability outcomes, emphasizing the unique challenges and opportunities faced by smaller firms in aligning digital and environmental strategies. It also offers valuable insights for policymakers aiming to support SMEs in their dual digital and green transitions, helping to bridge the gap between theoretical research and real-world applications. The empirical analysis advances existing research in two main directions: (i) by deepening the understanding of how DO enhances sustainability and environmental competitiveness in the SME context, and (ii) by incorporating demographic diversity variables to examine how young-female governance moderates the DO–sustainability relationship.

By contributing to both theory and practice, this study aims to serve as a reference point for future research exploring how digital and managerial intelligences jointly foster sustainable competitiveness in innovative SMEs. Ultimately, it guides firms toward more effective digital transformation strategies that not only improve performance but also strengthen their environmental and social responsibility.

3. Methodology

We constructed an ad hoc balanced panel dataset of 250 Italian innovative SMEs observed over a ten-year period (2013-2022), resulting in 2.500 firm-year observations. The sample was selected using probability-proportional-to-size sampling to ensure heterogeneity across firm status, industry, and geographical location, thereby enhancing the external validity of our results within the European SME context. SMEs were identified according to the European Commission (2002) and definition[3], the Italian Chamber of Commerce classification.

Data were collected from multiple sources, including AIDA Bureau van Dijk, Crunchbase, SME websites through the Wayback Machine, and the Italian Chamber of Commerce registers. These sources provided both structured (financial and governance) and unstructured (textual) data, allowing a comprehensive analysis of firms' digital orientation and sustainability. To ensure data accuracy, we implemented a multi-step validation process, cross-referencing records across different databases and performing extensive data cleaning to mitigate inconsistencies. The use of the Wayback Machine enabled the tracking of historical changes in each SME's digital footprint, allowing for a dynamic measurement of DO over time.

Digital Orientation, the main independent variable, was operationalized as a multidimensional construct encompassing the four interrelated dimensions (i) digital technology scope, (ii) digital capabilities, (iii) digital architecture configuration, and (iv) digital ecosystem coordination. Using textual data extracted from firms' official websites and the Chamber of Commerce registers, we performed keyword frequency analysis in MAXQDA to identify terms associated with these dimensions[4]. The resulting measures were aggregated through Principal Component Analysis (PCA) to generate a composite index of DO. A back-translation process ensured consistency between English and Italian terminology.

The dependent variable, sustainability performance, was measured through green certifications, reflecting a firm's commitment to environmental management and sustainable practices. Specifically, we calculated the ratio between the number of green certifications and the total certifications obtained by each SME per year. This dynamic indicator captures the intensity of environmental certification relative to other quality and process certifications, providing a standardized measure across industries and years.

To capture managerial intelligences, we included both board diversity and compositional variables. The Young-Female Board variable identifies female directors under 35 years old sitting on the board of directors. Following the Italian Youth Policy definition, we set the threshold at 35 years. The variable was computed in by identifying all female directors under 35 across SMEs and Years, weighting by the total number of board members to capture the overall representation of young women on the board. Additionally, we controlled separately for female board representation (ratio of female to total directors) and young board representation (ratio of directors under 35 to total directors), to isolate the independent effects of gender and age diversity.

To account for firm heterogeneity, several control variables were included. Firm size was measured as the natural logarithm of the number of employees (Awad & Martín-Rojas, 2023; Hervas-Oliver et al., 2021; Zhang et al., 2022). Firm age was measured as the natural logarithm of the number of years since establishment (Nunes et al., 2012; Zhang et al., 2022). Manufacturing industry was introduced as a dummy variable (1 for manufacturing, 0 otherwise) to capture

[3] Micro, small and medium-sized enterprises (SMEs) are enterprises which employ fewer than 250 people, and which have an annual turnover not exceeding EUR 50 million, and/or an annual balance sheet total not exceeding EUR 43 million, "Commission Recommendation of 6 May 2003 concerning the definition of micro, small and medium-sized enterprises" https://ec.europa.eu/smes/

[4] See Kindermann (Kindermann et al., 2021) and Escoz Barragan and Becker (Escoz Barragan & Becker, 2025) for the list of the word for the step involved in this research approach.

sectoral differences, given that manufacturing tends to be more innovation-intensive and male-dominated, while services exhibit higher female participation and softer forms of innovation (Brush et al., 2019; OECD, 2023). For governance structure, we controlled for average board age (Tejerina-Gaite & Fernández-Temprano, 2021), board size (La Rocca et al., 2024), and board composition ratios weighted over the total number of directors in the sample.

To test the proposed hypotheses, we employed the two-step System Generalized Method of Moments (GMM) estimator, which is well-suited for dynamic panel data structures. This approach accounts for unobserved heterogeneity and potential endogeneity by using lagged dependent variables as instruments (Arellano & Bond, 1991). The GMM estimator also corrects for autocorrelation and heteroskedasticity, ensuring consistent and efficient coefficient estimates.

Model specification tests, including the Hansen test for instrument validity (Sargan, 1958) and the Arellano-Bond AR(2) test for serial correlation, confirmed the reliability of our empirical strategy. Robustness checks using fixed-effects and random-effects models were performed, confirming the stability of the results across different estimation techniques. This methodology provides a rigorous empirical framework to assess how digital orientation drives sustainability performance in innovative SMEs, and how young-female governance amplifies this relationship through the interaction of technological and managerial intelligences.

4. Preliminary results

Preliminary results show that DO positively influences the sustainability performance of innovative SMEs. Firms with a stronger digital orientation, those more willing to adopt and integrate digital technologies into their processes, stakeholder relations, and strategic decision-making, display a higher likelihood of obtaining green certifications over time. This result suggests that digital orientation fosters an open and adaptive mindset, enabling SMEs to embrace change, experiment with new solutions, and incorporate environmental responsibility into their business models. In this sense, digital orientation acts as both a technological and cultural driver of sustainability, promoting transparency, efficiency, and proactive engagement with environmental and social challenges. The preliminary analysis further reveals that young board members strengthen this relationship. Their behavioural traits, such as openness to innovation, adaptability, and greater environmental and social sensitivity, enhance the firm's ability to translate digital initiatives into sustainable outcomes. Young leaders tend to approach digital transformation not only as a source of competitiveness but also as an opportunity to align business objectives with broader sustainability goals. Their future-oriented vision and familiarity with technological change make them particularly effective in embedding sustainability within digital strategies.

These preliminary findings highlight how the integration of digital and managerial intelligences can accelerate sustainable competitiveness. Digital orientation provides the strategic and technological foundation, while young board members contribute the behavioural and cognitive conditions needed to ensure that digital transformation evolves toward environmentally and socially responsible directions.

5. Theoretical and managerial implications

This study contributes to the growing debate on how digital and managerial intelligences jointly foster sustainable competitiveness in innovative SMEs. From a theoretical perspective, the paper advances the strategic management and sustainability literature in three ways. First, it extends the digital orientation literature by demonstrating that DO does not only enhance financial and innovation performance but also serves as a strategic capability that enables firms to achieve sustainability-oriented outcomes. By aligning digital transformation with environmental responsibility, DO emerges as a multidimensional orientation that integrates technological,

organizational, and relational resources to support long-term value creation. Second, the study conceptualizes sustainable competitiveness as the result of an interaction between technological resources and managerial cognition. This integrative approach emphasizes that digital transformation becomes effective only when accompanied by governance structures capable of guiding it toward responsible and ethical goals. Third, the analysis enriches the literature on governance diversity by highlighting the fundamental role of young and female board members. Their behavioural traits, openness to change, digital fluency, and sensitivity to environmental and social issues, act as complementary assets that translate digital orientation into sustainability performance. This result underscores the importance of considering demographic and cognitive diversity as part of firms' intangible capital.

From a managerial perspective, the findings offer several practical implications. Managers of innovative SMEs should recognize Digital Orientation as a dual strategic lever as it not only improves competitiveness but also drives sustainability when managed coherently across its four dimensions. Digital investments should therefore be strategically aligned with sustainability goals, ensuring that technological progress supports environmental efficiency, energy optimization, and transparency in stakeholder relations. Moreover, the results emphasize the strategic value of inclusive and generationally diverse governance. Involving young and female board members can strengthen SMEs' capacity to innovate responsibly, infuse long-term sustainability perspectives into strategic decisions, and accelerate the alignment between digital and green transitions. Training and mentoring programs aimed at enhancing the participation of young women in governance positions could amplify these benefits, fostering new forms of leadership aligned with the principles of sustainable and digital transformation.

Finally, from a policy standpoint, the study provides useful guidance for institutions and regulators. Policymakers should design integrated programs that link digitalization incentives to sustainability objectives, encouraging SMEs to pursue digital maturity while adopting environmental standards. Promoting diversity in governance through targeted funding or gender-youth inclusion initiatives, can further support the development of SMEs capable of combining innovation, responsibility, and competitiveness.

This work in progress study contributes to both theory and practice by positioning digital orientation and governance diversity as complementary intelligences that, when harmonized, enable SMEs to pursue sustainable growth grounded in technological innovation and ethical stewardship.

6. Research limitations

This study has several limitations that should be acknowledged. First, the sample focuses exclusively on Italian innovative SMEs, which may limit the generalizability of the findings to other geographical or institutional contexts. While Italy provides a particularly relevant setting due to its strong concentration of SMEs and increasing emphasis on sustainability-oriented innovation, extending the analysis to different countries would allow for comparative insights on how DO fosters sustainability under diverse regulatory and cultural frameworks. Second, the measurement of sustainability relies on the presence of green certifications, which, although objective and comparable indicators, may not fully capture the broader scope of firms' sustainability engagement, such as social responsibility initiatives, or informal environmental practices. Future studies could combine certification data with textual or survey-based evidence to obtain a more comprehensive view of sustainability performance. Moreover, future research could explore unobserved firm-specific factors, such as internalization or collaborations that may still influence the observed relationships. Exploring these dimensions in future research would help refine understanding of how digital and managerial intelligences jointly shape sustainable competitiveness in SMEs.

Artificial intelligence inside the sport industry: the Olympic AI Agenda

Mario Nicoliello[1]

1. Introduction

The advent of advanced technologies has instigated profound transformations across industries, altering how organisations operate, innovate and create value. As emphasised in the literature (Henning-Thurau et al., 2023; Akter et al., 2022; Dwivedi et al., 2022), the integration of Artificial Intelligence (AI) has the potential to foster sustainable progress with significant societal implications. The transformative wave is particularly pertinent in the field of sport, where digital innovation redefines the contours of operational efficiency, audience engagement and environmental sustainability (Hajli, 2025). The research examines the intersection of AI and the business model of the Olympic Games, focusing on the International Olympic Committee's (IOC) recently launched Olympic AI Agenda (IOC, 2024), in order to show how advanced technologies can catalyse innovative business ecosystems, while maintaining ethical integrity and sustainability.

The Olympic Games, a global phenomenon transcending sports, embody a complex nexus of stakeholders, including athletes, organisers, sponsors and fans, therefore in its intricate ecosystem, AI emerges as a critical enabler, capable of transforming the operational aspects and the broader value proposition for all stakeholders. The Olympic AI Agenda, introduced by the IOC in 2024, represents a strategic roadmap aimed at leveraging AI to enhance solidarity, fairness and sustainability while mitigating associated risks (IOC, 2024). The research explores how this AI Agenda reshapes the business model underpinning the Games and investigates its broader implications for the Olympic Movement.

The IOC, in its Olympic Agenda 2020+5, identified digitalisation as a pivotal trend influencing modern society (IOC, 2021). The subsequent evolution of this vision culminated in the Olympic AI Agenda, a program designed to harness the transformative power of AI to support athletes, optimise operations and enhance audience engagement. At its core, the Agenda aims to align technological advancement with the values of Olympism, including excellence, respect and friendship; however, the integration of AI into the Olympic ecosystem also raises critical questions about data privacy, fairness and the preservation of human-centric values in an increasingly digital world, these questions form the crux of the research's inquiry, as it seeks to understand the dual role of AI as both an opportunity and a challenge.

Therefore, the research question guiding the research is the following: how does the Olympic AI Agenda transform the Olympic Games and what are the implications of the transformation for the broader Olympic Movement?

In order to address the question, the research employs a case study methodology, grounded in a documentary investigation of official IOC documents, including the Olympic AI Agenda. The approach enables a detailed analysis of the Agenda's five focus areas (supporting athletes; ensuring equal access to AI benefits; optimising Games operations with a focus on sustainability; growing engagement with people; driving efficiency across the IOC's management) and examining the five domains the research uncovers the multifaceted impact of AI on the Olympic

[1] Associate Professor, ECON-06/A, University of Brescia; mario.nicoliello@unibs.it – corresponding author

ecosystem, from operational efficiencies and enhanced audience experiences to the ethical challenges inherent in AI deployment.

The case study, currently work in progress, highlights several key themes that encapsulate the transformative potential of AI within the Olympic context. First, AI's ability to personalise athlete training and optimise talent identification represents a paradigm shift in sports performance and development; through advanced data analytics and machine learning, AI enables hyper-personalised coaching and training programs, fostering a new era of athletic excellence; additionally, AI's role in promoting clean competition and safeguarding athletes underscores its alignment with the core values of Olympism.

Second, the operational efficiencies introduced by AI extend across event management, logistics and venue sustainability; streamlining processes and reducing costs, AI enhances the environmental footprint of the Games while contributing to the United Nations' Sustainable Development Goals.

Third, AI redefines audience engagement, creating immersive, personalised experiences for fans; from augmented reality features and interactive content to tailored viewing experiences, AI transforms how audiences interact with the Games, extending the value chain for broadcasting, sponsorships and merchandising.

However, the integration of AI is not without challenges, therefore the research examines the ethical and governance issues associated with AI deployment, including concerns about data privacy, algorithmic fairness and the potential for job displacement. The IOC's governance framework, as outlined in the Olympic AI Agenda (IOC, 2024), aims to address challenges, fostering responsible AI use, ensuring transparency and promoting accessibility.

2. Literature Review

2.1. The intersection of artificial intelligence and sport sector

The transformative power of advanced technologies has become a defining feature of contemporary business ecosystems, with Artificial Intelligence (AI) standing out as a pivotal driver of innovation. Across industries, AI has reshaped how organisations operate, innovate and engage with stakeholders, and sports, an inherently global and multifaceted industry, has embraced these technological advancements, making the sector an ideal lens through which to explore the broader implications of AI (Ray, 2024).

Akter et al. (2022) have demonstrated that digital technologies, including AI, blockchain and the Internet of Things (IoT), contribute significantly to operational efficiencies and revenue growth. Technologies, they argue, are instrumental in fostering sustainability and addressing societal challenges. Within sports, AI's potential extends beyond operational improvements, providing data-driven insights that enhance performance, optimise resource allocation and create immersive audience experience (Geissler et al., 2024). Burt et al. (2021) have highlighted the importance of scenario planning to navigate the risks and opportunities of technology adoption, emphasising the need for stakeholder collaboration and critical reflection, creating a framework highly relevant to the Olympic Games, which involve a diverse array of stakeholders, from athletes and coaches to sponsors, fans and policymakers. One of AI's most significant contributions to sports lies in its ability to revolutionise athlete performance, since through advanced data analytics, AI enables hyper-personalised training programs, optimising performance and reducing the risk of injury (Popp et al., 2024). Ceipek et al. (2021) have shown how IoT innovations facilitate real-time monitoring of information that improve decision-making. In the Olympic context, AI's role extends to talent identification, where predictive algorithms analyse performance metrics and physical attributes to identify emerging athletes. The ethical implications of such applications, particularly regarding data privacy and fairness, are explored by Dwivedi et al. (2022), who call for transparent governance frameworks to mitigate biases and ensure equitable access to these technologies.

The Olympic Games, as a mega-event, require extensive coordination and resource management, therefore AI-driven optimisations in transportation, logistics and venue design can significantly reduce costs and environmental impact. Harwood and Eaves (2020) argue that innovations align with the United Nations' Sustainable Development Goals (SDGs), highlighting the potential for AI to drive sustainability in large-scale events. Zheng and Kiritsis (2022) provide empirical evidence on the use of digital twins and cognitive AI systems in event management, demonstrating how technologies enable real-time adjustments and improved outcomes.

Audience engagement, a cornerstone of the Olympic Games' global appeal, has been fundamentally transformed by AI, because personalised content delivery, augmented reality (AR) experiences and interactive features have redefined how fans interact with sports. Hennig-Thurau et al. (2023) explore the potential of AI to enhance storytelling, an element that can be used offering fans tailored narratives that deepen their connection to the Games, in order to enrich the spectator experience and to expand commercial opportunities through sponsorships, broadcasting and merchandising. However, as Raisch and Krakowski (2021) caution, the innovations come with challenges, particularly around data security and user consent, therefore robust governance mechanisms are essential to address the issues, ensuring that technological advancements do not compromise ethical standards.

The governance of AI in sports presents a complex interplay of opportunities and challenges (Kim and Manah, 2024). Harwood and Eaves (2020) stress the importance of involving multiple stakeholders in the development of ethical guidelines, arguing that collaborative approaches are critical to balancing innovation with societal impact. Burt et al. (2021) similarly highlight the need for continuous adaptation to evolving technological landscapes, a sentiment reflected in the IOC's commitment to ongoing vigilance and responsible AI use.

Rietsche et al. (2022) explore the implications of quantum computing, highlighting its potential to process complex datasets and generate insights at unprecedented speeds. Similarly, studies on the metaverse by Dwivedi et al. (2022) suggest new possibilities for virtual fan engagement, including immersive experiences and community-building initiatives. Both the advancements challenge traditional notions of sports management, opening new avenues for research and practice, reflecting the complexity of integrating AI into the Olympic ecosystem, where operational efficiencies and audience engagement must be balanced with ethical considerations and societal impact. The literature underscores the importance of critical reflection and stakeholder collaboration in navigating these challenges, emphasising that the successful integration of AI requires a nuanced understanding of its implications (Secinaro et al, 2025).

2.2. Technological transformation in sport sector

The evolution of technology in sports can be traced to the increasing complexity and global reach of the industry. As noted by Akter et al. (2022), advanced technologies like AI, blockchain and IoT have reshaped traditional business practices and have introduced new paradigms of value creation, allowing organisations to leverage vast amounts of data to enhance decision-making processes, optimise resources and improve stakeholder engagement.

In the field of sports, these capabilities are particularly relevant given the industry's multifaceted nature, which spans athletic performance, event management and fan interactions. In particular, AI-driven innovation forms the cornerstone of technological transformation in sports, because harnessing the power of machine learning, natural language processing and predictive analytics, organisations can generate insights previously unattainable. In the context of business models, AI-driven innovation introduces new revenue streams and operational efficiencies. The ability to predict consumer preferences, tailor marketing strategies and deliver personalised content transforms the way organisations engage with their audiences (Cohen and Fishbain, 2025).

The integration of AI into event management and logistics has revolutionised the way large-scale events, as for instance the Olympic Games, are organised. Harwood and Eaves (2020) argue that AI-driven optimisations in transportation, venue management and resource allocation significantly reduce costs and environmental impact. The concept of digital twins, as explored by Zheng and Kiritsis (2022), further illustrates the potential of AI in operational contexts, since creating virtual replicas of physical assets, digital twins enable real-time monitoring and predictive analysis, ensuring that events run smoothly and efficiently.

The proliferation of digital platforms and the increasing demand for personalised experiences have compelled sports organisations to adopt innovative approaches to fan interaction. AI plays a central role in the transformation enabling organisations to analyse consumer behaviour and deliver tailored content that strengthen the emotional connection between fans and their favourite teams or athletes. The consequences are also for business models, fundamentally altering how value is created, delivered and captured (Osterwalder, 2004). Traditional revenue streams, like ticket sales and broadcasting rights, are increasingly supplemented by digital innovations that leverage AI to enhance consumer experiences and operational efficiencies. The convergence of technological and business strategies enables organisations to build more resilient and adaptive models, ensuring long-term sustainability in a rapidly evolving industry (Assiouras et at., 2025).

As emphasised by the International Olympic Committee (IOC) in its Olympic AI Agenda (2024), AI has the potential to bridge gaps in resource availability, ensuring that athletes and organisations in underrepresented regions benefit from technological advancements. The inclusivity aligns with the broader values of Olympism and underscores the importance of ethical governance in implementing AI-driven strategies.

3. Methodology

The research employs a combination of thematic analysis and documentary investigation as the primary research methods to explore the relationship between the International Olympic Committee (IOC) and the evolving role of artificial intelligence (AI) in the context of the Olympic Games.

The IOC-issued Olympic AI Agenda served as the primary document for the investigation. It outlines the IOC's official stance on AI technology, highlighting their strategic objectives, ethical guidelines and how AI is envisioned to impact various aspects of the Olympic Games.

Thematic analysis was utilised to identify, analyse and report patterns (themes) within the data collected from the Olympic AI Agenda, the approach was chosen for its flexibility in analysing complex, unstructured documents such as policy papers, strategic agendas and institutional reports (Braun and Clarke, 2006 and 2019).

The first step involved thoroughly reading the Olympic AI Agenda, noting down preliminary thoughts, questions and potential areas of interest. After that, key concepts and references to AI within the agenda were coded and codes were applied to segments of text that highlighted specific instances where AI is mentioned in relation to the Olympics, including ethical considerations, technological advancements and the potential impact on stakeholders. The coded data was then grouped into broader themes, for instance, themes "AI in Sports Performance", "Ethical Considerations", "AI for Enhancing Viewer Experience" and "Sustainability and AI" emerged as significant topics across the document. The initial themes were reviewed and refined to ensure they were coherent and accurately represented the content of the IOC-issued agenda. After that finalised themes were named to capture the essence of the categories, ensuring that they were meaningful and aligned with the research focus on AI's role in the Olympic Games.

4. The analysis

4.1. Olympic AI Agenda

The results distilled from the Olympic AI Agenda reveal a road-map for deploying artificial intelligence across the strategic arenas of the Olympic ecosystem. The Agenda positions AI as a high-impact catalyst for athlete support, clean competition and safe-sport initiatives, envisioning data-driven talent-identification, hyper-personalised training plans and real-time injury-prediction models, extending machine-learning techniques to anti-doping analytics and large-scale monitoring of online abuse. These performance gains, however, come with privacy, bias and over-automation risks; hence the IOC pledges to act simultaneously as Pioneer (building shared AI assets), as Catalyst (nurturing IA initiatives) and Guardian (ensuring equity and safety).

The Agenda addresses equal access to AI benefits, a historically sensitive issue for National Olympic Committees (NOCs) in the Global South. Mandating remote-coaching tools and solidarity funding, the Agenda reframes AI both as a competitive advantage for well-resourced federations and as a levelling technology. The corollary risk is a widening digital divide if infrastructure or know-how remains uneven; the IOC therefore introduces an AI-engagement programme with Worldwide Olympic Partners to spread education and resources.

The document highlights AI's capacity to optimise Games operations and sustainability, considering that the use-cases range from generative design of low-carbon venues to predictive transport routing and automated workforce scheduling. While these efficiencies promise cost and emissions savings, they enlarge the attack surface for cyber-threats and concentrate operational reliance on opaque algorithms. Learning loops from Paris 2024 are thus framed as proof-of-concept pilots that will feed into a formal AI solutions pipeline for future host cities.

AI is cast as the engine for growing engagement with people: athletes, on-site spectators and remote fans alike. From one side, personalised content curation, augmented-reality navigation in venues and automated highlight generation represent the imaginative frontier, on the other side algorithmic echo-chambers, sentiment manipulation and intellectual-property misuse are explicit red flags. In order to balance novelty with responsibility, the governance framework foregrounds transparency about data capture and algorithmic decision rules in all fan-facing applications.

4.2. Key Findings

The analysis of the Olympic AI Agenda reveals, in the initial development of the research currently in progress, the growing significance of artificial intelligence (AI) in shaping the future of the Olympic Games. Four key areas emerge until now where AI is expected to drive innovation and improve various aspects of the Games: athlete support, operational optimisation, audience engagement and governance. AI and Athlete Support

AI is positioned as a transformative tool for supporting athletes across multiple dimensions. Analysing vast amounts of data, AI can identify emerging athletes at an earlier stage of their careers, allowing more efficient talent scouting and ensuring that potential Olympians receive the appropriate training and support to maximise their development. In terms of training personalisation, AI technologies enable the creation of individualised training programs that are tailored to an athlete's unique needs and capabilities. Furthermore, machine learning algorithms can analyse performance metrics, adjust training loads and offer insights into injury prevention and recovery, helping athletes to optimise their performance minimising the risk of injury.

AI also plays a crucial role in clean competition supporting anti-doping efforts. The IOC's AI Agenda emphasises AI's potential in enhancing drug testing and detecting irregular patterns in an athlete's performance. AI systems can analyse large datasets to flag anomalies that may suggest doping, contributing to a cleaner and more equitable competitive environment.

Additionally, AI is used to enhance safe sport practices, since predictive models can monitor athletes' movements and physiological data to detect potential injury risks, allowing for early interventions. AI tools can assess mental health, ensuring that athletes' psychological well-being is prioritised alongside physical health, which is critical for their overall performance and longevity.

Operational Optimisation

AI's potential extends beyond athlete support to optimise various operational aspects of the Olympic Games, like the cost reduction. The IOC's AI Agenda highlights AI's ability to streamline operations and reduce the costs associated with hosting the Games, in fact automating logistical tasks, optimising resource allocation and improving supply chain management, AI can ensure that resources are used more efficiently and waste is minimised.

The Agenda notes how AI can improve ticketing systems, crowd control and the management of events, providing real-time insights into attendee behaviour. Predictive analytics can be employed to optimise crowd flows, ensuring that venues run smoothly and that attendees have a seamless experience. Furthermore, AI can assist in automating routine operational tasks, thus reducing the burden on staff and volunteers.

The role of AI in advancing sustainability initiatives is also emphasised in the Agenda. With growing concern about the environmental impact of large-scale events, the IOC is keen on leveraging AI to minimise waste and optimise energy consumption. AI can optimise lighting, temperature controls and waste management systems, helping to reduce the overall environmental footprint of the Games. Additionally, AI is used to track resource use throughout the event, ensuring that sustainability goals are met.

Knowledge transfer is another key benefit of AI, as it allows the IOC to gather insights from past Olympic Games and use them to improve future editions. AI platforms can aggregate data on everything from venue management to fan engagement, creating a repository of best practices and lessons learned, in order to help ensure that the organising committees of future Games are better equipped to handle the complexities of the event.

Audience Engagement

The IOC recognises the potential of AI to enhance audience engagement, providing fans with a more personalised and immersive experience. AI technologies enable the creation of personalised content, where recommendations are tailored to individual preferences and viewing habits, helping the increase of fan loyalty and ensuring that Olympic content reaches the right audience through customised channels.

Moreover, the integration of AI with immersive technologies (e.g, virtual and augmented reality, VR/AR) is set to transform how fans experience the Games. In particular, the technologies allow fans to engage with events in innovative ways, offering virtual access to venues, live-action simulations and behind-the-scenes content; through AI, fans can interact with the Games in real-time, receiving live insights, updates and even predictive performance analytics.

The IOC's AI Agenda highlights AI's ability to create enhanced fan experiences. Chatbots and AI-driven virtual assistants are increasingly used to improve fan service providing immediate answers to queries about tickets, venues and schedules. AI systems can analyse live data from events to offer personalised experiences, providing real-time commentary and insights that provide to individual fan interests, making the experience more engaging and interactive.

Governance and Ethical Considerations

With the increasing reliance on AI, the IOC has emphasised the importance of addressing governance and ethical considerations. The Agenda places a strong focus on data privacy, acknowledging the vast amounts of personal data that AI systems collect. The IOC is committed to ensuring that all data handling practices comply with international regulations, as the General Data Protection Regulation (GDPR), to protect athletes' and fans' privacy.

In addition to privacy concerns, the Agenda stresses the importance of developing AI algorithms that are transparent and unbiased, particularly when it comes to performance analysis, recruitment and anti-doping measures. Addressing potential biases in AI, the IOC aims to ensure that all decisions made by AI systems are fair and just, maintaining the integrity of the Olympic Games.

The IOC acknowledges the need for clear lines of responsibility when it comes to AI-driven decisions, it is crucial that AI technologies, whether used in competition results or event management, are subject to oversight and scrutiny to maintain public trust and ensure that the Games are conducted fairly.

The Agenda outlines risk mitigation strategies to address potential issues, like algorithmic failures, data breaches or the misuse of AI, including regular audits of AI systems, development of contingency plans and promoting a culture of transparency and ethical AI development.

The findings underscore the vast potential of AI to transform the Olympic Games. AI's applications span across enhancing athlete performance, optimising operational processes, engaging with audiences in new ways and ensuring ethical and governance standards are upheld. However, as AI becomes more integrated into the Olympic framework, the need for responsible management and oversight becomes increasingly important to address the challenges of data privacy, fairness and accountability. The IOC's strategic vision for AI presents an exciting future for the Olympic Games, where technology can enhance both the athlete experience and the overall quality of the event.

Implications

Integrating AI, the IOC demonstrates how advanced technologies can reshape traditional business models, operational practices and stakeholder interactions. The implications extend beyond the Olympic Games, offering insights for other global sporting events and industries that aim to harness AI for innovation and growth.

One key implication is the enhancement of athlete support systems. AI's ability to provide personalized training, injury prevention strategies and anti-doping measures contributes to a more ethical and performance-driven athletic environment. The operational efficiencies achieved through AI – including optimised logistics, energy-efficient venue designs and real-time decision-making – highlight the potential for significant cost savings and sustainability gains, which are increasingly critical in a resource-constrained world.

AI's role in audience engagement has far-reaching implications. Personalised and immersive fan experiences, using augmented reality and real-time analytics, redefine the spectator's relationship with the Games. The innovations expand revenue streams through targeted marketing, merchandising and virtual events, illustrating how AI can drive economic growth while fostering global community building.

The IOC's AI Agenda serves as a guiding example of how organisations can balance innovation with ethical considerations, but its long-term effectiveness remains to be seen. The challenges emphasise the importance of transparency, stakeholder collaboration and continuous monitoring in implementing AI-driven initiatives.

Limitations

While this research provides a comprehensive analysis of AI's impact on the Olympic Games, it has some limitations. One significant limitation is the reliance on documentary analysis, which primarily focuses on the IOC's official documents. While these sources offer valuable insights, they may not fully capture the perspectives of all stakeholders, including athletes, fans and sponsors. Future studies could address this gap, incorporating qualitative methodologies like interviews and focus groups to provide a more holistic understanding of AI's implications.

Another limitation lies in the evolving nature of AI technologies. As AI continues to advance, new opportunities and challenges may emerge that were not anticipated in this research. For instance, developments in quantum computing and the metaverse could introduce additional complexities to the integration of AI in sports. The findings of the research should therefore be interpreted as a snapshot of the current landscape, with the understanding that the field is dynamic and subject to rapid change.

The scope of the research is primarily centred on the Olympic Games, which, while globally significant, may not fully represent the diversity of sports events and contexts. Regional and local sporting events may encounter unique challenges and opportunities in implementing AI.

Future Developments

Building on the implications and limitations of this research, several avenues for future development can be identified. First, a longitudinal study that tracks the implementation and outcomes of the IOC's AI Agenda over multiple Olympic cycles would provide valuable insights into the long-term effects of AI integration. Such a study could assess whether the anticipated benefits in athlete performance, operational efficiency and audience engagement are realised, and how ethical challenges are addressed over time.

Second, future research could explore the scalability of AI initiatives across different levels of sports. While this study focuses on the Olympic Games, there is significant potential for AI to impact grassroots and community sports. Investigating how AI can democratise access to resources and opportunities for underrepresented regions and demographics would contribute to a more inclusive understanding of technological transformation in sports.

Third, interdisciplinary research that combines insights from technology, ethics and sports management could further enrich the discourse on AI in sports. For instance, exploring the intersection of AI and sustainability or examining how AI shapes cultural narratives around fairness and competition, would provide a deeper understanding of its societal implications. Partnerships between academia, industry and governing bodies could facilitate the development of best practices and innovative solutions.

Entrepreneurial Autonomy as a Socio-Cognitive Driver for Social Value Creation in Peripheral Regions. Evidence from a case study

Carmelo Arena[1], Antonella Silvestri[2], Stefania Veltri[3]

1. Introduction

A prevailing assumption in entrepreneurship research is that peripheral regions and resource-constrained environments are characterized by economic, social, and institutional barriers that primarily constrain, rather than enable, entrepreneurial action (Welter, 2011). While previous scholars explain how entrepreneurs operate within these constraints, we lack a theoretical understanding of the process by which entrepreneurs first critically challenge and then systematically transform these constraints.

This study addresses this gap by investigating the generative process of radical social value creation. We pose the following research question (RQ1):

RQ1: How do SME leaders exercise entrepreneurial autonomy to cognitively reframe and practically overcome perceived contextual limitations, thereby creating novel social business models?

We examine this question through a critical single-case study (Yin, 2018) of Green Energy, a small-to-medium enterprise (SME) in Calabria, Southern Italy. Green Energy established the first Italian free football school, the Invictus Share A.S.D. embedding a specific mission for the social inclusion of children.

2. Theoretical Framework: Entrepreneurial Autonomy

To develop a micro-foundational model of this phenomenon, we adopt the Entrepreneurial Autonomy perspective, a framework informed by the emancipation theory of Paulo Freire (Freire, 1970; Siqueira et al., 2023). This lens posits autonomy not as mere independence, but as a critical, three-stage process:

- Limit-Situations: The objective structural barriers (e.g., poverty, institutional voids, social exclusion) of a given context. Entrepreneurial autonomy begins with the critical awareness that these situations are not immutable realities but socially constructed, oppressive structures that can be transformed.
- Untested Feasibility: The new, emancipatory vision that emerges from this critical awareness. In an entrepreneurial context, this is the radical social business model that articulates an alternative, more just reality, defying the logic of the existing limit-situations.

3. Methodology

We employ a qualitative, single-case study methodology, an approach selected for its suitability in gaining deep, contextual insights into complex real-world phenomena (Yin, 2018).

[1] Resarch Fellow, ECON/06-A, University of Calabria; carmelo.arena@unical.it – corresponding author

[3] Associate Professor, ECON/06-A; University of Calabria; stefania.veltri@unical.it

The Green Energy case is particularly relevant as it offers a unique opportunity to analyze the specific mechanisms through which an SME successfully creates and sustains social value within a peripheral context, a setting often marginalized in mainstream research.

This extended abstract draws upon the preliminary findings from the first research phase. This initial phase consisted of in-depth, semi-structured interviews primarily with the SME's founders. This focus was essential for capturing the foundational cognitive and motivational drivers underpinning the venture and for exploring the limit situations, or critical challenges, from the entrepreneur's strategic perspective.

The study is currently progressing into its second phase, which is dedicated to rigorous data triangulation. This step is essential for enhancing the validity and reliability of our early findings. This triangulation involves two streams: (1) a comprehensive documental analysis (e.g., internal reports, mission statements, press releases) and (2) conducting further interviews with stakeholders. These stakeholders include (a) ecosystem actors (such as partners and sponsors) to validate the operational processes and external relationships, and (b) the direct beneficiaries (families) to assess the perceived impact and effectiveness of the social value created.

4. Preliminary Findings

Our analysis of the founder's data provides strong preliminary support for the entrepreneurial autonomy process:

- Stage 1: Critical Awareness of Limit-Situations: The founder's agency was initiated by a profound awarness of the interlocking contextual constraints:
  - Economic Constraint: The persistent financial crisis in Calabria, making private sports a luxury and excluding low-income families.
  - Social Constraint: The systemic marginalization of children with disabilities, evidenced by a total absence of adequate public or private structures for children with autism.
  - Institutional Constraint: A perceived environment of clientelistic logics and institutional obstructionism from the local municipality.
- Stage 2: Formulating the Untested Feasibility: This critical awareness catalysed a radical vision. The founder articulated this untested feasibility as a "small revolution" to "create social progress". The vision was explicitly emancipatory: to "put all children on the same level" through a high-quality, free, and inclusive model, thereby nullifying the oppressive logic of the "limit-situations."
- Stage 3: Enacting the "Limit-Acts": The founder then engaged in transformative limit-acts to realize this vision:
  - The Act of Systemic Replacement: The primary limit-act was the orchestration of a social ecosystem. By mobilizing a network of partners (sponsors, volunteers), the SME actively built a parallel support system that replaces the failing or absent state institutions. This ecosystem is sustained by relational governance.
  - The Act of Symbolic Inclusion: A specific limit-act that exemplified the mission was creating mixed football team embedding autistic children. This symbolic act directly challenged the "limit-situation" of social exclusion, providing tangible generated value and proving the untested feasibility was, in fact, possible.

5. Discussion

This study, while preliminary, offers distinct theoretical and practical contributions to the field of entrepreneurship.

This study offers distinct theoretical and practical contributions. Theoretically, we propose a micro-foundational, socio-cognitive model of social value creation. We argue that in peripheral regions, radical social business models are not a mere response to institutional voids but are

generated by an entrepreneur's emancipatory autonomy. This shifts the analytical focus from structural determinants to the cognitive processes of constraints awarness and agentic action. We further extend Siqueira et al.'s (2023) framework by applying it to the SME and ecosystem level. We conceptualize the limit-act not as a single action but as the complex, relational work of social ecosystem orchestration. Finally, we re-conceptualize constraints. Challenging their traditionally negative framing, we posit that severe constraints (e.g., institutional clientelism, poverty) function as cognitive catalysts. They trigger the critical awareness that is an essential prerequisite for envisioning and enacting emancipatory business models otherwise unthinkable in stable market contexts. Practically, we provide an actionable process model for entrepreneurs in peripheral regions. We suggest that success in creating systemic social change is not contingent on resource acquisition but on: (1) critically reframing the problem as an oppressive limit-situation to be solved, not merely navigated; (2) articulating a radical untested feasibility that inspires collective action; and (3) systematically orchestrating an ecosystem of partners to build a new, sustainable reality. The goal is to foster these ecosystem orchestrators as they build new, resilient social infrastructures from the ground up.

Identifying Critical Factors for Biodiversity Integration in Management Control Systems (MCS) using the Fuzzy Delphi Method

Carmelo Arena[1], Marion Ligonie[2], Marie Redon[3], Stefania Veltri[4]

1. Introduction

The contemporary organizational landscape is confronting a profound shift in risk perception. The global biodiversity crisis is no longer a peripheral environmental concern but is now recognized as a systemic economic risk, comparable in magnitude to climate change (WEF, 2024). This urgency is crystalizing into regulatory and market expectations. Emerging global frameworks, most notably the Taskforce on Nature-related Financial Disclosures (TNFD), are compelling organizations to transition from vague environmental statements to the rigorous measurement, management, and disclosure of their comprehensive nature-related impacts, dependencies, risks, and opportunities.

However, this transition exposes a critical implementation bottleneck. The management adage "what gets measured, gets managed" is contingent upon the systems that perform the measurement and management. Current corporate practice reveals a significant gap between disclosure ambitions and internal control realities.

On the one hand, external reporting on biodiversity remains nascent, fragmented, and largely superficial. Recent analysis of UK-listed companies confirms that while many firms acknowledge biodiversity, their disclosures are often narrative, lack quantitative metrics, and fail to integrate biodiversity considerations into core financial reporting (Maroun & Ecim, 2024; Hummel & Jobst, 2024). This suggests a lack of robust internal data aggregation, indicating that biodiversity is not yet a systematically managed issue.

On the other hand, this external reporting gap reflects a deeper, internal problem: Management Control Systems (MCS), defined as the formal and informal mechanisms, including budgets, Key Performance Indicators (KPIs), incentive structures, and diagnostic systems, that translate strategy into operational action, are fundamentally unprepared to govern the complexities of biodiversity (Hübel & Wenzig, 2025; Zhao & Atkins, 2021).

While the antecedent literature on Sustainability Control Systems (SCS) has matured, its focus has been predominantly on quantifiable global metrics such as carbon. Biodiversity, characterized by its site-specific, complex, non-linear, and multi-faceted nature, presents a far greater challenge. Exploratory research confirms this gap; even in sectors with high nature-dependency like the food industry, companies are only beginning to experiment with integrating biodiversity. These initial efforts are often informal, lack specialized KPIs, and struggle to connect high-level corporate commitments to operational management controls.

This creates a dual challenge: organizations are being pushed to report on data they do not have, produced by control systems they have not yet built. Therefore, there is an urgent need to

[1] Research Fellow, ECON/06-A, University of Calabria; carmelo.arena@unical.it – corresponding author

[2] Associate Professor, IESEG School of Management, m.ligonie@ieseg.fr

[3] Assistant Professor, IESEG School of Management, m.redon@ieseg.fr

[4] Associate Professor, University of Calabria, stefania.veltri@unical.it

define what these "Biodiversity MCS" should look like, moving beyond ad-hoc experimentation toward a validated framework.

2. Research Objectives and Questions

This study aims to bridge this critical gap. The general objective is to identify, prioritize, and validate a framework of critical factors essential for the effective design and implementation of "Biodiversity MCS". The research seeks to move beyond theoretical models by providing actionable, expert-validated guidance.

To achieve this, the study addresses two primary Research Questions (RQs):

RQ1: What are the primary drivers and most significant barriers that organizations face when attempting to integrate biodiversity considerations into their MCS?

RQ2: What are the most critical Key Performance Indicators (KPIs) and specific control practices required for organizations to effectively manage their corporate biodiversity impacts and dependencies?

3. Methodology: The Fuzzy Delphi Method (FDM)

To address these questions regarding a novel and complex topic, the chosen methodology is the Fuzzy Delphi Method (FDM).

The conventional Delphi technique is an established methodology for structuring consensus among a heterogeneous expert panel (Ghag & Sonar, 2024; Küchler et al., 2023). It is well-suited for this research, as biodiversity integration into MCS is a nascent field where structured expert judgment is more valuable than scarce historical data. The study will recruit a stratified panel (estimated N=25) comprising three key groups: academics (MCS/SCS scholars), practitioners (CSOs, Sustainability/Finance managers), and specialized consultants (biodiversity/TNFD experts).

The Fuzzy component, integrating fuzzy set theory, is a critical methodological enhancement. The evaluation of factors related to biodiversity is inherently ambiguous, subjective, and linguistic. A conventional Likert scale fails to capture the subjective space between semantic ratings (e.g., "Important" versus "Very Important").

FDM addresses this by converting linguistic variables into Triangular Fuzzy Numbers (TFNs). This approach mathematically models the vagueness, mitigates the ambiguity of expert responses, and ultimately improves the stability and convergence rate of the consensus.

Instrument Development (Round 1): A comprehensive questionnaire listing potential drivers, barriers, and KPIs will be developed based on an extensive literature review.

Expert Rating (Round 1): The panel will rate the "importance" of each factor using a 7-point linguistic scale.

Fuzzification: These linguistic responses will be mathematically converted into TFNs. An aggregated TFN (e.g., using a fuzzy geometric mean) will be calculated for each factor.

Consensus Check & Defuzzification (Round 2): Factors will be "defuzzied" to derive a score for ranking. For factors not achieving consensus in Round 1, participants will receive an anonymized feedback report (showing their score versus the group's fuzzy average) and will be asked to re-evaluate their position.

Final Analysis: The process concludes upon reaching consensus, resulting in a finalized, prioritized list of "Critical Factors".

4. Expected Contributions

This study is poised to deliver a threefold contribution, precisely positioned to address the gaps identified in the current literature and practice:

- Theoretical Contribution: The study will extend the theory of Sustainability Control Systems (SCS) by providing a specific framework for biodiversity. The current literature on SCS is dominated by carbon-centric models or limited, exploratory case studies. By employing a rigorous, multi-stakeholder consensus methodology (FDM), this research moves beyond exploration. It will provide a structured theoretical framework that articulates how MCS must be adapted to govern a complex, non-financial, and site-specific construct, thereby distinguishing the control requirements for biodiversity from simpler, global control metrics like carbon.
- Practical/Managerial Contribution: This contribution is twofold. Firstly, it addresses the "what" and "how" of implementation. While previous studies highlight the lack of quality reporting, this research provides the solution: a validated framework of critical drivers, barriers, and KPIs. Instead of diffusing limited resources on experimental controls, managers (CFOs, CSOs, Controllers) can use this framework to prioritize action and design effective control systems from the outset. Secondly, by achieving consensus among academics, practitioners, and consultants, the framework will possess a degree of legitimacy and practicality that is essential for its adoption in the field.
- Methodological Contribution: The study will demonstrate the utility of the Fuzzy Delphi Method (FDM) in solving a pressing environmental management accounting problem. Current research on biodiversity in MCS has relied on qualitative, exploratory case studies, which are excellent for identifying initial themes but cannot provide a prioritized or validated model. This study will show how FDM is a superior methodology for managing the inherent ambiguity and linguistic uncertainty (e.g., "what is critically important?") surrounding a nascent topic. It provides a blueprint for future research in sustainability strategy, showing how to build robust consensus where historical data is scarce, and expert opinion is paramount.

1. Introduction and theoretical background

The year 2015 marked a turning point in global sustainability policy with the adoption by the United Nations of the "Agenda 2030", a comprehensive programme for Sustainable Development structured around 17 Sustainable Development Goals (SDGs) and 169 related targets to be achieved by 2030 across the environmental, economic, social, and institutional dimensions. Reaching these objectives requires the active participation of all sectors of society, including private enterprises, public institutions, civil society, and decision-makers.

As noted by several authors (Berenberg, 2018; Sætra, 2021), the SDGs can be associated with environmental, social and governance (ESG) criteria, since each goal can be linked to one or more of these dimensions. Taken together, they encompass the three fundamental pillars of sustainability: environmental protection, social responsibility, and economic development. These pillars constitute the practical basis for advancing sustainable development, which the United Nations Brundtland Commission (1987) defined as meeting current needs without jeopardizing the ability of future generations to satisfy their own.

The academic debate has increasingly emphasized the growing attention paid by stakeholders to ESG and sustainability factors (Ahuja & Rani, 2025; Garzella & Capurro, 2024; Gyönyörová et al., 2021). In this context, companies are increasingly adopting incentive systems with the aim to align companies' actions to stakeholders' expectations (Berrone & Gomez-Mejia, 2009; Haque, 2017; Remo-Diez et al., 2025).

This topic has been primarily addressed in the literature through the agency and stakeholder theories (Freeman, 1984; Jensen & Meckling, 1976). A more integrative framework is provided by the agency–stakeholder theory, which reconceptualizes the principal-agent conflict as a contractual nexus that extends to multiple stakeholders (e.g., customers, employees, institutional investors and local communities) (Hill & Jones, 1992).

One effective mechanism for responding to stakeholder demands and regulatory pressures — as well as demonstrating environmental and social commitment — is the implementation of governance remuneration systems linked to ESG or sustainability metrics (Cohen et al., 2023; Veltri et al., 2025). As noted by Veltri et al. (2025), the relationship between ESG-linked executive compensation and ESG performance constitutes an emerging research frontier. Although prior evidence generally supports a positive association (Derchi et al., 2021; Radu & Smaili, 2022), further empirical investigation is warranted (Morrison et al., 2024; Veltri et al., 2025). For example, Veltri et al. (2025) bring to light the risk that this impact remains symbolic rather than substantial, and – to the best of authors knowledge –, no studies have been conducted on European context in the last years (Morrison et al., 2024).

In this scenario, the present study investigates the differential influence of financial-based and ESG-based executive compensation on firms' ESG outcomes, both contemporaneously and over the short-term. The empirical analysis relies on a panel of 2,176 European listed companies observed over the 2018–2023 period, a timeframe marked by increasing regulatory pressures (e.g., Non-Financial Disclosure Directive (2014/95/EU) and Corporate Sustainability Reporting Directive (2022/2464/EU)).

2. Data and methods

The study aims to assess whether the inclusion of ESG objectives in executive compensation schemes influences firms' overall ESG performance. In this context, the econometric analysis employs a panel data approach to estimate the influence of executive compensation policies on firms' sustainability performance. The dataset comprises 2,176 companies retrieved from Refinitiv and observed over the period 2018–2023.

The dependent variable, ESG_it, represents the aggregate ESG score of firm i in year t, which captures its environmental, social, and governance performance. The main explanatory variables are two dummy indicators generated to capture different configurations of executive compensation policies: D_{it}^{no}: takes the value 1 if the firm does not implement any executive compensation policy, while D_{it}^{perf}: takes the value 1 if the firm's compensation schemes are solely linked to financial performance indicators. The reference category for both dummies includes firms that adopt compensation policies tied to both financial and ESG performance. The model includes a set of control variables related to several aspect of the firms: governance and transparency ($CSRreport_{it}$, $CEOdual_{it}$), audit committee characteristics ($Auditindep_{it}$), and financial structure variables ($\ln Assets_{it}$, $DebtEquit_{it}$). The baseline specification is a Fixed Effects (FE) model:

$$ESG_{it} = \alpha_i + \beta_1 D_{it}^{no} + \beta_2 D_{it}^{perf} + \gamma' Z_{it} + \delta_t + \varepsilon_{it} \quad (1)$$

where α_i captures firm-specific unobserved heterogeneity, δ_t denotes year fixed effects, and Z_{it} is the vector of control variables. The FE specification controls unobserved heterogeneity across firms and across time.

To account for the possibility that changes in compensation structures affect sustainability performance with a temporal lag, a dynamic version of the model is estimated by including the one-period lag of the two compensation dummies:

$$ESG_{it} = \alpha_i + \beta_1 D_{it-1}^{no} + \beta_2 D_{it-1}^{perf} + \gamma' Z_{it} + \delta_t + \varepsilon_{it} \quad (2)$$

Since Fixed Effects models cannot estimate the impact of time-invariant variables (such as industry sector), an alternative specification is estimated using a Correlated Random Effects (CRE) model following Mundlak (1978). This approach introduces the firm-specific means of the time-varying regressors ($\bar{X}_i$) into the specification of random-effects, modeling explicitly the correlation between the unobserved individual effects and the explanatory variables:

$$ESG_{it} = \alpha + \beta_1 D_{it}^{no} + \beta_2 D_{it}^{p} + \gamma' Z_{it} + \theta_1 \bar{D}_i^{no} + \theta_2 \bar{D}_i^{p} + \theta' \bar{Z}_i + \phi_S + \pi_1 Poll + \pi_2 St + \delta_t + \mu_i + \varepsilon_{it} \quad (3)$$

where *Poll* and *St* are time-invariant dummy variables equal to one if the firm operates in a polluting industry and if it is included in the STOXX 600 index, respectively. In addition, ϕ_S is a vector of dummies to control for the economic sector of activities and μ_i is the idiosyncratic random component. This formulation enables the decomposition of the total effect into a within-

firm component (representing temporal variation) and a between-firm component (reflecting cross-sectional structural differences). A lagged version of the CRE model is also estimated to capture delayed effects in this richer specification.

All models are estimated using heteroskedasticity- and autocorrelation-consistent standard errors clustered at the firm level, following evidence of first-order serial correlation obtained through the Wooldridge test ($p < 0.001$). The Breusch–Pagan test confirmed significant variance across firms, justifying the use of panel methods. The Hausman test rejected the null hypothesis of no systematic differences between FE and RE estimates, indicating that the simple Random Effects estimator would be inconsistent. Finally, the joint significance test of the firm-level means in the Mundlak specification ($\chi^2 = 347.61$, $p < 0.001$) confirmed the presence of correlation between the regressors and the unobserved individual effects, validating the CRE correction.

Overall, this empirical strategy – combining Fixed Effects, dynamic Fixed Effects, and Mundlak specifications – provides a robust analytic framework to assess both the short-term within-firm dynamics and the long-term firm structural differences in the relationship between executive compensation design and ESG performance.

3. Results and discussion

Table 1 reports the estimates from four panel data models aimed at assessing the relationship between executive compensation policies and firms' ESG performance. Models (1) and (1-lagged) are fixed-effects specifications, while Models (2) and (2-lagged) are estimated using the Mundlak correlated random effects approach, which also incorporates the time-invariant variables (polluting sector and STOXX600 inclusion) and sectoral dummies. Standard errors are robust and clustered at the firm level.

The results are highly consistent across specifications. The coefficients associated with the two compensation policy dummies are negative and highly significant in all models, confirming the existence of a strong link between the structure of executive incentives and firms' ESG performance. Specifically, firms that do not implement any structured compensation policy show ESG scores on average 7.5 to 7.8 points lower than those adopting integrated schemes that link incentives to both financial and ESG objectives. Similarly, firms that base compensation exclusively on financial performance exhibit ESG scores about 2.7 to 2.8 points lower in the contemporaneous specification. When the lagged versions of these dummies are considered, the estimated coefficient remain statistically significant, but their magnitudes roughly halve (−3.5 for the absence of policy and −1.3 for financial-only schemes). This attenuation suggests that the primary impact of compensation design materializes contemporaneously, whereas its persistence over time is weaker but still observable.

These findings align with both agency and stakeholder theory perspectives. From an agency theory standpoint, the introduction of explicit ESG-related incentives provides a mechanism to align managerial behaviour with broader sustainability objectives, thereby improving the firm's ESG standing. From a stakeholder theory perspective, the adoption of measurable ESG incentives may be interpreted as a response to stakeholder pressure, signalling the firm's commitment to environmental and social accountability. Improvement in ESG ratings thus reflects greater alignment between corporate conduct and stakeholder expectations.

The control variables behave as expected and display stable signs across models. The publication of a CSR or sustainability report is strongly and positively associated with the ESG score (coefficient of approximately +9.4, $p < 0.01$), confirming that transparency and formal reporting are proxies for a broader sustainability orientation. Such reporting practices enhance accountability both in the agency perspective and in the stakeholder perspective, reinforcing the explanatory power of both theoretical frameworks.

The CEO duality variable (when the same individual holds both CEO and Chair roles) shows a negative and significant effect, indicating that concentrated leadership structures weaken

governance oversight and are associated with lower ESG performance. This result supports the theoretical view that power concentration reduces board independence and, consequently, the effectiveness of both shareholder and stakeholder monitoring.

Conversely, the independence of the audit committee has a positive and highly significant association with the ESG score, pointing to the role of board oversight in enhancing sustainability governance. An independent audit committee enhances managerial accountability and strengthens the internal control environment, fully consistent with both theoretical lenses adopted.

Among the financial controls, firm size (proxied by log total assets) shows a strong positive effect, implying that larger firms achieve higher ESG scores—possibly due to greater visibility, resources, and stakeholder scrutiny. The debt-to-equity ratio enters with a small but significant negative sign, suggesting that more leveraged firms face financial constraints or strategic trade-offs that limit investment in ESG practices.

The inclusion of time-invariant covariates in the Mundlak models provides further insights. Firms operating in polluting sectors show, on average, ESG scores about 3 points lower, reflecting both the structural environmental challenges and stricter stakeholder expectations that characterize these industries.

By contrast, firms listed in the STOXX 600 index display ESG scores roughly six points higher, consistent with the idea that inclusion in a major market index is associated with greater investor attention and higher transparency and sustainability standards. These outcomes corroborate both agency and stakeholder theories by illustrating how market visibility and institutional pressures foster responsible corporate behaviour.

The significance and stability of these time-invariant effects underscore the value of the Mundlak specification in capturing persistent cross-sectional differences that are not identifiable under a fixed-effects framework.

Note: For the sake of simplicity, coefficients of the firm-level means (Mundlak correction terms) are omitted from the table but included in the estimation.

Table 1. Results of the panel estimation (standard errors in parentheses)

Overall, the results confirm that executive compensation design is a critical determinant of corporate sustainability performance and serves as an effective governance mechanism to align managerial actions with both shareholder and stakeholder interests. The consistent and substantial differences between firms with integrated ESG-linked incentives and those without such mechanisms highlight the role of managerial motivation systems as a lever for aligning corporate strategy with sustainability objectives.

The robustness of the findings across fixed-effects and Mundlak specifications, and across both contemporaneous and lagged formulations, strengthens the conclusion that the integration of ESG criteria into compensation policies has a measurable and enduring positive role on firms' ESG performance.

4. Conclusions

In order to examine whether and to what extent the inclusion of ESG-related objectives in executive compensation schemes enhances firms' overall ESG performance – building on agency–stakeholder theory (Hill & Jones, 1992) – the research explores how incentive alignment mechanisms works for boosting sustainable practices.

The empirical evidence provides a clear answer to the research question: linking executive remuneration to ESG targets exerts a significant and positive role on firms' sustainability outcomes. Firms adopting integrated compensation schemes that combine financial and ESG metrics consistently outperform those relying solely on financial criteria or lacking formalized incentive systems. These findings confirm that executive compensation design represents a strategic governance lever for embedding sustainability principles into managerial behaviour and corporate decision-making.

From a theoretical standpoint, the study contributes to bridging agency and stakeholder perspectives by demonstrating how incentive systems can mitigate information asymmetries (agency approach) while simultaneously responding to external legitimacy pressures (stakeholder approach) (Freeman, 1984; Jensen & Meckling, 1976; Morrison et al., 2024). In doing so, it advances the understanding of how compensation mechanisms operate as dual alignment tools—internally aligning managerial interests with corporate purpose and externally aligning corporate conduct with stakeholder expectations. The use of a panel data approach further strengthens these conclusions by disentangling short-term behavioural responses from persistent cross-firm structural effects.

From a managerial and policy perspective, the results underscore the importance of designing incentive contracts that integrate measurable ESG metrics alongside traditional financial indicators. Boards and remuneration committees should recognize that such integration not only

improves sustainability performance but also enhances transparency and investor confidence. For regulators and standard setters, the evidence highlights the role of governance-based levers—such as remuneration disclosure requirements—in fostering the diffusion of sustainability-oriented practices across markets.

Overall, the findings demonstrate that integrating ESG criteria into executive compensation represents not merely a symbolic gesture, but a substantive governance practice that enhances firms' capacity to deliver sustainable value creation.

The study is not without limitations. A first limitation of the results is related to endogeneity and potential reverse causality, as firms with a stronger pre-existing sustainability orientation may be more likely to adopt ESG-linked executive compensation schemes. As a result, it is important to highlight that observed associations may partly reflect selection effects rather than purely causal relationships. Furthermore, the analysis focuses on European listed firms, which may limit generalizability to other institutional and cultural contexts. Lastly, the use of aggregate ESG scores – though comprehensive – may conceal heterogeneity across the environmental, social and governance dimensions.

In the next steps of this project research, the analysis will be extended by employing disaggregated ESG metrics (i.e., environmental score, social score and governance score), exploring non-linear effects, or investigating the moderating influence of national governance systems and stakeholder relevance. Qualitative or mixed-method approaches could also shed light on the internal decision-making processes linking compensation policies to sustainability outcomes.

Market liberalization and Non-Financial Disclosure: implications for firm performance in the utilities sector

Roberta Barbieri[1], Marco Sorrentino[2], Francesco Natale[3], Benedetta Coluccia[4]

1. Introduction

In recent decades, the European economic landscape has undergone profound institutional, regulatory, and economic transformations (Foster et al., 2005). Two key and interrelated phenomena have characterized this evolution across several sectors. On the one hand, markets have been progressively liberalized to foster competitiveness and improve efficiency (Bognetti and Obermann, 2008). On the other hand, the gradual and increasingly stringent introduction of Non-Financial Disclosure (NFD) requirements has aimed to enhance transparency, environmental and social accountability, and corporate responsibility (Testa, 2024). Within this broader context, the public utilities sector, comprising entities engaged in the provision of electricity, gas, water, and environmental services, has been particularly affected.

In Europe, the process of liberalization has profoundly altered the role of public authorities in regulating essential services (Wacziarg and Welch, 2008). Historically, the characteristics of service provision were defined by public administrations, both central and local, either directly or through public enterprises. However, since the 1980s and 1990s, there has been an increasing influence of market logic on these decisions (Stiglitz, 2000). This evolution is driven by three fundamental imperatives: (i) to safeguard consumers from predatory or exploitative practices by corporations in a dominant position; (ii) to invigorate investment by curbing the capriciousness of political decisions; and (iii) to enhance the efficacy of services through the introduction of competitive dynamics (Barros and Martínez-Zarzoso, 2022). In Italy, this phenomenon has manifested itself with varying intensity and in different ways depending on the sector in question. For instance, during the 1990s, companies operating within the energy sector, particularly those involved in the distribution and sale of electricity and natural gas, began operating in progressively liberalized markets. This transition was consistent with EU directives that promote competition, efficiency, and the freedom of choice for end users (Bojnec and Križaj, 2021). In contrast, utilities that are active in the management of integrated water services operate primarily in a non-liberalized environment. This context is marked by a monopolistic and highly regulated structure, wherein the provision of services is entrusted through concessions or in-house provision, and access to the market is strictly controlled by public authorities (Grafton et al., 2022).

Concurrent with economic and institutional transformations, there has been a marked strengthening of policies aimed at sustainability and transparency (Imperiale et al., 2023). The reporting of sustainability practices by utilities can be interpreted from different perspectives. On the one hand, these companies contribute to sustainable development by creating public value, providing essential services that improve collective well-being (Moore, 1995). On the other hand, they inevitably generate negative impacts on the environment, such as pollution, loss of

biodiversity, and deforestation (Coluccia et al., 2024). The aforementioned contradictions contribute to the complexity and strategic nature of NFD in the utilities sector. The gradual adoption of accountability tools, both voluntary and mandatory, has partially addressed the difficulties of reliably assessing the contribution of utilities to sustainable development (Bebbington and Unerman, 2020). Indeed, a growing number of companies have initiated the reporting of non-financial indicators, even in the absence of explicit regulatory mandates (KPMG, 2020; 2024). In any case, the introduction of Directive 2014/95/EU, implemented in Italy with Legislative Decree 254/2016, has established the mandatory reporting of non-financial information for specific corporate categories, effective from the 2017 financial year. This regulatory innovation signified a pivotal advancement in the domain of corporate governance, extending the ambit of corporate disclosure to encompass environmental, social, and governance (ESG) dimensions, in addition to traditional economic and financial performance metrics (Pizzi et al., 2021). More recently, the adoption of Directive 2022/2464/EU, known as the Corporate Sustainability Reporting Directive (CSRD), has further strengthened and expanded the scope of non-financial disclosure requirements, extending their applicability to a broader range of companies and aligning reporting standards with the EU Taxonomy and the Sustainable Finance framework (European Commission, 2022).

The extant literature has given increasing attention to the impact that these two key processes can have on the operational and economic performance of companies, particularly in the utilities sector.

According to classical economic theory, the increased competition that results from liberalization should promote greater allocative efficiency. Companies operating in liberalized markets face competitive pressures that can stimulate customer-oriented behavior and organizational innovation (Boubakri et al., 2005). Conversely, in non-liberalized sectors, companies tend to prioritize regulatory compliance and long-term infrastructure management, often under public ownership or concession arrangements (Baccini et al., 2022). However, empirical evidence has shown mixed results, as the degree of market openness, the characteristics of corporate structure and governance, and specific territorial dynamics have the potential to amplify or attenuate the expected effects (Pollitt, 2025).

The obligation to disclose non-financial information can also have different effects on company performance. From the perspective of governance theory and institutional legitimacy (Freeman et al., 2021), NFD can be a strategic lever capable of generating reputational value, reducing information risks, strengthening stakeholder confidence, and attracting capital (Latella and Veltri, 2024). However, mandatory disclosure can also entail compliance costs and highlight management inefficiencies, generating non-linear or even counterproductive effects on company performance, particularly in the short term (Ioannou and Serafeim, 2023). This phenomenon is particularly salient in companies operating within controversial or environmentally exposed sectors, such as utilities, which frequently engage in activities that simultaneously generate both positive and negative externalities (Martínez-Ferrero et al., 2023).

In this context, the interaction between market liberalization and NFD obligations is particularly interesting, but it is still underestimated in the scientific literature. Both can encourage companies to adopt more responsible management practices, thereby generating synergistic effects (Mejía-Dugand et al., 2017). However, the combination of competitive pressures and regulatory compliance can also generate management tensions, negatively affecting corporate performance if companies lack the organizational resources and skills to address both challenges (Lieberherr and Truffer, 2015). Therefore, understanding how these two processes interact is crucial for analyzing performance dynamics in the utilities sector.

In light of the theoretical and empirical ambiguities identified, the following research objectives are proposed:

- to assess the effect of market liberalization on the performance of utilities, distinguishing between companies operating in fully liberalized sectors and companies operating in non-liberalized sectors;
- to investigate the impact of the regulatory requirement for NFD on utilities' performance, comparing firms subject to and exempt from the obligation, and distinguishing the period preceding and following the enforcement of the mandatory reporting requirement;
- to assess the existence of possible joint or interactive effects between market liberalization and the NFD requirement in relation to the performance of utilities;
- to determine how specific company and regional characteristics may moderate these effects.

To analyze these relationships, the study focuses on two distinct yet complementary performance measures, aimed at capturing both the operational efficiency and economic profitability of companies:

- business productivity, estimated using Total Factor Productivity (TFP) and calculated using the ACF approach. This measure is indicative of the technical and operational efficiency of the business, as it takes into account the combined use of multiple inputs (capital and labour) in the output generation process (value-added);
- business profitability, estimated using the Return on Assets (ROA). This measure is a financial indicator that reflects the effectiveness of management in the use of available assets, and is particularly relevant in capital-intensive sectors, such as utilities.

The research adopts a quantitative approach based on panel data analysis, applying a fixed effects model. The analysis is conducted on a sample of Italian companies in the utilities sector, operating in the energy (ATECO 35 - Production, transmission, and distribution of electricity) and water (ATECO 36 - Collection, treatment, and supply of water) sectors, observed in the period between 2015 and 2024. This interval facilitates a longitudinal analysis of the company's performance. In contrast to conventional cross-sectional regressions, panel analysis allows for the identification of intricate relationships between variables over time, controlling for unobservable heterogeneity among companies and isolating specific effects that remain constant over time. Consequently, it enhances the reliability of causal inferences.

In the regression model, the dependent variables representing the company's performance are: (i) TFP, which serves as a proxy for operational efficiency; and (ii) ROA, which functions as a measure of the company's overall profitability. The explanatory variables include:

- Liberalization: dummy variable, which assumes the value 1 for companies operating in liberalized sectors (i.e., energy) and 0 for those operating in non-liberalized sectors (i.e., water);
- Non-Financial Discosure: dummy variable, which assumes the value 1 for companies that are subject to non-financial reporting requirements and 0 for those that are not subject to non-financial reporting requirements, as outlined in Legislative Decree 254/2016;
- Liberalization × Non-Financial Disclosure: interaction term between the two explanatory variables, useful for detecting any joint effects on productivity and profitability.

To improve the robustness of the model and isolate the specific effects of the institutional variables of interest, several control variables are also included, divided into three categories: firm-level, governance-level, and territorial-level.

The firm-level control variables included in the model are as follows:

- Age: the number of years since the firm's founding, used as a proxy for organizational experience and maturity;
- Size: measured by total assets, to account for potential economies of scale;
- Financial leverage: proxied by the debt-to-equity ratio, which reflects the firm's capital structure and exposure to financial risk;

- Private ownership: the percentage of equity held by private entities, included to capture differences in strategic orientation, management practices, and disclosure behaviors between publicly and privately owned firms.

The governance-level control variables included in the model are as follows:

- Board Size: total number of directors on the board;
- Board Independence: proportion of independent directors serving on the board;
- Board Age: average age of board members, used as a proxy for generational composition and experience;
- Board Education Level: average level of education among board members, indicating the board's human capital and potential cognitive diversity;
- Board Gender Diversity: proportion of female directors on the board, capturing gender-based diversity;
- CEO Duality: a dummy variable that indicates if the Chief Executive Officer also holds the role of Board Chair;
- CSR Committee: a dummy variable that indicates if the company has a formally established Corporate Social Responsibility (CSR) committee.

The territorial-level control variables included in the model are as follows:

- Regional GDP: a proxy for the level of economic development per capita in the geographical area where the firm operates, capturing differences in local wealth and infrastructure;
- Regional Population: an indicator of market size, reflecting the potential demand for utility services within the region;
- Institutional Quality: a proxy for the quality of local institutions and the intensity of regulatory frameworks, which may influence firm performance and compliance behavior.

This articulation enables the consideration of structural heterogeneity among companies, both internally (firm-level and governance-level) and externally (territorial-level). Consequently, it enhances the reliability of inferences regarding the relationships between liberalization, transparency requirements, and performance.

The regression model on panel data with fixed effects is illustrated in the following equation:

$$Performance_{it} = \beta_0 + \beta_1 Lib_{it} + \beta_2 NFD_{it} + \beta_3 (Lib_{it}\ x\ NFD_{it}) + \beta_4 X_{it}^{firm} + \beta_5 X_{it}^{gov} + \beta_5 X_{it}^{terr} + \alpha_i + \gamma_t + \varepsilon_{it}$$

where:

- $Performance_{it}$ alternatively represents the two dependent variables (TFP and ROA) for company *i* in year *t*;
- Lib_{it} is the dummy liberalization for company for company *i* in year *t*;
- NFD_{it} is the dummy Non-Financial Disclosure for company *i* in year *t;*
- $Lib_{it}\ x\ NFD_{it}$ is the interaction term between Lib and NFD for company *i* in year *t;*
- X_{it}^{firm} is the vector of firm-level control variables for company *i* in year *t;*
- X_{it}^{gov} is the vector of governance-level control variables for company *i* in year *t;*
- X_{it}^{terr} is the vector of territorial-level control variables for company *i* in year *t;*
- α_i represents the fixed individual effects (for each firm), which capture the unobserved heterogeneity that is constant over time;
- γ_t represents temporal effects (per year), to control for macroeconomic or regulatory shocks;
- ε_{it} is the idiosyncratic error term.

The data sources used to construct the dataset include AIDA Bureau van Dijk, for companies' information, CONSOB for the identification of companies subject to non-financial reporting requirements, and ISTAT for territorial variables.

Preliminary results indicate that market liberalization has a positive impact on firms' productivity, thereby confirming the hypothesis that competition can stimulate greater technical and operational efficiency. However, no systematic effects on ROA are observed, indicating that competitive pressures could translate into lower profit margins, at least in the short to medium term.

Non-financial reporting requirements have a positive impact on ROA, presumably attributable to reputational benefits and improved relationships with stakeholders and institutional investors. The effect on TFP, however, is not statistically significant, suggesting that the adoption of NFD does not directly affect operational efficiency, but rather strategic and relational aspects.

The interactive effect between liberalization and NFD reveals an interesting result: companies operating in liberalized markets and subject to NFD requirements achieve the highest levels of ROA, all other conditions being equal. This phenomenon could be indicative of a synergistic effect, wherein mandatory transparency serves to enhance corporate competitiveness within open market contexts. However, in the absence of adequate management resources, this combination can also increase operational complexity, generating divergent effects on TFP, especially among smaller companies.

Finally, the results of the moderation analyses indicate that company and regional characteristics play a crucial role. A higher percentage of private ownership is positively correlated with superior performance, both in terms of TFP and ROA, in corporate entities, in contrast to those under public control. Additionally, the presence of a CSR committee and greater diversity on the board, particularly in terms of independence and gender representation, are positively correlated with enhanced profitability. Finally, a positive relationship has been demonstrated between regional GDP per capita and productivity, suggesting that companies operating in more developed contexts benefit from positive externalities.

The present study represents a novelty on a theoretical level but also has practical and political implications. From a theoretical perspective, the study contributes to the development of literature on the performance of utilities in the context of institutional reforms, offering a combined analysis of market factors and regulatory transparency requirements in essential public services. From a managerial perspective, the results highlight the importance of a solid governance structure to maximize the benefits deriving from non-financial reporting and market liberalization. On the public policy front, the findings indicate that the implementation of liberalization initiatives must be coupled with the formulation of territorial support policies to avert potential regressive consequences in less developed regions. Moreover, for NFD to evolve from a mere bureaucratic obligation into a strategic instrument, it is imperative to furnish explicit guidelines and technical assistance to companies, thereby enabling its effective implementation.

Future studies may include: (i) extending the sample to other European countries; (ii) including ESG indicators extracted directly from sustainability reports; (iii) qualitative analysis to explore managerial adaptation mechanisms in greater depth.

Converging ESG frameworks: exploring interoperability across ESRS, GRI, SASB/IFRS

Rafaela Gjergji[1], Elena Montani[2], Alessandro Cortesi[3]

1. Introduction and research background

Research on consolidation and harmonization of sustainability reporting has increased in recent years, reflecting the growing importance of environmental, social, and governance (ESG) accountability in both academic and professional domains (Kolk, 2004; Fifka and Drabble, 2012; Milne & Gray, 2013; Carungu et al., 2025; Pizzi et al., 2025; Hobber and Schipper, 2025). Over the past few decades, a variety of international sustainability reporting standards have been developed to guide organizations in disclosing their ESG impacts. Since the 1990s, the Global Reporting Initiative (GRI) has offered one of the most widely used frameworks for sustainability disclosure, culminating in the publication of the GRI Standards (Petera and Wagner, 2015). Similarly, the Sustainability Accounting Standards Board (SASB) introduced a sector-specific approach centered on financial materiality, distinguishing it from GRI's focus on impact materiality orientation. In 2022, the International Sustainability Standards Board (ISSB) assumed responsibility for the SASB Standards following the merger of the Value Reporting Foundation (VRF) with the IFRS Foundation. With this transition, the ISSB aimed to establish globally consistent sustainability disclosure, recently issuing IFRS Sustainability Disclosure Standards (IFRS S1 and S2) (Carungu, 2025; Carungu et al., 2025).

At the European level, sustainability reporting has also gained momentum following the European Green Deal in 2019 and the subsequent introduction of the Corporate Sustainability Reporting Directive (CSRD) and European Sustainability Reporting Standards (ESRS) (Hummel and Jobst, 2024). The CSRD introduced the principle of double materiality, combining GRI's impact-oriented perspective with SASB/ISSB's financial materiality focus, thereby enhancing corporate accountability to stakeholders while ensuring relevance for investors (Panfilo et al., 2025).

The rapid proliferation of frameworks, including the Integrated Reporting Framework (since 2010), the UN Global Compact (since 2000), and ISO 26000 (since 2010), has further emphasized the need for greater harmonization. Recent initiatives, such as the GRI–ESRS Interoperability Index (developed jointly by GRI and EFRAG in 2024) and ESRS–ISSB interoperability guidance, reflect growing efforts to align reporting practices across jurisdictions. Likewise, the 2024 GRI–ISSB collaboration seeks to minimize duplication and facilitate the combined application of these standards. These interoperability initiatives acknowledge that many companies continue to report under multiple standards—a practice commonly referred to as double reporting—which increases operational complexity and reporting costs (Wahyuni, 2025). Despite these developments, aligning SASB/ISSB, ESRS, and GRI standards remains technically and practically challenging, particularly in ensuring consistency across frameworks while supporting sustainable development. Large international corporations, in particular, face difficulties in comprehensively

[3] Full Professor, ECON-06/A, Università Cattaneo, LIUC; acortesi@liuc.it

reporting on environmental, social, and economic impacts. For instance, GRI–ISSB interoperability guidance identifies common requirements between GRI 302/305 (energy and emissions) and IFRS S2 (climate), enabling companies to reuse GRI-aligned data to meet ISSB requirements for greenhouse gas emissions and climate risk management. This technical collaboration also harmonizes terminology, governance concepts, and materiality approaches, thereby enhancing alignment between stakeholder-oriented reporting (GRI) and investor-oriented reporting (ISSB).

This convergence supports the development of a coherent global sustainability disclosure ecosystem, in which reports prepared under different standards—ESRS, GRI, or SASB/ISSB—can interact and be interpreted in an integrated manner (Wagenhofer, 2024). Companies that adopt multiple standards may benefit in several ways: they can meet the expectations of diverse audiences, including both stakeholders and investors, while reducing redundant efforts and enhancing the credibility and comparability of their disclosures. Although empirical evidence from both academia and professional fields consistently shows that the GRI framework remains the most widely adopted sustainability reporting standard worldwide (KPMG, 2023; Michelon et al., 2022; Enciso-Alfaro & García-Sánchez, 2023), qualitative comparative studies reveal persistent tensions between investor-oriented frameworks (e.g., ISSB/IFRS) and stakeholder- or impact-oriented frameworks such as GRI. Harmonization and interoperability are frequently identified as the most promising strategies to reconcile differences that exist across different standards (Wagenhofer, 2024; Dinh et al., 2023). However, concrete evidence on how organizations operationalize interoperability in practice—particularly how they avoid double reporting and manage potential duplication of sustainability KPIs—remains limited (Adams & Abhayawansa, 2021; La Torre et al., 2020). This gap underscores the need for empirical research to clarify the current state of corporate practices in navigating multiple sustainability reporting standards.

In light of these developments, this study aims to investigate how European firms are addressing the interoperability challenge among the GRI standards, ESRS, SASB, and the recently introduced IFRS sustainability disclosure standards. In particular, given the mandatory adoption of the ESRS in the EU and the growing global demand for sustainability reporting, it is increasingly urgent to investigate whether—and how—organizations are responding to the convergence of sustainability reporting frameworks. Accordingly, this study addresses the following research question:

How do firms navigate multiple sustainability reporting standards and address interoperability issues?

To explore this question, we draw on institutional theory to examine the role of external and internal pressures—exerted through laws, norms, and professional recommendations—that shape organizational behavior. A central concept within institutional theory is isomorphism, the process through which organizations become similar in pursuit of legitimacy. Isomorphism can be coercive, arising from legal and political pressures (e.g., EU legislation); mimetic, through imitation of successful or widely recognized practices (e.g., the adoption of GRI); or normative, driven by professionalization and industry standards (e.g., ISSB) (DiMaggio & Powell, 1983). Firms operating in international contexts face institutional pressure and often also conflicting institutional logics, resulting in increased complexity and challenges in adopting multiple sustainability reporting standards. Therefore, understanding the areas of convergence or divergence among major sustainability frameworks—and how organizations prioritize or reconcile these competing logics—becomes essential for explaining variations in reporting practices and the challenges of implementing interoperable standards.

2. Methodology and expected results

The study is exploratory in nature, as the topic is both timely and highly debated. Inspired by the recent call for papers on "Interoperability Challenges: Exploring the opportunities and technical and practical difficulties in aligning ISSB, ESRS, and GRI standards, particularly in achieving consistency across reporting frameworks and advancing sustainable development" published by the Sustainability Accounting, Management and Policy Journal, this research seeks to nest inside this debate to sketch the state of play of European firms in this evolving context.

To achieve this goal, the study design follows three steps: (i) conducts a brief review of the literature on interoperability challenges in sustainability standards; (ii) compares key aspects of the major reporting frameworks to understand the degree of standard general requirements overlap; and (iii) performs a qualitative content analysis of firms' sustainability reports to assess the extent to which this path toward convergence/divergence of interoperable standards concretely reduce/increase double reporting.

Starting with the first step, a search of the Scopus database on the interoperability of sustainability reporting standards shows that, despite its growing policy relevance, scholarly research on this topic remains limited. Only 15 peer-reviewed papers were published between 2019 and 2025, with the majority appearing in 2025, indicating that academic inquiry into this emerging field is still in its early stages.

Building on this preliminary literature review, the study then undertakes a comparative analysis of the general requirements and principles of ESRS, GRI, and SASB/ISSB (IFRS) in relation to interoperability challenges. Drawing on established interoperability tools—such as the ESRS–GRI Interoperability Index, the ISSB Interoperability Index, and the GRI–ISSB interoperability guidance—the analysis assesses the alignment efforts pursued by the respective standard-setting bodies (GRI, ISSB, and EFRAG). The comparison focuses on key dimensions, including reporting scope, materiality concepts, topical coverage, disclosure structure, and assurance requirements. Table 1 summarizes the findings of this preliminary assessment, highlighting the main areas of interoperability and alignment across the ESRS, GRI, and ISSB/IFRS standards.

Dimension	**ESRS**	**GRI**	**IFRS S1–S2**	**Interoperability highlights**
Issuing Body	EFRAG (EU CSRD)	GRI	IFRS Foundation (ISSB)	Formal cooperation between GRI–EFRAG, GRI–ISSB and EFRAG – ISSB
Primary Objective	Regulatory compliance and transparency under EU law	Stakeholder accountability	Investor-focused sustainability-related financial disclosures	Avoid double reporting
Target audience	Multiple stakeholders	Multiple stakeholders	Investor and capital markets	Multiple international audiences
Materiality Concept	Double materiality (financial + impact)	Impact materiality	Financial materiality	ESRS bridges both perspectives
Reporting Scope	EU-based large entities and listed SMEs	Voluntary, global application	Global, capital-market-oriented disclosures	Firms may report under both ESRS and ISSB, using GRI metrics to

				address stakeholder needs
Topical Coverage	Environment (E1–E5), Social (S1–S4), Governance (G1)	Universal, Topic-specific (200+, including 300–400 series)	IFRS S1: General requirements; IFRS S2: Climate-related disclosures	ESRS E1–E5 mapped to GRI 300 series; IFRS S2 partially aligned with GRI 302/305
Material Topics Examples	E1 Climate, E2 Pollution, S1 Own Workforce, G1 Governance	GRI 302 Energy, 305 Emissions, 403 Occupational Health, 406 Non-discrimination	IFRS S2 Climate-related risks/opportunities; IFRS S1 general sustainability governance and metrics	ESRS E1–E5 ↔ GRI 302/305 equivalence; IFRS S2 ↔ GRI 305 (GHG) cross-compatibility
Disclosure Approach	Structured, mandatory datapoints; linked to EU Taxonomy	Principles-based, qualitative and quantitative disclosures	Prescriptive, risk and opportunity-based (aligned with TCFD)	GRI and ISSB coordinate metrics and terminology for the reuse of disclosures. ESRS integrates impact (emphasized by GRI) with risks and opportunities (emphasized by ISSB/SASB)
Assurance Requirement	Mandatory (limited assurance, moving toward reasonable)	Voluntary, recommended	Voluntary (depends on jurisdiction)	-
Interoperability Tools	ESRS - GRI Interoperability Index; ESRS – ISSB interoperability guidance	ESRS - GRI Interoperability Index; GRI–ISSB Interoperability Guidance	GRI–ISSB Interoperability Guidance ESRS – ISSB interoperability guidance	Mapping of equivalent disclosures, shared glossary, and data reusability protocols
Practical Implications	Required for EU firms; ensures investor and stakeholder relevance	Provides detailed impact metrics usable for ESRS and ISSB reporting	Supports investor comparability and financial risk assessment	Reduces double reporting; enhances global–regional alignment; increases comparability

Table 1. Key aspects between ESRS, GRI, and ISSB (IFRS S1 & S2) and Interoperability

The third step of the research design aims to more directly capture interoperability challenges in practice. To this end, the analysis focuses on the European context, specifically, on Italian listed firms. This setting is particularly relevant because, unlike other reporting frameworks, the ESRS are mandatory within the EU. Consequently, many large companies that previously disclosed sustainability information under the NFRD using the GRI Standards are now required to transition to the ESRS framework.

In this phase, the study conducts a qualitative content analysis of Italian companies that apply more than one sustainability reporting standard, assessing the extent to which interoperability is

reflected in their disclosures. This analysis makes it possible to identify practical strategies, recurring challenges, and potential areas of duplication arising either from the simultaneous adoption of multiple reporting standards or from the ongoing transition of many firms from GRI to ESRS.

To identify these companies, the study begins with the 2024 CONSOB report, which lists 150 firms that disclose sustainability information, either in standalone sustainability reports or within their management reports. This information is then cross-referenced with data from other sources, including the SASB Standards reporter website and the GRI reporter website. This process yields a sample of companies, presented in Table 2, which provides the foundation for examining how interoperability challenges are navigated when multiple sustainability reporting standards are adopted. It also allows for the identification of commonalities and divergences (e.g., presence of overlapping KPIs) in the way these standards are operationalized within corporate reports.

Company	**GRI**	**ESRS**	**SASB / IFRS (ISSB)**	**Sources and notes**
Leonardo SpA	–	✓	✓	The 2024 Integrated Report states that Leonardo applies the ESRS and includes a "SASB Content Index" for the Aerospace & Defense sector.
Pirelli SpA	–	✓	✓	The 2024 Annual Sustainability Report declares alignment with the "SASB Auto Parts Standard" and coverage of ESRS requirements
Saipem SpA	–	✓	✓	The 2024 Consolidated Sustainability Report discloses ESG topics according to ESRS obligations and SASB standards.
SNAM SpA	–	✓	✓	The 2024 Sustainability Statement / Consolidated Sustainability Report indicates the use of ESRS and SASB for the Oil & Gas Midstream sector.
Prysmian SpA / Prysmian Group	✓	✓	✓	The 2024 report follows ESRS standards as required by the CSRD. Prysmian previously published SASB- and GRI-based reports.
Unidata SpA	✓	✓	–	Unidata has used the GRI Standards and reports mappings to the ESRS in its sustainability disclosures.
RETI SpA	✓	✓	–	Listed on EGM, RETI voluntarily publishes sustainability reports. The 2024 Integrated Report references both ESRS and GRI and provides a mapping between the two.

Table 2. Sample selection

Using the available interoperability documents—linking GRI to ESRS, ESRS to SASB, and GRI to SASB/ISSB—this study aims to develop an indicator-level mapping across the different frameworks and their material topics that goes a step further by analyzing how individual disclosures and metrics correspond across frameworks. This approach can provide a more granular understanding of overlaps, differences, and practical implementation challenges, something that the broad interoperability indexes do not fully capture (Paoloni et al., 2025; Niccolò et al., 2025).

In terms of expected results, the analysis aims to provide company-level evidence of how these frameworks interact in practice, offering insights for practitioners on operationalizing multiple standards and identifying potential redundancies or gaps in reporting. We anticipate a relatively strong alignment between GRI and ESRS, given their shared emphasis on impact materiality and broad stakeholder orientation. By contrast, larger discrepancies are expected between ESRS and SASB, reflecting the sector-specific focus of SASB standards and the current draft status of ESRS sector standards, which may be delayed following the EU Omnibus package. Some alignment with the new IFRS sustainability disclosure standards is also anticipated, particularly regarding general requirements.

Overall, the study aims to map areas of convergence and divergence across frameworks and provide a detailed indicator-level alignment of different sustainability standards. Anchoring the analysis in institutional theory, the study also examines how organizations respond to multiple (internal and external) institutional pressures shaping sustainability disclosure practices. This approach enables an in-depth understanding of firms' capacity to interpret, prioritize, and operationalize interoperability across different reporting frameworks in practice.

3. Conclusion and contributions

This study aims to map areas of convergence and/or divergence across major sustainability reporting frameworks and provide a detailed indicator-level alignment of different standards. From a theoretical perspective, the study contributes to the sustainability reporting and accounting literature by providing new insights into how firms navigate interoperability under competing institutional logics, particularly in a context of regulatory change and the convergence of reporting frameworks.

From both scholarly and practitioner perspectives, the study provides a foundation for the future development of comparable reporting-quality metrics capable of assessing the effects of mixed-standard adoption (e.g., ESRS and GRI, or GRI and SASB/IFRS) on firm-level outcomes such as cost of capital, firm value, or corporate reputation. Such metrics could enable more rigorous empirical evaluations of how interoperability—or the lack thereof—affects corporate performance and reporting quality.

From a policy-making perspective, and guided by the Interoperability Indexes, the research offers empirical evidence on the degree of alignment among major sustainability reporting standards and the potential for streamlining corporate reporting processes. These insights can inform regulators and institutions in designing tools for unified disclosure mappings, facilitating multi-standard reporting while reducing the disclosure burden for firms.

Family Businesses in the Made in Italy Ecosystem: Interactions between Corporate Culture and Knowledge Management Dynamics

Tommaso Beck[1], Martina Manzo[2], Veronica Procacci[3]

1. Positioning and Theoretical Framework

Until the twentieth century, management studies paid limited attention to the distinction between family and non-family businesses, as most firms operated as family-run entities (Aldrich & Cliff, 2003). Subsequent historical, political, and cultural developments progressively clarified the boundaries between family and firm, resulting in a well-defined separation and prompting the literature to treat them as distinct , though interrelated, systems (Heck & Trent, 1999). Given the complexity of the family-business relationship, research on family firms has coalesced around several theoretical frameworks that explain their unique governance, behavior, and performance characteristics (Chrisman et al., 2005; Chrisman et al., 2008). Notable among these are agency theory, stewardship theory, the resource-based view (RBV), and Socioemotional Wealth (SEW), which serve as foundational reference points for rigorous theoretical inquiry.

These major theoretical perspectives provide complementary insights into the dynamics of family firms. However, they differ in the extent to which they account for the non-economic foundations of family firms. Agency theory emphasizes potential conflicts between ownership and management, which are often mitigated in family firms by overlapping decision-making roles and shared long-term objectives. However, this alignment does not fully eliminate risks such as nepotism or intergenerational tensions, which can undermine managerial efficiency and decision-making (Schulze et al., 2001). In contrast, stewardship theory posits that family managers often act as stewards, motivated by responsibility, continuity, and reputational capital. These factors foster collaboration and long-term orientation but may also result in conservative decision-making and limited innovation (Miller and Le Breton-Miller, 2006; Le Breton-Miller et al., 2011). The RBV further expands this framework by identifying unique, hard-to-imitate resources, such as trust, internal cohesion, and tacit knowledge, that can provide a sustainable competitive advantage for family firms (Habbershon & Williams, 1999; Zahra et al., 2007).

Among these frameworks, SEW emerges as a central theoretical lens for this study. In particular, this study adopts the SEW perspective as its primary interpretative framework, as it explicitly accounts for the non-economic goals that shape family firm behavior. While incorporating elements from previous theories, SEW emphasizes the emotional and symbolic bonds that the owning family forms with the firm, assigning these factors a critical role in shaping strategic decisions and long-term orientation. The literature demonstrates that protecting family identity, ensuring generational continuity, and preserving control are non-economic objectives that can guide organizational choices, sometimes at the expense of short-term efficiency (Gomez-Mejia et al., 2007). Further research highlights how SEW shapes family firms' responses to institutional pressures, risk-taking behavior, and approaches to social responsibility, reflecting a dynamic balance between emotional priorities and competitiveness (Berrone et al., 2010).

Accordingly, building on this perspective, this study argues that family values represent the primary symbolic foundation of organizational life in family firms, influencing not only strategic choices but also internal organizational dynamics. This approach facilitates an understanding of how values, identity, and non-economic objectives influence Corporate Culture (CC), and Knowledge Management (KM) processes in family businesses within the Made in Italy context. It provides an analytical lens for examining both organizational choices and the mechanisms that support intergenerational continuity.

Collectively, these theoretical perspectives demonstrate that family firms operate at the intersection of economic and non-economic logics, where financial objectives are closely linked to the preservation of resources, core values, and family identity. In this context, family values are conceptualized as the key driver of organizational behavior, encompassing emotional, symbolic, and relational dimensions that guide the owning family's decision-making. These values evolve over time and are embedded in CC, which shapes shared norms, behavioural expectations, and collective orientations that promote cohesion, trust, and sustained commitment. CC can thus be interpreted as the organizational infrastructure through which family values are institutionalised and enacted in daily organisational practices.

The effective transmission and reinforcement of these cultural elements depend significantly on KM systems. In this framework, KM is conceptualized not merely as a set of technical processes, but as a culturally embedded mechanism through which family values are enacted, transmitted, and renewed across generations. KM encompasses both formal and informal mechanisms for creating, disseminating, and retaining knowledge rooted in family values across generations. By enabling the circulation of explicit and tacit knowledge, KM preserves cultural meanings, organisational routines, and core practices while supporting adaptation to evolving internal and external conditions. Accordingly, this study proposes a conceptual relationship in which family values shape CC, and CC, in turn, influences KM processes, which sustain continuity and adaptive capacity in family firms. This interdependence between family values, CC, and KM necessitates a dual focus: first, on how KM processes operationalise and disseminate family values throughout the organization, and second, on how these institutionalised values shape and consolidate the CC of family firms.

2. Literature review

The literature extensively discusses KM in family firms (Audretsch et al., 2025; Bohorquez-Lopez et al., 2024; Pham et al., 2025). A recurring theme is that intergenerational knowledge transfer, while essential for sustaining organizational continuity, often remains tacit and confined within the family nucleus. This internal orientation can limit engagement with external knowledge sources, thereby constraining opportunities for innovation and adaptation (Cabrera-Suárez et al., 2018; Woodfield and Husted, 2017). In this respect, knowledge in family firms cannot be understood solely as a strategic or economic asset, but rather as a resource deeply embedded in the symbolic and emotional dimensions of the family, linking the firm’s heritage to its identity and long-term vision.

This inwardly focused knowledge system has a dual effect. It strengthens cohesion, identity, and brand reputation, providing stability and continuity. Conversely, it can create vulnerabilities, such as organizational insularity, reduced absorptive capacity, and resistance to new technologies or external ideas (Patel & Fiet, 2011; Brinkerink, 2018). These challenges are often intensified during generational transitions, when emotional ties and intra-family conflicts may interfere with rational decision-making, thereby affecting the firm’s capacity for growth and innovation (Chrisman et al., 2005; Lansberg et al., 1997).

Within this context, KM processes emerge as a critical organizational mechanism through which such tensions between continuity and adaptation are managed. Corporate governance is equally crucial in this context, as governance structures determine how knowledge is formalized,

shared, and safeguarded within family firms. Board composition, the extent of family involvement, and the presence of independent directors influence both strategic decision-making and openness to external knowledge sources. Research demonstrates that governance mechanisms are essential for balancing emotional attachments with rational organizational needs, particularly during generational transitions when conflicts may impede effective knowledge transfer (Gjergji et al., 2019). A robust governance system can mitigate risks of insularity, enhance absorptive capacity, and support alignment between family values, long-term vision, and the firm's KM practices (Melis, 2000; Melis 2004).

Within this framework, KM processes are essential not only for preserving knowledge but also for operationalizing family values and embedding them in daily practices. In line with the theoretical framework adopted in this study, KM is therefore conceptualized as the mechanism through which family values are translated into organizational practices and sustained over time. The effectiveness of KM is closely linked to CC, which establishes the norms, behaviors, and shared orientations through which knowledge is codified, communicated, and internalized across the organization (Cuozzo et al., 2025; Arduini et al., 2024). In this sense, corporate culture acts as the enabling infrastructure that shapes how knowledge processes unfold within the organization. CC functions as both the conduit and the stabilizing infrastructure for knowledge transfer, ensuring that family values and tacit knowledge are translated into collective practices while enabling adaptation to changing environments.

By integrating KM processes with the firm's value-based and cultural framework, family businesses can maintain continuity, reinforce identity, and sustain competitive advantage over time (Barney, 1986; Bolton et al., 2013; Gorton and Zentefis, 2020). Furthermore, scholars emphasize that CC and KM are mutually reinforcing: culture provides the interpretive framework within which knowledge is created, shared, and transferred, while sustained knowledge practices progressively reshape cultural patterns and reinforce collective learning (Nonaka, 1994; Nonaka and Takeuchi, 2007). However, in family firms, this relationship is further intensified by the central role of family values, which shape both cultural orientations and knowledge dynamics. Three main perspectives have emerged, functionalist, metaphorical, and dynamic, all converging on the idea that knowledge flows and cultural systems are deeply intertwined (Smircich, 1983; Krefting and Frost, 1985). This interdependence is particularly significant in family businesses, where values and identity strongly influence both cultural patterns and knowledge processes (Craig and Moores, 2006).

Accordingly, this study builds on this literature by proposing that KM operates as a mediating mechanism between family values and corporate culture, enabling the preservation, transmission, and renewal of identity-based knowledge across generations.

3. Gap and Research Questions (RQs)

Despite extensive literature on KM and CC in family businesses, limited attention has been devoted to understanding how KM processes function as a connecting mechanism between family values and corporate culture, particularly within context-specific settings such as "Made in Italy." Italian family firms serve as custodians of a unique heritage of skills, practices, and values that exemplify national production excellence, integrating economic, symbolic, and emotional dimensions. Although international studies emphasize the role of KM and CC in intergenerational knowledge transfer, they largely overlook how these processes are concretely enacted and aligned with identity-based logics in specific socio-cultural contexts.

In these firms, cultural and productive heritage are closely linked to brand identity and the distinctive practices associated with Made in Italy. Specifically, further investigation is needed into how tacit knowledge and family values are formalized and transmitted while maintaining the uniqueness of products and processes, and how KM systems and CC facilitate both innovation

and continuity, while mitigating risks of isolation and organizational rigidity common in family firms.

Accordingly, this study addresses this gap by conceptualizing KM not only as a mechanism for intergenerational transfer, but as a strategic and culturally embedded process through which family values are translated into corporate culture and organizational practices. Therefore, the research gap centers on the need to analyze KM processes in Italian family firms not only as mechanisms for intergenerational transfer, but also as strategic levers for enhancing and preserving the cultural and productive heritage that defines Made in Italy.

To address this gap, the present study aims to answer the following research questions: RQ1: What are the defining elements of the KM process in family businesses

RQ2: How do family values contribute to the formation and consolidation of CC in family businesses, through KM processes?

4. Methodology and Sample Selection

To address the research questions, this study adopts a qualitative and exploratory approach based on a multiple-case study design, to investigate how family values are embedded in the corporate culture of family firms and influence KM processes. The analysis is structured in three steps. First, a questionnaire is used to gather initial insights on the role of family and corporate values. This preliminary phase is intended to support case familiarization and refine the subsequent data collection process. Second, in-depth interviews with family members and managers explore the transmission of values and their impact on organizational practices. Third, on-site observations examine how these values are enacted in daily routines and integrated into KM processes.

For the empirical component, a sample of family-owned firms operating in the agri-food sector will be selected, as a theoretically relevant context for observing the interaction between identity, tradition, and knowledge processes within the Made in Italy ecosystem. This context enables the analysis of companies where family values, corporate culture, and KM processes are closely intertwined with tradition, production excellence, and the transmission of specific skills. The sample will include firms of varying sizes and generations to capture the dynamics of value and knowledge transfer both across generations and within daily organizational practices. This variation allows for analytical generalization across different organizational configurations. The objective is to observe how the characteristics of the agri-food sector influence the implementation and effectiveness of KM processes in Italian family businesses.

To ensure full clarity regarding the empirical analysis and to guarantee the complete replicability of the study, the sample of family firms will be identified using the authoritative AIDA database (Bureau van Dijk). To narrow the scope of the research and include only companies relevant to our objectives, we will select firms operating in the agri-food sector that are considered representative of Made in Italy. These firms will be identified using sectoral codes, firm size, and ownership structure, with particular attention to organisations characterised by concentrated family ownership and multi-generational involvement in management or governance. Selection criteria will also include the presence of established intergenerational dynamics and identifiable KM practices. In line with the study conducted by Grosso et al. (2021), to identify the agri-food sectors most directly connected to the Made in Italy for extraction from AIDA, the ATECO codes (National Statistical Industrial Classification) reported in Table 1 will be considered.

ATECO CODES (N°)	Description
101	Meat and meat-based products
102	Fish, crustaceans and molluscs
103	Fruits and vegetables

104	Oils and Fats
105	Milk and dairy products
106	Grains, flour, starches
107	Bakery and flour-based products
108	Other food products (e.g. coffee, tea, sugar, dietary food)

Table 1. ATECO codes and descriptions

5. Methodology and Sample Selection

Drawing on the SEW perspective and existing literature on KM and corporate culture in family firms, this study anticipates that KM processes serve as a critical mediating mechanism through which family values are translated, enacted, and reinforced within corporate culture. In particular, family values, such as continuity, trust, and identity preservation are anticipated to influence the design and implementation of KM practices, favouring relational, experience-based, and tacit forms of knowledge transfer, particularly through informal interactions and intergenerational mentoring. Furthermore, CC is likely to function as the interpretive framework that stabilises and legitimises these practices, ensuring their coherence and persistence over time.

Consistent with prior research, the findings are also anticipated to reveal a structural tension between continuity and adaptation. While value-driven knowledge systems enhance cohesion and identity, they may also limit openness to external knowledge and innovation. Firms that implement more structured and hybrid KM approaches, integrating both tacit and explicit knowledge processes, are expected to exhibit a greater ability to balance tradition with innovation. In the context of Made in Italy, the study is anticipated to demonstrate that the strong interplay among territorial identity, symbolic heritage, and production practices amplifies the influence of family values on both corporate culture and knowledge dynamics, thereby reinforcing the significance of identity-based knowledge as a key driver of long-term competitiveness.

The findings are anticipated to demonstrate that KM serves as a strategic lever enabling family firms to preserve their identity while fostering innovation, thereby overcoming the traditional trade-off between continuity and change.

6. Originality

This study offers an original contribution to the family business literature by developing an integrated perspective on the relationship between family values, organisational culture, and KM processes. While these concepts have been widely examined, they are rarely theorised as part of a coherent and interdependent system.

The originality of the work lies in the conceptualisation of KM as a connecting and mediating mechanism linking family values and organisational culture within the distinctive context of the Italian agri-food sector, a setting in which productive identity, family history, and symbolic capital converge in a singular manner. Rather than examining these elements in isolation, as is frequently the case in the literature, the research analyses them as a dynamic and mutually reinforcing system shaping organisational continuity and adaptive capacity.

By positioning KM as a culturally embedded process, the study advances theoretical understanding of the identity-laden, embodied, and tacit nature of family-based knowledge, showing how such knowledge is transformed into a cultural infrastructure that sustains both tradition and innovation.

7. Theoretical and Practical Implications

The study advances scholarship on family firms by illustrating how family values, once incorporated into organisational culture, become a generative mechanism for the creation,

transmission, and renewal of knowledge. The study reconceptualises KM not as a purely technical function, but as an institutionalised process of identity transfer within family firms, thereby contributing to the literature on both KM and family business.

The focus on the Made in Italy context additionally offers a contextualised theoretical contribution, demonstrating that territorial embeddedness and symbolic heritage significantly shape the cultural and knowledge-related dynamics of family enterprises. This suggests that identity-intensive contexts amplify the role of values in structuring both cultural patterns and knowledge processes, offering avenues for future comparative research across different institutional and cultural settings.

In line with these insights, family firms can strengthen continuity and competitiveness by implementing knowledge-management systems that make explicit the values, routines, and tacit competencies rooted in the family's history through selected practices. Structured mechanisms – such as intergenerational mentoring, formal moments of shared reflection, and digital tools for codification – facilitate the translation of values into organisational capabilities. In particular, the findings suggest that making tacit, value-based knowledge more visible and transferable can reduce the risk of knowledge loss during generational transitions.

At the same time, governance systems that balance value orientation with external openness can mitigate the risk of cultural closure and foster the absorption of new knowledge. This balance is critical for avoiding the trade-off between continuity and innovation that often characterises family firms. The approach proposed in this study thus provides operational guidance for aligning tradition, identity, and innovation over the long term.

Keywords: Corporate culture; family business; agri-food; KM; made in Italy

Economia circolare e sostenibilità nel settore tessile della Sardegna: risultati preliminari da un'analisi cluster

Sofia Siotto[1], Alberto Ezza[2], Gianfranco Pischedda[3]

1. Inquadramento teorico e obiettivi

Nel quadro della transizione verso modelli di produzione e consumo più sostenibili, l'Unione Europea ha individuato nell'economia circolare (EC) una leva per ridurre la pressione ambientale dei settori industriali più impattanti. Tra questi, il tessile occupa una posizione centrale, risultando tra i primi comparti per emissioni di elementi inquinanti (Parlamento Europeo, 2020; EEA, 2025).

Per affrontare queste criticità, la Commissione Europea ha lanciato la Strategia per i Tessili Sostenibili e Circolari (2022), parte integrante del Piano d'Azione per l'Economia Circolare e in coerenza con gli obiettivi del Green Deal (Commissione Europea, 2019). Questa strategia mira a promuovere prodotti durevoli, riparabili e riciclabili, inserendosi in un quadro normativo più ampio, che regola il settore attraverso un complesso insieme di strumenti legislativi che coprono tutte le fasi del ciclo di vita del prodotto. Tra questi, il Regolamento sull'Ecodesign per i Prodotti Sostenibili (ESPR) si concentra sul design del prodotto come leva cruciale per ridurre gli impatti ambientali e introduce il Passaporto Digitale del Prodotto, strumento essenziale per tracciare i dati lungo tutto il ciclo di vita (Commissione Europea, 2024). La strategia prevede anche regole armonizzate sulla Responsabilità Estesa del Produttore (EPR), che obbliga le imprese a contribuire finanziariamente alla gestione del fine vita dei prodotti, stimolando al contempo il miglioramento del design e della qualità dei beni (Commissione Europea, 2022; Minucci, 2023; Osservatorio sul Riutilizzo, 2024; EEA, 2025).

In Italia, il Decreto Ministeriale n. 259/2022 ha introdotto la Strategia Nazionale per l'Economia Circolare, mentre il Ministero dell'Ambiente e della Sicurezza Energetica (MASE) ha predisposto una proposta di decreto EPR per il settore tessile. Questa attribuisce ai produttori l'obbligo di contribuire alla gestione del fine vita dei prodotti tramite consorzi, con eco-contributi modulati e misure di sostegno per le piccole-medie imprese (PMI). La regolamentazione nazionale ed europea converge dunque verso un nuovo modello tessile, orientato alla circolarità, alla qualità e alla trasparenza lungo l'intera filiera (Assoambiente, 2024).

Parallelamente all'evoluzione normativa, la letteratura scientifica ha progressivamente chiarito il significato e le implicazioni dell'EC, configurandola come un paradigma economico alternativo al modello lineare tradizionale take-make-dispose (Ellen MacArthur Foundation, 2013). Tra le diverse definizioni proposte, Geissdoerfer et al. (2017) descrivono l'EC come un sistema rigenerativo, in cui l'impiego di risorse, la produzione di rifiuti, le emissioni e le dispersioni energetiche sono minimizzati attraverso il rallentamento, la chiusura e l'accorciamento dei cicli dei materiali e dell'energia. Kirchherr et al. (2017) ne enfatizzano, invece, la dimensione sistemica e multiscalare (micro, meso, macro), associandola alla sostituzione del concetto di "fine vita" con strategie di riduzione, riuso, riciclo e recupero. Ancora,

[3] Ricercatore, ECON-06/A, Università degli Studi di Sassari; gf.pischedda@uniss.it

Ghisellini et al. (2016), pur senza proporre una definizione univoca, sottolineano il ruolo chiave della responsabilità condivisa tra imprese, consumatori e policy-maker.

L'EC si realizza attraverso strategie di riduzione, riutilizzo e riciclo - 3R - (Austin e Rahman, 2022), che trovano applicazione concreta nei Circular Business Models (CBM) (Urbinati et al., 2017). I CBM costituiscono una tipologia distintiva all'interno dei più ampi ambiti dei Sustainable Business Model (SBM) e dei Business Model Innovation (BMI). In quanto sottogruppo degli SBM, i CBM integrano obiettivi ambientali e sociali nelle operazioni aziendali di base, mirando a disaccoppiare la crescita economica dal consumo di risorse e dal degrado ambientale (Urbinati et al., 2017; Centobelli et al., 2020; Kirchherr et al., 2017). Allo stesso tempo, in quanto forma di BMI, i CBM si discostano dalla logica lineare, introducendo nuove modalità per creare, trasferire e catturare valore attraverso i principi della circolarità (Franzò et al., 2021). Questa innovazione spesso richiede una riconfigurazione della value proposition, una riprogettazione delle supply chain e l'adozione di nuovi revenue model (Bocken e Konietzko, 2022).

I CBM sono progettati a livello micro, ossia a livello aziendale, con l'obiettivo di rendere operative le strategie dell'EC (Bocken et al., 2016; Das e Bocken, 2024; Ritala et al., 2023). Tali strategie si articolano in quattro principali approcci:

- Slowing, per estendere la durata dei prodotti attraverso design durevole, riparazione e riutilizzo (Urbinati et al., 2017).
- Narrowing, per ridurre il consumo di risorse per unità di output (efficienza dei materiali e dell'energia) (Darmandieu et al., 2022).
- Closing, per creare cicli chiusi di recupero e reimmissione (riciclo, rigenerazione) (Brydges, 2021; Caldera et al., 2022).
- Regenerating, per promuovere un impatto positivo su ecosistemi e comunità (Ritala et al., 2023; Benites e Osmond, 2021).

Queste strategie sono implementate attraverso sei pattern principali che consentono alle aziende di chiudere i cicli delle risorse ed estendere il valore dei materiali: manutenzione, riuso, rigenerazione, riciclo, riutilizzo alternativo e impiego di risorse organiche (Lüdeke-Freund et al., 2019). In parallelo, Urbinati et al. (2017) propongono una tassonomia dei CBM articolata lungo due dimensioni: la proposta di valore al cliente e il network di valore. Da questa analisi emergono quattro livelli di adozione della circolarità: tradizionale, circolare a valle, circolare a monte e completamente circolare, con quest'ultima che implica una trasformazione sistemica dell'intero modello di business.

L'integrazione dei CBM può essere analizzata attraverso il Business Model Canvas (Osterwalder e Pigneur, 2010), evidenziando come la circolarità agisca su tutti i blocchi del modello: dalla progettazione del prodotto, ai canali di marketing, includendo le relative logiche di generazione del profitto (Centobelli et al., 2020; Del Vecchio et al., 2022; Urbinati et al., 2021). Narrowing, slowing, closing e regenerating costituiscono, inoltre, le leve strategiche mediante le quali il management traduce i principi dell'EC in pratiche organizzative e operative, favorendo la transizione verso CBM (Ünal et al., 2018). Tecnologicamente abilitanti e guidate dall'innovazione, esse permettono alle aziende di trasformare modelli lineari in sistemi rigenerativi (Santolin et al., 2024; Urbinati et al., 2023). Nel settore tessile e dell'abbigliamento, l'adozione di pratiche di EC rappresenta una leva strategica particolarmente rilevante, considerando le criticità ambientali che lo caratterizzano. Questo comparto, tra i più intensivi in termini di risorse ed emissioni, è indicato tra i principali responsabili dell'inquinamento globale e, secondo le stime, potrebbe arrivare a generare fino al 25% delle emissioni mondiali di carbonio entro il 2050 (Ellen MacArthur Foundation, 2021). A queste criticità si aggiungono le distorsioni generate dal modello del fast fashion, che ha contribuito ad accelerare i ritmi di produzione e consumo, riducendo la durabilità dei capi e incrementando significativamente la quantità di rifiuti tessili (Auke e Simaens, 2019; Vijeyarasa e Liu, 2022).

In risposta, l'EC offre soluzioni trasformative, quali progettazione per durabilità, sostituzione dei materiali vergini con fibre riciclate o bio-based, modelli basati su servizi

(noleggio, resale, riparazione) (Niinimäki et al., 2020; Sandin e Peters, 2018; Persson e Hinton, 2023) e sistemi di take-back e riciclo a ciclo chiuso (Abdelmeguid et al., 2024; Jia et al., 2020). Tecnologie come blockchain, IoT e RFID facilitano tracciabilità e trasparenza, supportando strategie di circolarità e coinvolgimento dei consumatori (Sandvik e Stubbs, 2019; Abbate et al., 2024; Agrawal et al., 2021; Charnley et al., 2022). Tuttavia, per una reale transizione sono necessari cambiamenti sistemici, quali ad esempio maggiore collaborazione lungo la supply chain, incentivi normativi e cambiamento nei comportamenti dei consumatori (Agrawal et al., 2021; Jäämaa e Kaipia, 2022). Centobelli et al. (2022) e Dissanayake e Weerasinghe (2022) identificano le pratiche manageriali chiave per CBM nel settore tessile, basate sulle 3R, che includono l'uso di materiali sostenibili, investimenti in tecnologie per l'efficienza e la depurazione, supply chain corte, sistemi di ritiro e certificazioni ambientali. Le tecnologie digitali, inoltre, agiscono come abilitatori trasversali, consentendo l'ottimizzazione predittiva e il monitoraggio in tempo reale.

Partendo da queste premesse, pare interessante analizzare la propensione verso la sostenibilità e l'EC nel settore tessile, esaminando al contempo le modalità con cui le imprese gestiscono e si interfacciano con le pressioni provenienti dal contesto istituzionale e dagli stakeholder (PE), successivamente integrate nei rispettivi BM. L'analisi di tali pressioni si fonda su un duplice riferimento teorico – la Stakeholder Theory (ST) e la Institutional Theory (IT) – che offrono prospettive complementari nell'interpretazione del comportamento organizzativo. Da un lato, la ST (Freeman et al., 2010; Laplume et al., 2008) evidenzia come le imprese rispondano alle aspettative di un'ampia pluralità di attori per mantenere legittimità e garantire accountability. Dall'altro, la IT (DiMaggio e Powell, 1983) sottolinea come le organizzazioni tendano a conformarsi a norme e modelli dominanti per ottenere legittimazione nel campo istituzionale di riferimento.

Questa chiave interpretativa ben si adatta al tessuto economico della Sardegna, caratterizzato da frammentazione, prevalenza artigianale e forte radicamento territoriale. In questo contesto produttivo, periferico e ad alta densità relazionale, le imprese tessili non agiscono soltanto in risposta alle pressioni esterne, ma possono perseguire anche forme di legittimazione istituzionale e sociale, dove l'adozione di pratiche sostenibili rappresenta al tempo stesso una sfida e un'opportunità per la valorizzazione del capitale locale. Per tali ragioni, il progetto di ricerca, allo stato attuale ancora in fase di realizzazione, si propone di osservare il settore tessile sardo per: 1) identificare, con idonea metodologia quantitativa, gruppi di aziende omogenee per l'approccio alla sostenibilità, all'EC e alle pressioni esterne; 2) osservare, con un approccio mixed-method, le somiglianze intra-cluster e le differenze inter-cluster, al fine di individuare le pratiche che abilitano un orientamento positivo alla sostenibilità e alla circolarità.

2. Metodologia

Per rispondere agli obiettivi del lavoro è stata condotta un'indagine indirizzata alle imprese operanti nel settore tessile della Sardegna e identificate mediante la piattaforma Telemaco, un servizio delle Camere di Commercio (gestito da InfoCamere) che permette di accedere a tutte le banche dati del Registro Imprese. In questo modo è stato possibile estrapolare, qualora presente, indirizzo e-mail e numero di telefono, informazioni impiegate successivamente per contattare le aziende. Gli eventuali dati mancanti sono stati poi integrati con una ricerca ad hoc. La raccolta dei dati è avvenuta mediante il supporto di un questionario, inviato via e-mail e somministrato con l'ausilio della piattaforma Survey Monkey. L'indagine è stata condotta durante i mesi di

maggio-settembre 2025 e ha prodotto un numero di risposte complete pari a 75. Considerando le risposte pervenute, il tasso di risposta è stato di circa il 20%[4].

Il questionario utilizzato nell'indagine, strutturato in sezioni tematiche e composto prevalentemente da domande a risposta multipla, rileva inizialmente le caratteristiche di base dell'impresa e approfondisce successivamente le pratiche di sostenibilità ed economia circolare, nonché il grado di adozione delle tecnologie digitali. La sezione conclusiva è infine orientata all'analisi degli aspetti riconducibili alla IT (DiMaggio e Powell, 1983) e alla ST (Freeman et al., 2010; Laplume et al., 2008) e al livello di conoscenza del quadro normativo di riferimento. Ove richiesto, i partecipanti hanno espresso il proprio livello di accordo o partecipazione attraverso una scala Likert a 5 punti (1 = "per nulla"; 5 = "totalmente").

Al fine di approfondire la propensione alla sostenibilità delle aziende tessili sarde è stata condotta una Cluster Analysis focalizzata su due sezioni tematiche del questionario. La prima contenente 14 item riferiti all'orientamento alla circolarità e sostenibilità e la seconda riguardante 9 item volti a comprendere come sono gestite le pressioni esterne del livello istituzionale e degli stakeholder che sono poi riflesse nel loro BM. In particolare, l'integrazione delle dimensioni riconducibili alla ST e alla IT nella Cluster Analysis consente di operazionalizzare concetti come la percezione delle pressioni esterne e istituzionali in indicatori misurabili. In tal modo, è possibile classificare le imprese sulla base sia dell'adozione di pratiche sostenibili e circolari, sia della loro sensibilità verso i meccanismi di legittimazione e adattamento che caratterizzano il campo istituzionale e relazionale in cui operano.

Prima di procedere alla Cluster Analysis, gli item sono stati sottoposti ad Analisi Fattoriale Esplorativa (EFA), condotta mediante il software STATA MP 18.

3. Risultati

3.1. Il campione

Di seguito vengono presentate alcune delle statistiche descrittive relative alle 75 aziende che hanno collaborato allo studio. Le imprese incluse nell'indagine, spesso a conduzione familiare, presentano una struttura di piccola dimensione. Circa il 70% dichiara, infatti, un fatturato annuo inferiore a €100.000 e l'85% si definisce a prevalente orientamento artigianale. La maggior parte opera come ditta individuale (60%), con uno o nessun dipendente. Ancora, il 35% delle imprese opera nell'ambito dell'abbigliamento in senso ampio, mentre il 19% è attivo nel tessile per interni (ad esempio tappeti e cuscini). Ulteriore caratteristica riguarda la localizzazione geografica che evidenzia una forte concentrazione nei centri urbani, con una progressiva diminuzione man mano che si passa a città di dimensioni più ridotte. Cagliari, Sassari e Olbia si configurano come poli di riferimento, ospitando il numero più elevato di imprese. Tale distribuzione è verosimilmente riconducibile a fattori quali la maggiore densità demografica, la presenza di infrastrutture più sviluppate e l'esistenza di reti commerciali più articolate, che complessivamente offrono condizioni più favorevoli allo svolgimento delle attività economiche.

I dati sull'adozione delle tecnologie digitali evidenziano che soltanto il 30% delle imprese dichiara di aver effettuato investimenti in tecnologia. La Figura 1 presenta due mappe costruite sulla base di indici sintetici calcolati su scala comunale, ottenuti mediando le risposte fornite dalle imprese agli item relativi alla digitalizzazione. La mappa di sinistra rappresenta l'"Indice di conoscenza delle tecnologie digitali", mentre quella di destra illustra l'"Indice di adozione degli

[4] Il campione iniziale era costituito da 846 imprese. A seguito dello *screening* preliminare, è risultata eleggibile circa la metà delle imprese inizialmente selezionate. Una quota significativa delle imprese originariamente individuate risulta, infatti, cessata o ha nel frattempo modificato il proprio *core business*. Le risposte complete pervenute sono state 75, su un totale di 375.

strumenti e processi digitali". Entrambe le rappresentazioni evidenziano una distribuzione territoriale della digitalizzazione coerente con la gerarchia urbana regionale: le imprese situate nei principali centri urbani e nelle relative aree periurbane mostrano livelli più elevati di digitalizzazione, beneficiando di maggior disponibilità di infrastrutture, servizi di consulenza specializzata e capitale umano qualificato. Al contrario, le imprese localizzate nei comuni dell'entroterra presentano livelli inferiori, confermando la persistenza di un "digital divide" territoriale che, nel lungo periodo, può accrescere le disparità di competitività tra aree centrali e periferiche. Tale divario riflette differenze strutturali nell'accesso a risorse immateriali, elementi centrali nei processi di innovazione.

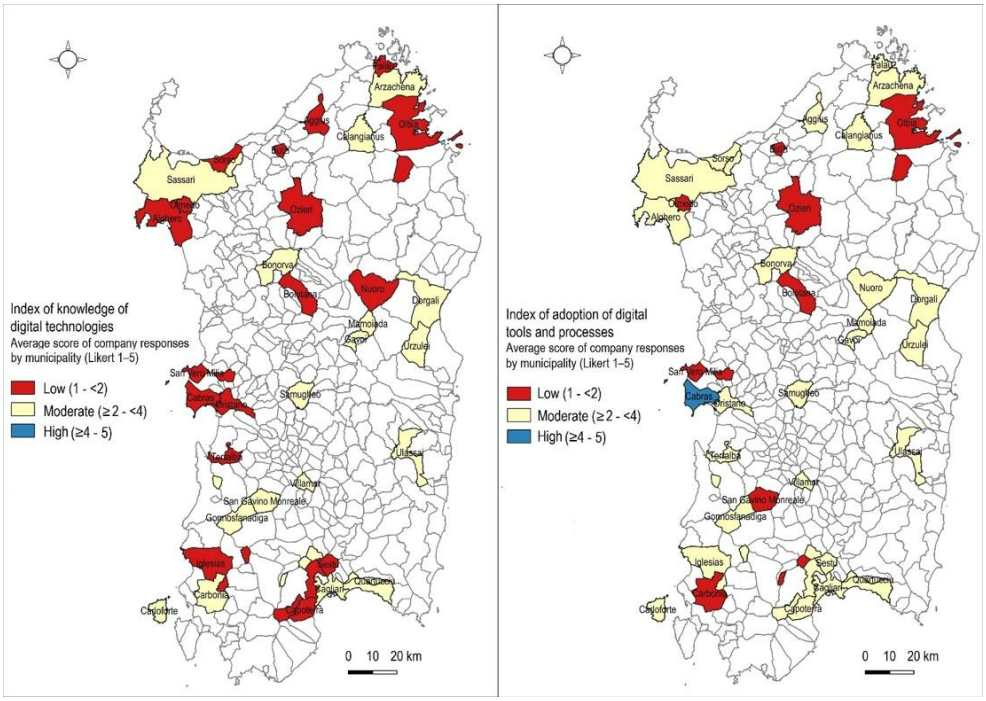

Figura 1. Indici di digitalizzazione nel settore tessile sardo: conoscenza delle tecnologie digitali (a sinistra) e adozione di strumenti e processi digitali (a destra)

3.2. L'analisi fattoriale esplorativa

Le verifiche preliminari di idoneità degli item utilizzati per l'EFA sono state effettuate tramite il metodo di estrazione principal-factor. La coerenza interna relativa a ciascuna delle dimensioni considerate è stata valutata mediante l'indice di Cronbach, il quale ha evidenziato un livello di affidabilità elevato per entrambe (EC: α = 0,9008; PE α = 0,8919). Il supporto all'applicazione dell'EFA è stato ulteriormente confermato dalla matrice delle correlazioni, dal test di sfericità di Bartlett e dalla misura di adeguatezza del campione Kaiser–Meyer–Olkin (KMO), come riportato nella Tabella 1.

	EC	**IT**
Crombach's alpha	0.9008	0.8919
Correlation matrix	0.0000	0.0070
Bartlett test of sphericity	0.0000	0.0000
Kaiser-Meyer-Olkin test	0.8300	0.8490

Tabella 1. Test preliminare EFA

È stata successivamente condotta un'EFA in modo distinto sugli item relativi alle dimensioni EC e PE, in accordo con quanto proposto da Dorrego Viera et al. (2024). Per la dimensione EC, l'analisi ha suggerito una struttura bi-fattoriale sulla base del criterio di Kaiser (eigenvalue > 1), come riportato nella Tabella 2.

Factor	Eigenvalue	Difference	Proportion	Cumulative
Factor1	**5.8526**	**4.5834**	**0.7009**	**0.7009**
Factor2	**1.2692**	**0.4408**	**0.1520**	**0.8528**
Factor3	0.8284	0.1996	0.0992	0.9520
Factor4	0.6288	0.3428	0.0753	1.0273
Factor5	0.2860	0.1317	0.0343	1.0616
Factor6	0.1543	0.0710	0.0185	1.0801
Factor7	0.0833	0.0262	0.0100	1.0901
Factor8	0.0571	0.0711	0.0068	1.0969
Factor9	-0.0140	0.0698	-0.0017	1.0952
Factor10	-0.0838	0.0464	-0.0100	1.0852
Factor11	-0.1302	0.0367	-0.0156	1.0696
Factor12	-0.1668	0.0255	-0.0200	1.0496
Factor13	-0.1923	0.0298	-0.0230	1.0266
Factor14	-0.2221	.	-0.0266	1.0000

Tabella 2. Risultati analisi fattoriale su EC

Tale soluzione a due fattori è stata ulteriormente corroborata dall'osservazione del punto di flesso ("elbow test") nel grafico Scree-plot, illustrato nella Figura 2.

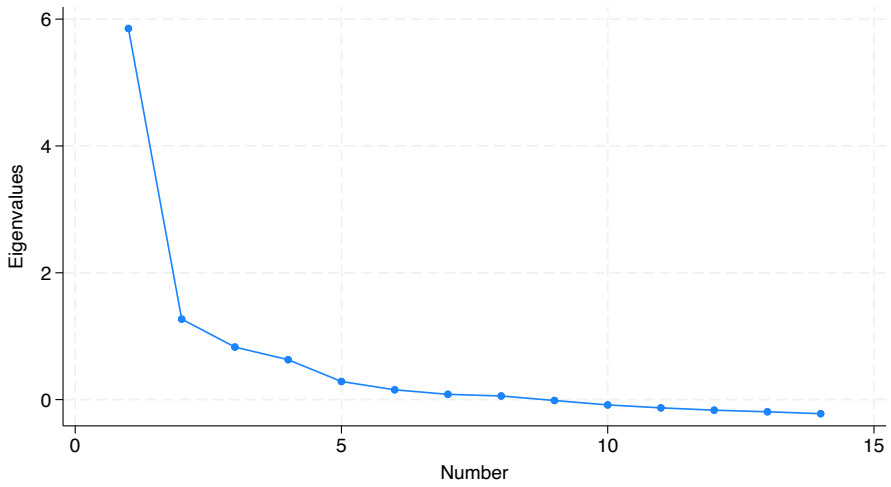

Figura 2. Scree plot degli eigenvalues per la EC

Per migliorare l'interpretabilità della soluzione, è stata altresì applicata la rotazione Promax, poiché gli item riconducibili alla dimensione EC risultavano correlati a livello teorico ed empirico. In linea con Howard (2016), l'assegnazione degli item ai fattori è avvenuta considerando un valore di loading superiore a 0,40 sul fattore primario, inferiore a 0,30 sul fattore alternativo, e una differenza tra i due coefficienti almeno pari a 0,20.

Il Fattore 1 (denominato "Produzione sostenibile") comprende cinque item, mentre il Fattore 2 (denominato "Pratiche circolari nell'industria tessile") include quattro item, come riportato nella Tabella 3.

Variable	Factor1	Factor2	Uniqueness
EC1	0.4401	0.1571	0.7067
EC2	0.6228	0.0808	0.5511
EC3	0.7388	-0.0801	0.5120
EC4	0.7749	-0.0259	0.4207
EC5	0.7061	-0.0835	0.5584
EC6	0.2977	0.4343	0.5824
EC7	0.2706	0.5720	0.4316
EC8	0.3496	0.4475	0.5078
EC9	0.6657	-0.1557	0.6451
EC10	0.4933	0.4605	0.298
EC11	-0.1554	0.9039	0.3113
EC12	-0.1270	0.8401	0.394
EC13	0.4388	0.3753	0.4879
EC14	0.0611	0.6921	0.4714

Tabella 3. Loading factors dopo rotazione Promax a due fattori

Per la dimensione PE, l'EFA ha evidenziato una soluzione mono-fattoriale (vedi Tabella 4), in quanto soltanto il primo fattore presentava un eigenvalue superiore a 1. Di conseguenze non si è resa necessaria l'applicazione di una rotazione[5].

Factor	Eigenvalue	Difference	Proportion	Cumulative
Factor1	**4.47084**	**3.98002**	**0.9**	**0.9**
Factor2	0.49081	0.09863	0.0988	0.9988
Factor3	0.39218	0.28303	0.0789	1.0777
Factor4	0.10915	0.05904	0.022	1.0997
Factor5	0.05011	0.1158	0.0101	1.1098
Factor6	-0.06569	0.06326	-0.0132	1.0965
Factor7	-0.12896	0.00547	-0.026	1.0706
Factor8	-0.13442	0.08174	-0.0271	1.0435
Factor9	-0.21617	.	-0.0435	1

Tabella 4. Risultato EFA - PE

Tutti i nove item relativi alla dimensione PE sono stati mantenuti all'interno del fattore denominato "Pressioni istituzionali ed esterne". La tabella 5 sintetizza la composizione interna dei tre fattori individuati, due per EC e uno per PE.

Fattore 1 (EC1) Produzione sostenibile	
EC2	Utilizziamo materiali naturali.
EC3	Utilizziamo coloranti naturali o processi di tintura a basso impatto.

[5] Le verifiche complementari hanno ulteriormente confermato la soluzione a un solo fattore: l'analisi delle componenti principali ha individuato una componente dominante (eigenvalue = 4,885; varianza spiegata = 54,3%), mentre la Horn's parallel analysis (270 repliche, stima media) ha restituito valori di eigenvalue corretti pari a 4,31014 per la prima componente e 0,71854 per la seconda. Applicando il criterio di mantenere soltanto i fattori con eigenvalue corretto superiore a 1, è stata quindi supportata la ritenzione di un unico fattore.

EC4	Utilizziamo materiali riciclati (ad esempio fibre rigenerate).
EC5	Comunichiamo attivamente l'impegno del nostro *brand* per la sostenibilità.
EC9	Facciamo affidamento su fonti di energia rinnovabile nel processo produttivo.
Fattore 2 (EC2) Pratiche circolari nelle industrie tessili	
EC7	Progettiamo prodotti che riducono l'uso di imballaggi.
EC11	Offriamo servizi di riparazione o incoraggiamo i clienti a riparare i prodotti.
EC12	Promuoviamo iniziative che facilitano il riutilizzo dei nostri prodotti da parte dei clienti.
EC14	Promuoviamo la raccolta e il riciclo dei prodotti usati.
Fattore 3 (IT) Pressioni istituzionali ed esterne	
IT1	La nostra azienda è soggetta a regolamenti ambientali che influenzano le nostre pratiche.
IT2	Le politiche pubbliche incidono sull'adozione di pratiche sostenibili e circolari nelle nostre operazioni.
IT3	I nostri clienti si aspettano o richiedono l'utilizzo di materiali sostenibili.
IT4	I nostri *stakeholder* ci incoraggiano a migliorare il nostro impatto ambientale.
IT5	Sperimentiamo pressioni da parte della società e dei media riguardo alla sostenibilità.
IT6	Gli standard di settore incoraggiano l'adozione di pratiche di economia circolare.
IT7	Abbiamo adottato pratiche di economia circolare seguendo l'esempio delle aziende leader del settore.
IT8	Monitoriamo attivamente le iniziative ambientali dei nostri concorrenti.
IT9	Implementiamo pratiche di economia circolare per mantenere la nostra reputazione all'interno del settore.

Tabella 5. Composizione interna dei fattori individuati

3.3. L'analisi dei cluster

La cluster analysis ha permesso di individuare tre gruppi tra le aziende rispondenti che denotano altrettanti differenti 'modelli' di approccio alla produzione e di interazione con le tematiche sostenibili e circolari. La tabella 6 presenta la media degli Z-scores che consentono di delineare in via preliminare la configurazione e le caratteristiche dei cluster alla luce dei tre fattori identificati nelle imprese oggetto di studio.

Variable	**Tradizionalisti a basso coinvolgimento (n = 24)**	**Sperimentatori (n = 10)**	**Leader circolari integrati (n = 41)**
(EC1) Produzione sostenibile	-0.71 (0.70)	-1.05 (0.30)	0.67 (0.71)
(EC2) Pratiche circolari	-1.08 (0.57)	0.80 (0.51)	0.44 (0.73)
(IT) Pressioni istituzionali ed esterne	-0.87 (0.81)	-0.19 (0.45)	0.56 (0.80)

Tabella 6. Media dei fattori (z-score) per ciascun cluster

Le 24 aziende (~32%) che compongono il primo cluster sono state definite come "Tradizionalisti a basso coinvolgimento". Tale classificazione, derivante dagli Z-score più bassi sui tre fattori considerati, evidenzia un utilizzo limitato di input sostenibili e di energia rinnovabile, una presenza marginale di servizi circolari (quali riparazione, riutilizzo e sistemi di raccolta e restituzione) e pressioni istituzionali deboli. La configurazione in parola può suggerire, in primo luogo uno stadio embrionale di circolarità, caratterizzato dall'avvio di prime sperimentazioni (ad es., alcune pratiche di design for X), da un'adozione contenuta di strumenti

digitali e da interventi selettivi di aggiornamento (es. macchinari eco-efficienti e sistemi chiusi di trattamento delle acque). Il profilo che ne emerge è tipico di imprese che incontrano maggiori difficoltà nell'innovare e nell'implementare pratiche manageriali orientate alla tecnologia. Alternativamente, questo può suggerire il limitato coinvolgimento di queste aziende sulle tematiche sostenibili e circolari e la mancata interazione con gli input che giungono dai regolatori, dai clienti e dagli stakeholder. Queste rappresentano quindi i soggetti più resistenti al cambiamento e, ragionevolmente, non in grado di percepire i vantaggi e le opportunità di una transizione circolare.

Il secondo gruppo è quello più esiguo in termini numerici poiché composto da sole 10 aziende (~13%), che interpretano la sostenibilità alla stregua degli "sperimentatori" dal momento che prestano maggiore attenzione verso le pratiche circolari con nessuna o scarsa attenzione verso la produzione sostenibile e una apparente neutralità verso le pressioni di natura esterna. In altre parole, il cluster degli sperimentatori risulta maggiormente orientato ai servizi circolari a valle (ad es., riparazione, riutilizzo, sistemi di raccolta e restituzione), mentre mostra ritardi rispetto ai fattori abilitanti a monte, quali l'impiego di materiali a basso impatto, l'adozione di energia rinnovabile e il miglioramento dell'efficienza dei processi. Questo profilo suggerisce una fase transizionale, nella quale le imprese sperimentano modelli di circolarità basati sui servizi senza disporre, tuttavia, di una base produttiva pienamente allineata. Potrebbe, pertanto, suggerire la situazione di aziende in 'transizione' che ancora non hanno pienamente e coscientemente integrato la circolarità nel proprio BM. Queste, quindi, nel prossimo futuro possono trasformarsi in leader della circolarità o arretrare verso posizioni contrarie ove la sperimentazione non suggerisca o evidenzi vantaggi tangibili.

Il terzo e ultimo cluster, primo per dimensione tra i tre esaminati (41 aziende), comprende il 55% delle aziende analizzate e può essere definito come quello dei "leader circolari integrati". Tali imprese presentano, infatti, punteggi superiori alla media in relazione sia alla produzione sostenibile sia all'adozione di pratiche circolari, risultando allo stesso tempo maggiormente coinvolte ed attive nel gestire le pressioni esterne (ad es., regolamenti, richieste dei clienti, standard di settore). La rilevanza numerica di questo gruppo riflette una vocazione verso una produzione intrinsecamente sostenibile, spesso a carattere artistico o artigianale, meno esposta alle dinamiche tipiche del fast fashion.

Le imprese appartenenti a questo cluster adottano, inoltre, pratiche di progettazione orientate alla durabilità, privilegiando l'impiego di materiali locali e, in numerosi casi, riciclati o riutilizzati. In una prospettiva evolutiva, tali aziende potrebbero consolidare il proprio vantaggio competitivo ampliando l'offerta di servizi – anche post-vendita – collegati ai prodotti

(come la riparazione e la manutenzione), potenziando i sistemi di tracciabilità dei materiali e dei processi (ad es. attraverso i digital product passports) o, ancora, sviluppando collaborazioni con altre aziende per attività di remanufacturing. Nei confronti di queste, considerando anche la positiva interazione con le pressioni istituzionali, è fondamentale che i regolatori e il sistema economico siano pronti a creare e mantenere un set di incentivi che consolidi la loro posizione di leader della sostenibilità.

4. Considerazioni finali

In questo primo step, il progetto di ricerca, ancora nella sua fase preliminare, ha approfondito l'orientamento alla sostenibilità e alla circolarità delle imprese artigianali del settore tessile della Sardegna. Queste sono state classificate attraverso una Cluster Analysis basata da un lato sulle pratiche e l'orientamento verso la sostenibilità e la circolarità, dall'altro sulla percezione e gestione delle pressioni istituzionali ed esterne. L'analisi cluster svolta sui tre fattori emersi – due per l'EC e uno per l'PE – ha verificato l'esistenza di 3 gruppi distinti di imprese. Il cluster più numeroso, formato da 42 imprese, individua quelle realtà che si collocano nello stadio più avanzato di circolarità, caratterizzato da livelli elevati di produzione sostenibile e da una maggiore coscienza verso le pressioni e le dinamiche istituzionali e di mercato. Per contro, i cluster

rimanenti mostrano livelli di circolarità inferiori rispetto al gruppo dei leader, ma condividono una crescente consapevolezza del ruolo della sostenibilità. In particolare, il cluster degli sperimentatori, pur ridotto numericamente, lascia intravedere margini di evoluzione verso modelli più maturi, qualora vengano rafforzati approvvigionamenti sostenibili, investimenti in energie rinnovabili, pratiche di design-for-X e sistemi di tracciabilità.

I risultati, da un lato, sembrano segnalare che alcuni contesti artigianali possano configurarsi come veri e propri "laboratori di sostenibilità territoriale". Dall'altro, mostrano anche una certa asimmetria nella capacità delle imprese di assorbire le pressioni esterne: se, infatti, alcune realtà internalizzano tali sollecitazioni traducendole in innovazione di processo e di prodotto, altre ne restano parzialmente impermeabili. L'ulteriore approfondimento quali-quantitativo previsto mirerebbe a esaminare con maggiore precisione la composizione interna dei cluster, integrando variabili strutturali e socio-organizzative utili a chiarire le dinamiche sottostanti ai differenti profili emersi. Lo studio delle variabili strutturali e socio-organizzative risulta dunque fondamentale per comprendere, da un lato, se e in che modo caratteristiche demografiche, organizzative e produttive influenzino l'orientamento delle imprese alla sostenibilità e alla circolarità, contribuendo a delineare le traiettorie evolutive sottostanti ai differenti profili emergenti. Dall'altro, tale analisi consentirà di chiarire, in un'ottica coerente con la IT e ST, il ruolo moderatore svolto da queste variabili nei processi di adattamento e risposta alle pressioni istituzionali e alle sollecitazioni provenienti dagli stakeholder.

Appare, infatti, plausibile ipotizzare che una maggiore anzianità dell'impresa o dell'imprenditore si associ a una minore propensione al cambiamento, con effetti potenzialmente limitanti sulla capacità di integrare pratiche orientate alla sostenibilità e alla circolarità. Analogamente, nelle imprese familiari caratterizzate da una continuità intergenerazionale stabile e da strutture decisionali accentrate possono manifestarsi forme di path dependency che riducono la sensibilità alle pressioni istituzionali e competitive favorevoli alla transizione circolare. Tali dinamiche potrebbero invece attenuarsi in presenza di passaggi generazionali più recenti e di leadership più giovani.

Il progetto presenta alcuni limiti che è necessario evidenziare. I risultati preliminari presentati sono allo stato attuale scarsamente generalizzabili. Per tale ragione, una nuova somministrazione della survey, mirata a coinvolgere un numero più ampio di imprese, consentirebbe di consolidare la robustezza empirica dell'analisi e di accrescere la generalizzabilità dei risultati. Inoltre, sarebbe utile estendere l'indagine a imprese appartenenti a contesti territoriali differenti, così da aprire prospettive comparative e valutare se – e in che misura – unità economiche operanti nello stesso settore e con configurazioni organizzative analoghe contribuiscano all'impiego sostenibile delle risorse naturali e sociali.

Infine, un approfondimento qualitativo del profilo delle imprese, attraverso la metodologia del multiple case study, risulterebbe fondamentale per identificare best practices e meccanismi organizzativi sottostanti, offrendo indicazioni utili sia per la definizione di politiche di supporto sia per la progettazione di strumenti manageriali replicabili.

Parole chiave: Economia circolare; sostenibilità; settore tessile; circular business model; cluster analysis

Ringraziamenti

Il presente lavoro è stato sviluppato nell'ambito delle attività di ricerca del progetto Economia Circolare nel settore tessile sardo (ECOTESS) – finanziato dall'Unione Europea – Next-Generation-EU - Programma di ricerca PE00000004 "Made in Italy Circolare e Sostenibile - MICS" e i risultati qui presentati contribuiscono al raggiungimento degli obiettivi prefissati dallo stesso.

Pratiche di sostenibilità nelle PMI: un'analisi preliminare nei territori di Verona e Vicenza

Paolo Roffia[1]

1. Introduzione

La sostenibilità rappresenta oggi una delle sfide più rilevanti per il sistema economico europeo e per il tessuto imprenditoriale italiano. Negli ultimi anni, la crescente attenzione verso le tematiche ESG ha accelerato la necessità per le imprese di ripensare modelli organizzativi, processi e strumenti manageriali in un'ottica di lungo periodo. Tale trasformazione riguarda non solo le grandi imprese, ma anche le piccole e medie imprese (PMI), che costituiscono oltre il 99% del sistema produttivo nazionale e che sono sempre più chiamate ad affrontare pressioni competitive, normative e reputazionali (Baumgartner & Ebner, 2010; Lozano, 2015). Nonostante ciò, la letteratura accademica evidenzia come il tema della sostenibilità nelle PMI sia ancora caratterizzato da approcci frammentari e da un significativo divario informativo, che rende complessa una valutazione sistematica delle pratiche adottate (Spence, 2016; Del Baldo, 2012).

In particolare, permane una distanza tra le pratiche di sostenibilità effettivamente adottate dalle PMI — spesso distinguibili tra pratiche formali e informalmente incorporate nelle routine aziendali — e la loro formalizzazione secondo logiche strutturate di misurazione e reporting. Tale divario è influenzato dalla limitata disponibilità di risorse, dalle competenze manageriali e dalla natura stessa delle PMI, spesso guidate da logiche intuitive e informali piuttosto che da processi codificati (European Commission, 2023). Al tempo stesso, numerosi contributi sottolineano come la sostenibilità possa rappresentare una leva strategica in grado di rafforzare competitività, reputazione, innovazione e relazioni con gli stakeholder e pertanto configurarsi come un obiettivo strategico (Nidumolu, Prahalad & Rangaswami, 2009; Hörisch, 2022; Seuring & Müller, 2008). Risulta quindi fondamentale promuovere attivamente la ricerca della sostenibilità e comprendere in quali condizioni le imprese, in particolare le PMI, scelgono di perseguirla e integrarla nelle proprie strategie.

In questo contesto, il presente lavoro – configurato come work in progress – si inserisce all'interno di un progetto di ricerca volto a comprendere le pratiche concrete di sostenibilità adottate dalle PMI dei territori di Verona e Vicenza, con l'obiettivo di esplorare la relazione tra consapevolezza, comportamenti, motivazioni e strutture di governance. In particolare, il lavoro intende contribuire alla letteratura colmando il divario tra l'analisi teorica della sostenibilità nelle PMI e l'effettiva comprensione delle pratiche adottate, ancora limitatamente indagate attraverso evidenze empiriche sistematiche. L'elemento di novità del lavoro risiede nell'analisi congiunta dell'informalità delle patiche di sostenibilità e del ruolo della governance, con specifico riferimento alle imprese familiari e alla prospettiva della Socioemotional Wealth (SEW). Particolare attenzione è dedicata al ruolo della leadership imprenditoriale e, nelle imprese familiari, al contributo della Socioemotional Wealth (SEW), che influenza profondamente orientamenti, priorità e scelte non economiche (Jenkins, 2006; Stoian & Gilman, 2017; Cruz et al., 2014; Berrone, P., Cruz, C., & Gómez-Mejía, L. R., 2012).

2. Literature review, Sviluppo concettuale, e research questions

[1] Professore associato, ECON-06/A, Università di Verona; paolo.roffia@univr.it – corresponding author

Il concetto di sostenibilità ha conosciuto un'evoluzione rilevante negli ultimi decenni. A partire dal Rapporto "Our Common Future" (UNWC, 1987), lo sviluppo sostenibile è stato definito come un equilibrio intergenerazionale orientato alla tutela delle risorse naturali e del benessere sociale. Successivamente, la visione proposta da Elkington (1998) — il triple bottom line — ha ulteriormente ampliato il perimetro concettuale definendo tre pilastri fondamentali della sostenibilità aziendale: ambientale, sociale ed economico. Questa articolazione è divenuta la base teorica per numerosi studi empirici e modelli organizzativi (Hansen et al., 2009; Norman & MacDonald, 2004; Jay & Gerard, 2015).

La letteratura più recente riconosce però che tali tre dimensioni non sono sufficienti a descrivere la complessità della sostenibilità contemporanea. Si è diffuso il riconoscimento di un quarto pilastro: la corporate governance (Bebbington & Unerman, 2018; Confetto & Covucci, 2021), intesa come insieme di processi decisionali, meccanismi di controllo, ruoli e pratiche che consentono all'impresa di orientarsi al lungo periodo. La governance non rappresenta una mera estensione tecnica dell'ESG, ma una dimensione costitutiva che permette la realizzazione concreta degli altri tre pilastri, garantendo trasparenza, accountability, dialogo con gli stakeholder e capacità di misurare e rendicontare gli impatti (Aguilera et al., 2007; Eccles & Klimenko, 2019; Camilleri, 2023; Cantele et al. 2024). Tale punto è particolarmente rilevante nel contesto europeo, dove gli standard ESRS rafforzano gli obblighi di disclosure su strategia, governance e processi di gestione dei rischi. In questo contesto, emerge la necessità di comprendere non solo la presenza di pratiche sostenibili, ma anche il loro grado di formalizzazione, distinguendo tra comportamenti informali, radicati nelle routine aziendali, e pratiche strutturate, supportate da strumenti e processi formalizzati.

Chiarito il quadro concettuale entro il quale collocare il tema della corporate sustainability, emerge la questione fondamentale del perché le organizzazioni — e in particolare le PMI — dovrebbero impegnarsi nella sostenibilità. Limitare la risposta ai soli obblighi normativi significherebbe trascurare motivazioni più profonde, strategiche e identitarie. Numerosi studi evidenziano come la sostenibilità rappresenti un driver competitivo capace di influenzare la resilienza organizzativa, l'innovazione, la reputazione e la qualità delle relazioni con gli stakeholder (Porter & Kramer, 2006; Hart & Dowell, 2011; Adams et al., 2016). Per le PMI, ciò si traduce nella possibilità di accedere a nuove catene di fornitura, rispondere a pressioni crescenti da parte dei clienti e mantenere credibilità nei mercati globalizzati (Johnson & Schaltegger, 2016; Bos-Brouwers, 2010). Cantele et al. (2024) sottolineano come l'adozione di pratiche sostenibili è spesso guidata da un processo di apprendimento organizzativo progressivo, dove l'impresa sviluppa progressivamente capacità e routine coerenti con la sostenibilità, prima in forma tacita e poi strutturata.

Oltre agli aspetti competitivi, le PMI manifestano spesso motivazioni valoriali legate al ruolo dell'imprenditore, alla sua cultura, leadership e radicamento territoriale (Jenkins, 2006; Russo & Tencati, 2009). In molte realtà italiane, l'impresa è considerata un attore sociale responsabile del benessere della comunità locale e dei propri dipendenti, con conseguente attenzione spontanea — seppur talvolta non formalizzata — a tematiche ambientali e sociali (Klewitz & Hansen, 2014; Cantele & Zardini, 2018). Queste pratiche intuitive e contestuali costituiscono veri e propri "semi" di sostenibilità che non sempre trovano riscontro nei framework di misurazione ESG.

Nel caso delle imprese familiari, largamente diffuse nel contesto veneto, tali dinamiche sono ulteriormente rafforzate dalla prospettiva della Socio-Emotional Wealth (SEW). La SEW descrive il valore socio-emotivo che le famiglie imprenditoriali attribuiscono all'impresa, orientando le decisioni verso obiettivi non strettamente economici: reputazione, identità, continuità generazionale, legami con il territorio, fiducia degli stakeholder (Gómez-Mejía et al., 2007; Berrone et al., 2012; Deephouse & Jaskiewicz, 2013). In linea con la letteratura sulla SEW, tale costrutto può essere ulteriormente articolato secondo il modello FIBER (Family control and influence, Identification of family members with the firm, Binding social ties, Emotional attachment, Renewal of family bonds), che consente di interpretare in modo più analitico le

motivazioni non economiche che guidano il comportamento delle imprese familiari (Berrone et al., 2012).

Ai fini del presente studio, adottiamo una definizione di impresa familiare che considera "familiare" ogni impresa nella quale una famiglia esercita un'influenza sostanziale sulla proprietà, sulla governance o sul management, contribuendo a determinare visione di lungo periodo, obiettivi strategici e processi decisionali (Chua, Chrisman & Sharma, 1999; Astrachan, Klein & Smyrnios, 2002; Roffia, Moracchiato, Liguori & Kraus, 2021). Operativamente, tale influenza sarà rilevata attraverso indicatori relativi alla concentrazione proprietaria, alla presenza di membri della famiglia negli organi di governo e al coinvolgimento diretto nella gestione.

In quest'ottica, la sostenibilità diventa una forma di tutela del patrimonio socio-emotivo, uno strumento per consolidare relazioni e rinsaldare il ruolo dell'impresa nel sistema locale. Ne deriva che la sostenibilità nelle PMI si configura come un intreccio complesso di elementi strategici, culturali e identitari. Alla luce di questo quadro teorico, il presente studio si propone di rispondere alla seguente domanda di ricerca:

RQ1: In che modo le PMI integrano i quattro pilastri della sostenibilità (ambientale, sociale, economico e di governance) e quali motivazioni — strategiche, valoriali o identitarie — guidano tale integrazione?

La domanda di ricerca muove dalla consapevolezza che le PMI non adottano la sostenibilità in modo uniforme, ma secondo logiche che combinano obiettivi economici, vincoli organizzativi, valori imprenditoriali e, nel caso delle imprese familiari, meccanismi socio-emotivi. Comprendere tali differenze è cruciale per interpretare i livelli di maturità sostenibile e per chiarire quali dimensioni della sostenibilità risultino maggiormente presidiate a livello di pratica.

Coerentemente con la letteratura su PMI e imprese familiari, proponendoci di misurare l'orientamento alla sostenibilità come un costrutto multidimensionale comprendente pratiche ambientali, sociali, economiche e di governance, formuliamo inoltre la seguente ipotesi di ricerca esplorativa:

HP1: Le PMI familiari mostrano livelli più elevati di orientamento alla sostenibilità rispetto alle PMI non familiari, in virtù dell'influenza della Socioemotional Wealth (SEW) che orienta le decisioni verso obiettivi di lungo periodo, reputazione e continuità generazionale (Gómez-Mejía et al., 2007; Berrone et al., 2012).

Oltre alla dimensione legata alla proprietà familiare, la letteratura suggerisce che nelle PMI l'attenzione alla sostenibilità non sia omogenea tra i diversi pilastri. Numerose ricerche evidenziano che le PMI tendono a sviluppare in via prioritaria iniziative a carattere ambientale e sociale, spesso intuitive, informali e collegate al territorio, mentre risultano meno strutturate nelle dimensioni economica e, soprattutto, di governance. Tale sbilanciamento deriva dalla maggiore visibilità degli impatti ambientali e sociali nella relazione con clienti, comunità locali e dipendenti, nonché dalla presenza di valori imprenditoriali che favoriscono comportamenti responsabili anche in assenza di formalizzazione.

HP2: Nelle PMI le pratiche di sostenibilità ambientale e sociale risultano più diffuse e maggiormente integrate rispetto alle dimensioni economica e di governance, a causa della loro immediata rilevanza relazionale e territoriale, in linea con l'evidenza empirica che evidenzia una priorità attribuita agli aspetti più visibili e reputazionali della sostenibilità (Sun et al., 2024).

Tali ipotesi, di natura preliminare, verranno verificate attraverso l'indagine empirica prevista nella seconda fase dello studio.

3. Obiettivi della ricerca

Il presente lavoro si propone di analizzare le pratiche di sostenibilità adottate dalle piccole e medie imprese nei territori di Verona e Vicenza, con l'obiettivo di comprendere come tali imprese interpretino e integrino i quattro pilastri della sostenibilità — ambientale, sociale, economico e di governance — nel loro modello di business. In primo luogo, l'obiettivo è mappare in modo

sistematico il grado di presenza, diffusione e formalizzazione delle pratiche riconducibili a ciascuna dimensione, distinguendo fra iniziative strutturate e comportamenti informali, spesso radicati nelle routine e nella cultura organizzativa delle PMI, nonché nella definizione di una tassonomia delle pratiche e dei livelli di maturità sostenibile, sviluppando un sistema di misurazione (score) in grado di cogliere il diverso grado di formalizzazione delle pratiche di sostenibilità (Cantele et al., 2024). Tale analisi consente di offrire un contributo alla letteratura fornendo una lettura integrata e operativa dell'orientamento alla sostenibilità nelle PMI, contribuendo a superare approcci frammentari e prevalentemente teorici ancora presenti in letteratura.

Un secondo obiettivo riguarda l'analisi delle motivazioni che guidano tali pratiche, esplorando sia i driver strategici — competitività, innovazione, reputazione — sia quelli valoriali, con particolare attenzione alla leadership imprenditoriale e ai meccanismi socio-emotivi tipici delle imprese familiari. In quest'ottica, la tassonomia P–P–P–G proposta da Confetto & Covucci (2021) offre un quadro interpretativo utile a comprendere come le imprese attribuiscano priorità differenti alle varie dimensioni della sostenibilità e come tale attribuzione rifletta valori, identità e visioni imprenditoriali.

In termini applicativi, la ricerca mira a produrre output operativi utili a studiosi e practitioner, tra cui una tassonomia delle pratiche di sostenibilità nelle PMI, una matrice di maturità sostenibile e una classificazione (cluster) delle imprese in base all'orientamento alla sostenibilità e alle caratteristiche di governance.

Un terzo obiettivo consiste nell'esaminare il ruolo della natura familiare dell'impresa. Sulla base della letteratura sulla Socioemotional Wealth (SEW), ci proponiamo di comprendere se e in che misura la proprietà familiare influenzi l'orientamento alla sostenibilità, in particolare nelle dimensioni sociale e di governance, tipicamente connesse alla reputazione, alla continuità e ai legami con il territorio.

Un ulteriore obiettivo è valutare la distribuzione della sostenibilità lungo le diverse dimensioni, verificando se — come suggerito dalla letteratura recente — le PMI tendano a presidiare maggiormente la sostenibilità ambientale e sociale rispetto a quella economica e di governance, e quali fattori spiegano tale sbilanciamento.

Infine, la ricerca mira a costruire una prima classificazione dei livelli di maturità sostenibile delle PMI del campione, sviluppando un modello descrittivo utile per interpretare diversità, punti di forza e aree critiche del loro approccio alla sostenibilità.

Tale classificazione costituirà la base per la successiva fase empirica del progetto e potrà rappresentare un riferimento utile sia per la ricerca futura sia per l'elaborazione di strumenti manageriali e policy di supporto alle PMI.

4. Metodologia

La metodologia adottata in questo studio riflette la natura esplorativa del progetto e si articola in due fasi principali, complementari tra loro. L'obiettivo è garantire una comprensione approfondita sia del quadro teorico sia delle pratiche effettivamente adottate dalle PMI, combinando un approccio qualitativo-interpretativo (fase 1) e un approccio quantitativo-descrittivo (fase 2).

4.1. Fase 1 – Rassegna sistematica della letteratura

La prima fase consiste nella realizzazione di una systematic literature review (SLR), attualmente in via di completamento. La SLR è condotta seguendo le linee guida proposte da Tranfield, Denyer & Smart (2003) e Snyder (2019), che prevedono la definizione di stringhe di ricerca, criteri trasparenti di inclusione e esclusione, codifica tematica dei risultati e tracciabilità dell'intero processo. La ricerca bibliografica ha coinvolto le principali banche dati (Scopus, Web

of Science, Google Scholar), focalizzandosi su lavori relativi alla sostenibilità nelle PMI, alla governance sostenibile, all'innovazione sostenibile, alle imprese familiari e alla SEW.

Tale fase è inoltre arricchita dalla considerazione di contributi recenti che propongono strumenti operativi per la misurazione della sostenibilità, come il modello multidimensionale a struttura formativa di Cantele et al. (2024) e la tassonomia P–P–P–G di Confetto & Covucci (2021), che offrono basi concettuali utili alla costruzione dello strumento di rilevazione empirica. L'integrazione di tali contributi consente di mappare con maggiore precisione le dimensioni emergenti della sostenibilità e di indirizzare le scelte di operazionalizzazione delle variabili nella fase successiva.

4.2. Fase 2 – Disegno e somministrazione del questionario (2026)

La seconda fase prevede la progettazione e la somministrazione di un questionario strutturato rivolto alle PMI delle province di Verona e Vicenza. Il questionario sarà costruito combinando scale validate presenti nella letteratura e adattate al contesto delle PMI (Torres & Maciel, 2019), integrando gli item derivati dalle dimensioni individuate in Cantele (2024) e dalla tassonomia di Confetto & Covucci (2021). Il campione sarà reclutato attraverso contatti diretti con imprenditori e per il tramite di associazioni di categoria locali; per ridurre il rischio di bias di risposta, il questionario sarà indirizzato prioritariamente a imprenditori, owner-manager o top manager e saranno effettuate verifiche ex post di non-response bias

Il questionario indagherà le seguenti aree principali:

- pratiche ambientali, incluse iniziative di efficientamento energetico, gestione risorse, emissioni e rifiuti;
- pratiche sociali, con attenzione al capitale umano, alle relazioni con gli stakeholder, al benessere organizzativo e alla comunità locale;
- pratiche economiche, riguardanti continuità, investimenti, resilienza e gestione delle risorse finanziarie;
- strutture di governance, comprese politiche, responsabilità e processi decisionali relativi alla sostenibilità;
- valori e cultura imprenditoriale, con particolare focus sulla leadership e sull'identità familiare;
- elementi SEW relativi alla reputazione, alla continuità generazionale e al legame con il territorio.

Le diverse pratiche saranno inoltre aggregate in indicatori sintetici (score) per ciascuna dimensione della sostenibilità, al fine di consentire analisi comparative e successive modellizzazioni statistiche.

Le risposte saranno raccolte tramite una scala Likert a 7 punti, integrando anche domande aperte per cogliere elementi qualitativi utili all'interpretazione dei comportamenti. Saranno inoltre rilevate variabili di controllo quali dimensione, settore, natura familiare, presenza di certificazioni e appartenenza a filiere internazionali.

4.3. Analisi dei dati

L'analisi dei dati quantitativi seguirà un approccio multilivello, includendo anche l'utilizzo di modelli di Partial Least Squares Structural Equation Modeling (PLS-SEM), coerenti con la natura esplorativa dello studio e con la misurazione di costrutti multidimensionali formativi. L'affidabilità e la validità delle scale saranno valutate mediante indicatori standard (ad es. alpha di Cronbach e analisi fattoriale esplorativa), coerentemente con la natura esplorativa dello studio. In primo luogo verranno effettuate analisi descrittive per mappare la diffusione delle pratiche sostenibili tra le PMI del campione. Saranno inoltre sviluppate analisi di clustering finalizzate all'identificazione di profili differenziati di maturità sostenibile tra le PMI del campione.

Successivamente verrà condotta un'analisi fattoriale esplorativa (EFA) per verificare la coerenza delle dimensioni teoriche individuate nella fase 1. Tale scelta è coerente con studi che analizzano la sostenibilità come costrutto multidimensionale (Cantele et al., 2024).

In aggiunta, verranno sviluppate analisi di cluster per identificare profili differenti di maturità sostenibile, in linea con gli approcci proposti da Baumgartner (2014) e con la letteratura sugli stadi evolutivi della sostenibilità nelle PMI. I dati qualitativi derivanti dalle risposte aperte saranno analizzati tramite analisi tematica, utile per cogliere sfumature legate alla motivazione imprenditoriale, alla leadership e alla SEW.

L'integrazione dei risultati permetterà di interpretare in modo coerente le due ipotesi formulate (Hp1 e Hp2) e di comporre una visione articolata dell'approccio alla sostenibilità nelle PMI venete.

5. Risultati attesi

I risultati attesi si articolano su più livelli e riflettono la natura esplorativa del progetto.

In primo luogo, ci si attende di riscontrare una diffusione significativa di pratiche sostenibili informali nelle PMI, distinte da pratiche formali più strutturate e riconducibili a sistemi espliciti di gestione e rendicontazione, spesso non identificate come "pratiche di sostenibilità" ma radicate nelle routine operative, nella cultura organizzativa e nei valori dell'imprenditore. Tale fenomeno è ampiamente documentato nella letteratura che sottolinea come le PMI — pur non adottando formalmente sistemi ESG — manifestino comportamenti coerenti con la sostenibilità attraverso scelte quotidiane, relazioni con il territorio e attenzione verso utenti interni ed esterni (Johnson & Schaltegger, 2016; Jenkins, 2006; Cantele, 2024).

Un secondo risultato atteso riguarda la presenza di livelli eterogenei di maturità sostenibile, che si rifletteranno nella diversa intensità con cui le imprese adottano le pratiche riconducibili ai quattro pilastri della sostenibilità. Ci si aspetta di identificare profili distinti di maturità, coerenti con modelli evolutivi già osservati nella letteratura (Baumgartner, 2014), che si distribuiscono lungo un continuum che va da pratiche intuitive e sporadiche fino a sistemi strutturati di gestione e rendicontazione. Tali evidenze potranno contribuire alla costruzione di una matrice di maturità sostenibile, utile per classificare le imprese in funzione del livello di sviluppo delle pratiche ESG.

Un terzo risultato atteso concerne lo sbilanciamento tra le dimensioni della sostenibilità. In linea con studi recenti, prevediamo che le PMI presidino maggiormente le dimensioni ambientale e sociale rispetto a quelle economica e di governance, poiché i comportamenti relativi a ambiente e persone risultano più tangibili, immediatamente percepibili dagli stakeholder e spesso più coerenti con i valori imprenditoriali e territoriali (Russo & Tencati, 2009; Confetto & Covucci, 2021). Ci si attende invece una minore strutturazione nella dimensione di governance, che tipicamente richiede formalizzazione, processi decisionali chiari e competenze manageriali più avanzate.

Un quarto risultato atteso riguarda il ruolo della natura familiare dell'impresa. Coerentemente con l'ipotesi Hp1, ci si aspetta che le PMI familiari mostrino un orientamento alla sostenibilità più forte rispetto alle PMI non familiari, soprattutto nelle dimensioni sociale e di governance, grazie alla presenza della Socioemotional Wealth (SEW) e alla volontà di proteggere identità, reputazione e continuità generazionale (Gómez-Mejía et al., 2007; Berrone et al., 2012). Tali imprese potrebbero dimostrare una maggiore sensibilità alle aspettative degli stakeholder locali e una maggiore propensione a pratiche che rafforzano la fiducia e il radicamento nel territorio.

Un quinto risultato atteso riguarda la verifica dell'ipotesi Hp2, secondo cui le PMI tendono a presidiare maggiormente le dimensioni sociale e ambientale della sostenibilità rispetto a quelle economica e di governance. Ci aspettiamo che l'indagine empirica confermi tale sbilanciamento, mettendo in evidenza che le PMI attribuiscono priorità a pratiche immediatamente riconducibili

al benessere del territorio, dei dipendenti e della comunità, mentre mostrano minore strutturazione nelle dimensioni che richiedono processi formali, politiche scritte e sistemi di responsabilità.

Infine, ci si attende di ottenere una prima mappatura delle pratiche sostenibili nelle PMI del territorio, utile per individuare pattern ricorrenti, aree critiche e potenziali ambiti di intervento da parte di associazioni di categoria, istituzioni e policy maker. Tale mappatura servirà come base per sviluppare azioni di accompagnamento alla transizione sostenibile delle PMI, anche in vista dell'estensione futura degli obblighi di rendicontazione.

6. Conclusioni

Le evidenze emerse dal quadro teorico e dagli obiettivi di ricerca delineano una prospettiva articolata sul ruolo della sostenibilità nelle PMI dei territori di Verona e Vicenza. La sostenibilità si configura come un fenomeno complesso, stratificato e multidimensionale, che non può essere ridotto a un semplice adempimento normativo, ma deve essere interpretato come un insieme di pratiche, valori e processi che si sviluppano nel lungo periodo all'interno dell'impresa.

Da un lato, la letteratura mostra come spesso le PMI — pur operando con risorse limitate — abbiano un orientamento spontaneo e spesso informale alla sostenibilità, soprattutto nelle dimensioni ambientale e sociale, grazie al forte legame con i territori e alla vicinanza alle comunità locali. Questo orientamento rappresenta una risorsa importante, ma al tempo stesso evidenzia la necessità di strumenti e percorsi di formalizzazione che permettano di trasformare tali intuizioni in pratiche strutturate e misurabili, anche attraverso l'adozione di strumenti di valutazione e score sintetici delle performance di sostenibilità.

Dall'altro, le dimensioni economica e di governance risultano meno presidiate, in linea con l'eterogeneità dei livelli di maturità sostenibile nelle PMI. Tale sbilanciamento suggerisce la necessità di sviluppare modelli di governance più chiari e processi più formalizzati, soprattutto in vista delle evoluzioni normative europee e dell'aumento delle richieste da parte delle filiere produttive.

Un elemento particolarmente significativo riguarda il ruolo delle imprese familiari e della Socioemotional Wealth (SEW) nell'analisi della sostenibilità nel contesto delle PMI. Le evidenze teoriche suggeriscono che la sostenibilità possa essere utilizzata come strumento per preservare identità, reputazione e continuità generazionale. In tale prospettiva, le imprese familiari potrebbero rappresentare un laboratorio privilegiato per osservare l'integrazione valoriale e strategica della sostenibilità nelle PMI, in particolare nelle dimensioni sociale e di governance.

Le conclusioni preliminari di questo lavoro sono che è importante comprendere non soltanto se le PMI adottano pratiche sostenibili, ma quando e perché tali pratiche emergono e si consolidano. Questo approccio consente di superare interpretazioni puramente prescrittive e di cogliere la sostenibilità come processo evolutivo, incrementale e dipendente dalla cultura imprenditoriale.

Dal punto di vista operativo, la futura indagine empirica prevista per l'autunno 2026 rappresenterà un passaggio cruciale per validare le ipotesi formulate (Hp1 e Hp2), per misurare i livelli di maturità sostenibile e per individuare eventuali cluster di comportamento tra le PMI. I risultati della survey offriranno una base solida per orientare sia la ricerca futura sia le azioni di accompagnamento delle associazioni imprenditoriali e delle istituzioni locali.

In conclusione, questo lavoro contribuisce a porre le basi per una comprensione più profonda della sostenibilità nelle PMI venete, evidenziando la necessità di sviluppare strumenti concettuali e operativi che tengano conto delle specificità territoriali, della natura familiare delle imprese e della centralità dei valori imprenditoriali. La sostenibilità nelle PMI non si configura soltanto come un insieme di pratiche, ma come una lente attraverso cui leggere identità, scelte e aspirazioni delle imprese in un contesto in rapida evoluzione.

Il ruolo di governance e accountability per la sostenibilità: verso la proposta di un framework

Cristina Leone[1], Sonia Quarchioni[2], Pasquale Massimo Picone[3]

1. Contesto di riferimento

Il secondo dopoguerra fu caratterizzato da una rapida industrializzazione che, da un lato, ha sostenuto la crescita economica di molti Paesi e, dall'altro, ha determinato un utilizzo intensivo delle risorse naturali, sovente senza alcuna attenzione né alla loro scarsità né alle conseguenze ambientali (Brown, 1985; Catton, 1982). La consapevolezza di tali problematiche si sviluppò progressivamente nei decenni successivi, fino a raggiungere un momento di svolta nel 1987, quando la Commissione Brundtland delle Nazioni Unite definì la sostenibilità come "soddisfare i bisogni del presente senza compromettere la capacità delle generazioni future di soddisfare i propri" (World Commission on Environment and Development, 1987).

Dalla definizione di sostenibilità proposta dalla Commissione Brundtland a oggi, il concetto ha conosciuto un'evoluzione significativa. Inizialmente focalizzato sul bilanciamento tra sviluppo economico e tutela ambientale, il concetto di sostenibilità si è progressivamente ampliato fino a includere anche la dimensione sociale, comprendente aspetti quali i diritti dei lavoratori e il benessere umano (Bansal e Song, 2017). In questa prospettiva, la Dichiarazione dell'Organizzazione Internazionale del Lavoro del 1998 sui principi e diritti fondamentali nel lavoro ha rappresentato un momento cruciale per l'affermazione della sostenibilità sociale, collocandosi in continuità con i più ampi sforzi di sostenibilità promossi all'interno dei quadri di governance globale.

Facendo un rapido balzo in avanti nella storia, un momento di cruciale importanza per l'affermazione della sostenibilità nella pratica d'impresa è rappresentato dal lancio dell'Agenda 2030 per lo Sviluppo Sostenibile. In questo contesto, una molteplicità di attori pubblici e privati, insieme a organizzazioni della società civile, ha progressivamente esercitato pressioni sulle imprese – in particolare sulle multinazionali – affinché affrontassero in modo concreto le sfide della sostenibilità (George et al., 2016; Leone, 2025). Gli Obiettivi di Sviluppo Sostenibile (conosciuti con l'acronimo inglese SDGs, Sustainable Development Goals) richiedono l'integrazione delle dimensioni economica, sociale e ambientale della performance. Tali dimensioni sono state progressivamente incorporate nelle strategie d'impresa (Aras e Crowther, 2009; George et al., 2012), e gli SDGs possono essere considerati come una bussola che orienta le imprese oltre la mera massimizzazione del valore per gli azionisti, invitandole "a compiere scelte intertemporali per salvaguardare l'equità intergenerazionale" (Bansal e DesJardine, 2014, p. 70, nostra traduzione).

La definizione di sostenibilità evidenzia la natura poliedrica del concetto, richiamando la necessità di preservare congiuntamente le risorse naturali e l'equità sociale, sollecitando al contempo un ripensamento dei modelli di governance e delle pratiche d'impresa. Proprio questa ampiezza di prospettive spiega perché la sostenibilità sia divenuta un tema di crescente rilievo in ambito accademico, stimolando il contributo di discipline diverse e tra loro eterogenee,

dall'ecologia alla sociologia, dall'economia al management. Nell'area economico-aziendale, in particolare, l'interesse si è tradotto in filoni di ricerca distinti che hanno coinvolto studiosi di etica (Bansal e Song, 2017) e strategia d'impresa (Hansen e Schaltegger, 2016), business internazionale (Burritt, et al., 2020; Sharma, 2025), governance d'impresa (Aguilera et al., 2021; Kavadis e Thomsen, 2023) e contabilità e controllo (ad esempio, Hsiao et al., 2022; Schaltegger et al., 2022). Tale pluralità di approcci, se da un lato ha sostenuto una maggiore specializzazione e un arricchimento delle conoscenze, dall'altro lato ha determinato una certa frammentazione del dibattito (Aversa et al., 2024). Infatti, ciascuna disciplina tende a considerare soltanto una delle molteplici dimensioni del fenomeno, fondandosi su presupposti ontologici ed epistemologici propri (Kuhn, 2012). Questa disomogeneità rappresenta al tempo stesso una fonte di vitalità e una sfida per lo sviluppo di una visione realmente integrata della sostenibilità, nonché per il suo effettivo perseguimento e la sua concreta implementazione da parte delle imprese.

In linea con questa impostazione, una delle principali sfide degli studi sulla sostenibilità riguarda la necessità di ampliare la comprensione della governance e dell'accountability. Mentre la letteratura riconosce che entrambe le prospettive sono fondamentali per affrontare le sfide della sostenibilità e implementare efficacemente gli SDGs (Arjaliès e Bansal, 2018; Bebbington e Unerman, 2020), il superamento della frammentazione del dibattito appare una condizione imprescindibile. La prospettiva della governance consente di esaminare le strutture formali e informali che definiscono le regole e le responsabilità all'interno dell'impresa (Hambrick et al., 2008). Come sottolinea Elkington (2006, p. 522, nostra traduzione): "la corporate governance riguarda fondamentalmente questioni come la finalità dell'impresa – per chi e nell'interesse di chi le imprese dovrebbero essere gestite, e come". L'accountability, invece, riguarda i processi attraverso i quali le imprese spiegano, giustificano e rendono comprensibili le proprie attività agli stakeholder, in particolare con riferimento agli impatti sociali e ambientali, assumendosi al contempo la responsabilità delle conseguenze delle proprie azioni (Gray et al., 1996; Zadek, 1998).

Il modo in cui le imprese considerano effettivamente la governance e l'accountability come strumenti per promuovere la sostenibilità resta oggetto di dibattito. L'impegno verso la sostenibilità può essere determinato da forme di attivismo azionario (Goranova e Ryan, 2014) o dalla discrezionalità manageriale (Aragon-Correa et al., 2004), più che da un autentico orientamento ad ampliare la responsabilità d'impresa (Dillard e Vinnari, 2019). Nella pratica, molte imprese si affidano a un mosaico di standard adottati su base volontaria per valutare la propria performance in materia di sostenibilità (Howard-Grenville, 2021). Tuttavia, la proliferazione di standard, indicatori e sistemi di valutazione, talora caratterizzati da opacità, ha generato un vero e proprio "mercato degli standard" della sostenibilità, con effetti talvolta perniciosi sulla reale efficacia di tali metriche e sulla comparabilità (Barkemeyer et al., 2015; Christmann e Taylor, 2006; Reinecke et al., 2012).

In ultima analisi, il dibattito appena richiamato riporta al tema della finalità dell'impresa (Elkington, 2006), e alla questione su chi l'impresa debba rendere conto e per quali ragioni (Agyemang, 2024). Ciò continua a sollevare interrogativi centrali, che possono essere formulati come segue: Come vengono interpretate le pratiche di sostenibilità all'interno dei confini disciplinari della governance e dell'accountability? Quale influenza esercitano i meccanismi di governance sull'efficacia degli strumenti di accountability (e viceversa)? In che modo i contesti settoriali e culturali incidono sull'interpretazione e sull'attuazione delle pratiche di sostenibilità nei rispettivi ambiti di governance e accountability? Per affrontare tali questioni sarà necessario fare leva sulla ricca ed eterogenea letteratura su governance e accountability per la sostenibilità, al fine di elaborare una visione coerente e realmente unitaria del concetto di sostenibilità.

2. Formulazione del problema di ricerca

In questo studio facciamo leva sulla letteratura di governance e accountability per analizzare come le imprese definiscono, costruiscono e implementano la sostenibilità. La ricerca, ancora in fieri, mira a sviluppare un framework integrativo che metta in luce le intersezioni concettuali tra i due approcci e la loro reciproca influenza sui processi di transizione e affermazione della sostenibilità all'interno delle imprese. Due sono le chiavi di lettura adottate: da un lato, la governance declinata nei meccanismi formali e relazionali; dall'altro, l'accountability intesa come rendicontazione stakeholder-oriented e meccanismi interni di costruzione. Queste prospettive consentono di indagare come possano attivarsi meccanismi più efficaci di promozione della sostenibilità, contribuendo a colmare i gap teorici e a rafforzare le pratiche manageriali.

3. Quadro teorico di riferimento

3.1. Governance della sostenibilità tra strutture e relazioni

La governance si riferisce a "strutture formali, strutture informali e processi" (Hambrick et al., 2008, p. 381, nostra traduzione) attraverso cui le strategie delle imprese vengono allineate alle sfide della sostenibilità (Hussain et al., 2018; Montiel et al., 2021). Aumentare la consapevolezza degli azionisti rispetto alle questioni di sostenibilità e alle loro fonti di legittimazione (Kavadis et al., 2024), adottare codici di condotta d'impresa (Kolk e Van Tulder, 2002) e creare ruoli manageriali specifici dedicati alla sostenibilità – come il ruolo di Chief Sustainability Officer (Shui et al., 2022) – sono tutti esempi di pratiche attraverso cui le imprese sviluppano soluzioni di governance orientate alla sostenibilità.

È possibile sostenere che la governance rappresenti, solo in prima approssimazione, un sistema di strutture e processi volto ad allineare le decisioni manageriali agli interessi degli azionisti. Essa costituisce, piuttosto, un quadro più ampio che definisce come le imprese si relazionano con una pluralità di stakeholder e rispondono alle aspettative sociali (Aguilera e Ruiz Castillo, 2025; Filatotchev e Nakajima, 2010), determinando in ultima istanza il loro ruolo all'interno del sistema economico e sociale. Lungo questo scritto assumeremo la seconda prospettiva perché ci consente di riconoscere la governance come un fattore propulsivo della sostenibilità. Infatti, la governance fornisce le regole, le strutture decisionali e i meccanismi attraverso cui gli obiettivi ambientali e sociali possono essere integrati all'interno delle strategie d'impresa (Aguilera et al., 2021; Aragón-Correa et al., 2020; Wang et al., 2024).

Le prime ricerche sulla sostenibilità hanno affrontato la governance da un punto di vista formale, fondando la propria analisi sull'economia dei costi di transazione (Williamson, 1985, 1991) e sulla teoria dell'agenzia (Meckling e Jensen, 1976). In questo filone di letteratura, la governance è rappresentata come uno strumento progettato per minimizzare l'opportunismo, l'asimmetria informativa e i rischi di scambio, attraverso la definizione di termini contrattuali precisi e la responsabilizzazione legale dei dirigenti (Aguilera e Ruiz Castillo, 2025; Poppo e Zenger, 2002). I manager sono chiamati a predisporre accordi contrattuali e organizzativi dettagliati, nei quali siano specificati ruoli, responsabilità e rimedi in caso di contingenze (Poppo e Zenger, 2002). Nel trattare gli obiettivi di sostenibilità, questa prospettiva ha fatto leva sui meccanismi di governance per spiegare come le imprese garantiscano la conformità ai requisiti ambientali e sociali (Aguilera et al., 2021; Hussain et al., 2018; Leone et al., 2026). Ad esempio, Berrone e Gomez-Mejia (2009) analizzano se la remunerazione dei dirigenti possa trarre beneficio da una buona performance ambientale; Post et al. (2011) indagano in che modo la composizione del consiglio di amministrazione influenzi l'implementazione delle strutture e dei processi di governance ambientale. Numerosi studiosi si sono, inoltre, concentrati sulla valutazione dell'efficacia dei codici di condotta nella regolamentazione del comportamento responsabile lungo le catene di fornitura, esaminando se tali strumenti siano in grado di prevenire pratiche scorrette e di favorire l'adesione a standard di sostenibilità (Van Tulder et al., 2009). In questa letteratura, la governance formale può tradursi nella progettazione di incentivi legati a obiettivi di sostenibilità, nell'istituzione di sistemi di controllo interno (es. ESG KPIs o comitati di controllo

per la sostenibilità; Gebhardt et al., 2023), nella codificazione dei processi (codici di condotta, procedure di due diligence; es. Yu, 2008) e nell'utilizzo di verifiche esterne per certificare le informazioni non finanziarie (es. Short et al., 2016).

Con il tempo, tuttavia, gli studiosi hanno riconosciuto i limiti di una governance puramente formale, superando la concezione di un mero insieme di contratti e meccanismi di protezione dall'opportunismo per considerarla come un sistema capace di indirizzare le azioni individuali verso il bene collettivo dell'impresa e dei suoi stakeholder (Aguilera e Ruiz Castillo, 2025; Bacq e Aguilera, 2022; Boström, 2015). Da un lato, i contratti e i relativi meccanismi di governance non possono prevedere ogni possibile contingenza, e un'eccessiva enfasi su controllo e monitoraggio può generare costi e rigidità aggiuntivi (Busco et al., 2005; Poppo e Zenger, 2002). Dall'altro lato, gli attori talvolta si comportano come steward motivati dal benessere di lungo periodo dell'impresa più che da interessi personali (Aguilera e Ruiz Castillo, 2025). In tal caso, la governance è radicata nelle relazioni sociali e istituzionali più ampie, dove la cooperazione è sostenuta anche da salvaguardie contrattuali, ma soprattutto dalla fiducia, dalla reciprocità e da norme condivise tra gli attori coinvolti (Aguilera e Ruiz Castillo, 2025; Poppo e Zenger, 2002). Questo riconoscimento ha portato a un orientamento relazionale negli studi sulla governance, sottolineando che un coordinamento e un controllo efficaci spesso emergono da interazioni continue e da aspettative reciproche tra stakeholder, più che da strutture formalizzate (Elkington, 2006; Lee et al., 2020). Il passaggio concettuale – da un orientamento formale a uno relazionale – è stato favorito dall'integrazione della teoria degli stakeholder e di approcci sociologici che evidenziano la dimensione sociale della governance (Bacq e Aguilera, 2022; Poppo e Zenger, 2002). Un'idea guida in questa letteratura è che la fiducia e reciprocità funzionino come "collante sociale" auto-rinforzante che integra – e non sostituisce – i contratti formali (Poppo e Zenger, 2002; Zaheer e Venkatraman, 1995). Questo è particolarmente vero nel perseguimento degli obiettivi di sostenibilità. Infatti, un'eccessiva dipendenza da meccanismi formali di governance può condurre a una conformità meramente simbolica ai requisiti di sostenibilità (Berrone e Gomez-Mejia, 2009). Al contrario, un approccio collaborativo e basato sulla fiducia rappresenta un complemento essenziale alla conformità formale, consentendo di affrontare in modo più efficace le sfide della sostenibilità (Gimenez e Sierra, 2013; Lee et al., 2020). Tali approcci enfatizzano modalità di governance relazionale, nelle quali la responsabilità per gli esiti della sostenibilità è distribuita tra reti di attori che includono organizzazioni non governative, governi e comunità (Albareda e Waddock, 2018; Fougère e Solitander, 2020).

In estrema sintesi, la letteratura sulla governance della sostenibilità – dal punto di vista cronologico – ha compiuto un'evoluzione che l'ha condotta da un orientamento prevalentemente formale a uno maggiormente relazionale. Quest'ultimo supera la visione centrata esclusivamente sulla singola impresa e valorizza la dimensione interattiva delle relazioni tra l'impresa stessa e gli altri attori (ad es. Albareda e Waddock, 2018; Belhadi et al., 2021). In questa prospettiva, le imprese si confrontano con attori pubblici e civili attraverso pratiche di dialogo, cooperazione e processi decisionali condivisi (Scherer e Palazzo, 2011). Tuttavia, tali approcci coesistono con altri modelli che si fondano su logiche gerarchiche o di controllo di mercato. Ne consegue l'esistenza di una pluralità di meccanismi, formali e informali, che rendono complesso il ruolo della governance nella sostenibilità e richiedono un'analisi più approfondita dei diversi strumenti.

3.2. Accountability e sostenibilità: logiche di rendicontazione e di costruzione

Storicamente, la nozione di accountability si fonda sull'idea che alle imprese è richiesto di "rendere conto" ai propri stakeholder – principalmente finanziari, quali investitori e autorità di vigilanza – del modo in cui il valore economico è creato e distribuito (es. Nelson, 1993). Nel tempo, tuttavia, il concetto si è esteso oltre questi confini, riflettendo una crescente consapevolezza del fatto che le imprese sono inserite in sistemi sociali e ambientali più ampi (Roberts, 1991; Shearer, 2002). L'opera pionieristica di Gray et al. (1988) aveva già sottolineato

la necessità di concepire l'accountability come una relazione sociale tra imprese e società, mediando aspettative, valori e impatti attraverso le dimensioni economica, sociale e ambientale.

L'emergere delle preoccupazioni per la sostenibilità e il lancio dell'agenda globale per lo sviluppo sostenibile hanno ulteriormente accelerato questo cambiamento. L'impatto più visibile si è manifestato nell'ambito del corporate reporting. Alle imprese è ora richiesto di dimostrare in che modo creano valore sostenibile e la reportistica finanziaria tradizionale presenta, sotto questo profilo, dei limiti (Unerman et al., 2018). Tale aspettativa ha favorito lo sviluppo di nuovi strumenti di rendicontazione, tra cui il Integrated Reporting, progettato per rafforzare la responsabilità delle imprese riguardo alla varietà di risorse impiegate e per promuovere un pensiero integrato orientato alla creazione di valore sostenibile per gli stakeholder (Busco et al., 2013). Pur oggetto di critiche (es. Brown e Dillard, 2014), iniziative come il reporting integrato incarnano i tentativi in corso di ridefinire il significato e la pratica dell'accountability in linea con una concezione dell'impresa orientata agli stakeholder.

Parallelamente, si sta affermando la consapevolezza che questa concezione allargata di accountability richieda di riconsiderare anche meccanismi interni di governo, misurazione e controllo. Le logiche di accountability devono essere interiorizzate da tutti i dipendenti, i quali dovrebbero sviluppare un senso collettivo di responsabilità per i risultati d'impresa (Busco et al., 2005). In questo modo, forme di accountability interna possono supportare la costruzione di "conti di sostenibilità" che rispondono alle richieste di accountability esterna (Frostenson e Johnstone, 2023). In tale prospettiva, inoltre, è dai processi interni che portano alla costruzione di reportistica per gli stakeholder che dipende il grado di reale integrazione della sostenibilità nei processi decisionali (Adams e McNicholas, 2007) e di dialogo tra "preparatori" e "utilizzatori" (Lai et al., 2018).

Nonostante tali sviluppi, rimangono dubbi circa la capacità degli strumenti attuali di rendere conto della complessità delle interrelazioni che legano le imprese allo sviluppo sostenibile. Alcuni autori hanno proposto di muovere l'attenzione da forme di accountability "basate sull'accounting" (centrate, cioè, su disclosure e misurazione di carattere prevalentemente finanziario) verso modelli di accounting costruiti a partire da specifiche relazioni di accountability (Dillard e Vinnari, 2019). Questa evoluzione riflette un più ampio movimento verso forme dialogiche di accountability (e.g. Bebbington et al., 2007), nelle quali le imprese cercano di interagire con un insieme più ampio di portatori di interesse – tra cui dipendenti, comunità e ambiente naturale – ascoltandone le istanze e rispondendo ad esse (Rinaldi et al., 2014).

In questo contesto, diversi studiosi hanno sostenuto che l'accountability richiede, da un lato, riforme istituzionali e di governance d'impresa, poiché le pratiche di rendicontazione esistenti raramente consentono agli stakeholder di incidere sulle decisioni delle imprese (Cooper e Owen, 2007). Dall'altro, l'accountability pretende che i processi di rendicontazione di sostenibilità e di coinvolgimento degli stakeholder si trasformino in strumenti di dialogo, offrendo agli attori sociali la possibilità di esprimere le proprie prospettive (Bellucci et al., 2019). Più in generale, l'approccio dialogico mira a favorire forme di governance più inclusive (Brown e Dillard, 2015). Questa prospettiva deve manifestarsi non solo nella reportistica, ma anche nelle interazioni quotidiane alla base delle relazioni con gli stakeholder. In questo senso, l'accountability è intrinsecamente relazionale e la sua efficacia dipende dalle micro-interazioni che emergono nei processi di stakeholder engagement (Bianchi et al., 2025).

Le assunzioni tradizionali sull'accountability vengono così rimesse in discussione, sollecitando una riflessione sulla pertinenza delle lenti analitiche attraverso cui essa è stata storicamente osservata, alla luce delle nuove esigenze poste dalla sostenibilità. Ad esempio, la stessa nozione di trasparenza, frequentemente considerata il fondamento dell'accountability, è oggetto di revisione critica. La trasparenza non è più intesa come valore intrinsecamente virtuoso: da un lato, le logiche contabili tradizionali possono indurre individui e imprese a concentrarsi maggiormente su come appaiono, piuttosto che sulle reali conseguenze delle proprie azioni (Roberts, 2009); dall'altro, la trasparenza non è un costrutto stabile o oggettivo, ma una pratica

negoziata che evolve continuamente in relazione a ciò che viene considerato di interesse collettivo, in particolare rispetto a questioni di disuguaglianza sociale e sostenibilità (Quattrone, 2022). Questi dibattiti invitano a re-immaginare la contabilità in modo da includere attori non umani – come la natura (Quattrone, 2022) – e da incorporare le voci di stakeholder emarginati o "silenziosi", in risposta a imperativi sociali emergenti quali l'equità di genere, la diversità e la giustizia climatica (Agyemang, 2024). Senza tale ripensamento, l'accountability rischia di non incarnare il legame tra imprese e società che essa stessa pretende di rappresentare, e di finire, invece, per rafforzare gli squilibri di potere esistenti.

4. Risultati attesi

Come già enunciato, l'obiettivo principale di questo studio è la costruzione di un framework teorico-concettuale che consenta di interpretare e integrare le discipline della governance e dell'accountability nel contesto della sostenibilità d'impresa. L'assunto di fondo è che la governance può svolgere un ruolo cruciale nel migliorare l'accountability delle imprese, garantendo un uso efficace delle risorse d'impresa e promuovendo il raggiungimento degli obiettivi di sostenibilità (Aguilera e Ruiz Castillo, 2025). La governance non può essere ridotta a una scelta binaria tra controllo formale e coordinamento relazionale. Il perseguimento della sostenibilità richiede di ripensare la stessa nozione di azione di governo e i meccanismi organizzativi che la sostengono – come il controllo, la misurazione della performance, la gestione del rischio e la governance della conoscenza (Busco et al., 2005). Da questa prospettiva, l'accountability diventa una lente analitica fondamentale per andare oltre la mera istituzione di meccanismi formali e relazioni, concentrandosi invece su come essi operano, sono monitorati e generano risultati di sostenibilità, rendendo visibili le dinamiche di "costruzione", assunzione di responsabilità e risposta alle istanze degli stakeholder – anche quelli più "silenti" – che determinano l'effettiva qualità delle pratiche adottate.

Attraverso la revisione e la ricomposizione critica delle due aree di ricerca, il lavoro si propone di delineare le dimensioni fondamentali che caratterizzano la governance e l'accountability, in particolare le dimensioni formale e relazionale della governance e le dimensioni di rendicontazione stakeholder-oriented e costruzione interna dell'accountability, alla luce degli obiettivi di sostenibilità. L'integrazione di tali dimensioni concettuali consente di analizzare in modo più coerente come le imprese definiscono, implementano e comunicano la sostenibilità, e di comprendere i meccanismi attraverso cui la governance influenza le pratiche di sostenibilità e, viceversa, come l'accountability contribuisce a plasmare la governance sostenibile. Il risultato atteso è, quindi, un framework concettuale che non solo sistematizzi le interconnessioni tra queste due tradizioni teoriche, ma offra anche una base per costruire un'agenda di ricerca in cui emergano nuove linee di indagine empirica e teorica sul ruolo della governance e dell'accountability nel promuovere la creazione di valore sostenibile.

5. Contributi attesi

Questo lavoro intende offrire tre principali contributi alla letteratura sulla sostenibilità d'impresa. In primo luogo, lo studio ambisce a integrare due tradizioni disciplinari di ricerca sviluppatesi in modo parallelo – quella della governance e quella dell'accountability – per interpretare un fenomeno comune: la sostenibilità. Tale integrazione consente di superare la frammentazione disciplinare che ha a lungo caratterizzato gli studi esistenti, offrendo un quadro concettuale unitario capace di cogliere le interdipendenze tra strutture di governo, processi di responsabilizzazione e obiettivi di sviluppo sostenibile.

In secondo luogo, il lavoro propone un quadro concettuale che identifica le principali dimensioni della governance (formale e relazionale) e dell'accountability (rendicontazione stakeholder-oriented e meccanismi interni di costruzione) al fine di analizzare i punti di contatto e di reciproca influenza. In questo modo, fornisce una struttura analitica utile per organizzare e interpretare i contributi prodotti finora dalla letteratura, oltre che per guidare nuove indagini empiriche.

Infine, il terzo contributo riguarda l'avanzamento della ricerca futura. Partendo dal quadro concettuale proposto, lo studio intende individuare le aree della letteratura ancora poco esplorate o teoricamente deboli, delineando così possibili direzioni di sviluppo. In particolare, sottolinea la necessità di approfondire le modalità attraverso cui i meccanismi di governance e le pratiche di accountability si co-evolvono, si rafforzano o entrano in tensione nel processo di attuazione della sostenibilità.

Parole chiave: Sostenibilità; governance; accountability

Architetture di Governance per la Sostenibilità: Il ruolo del CEO e dei meccanismi organizzativi

Vincenzo Riso[1], Ernest Paapa Kwaku Kyereh[2], Silvia Cantele[3]

1. Introduzione

Nel dibattito contemporaneo sulla sostenibilità d'impresa emerge con crescente intensità la necessità di ripensare la funzione della governance aziendale. Le aspettative normative, la crescente attenzione degli investitori, la pressione degli stakeholder e l'evoluzione dei modelli competitivi hanno reso evidente che la sostenibilità non può più essere trattata come un'estensione volontaria delle attività di responsabilità sociale, né come un mero adempimento formale: occuparsi di sostenibilità implica una ridefinizione coerente dei processi decisionali, delle strutture organizzative e dei meccanismi che orientano la strategia (Klettner et al., 2014; Zhu et al., 2025).

La governance è chiamata quindi a svolgere un ruolo diverso rispetto al passato, non limitandosi alla trasparenza o al controllo dei rischi ma richiedendo una capacità di integrare la sostenibilità nella definizione degli obiettivi strategici, nella distribuzione delle responsabilità e nella costruzione di modelli organizzativi coerenti. Si osserva una transizione da modelli di governance of sustainability, focalizzati sulla rendicontazione e sulla gestione dei rischi ESG, verso modelli di governance for sustainability che assumono la sostenibilità come capacità strategica fondamentale e dimensione costitutiva dell'identità aziendale (Lu et al., 2025; Tron et al., 2025).

Nonostante questo sviluppo concettuale, la letteratura mostra ancora limiti rilevanti. Le ricerche sul ruolo del board e quelle sui ruoli manageriali dedicati alla sostenibilità evolvono spesso separatamente, senza una piena comprensione di come diversi meccanismi operino congiuntamente per favorire l'istituzionalizzazione della sostenibilità nei processi decisionali (Coffie et al., 2018; Ebele et al., 2023). Inoltre, il ruolo del CEO è stato frequentemente analizzato attraverso indicatori indiretti – come la dualità o la partecipazione proprietaria – che non riflettono il mandato formale attribuito al CEO in materia di sostenibilità. Si tratta di un punto critico, poiché l'effettiva capacità del CEO di orientare la strategia dipende dalla legittimazione formale della sua autorità, non solo dalla sua posizione strutturale.

Partendo da queste riflessioni, il presente contributo si propone di rispondere alla seguente domanda di ricerca: In che misura la formalizzazione dei ruoli aziendali dedicati alla sostenibilità, come comitati, responsabili e delega al CEO, influenza il livello di implementazione della sostenibilità della governance nelle imprese?

Per rispondere, l'analisi si concentra su tre elementi: la presenza di un comitato per la sostenibilità a livello di consiglio di amministrazione, l'esistenza di un responsabile della sostenibilità o team dedicato e la delega formale al CEO. L'obiettivo è comprendere come questi strumenti influenzino la Governance Sustainability, concetto che identifica la misura in cui la sostenibilità è incorporata nella struttura di governo dell'impresa (Cantele et al., 2024).

2. Governance sustainability e stewardship theory

La letteratura ha tradizionalmente analizzato la governance come antecedente della performance ESG, indagando se attributi del board, quali diversità di genere (Bear et al., 2010; Yahya, 2025), indipendenza (Hossain & Reaz, 2007; Khan et al., 2013), proprietà del CEO (Ben Fatma & Chouaibi, 2021) o dualità (Rechner & Dalton, 1991; Biswas et al., 2022), influenzino la qualità della disclosure o la performance sociale e ambientale. Sebbene tali variabili abbiano mostrato associazioni rilevanti, esse non colgono pienamente il modo in cui le imprese incorporano la sostenibilità nei loro processi interni.

Per avanzare nella comprensione del fenomeno è necessario assumere una prospettiva diversa: la governance non è solo un antecedente della sostenibilità, ma una sua dimensione costitutiva. In questa cornice, la Governance Sustainability (GS) rappresenta l'insieme di pratiche, procedure, ruoli e meccanismi che integrano etica, strategia sostenibile e trasparenza nei processi decisionali apicali (Cantele et al., 2024). In questa concezione, la GS comprende tre dimensioni: pratiche operative eque, formalizzazione della strategia di sostenibilità e trasparenza nella rendicontazione. Rappresenta quindi un indicatore diretto della maturità organizzativa con cui la sostenibilità è istituzionalizzata nel sistema di governo.

Per interpretare come i meccanismi analizzati contribuiscano a sviluppare tale dimensione, la lente teorica adottata è la stewardship theory. A differenza della teoria dell'agenzia, che considera i dirigenti come soggetti opportunistici da monitorare (Jensen & Meckling, 1976), la stewardship theory assume che i manager possano agire nell'interesse dell'organizzazione quando godono di fiducia, legittimazione e un mandato chiaro (Donaldson & Davis, 1991; Davis et al., 1997). In questa prospettiva, quindi, la capacità dei CEO, del Board o dei Managers di orientare l'impresa verso obiettivi collettivi deriva dalla combinazione di motivazione intrinseca, identificazione con lo scopo organizzativo e chiarezza dei ruoli (Hernandez, 2008; 2012).

La delega formale al CEO rappresenta un esempio emblematico di questa prospettiva: non è meramente un segnale di accentramento del potere ma un meccanismo che chiarisce le competenze decisionali, legittima il ruolo del CEO nella definizione delle priorità di sostenibilità e responsabilizza il vertice nel coordinare le iniziative ESG (French & Raven, 1959; Cannella et al., 2008; Duong et al., 2023).

Questa cornice consente di formulare le ipotesi analizzate:

H1. La presenza di un comitato per la sostenibilità è associata positivamente alla Governance Sustainability.

H2. L'esistenza di un responsabile o team di sostenibilità contribuisce positivamente alla Governance Sustainability.

H3. La delega formale al CEO in materia di sostenibilità è positivamente associata alla Governance Sustainability.

3. Metodologia

L'analisi empirica si fonda sui dati raccolti attraverso una survey e somministrata a un ampio campione di imprese manifatturiere italiane, che ha portato ad avere un campione di 297 imprese rispondenti. Le imprese osservate rappresentano il tessuto tipico dell'industria italiana, caratterizzato da assetti proprietari concentrati, una prevalenza di imprese familiari e una differente maturità nei percorsi legati alla sostenibilità. Il questionario è stato elaborato per intercettare diverse informazioni relative alla struttura organizzativa della governance e, quale variabile dipendente del modello, al livello di implementazione delle pratiche di sostenibilità riconducibili al costrutto di Governance proposto da Cantele et al. (2024), che misura il grado di integrazione della sostenibilità nei processi di governo aziendale, includendo pratiche operative eque, formalizzazione della strategia e trasparenza nella rendicontazione. L'indice deriva dagli

undici item individuati ed è costruito aggregando i pesi normalizzati derivati dal modello PLS-SEM originario, mantenendo la scala di rilevazione a cinque punti.

Le variabili indipendenti introducono tre meccanismi centrali del governo societario, ovvero la presenza di un comitato per la sostenibilità all'interno del Board, l'esistenza di un responsabile o team di sostenibilità e la delega formale al CEO: queste variabili rappresentano diversi modi di istituzionalizzare la sostenibilità, collocandola tanto nella sfera di controllo e supervisione del board quanto in quella esecutiva e operativa. La loro misurazione è diretta e non sovrapposta alla variabile dipendente (in scala), garantendo la possibilità di cogliere gli effetti organizzativi di tali meccanismi.

Sono stati inclusi vari controlli relativi alle caratteristiche delle imprese, tra cui la dimensione (misurata tramite il logaritmo dei ricavi), l'età, l'appartenenza a settori socialmente o ambientalmente sensibili, la natura familiare della proprietà, la quota di donne nel consiglio, la presenza di amministratori indipendenti, la dualità del CEO e la proprietà detenuta dal CEO stesso. La stima dell'impatto delle variabili esplicative è stata condotta mediante modello OLS. Le verifiche diagnostiche mostrano l'assenza di collinearità e non rilevano problemi di eteroschedasticità.

4. Risultati e discussione

Come riportato in tabella 1, i risultati mostrano una relazione positiva tra dimensione aziendale e livello di GS, segnalando che le imprese più grandi tendono ad avere strutture più mature. Le imprese familiari evidenziano una minore formalizzazione delle pratiche di governance della sostenibilità, probabilmente a causa del prevalere di logiche informali e della persistenza di assetti decisionali centrati sulla proprietà. L'appartenenza ai settori socialmente o ambientalmente sensibili mostra invece un effetto positivo, coerente con una maggiore pressione regolatoria e reputazionale.

Tabella 1. Modello di regressione OLS

Entrando nel merito delle ipotesi, tutte e tre trovano riscontro positivo. La presenza di un comitato per la sostenibilità risulta associata a un maggiore livello di implementazione delle pratiche di governance sostenibile. Sebbene la loro diffusione rimanga limitata, quando presenti tali comitati sembrano svolgere una funzione significativa nel radicare la sostenibilità nel processo deliberativo del consiglio. È un risultato che richiama quanto evidenziato da Klettner et al. (2014), secondo cui la strutturazione dei ruoli all'interno del board contribuisce a stabilizzare l'attenzione verso i temi ambientali e sociali. Un'associazione ancora più marcata emerge per la presenza di un responsabile o team di sostenibilità. Il ruolo di tali figure è centrale: queste professionalità agiscono come traduttori della strategia in processi, coordinano le attività interfunzionali e alimentano la qualità della rendicontazione, contribuendo così a costruire una sostenibilità operativa più solida (Bang & Ramachandran, 2025; Yadav & Jain, 2023). Anche la terza ipotesi è confermata: la delega formale al CEO, infatti, risulta significativamente associata alla Governance Sustainability. Questo risultato è rilevante perché offre la possibilità di andare oltre le tradizionali proxy utilizzate per misurare il potere del CEO. Nel nostro studio la delega rappresenta un atto organizzativo che conferisce al vertice esecutivo un mandato chiaro e legittimato, fondamentale per coordinare e integrare le iniziative legate alla sostenibilità (Shui et al., 2022; Duong et al., 2023). Un aspetto ulteriore che merita attenzione riguarda il modo in cui questi meccanismi possono interagire tra loro. Anche se l'analisi empirica non esplora effetti combinati o moderati, l'osservazione dei coefficienti suggerisce che la presenza congiunta di un comitato e di un responsabile dedicato potrebbe creare un sistema di rinforzo reciproco: il comitato fissa indirizzi e priorità, mentre il responsabile presidia il livello operativo, riducendo il rischio che la sostenibilità si riduca a un esercizio formale: in questo modo la delega al CEO può fungere da ponte tra i due livelli, coordinando il processo complessivo. Questa ipotesi, non testata ma suggerita dai dati, apre spazi per futuri approfondimenti, poiché permette di considerare la

governance non come un insieme di elementi isolati ma come un sistema di meccanismi che, se coerenti, generano un potenziale trasformativo maggiore della somma delle singole parti.

Un ultimo elemento di riflessione riguarda il contesto culturale delle imprese, soprattutto quelle familiari. I risultati mostrano una tendenza a formalizzare meno le strutture di sostenibilità. Tuttavia, la stewardship theory suggerisce che proprio in questi contesti, caratterizzati da forti valori identitari e visione di lungo periodo, la sostenibilità potrebbe trovare terreno fertile. La sfida, quindi, non è soltanto introdurre meccanismi formali ma accompagnarli con una definizione chiara dell'architettura organizzativa capace di connettere sostenibilità e continuità imprenditoriale, mostrando come le scelte sostenibili rafforzino la capacità dell'impresa di prosperare nel tempo.

5. Conclusioni, limiti e linee di ricerca future

La lettura di queste evidenze attraverso la *stewardship theory* consente di coglierne ulteriormente il significato. In questa prospettiva, gli attori che operano per la sostenibilità aziendale non sono mossi esclusivamente da finalità opportunistiche, come ipotizzato dalla teoria dell'agenzia (Jensen & Meckling, 1976), ma possono agire nell'interesse dell'organizzazione quando dispongono della legittimazione necessaria, di un ruolo chiaramente definito e del supporto istituzionale adeguato (Donaldson & Davis, 1991; Davis et al., 1997). La delega al CEO, ad esempio, non è soltanto un trasferimento formale di responsabilità ma un meccanismo che abilita comportamenti orientati al bene collettivo permettendogli di assumere una posizione di guida nella definizione delle priorità di sostenibilità, di mobilitare risorse e coordinare le funzioni interne in modo coerente e favorire l'allineamento tra visione strategica e dimensione operativa. Allo stesso modo, la presenza di un comitato di sostenibilità e di manager o team dedicati crea un contesto che promuove la responsabilizzazione diffusa e l'adozione di pratiche che trascendono l'adempimento formale, mostrando come la sostenibilità possa diventare parte integrante del "modo di decidere" dell'impresa.

L'insieme di tutti questi meccanismi, operando su livelli distinti del sistema di governo, contribuisce alla costruzione di una governance più attenta all'etica, alla trasparenza e alla formalizzazione di ruoli e procedure. L'impatto osservato suggerisce che la sostenibilità non si affermi spontaneamente ma richiede un'infrastruttura organizzativa chiara, in cui la supervisione del board, la professionalizzazione e la leadership esecutiva cooperano in modo complementare.

Alla luce dei risultati emersi si può affermare che la governance della sostenibilità non può essere ridotta a un antecedente della performance ESG, ma rappresenta essa stessa un risultato organizzativo, una capacità che si costruisce attraverso ruoli e meccanismi coerenti.

Sul piano teorico, i risultati offrono un contributo rilevante alla letteratura sulla sostenibilità e sulla corporate governance, sottolineando l'importanza di trattare la governance non solo come struttura di controllo ma come dimensione dinamica e costitutiva dell'integrazione della sostenibilità. La misurazione diretta della delega al CEO amplia inoltre le modalità con cui la ricerca può analizzare la leadership esecutiva, superando le limitazioni delle proxy tradizionali. Infine, la valorizzazione dei ruoli professionali dedicati arricchisce la comprensione del modo in cui le imprese traducono gli impegni strategici in pratiche organizzative.

Dal punto di vista pratico e manageriale, i risultati offrono la possibilità di fare alcune riflessioni: in primis, le pratiche organizzative analizzate non rappresentano semplici dispositivi di conformità ma leve strategiche che migliorano la capacità dell'impresa di orientare e coordinare le sue iniziative. Ad esempio, le imprese familiari, tradizionalmente più orientate a logiche informali, potrebbero trarre beneficio dall'introduzione di ruoli e comitati dedicati, che contribuirebbero ad aumentare la continuità e la trasparenza delle pratiche. Inoltre, l'adozione di strutture di governance più strutturate non solo risponde alle pressioni esterne ma aiuta a costruire un percorso di maturazione interna verso una sostenibilità più coerente.

Sicuramente la ricerca presenta alcuni limiti. Il campione analizzato, pur rappresentativo dell'industria manifatturiera italiana, non consente estensioni automatiche a contesti differenti. Inoltre, la misurazione della delega, basata su informazioni autoriferite, potrebbe essere approfondita tramite ricerche qualitative che esplorino più da vicino i processi decisionali legati alla sua attribuzione.

Tuttavia, questi aspetti aprono la strada a futuri sviluppi di ricerca: in prima battuta, potrebbe essere utile ampliare il campo di analisi a settori e contesti istituzionali differenti, per comprendere, ad esempio, come fattori quali la regolazione, la pressione degli investitori e la cultura nazionale influenzino la configurazione dei meccanismi interni. Approcci longitudinali potrebbero inoltre cogliere l'evoluzione della governance della sostenibilità nel tempo, mettendo in luce come le organizzazioni maturano nella definizione e nell'implementazione delle loro pratiche. Infine, un'attenzione maggiore potrebbe riguardare l'analisi delle interazioni tra board, CEO e responsabili di sostenibilità, per cogliere come si costruisce, si negozia e si consolida la coerenza delle decisioni nel tempo.

Evaluating corporate commitment to ESG: the potential misalignment rating-sentiment

Francesca Costanza[1], Anna Minà[2], Sergio Paternostro[3], Marco Torri[4]

1. Purpose

Nowadays ESG (environmental, social, governance) is considered an essential framework to pursue the challenge of sustainable development (Bogers et al., 2020; Nirino et al., 2021; Kotsantonis et al., 2016; Sciarelli et al., 2021). Literature acknowledges the importance of effective communication about ESG conduct ESG practices, which can be source of competitive advantage (Bhandari et al., 2022). Indeed, they have a positive impact on brand image and consumer behavior (Lee et al., 2022), attract responsible investors (Eccles and Viviers, 2011; Van Duuren et al., 2016), and improve financial and non-financial results (Friede et al., 2015; Inigo and Albareda, 2019).

The management of ESG performances requires their appropriate evaluation. The current reference point for assessing corporate ESG performance is represented by ESG ratings, consisting of synthetic judgments evaluating firms' environmental, social and governance aspects, e.g., reduction of CO2 emissions, respect for human rights, policies of social inclusion (Avetisyan and Hockerts, 2017; Clementino and Perkins, 2021). These assessments are drawn up by specialized agencies and based on information communicated by firms, in particular, contents of sustainability/CSR reports and corporate websites (Jackson et al., 2020), and from other elements collected by the agencies (company documents, data from supervisory authorities, trade associations, company inspections, interviews with management and workers, etc.), which point out the company's commitment on the ESG spheres (Crace and Gehman, 2023; Jackson et al., 2020).

Extant literature has explored the main drivers of ESG rating. For example, according to the study of Drempetic and colleagues (2020), there is a positive correlation between firm size and ESG score. Also, governance structure is able to affect ESG rating (Gillan et al., 2021); e.g., studies found that this is positively affected by board gender diversity (Endrikat et al., 2021; Disli et al., 2022), and by the existence of CSR committees (Amran et al., 2014; Cucari et al., 2018; Endrikat et al., 2021).

However, the use of ESG ratings has been widely criticized and tackled as controversial. It was pointed out the fact that rankings from different agencies may lead to different conclusions about the same firm (Edmans, 2023; Berg et al., 2022; Chatterji et al., 2016). According to Chatterji and colleagues (2016), among the reasons of such divergencies there are different theorizations about CSR, able to affect numerical evaluations. Berg et al. (2022) go as far to theorize a "rater effect", explaining the differences in the rankings from different providers with three sources of causation: a "scope divergence" (ratings are based on different sets of attributes), "measurement divergence" (use of different indicators to quantify the same attribute), and "weight

divergence" (different relative importance of attributes). In this contest, the interrelatedness of scope, measurement, and weight divergences creates difficulties in the interpretation of different ESG ratings.

Other critics to ESG ratings are ascribable to their focus on the current status (and then on past performances) rather than on the future potential (Edmans, 2023), up to the progressive promotion of an "ideology of numbers", based on a narrow vision of CSR, and resulting in a regime of normalization for the governance of socio-environmental performance (Chelli and Gendron, 2013). Nevertheless, some scholars lament that ESG rating agencies evaluate corporate practices more than the resulting impacts to the broad society (Crace and Gehman, 2023). Edmans' exhortation "We want great companies, not just companies that are great at ESG" (p. 3) particularly reflects the distortion of a mere instrumental approach to ESG.

An interesting angle to deal with ESG rating can be the literature review of Rindova and colleagues (2018), dealing with organizational rankings in general terms (not specifically considering the ESG sphere). These authors categorize extant research in light of three main deliberate functions of rankings: information intermediaries, means of surveillance and control, creators of comparative orderings.

The first function refers to rankings as information products suitable to reduce firms-stakeholders' asymmetries by favoring the public disclosure of corporate private information, or by enhancing accessibility and intelligibility of public information (Rindova et al., 2018, p. 2180). Such view is somehow questioned in consideration of its scarce utility for well-informed stakeholders (Vidaver-Cohen, 2007), backward orientation and production of low-level and normalized information (Adler and Harzing, 2009).

The rankings' function to ensure firms' surveillance and control sees ranking as disciplining tools, coercing organizations to political and economic interests (Rindova et al., 2018, p. 2175). Even such perspective leads to unintended consequences, such as the "commensuration", i.e., the exasperate need to measure qualitative aspects, and the "reactivity" (Espeland and Sauder, 2007), consisting of the tendency of companies to adapt to the requests of the ranking system in a servile and uncritical manner, even committing crimes (Mishina et al., 2010), due to both simplified cognition and unreflective decision-making (Espeland and Sauder, 2007).

Finally, the comparative orderings' perspective views rankings as representations of organizational status, i.e., the relative actual standing of a certain organization; and reputation, i.e., the organizational quality anticipating future relative performance (Clardy, 2012; Mariconda and Lurati, 2014). In reviewing the comparative orderings' literature stream, Rindova and collegues (2018) call for more research enucleating the reputational component (p. 2185), also highlighting the relevance of rankings directly generated by stakeholders (p. 2186).

In this vein, compounding ESG performance just through ESG ratings seems short-sighted, distortive, and with little usefulness in consideration of long-term value creation (Edmans, 2023). On the contrary, it appears more relevant to explore the main forces shaping the stakeholders' viewpoint about a firm implementing ESG practices. In this regard, stakeholders' perceptions mirrored within the web epitomize current times of technological development and coexistence of online and offline behaviors, the so-called "onlife" (Floridi, 2015), connoted by continuous interactions between human and non-human actors (belonging to the natural and to the machine worlds).

Considering the pitfalls of ESG ratings mentioned above, management research concerning ESG needs to account for the stakeholders' perceptions on the web ecosystem, in turn affecting offline activities and firms' reputation (Besiou et al., 2013; Illia et al., 2017). This figure can be captured by the web sentiment, which indicates the aggregation of positive and/or negative perceptions of corporate practices, resulting from individuals writing and commenting online about a certain firm (Nicolas et al., 2024; Serrano-Guerrero et al., 2015). Specifically, ESG sentiment metrics are derived through natural language processing applied to stakeholder-generated texts, such as social media and online journalistic content (Bharadwaj et al., 2022).

Accordingly, these metrics enrich ESG ratings by capturing how stakeholders interpret potential ESG-related risks and controversies concerning firms (Galletta and Mazzù, 2023).

These elements stress on the reputational features of stakeholder-generated rankings (Rindova et al., 2018), acknowledging reputation as a key asset for firms, suitable to create competitive advantage and stakeholders' trust (Nirino et al., 2021). On the one hand, the web reputation holds commonalities with the offline one (Clardy, 2012; Mariconda and Lurati, 2014); on the other hand, it follows its own rules and is connoted by specific properties: wider scale, technology-driven systematic design, continuous feedback (Dellarocas, 2006). Looking at the challenges of the web, ESG performance is mirrored by the ESG sentiment, an esteem of the web perception of corporate risk of ESG controversies, making firms subjected to negative media exposure (Xue et al., 2023). Therefore, this sentiment represents the stakeholders' "mood" on ESG conducts, both reflecting and socially constructing corporate image and reputation (Bergson, 1988) within technology-aided spaces (Goodings and Tucker, 2014).

This study is part of a broader research project situated within the growing stream of literature assessing corporate ESG commitment and the evolving debate on the accuracy, comparability, and conceptual robustness of ESG ratings, as discussed above. Responding to these concerns, the project investigates alternative or complementary evaluative mechanisms, with particular emphasis on stakeholder-generated metrics such as measures of ESG sentiment.

Specifically, our aim is twofold:

(1) to examine to what extent stakeholder-driven ESG sentiment reflects or diverges from rating-based assessments;

(2) to uncover the causal processes that may explain convergence or misalignment between the two.

2. Methodology

To address the above aims, our starting point draws on results from our prior work (Costanza et al., 2025), which examined the determinants of web-based ESG sentiment toward firms using multivariate mixed statistical modeling (Generalized Additive Mixed Model, or GAMM approach). In that study, we analyzed a panel of the top 113 global firms (from 16 countries) by market capitalization (source: companiesmarketcap.com) and found a negative relationship between firm size and profitability, and a positive relationship between board size and online ESG sentiment. The online ESG sentiment score (the dependent variable) was sourced from the ESGAnalytics® database (with data collected on July 7, 2023) and is referred to as "ESG Analytics" in our model. The dataset also included ESG rating scores provided by Refinitiv Eikon as a mere control variable. Conversely, in the present research we change our angle of observation and focus on the relationships between ESG ratings and ESG sentiment.

So far, given the preliminary stage of our current investigation, we have relied on the same panel of firms and the same ESG Analytics dataset used in our earlier study. Nonetheless, to strengthen the robustness of our analysis, we considered not one but two types of ESG ratings, provided by two leading rating agencies (Refinitiv Eikon and Sustainalytics), within the same time period of ESG sentiment data. We then conducted bivariate analyses aimed at assessing whether, and to what extent, ESG sentiment aligns with formal ESG evaluations. The results revealed a heterogeneous pattern (see Figure 1).

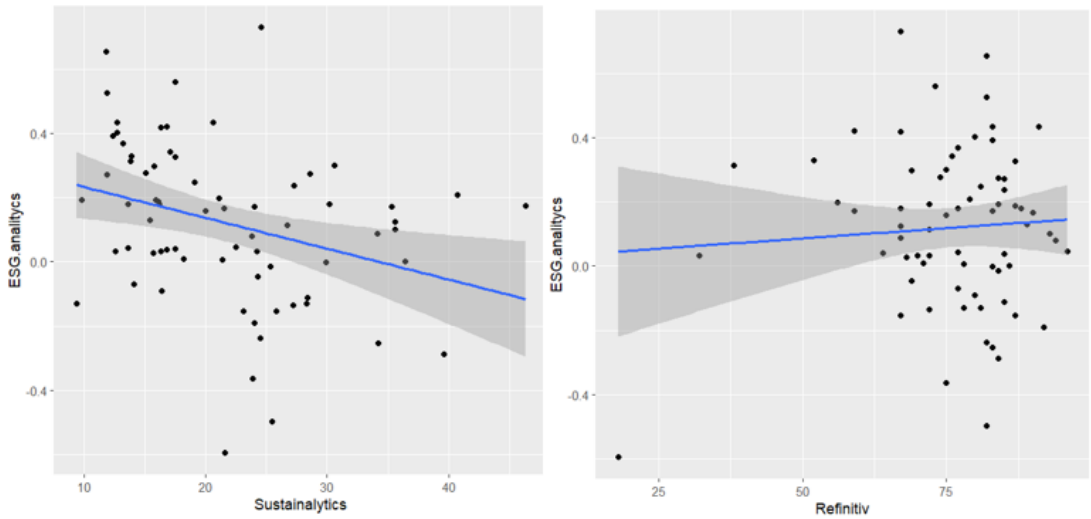

Figure 1. Bivariate relationships between ESG sentiment and two ESG ratings, source: Authors' elaboration

On the left side of Figure 1, it is possible to observe a significant correlation between the Sustainalytics ESG risk rating and ESG sentiment. Indeed, the Pearson coefficient ($r = –0.32$, $p < 0.05$) indicates a negative association, suggesting that higher levels of positive sentiment tend to be related with lower ESG risk scores. On the right side, the analysis based on Refinitiv data shows no statistically significant relationship between the ESG score and sentiment ($r = 0.07$), thus pointing to a substantial divergence between these two evaluative dimensions.

On the one hand, this result reflects methodological and conceptual differences across rating systems. On the other hand, it underscores the need for a qualitative perspective. In this direction, we propose the development of a bidimensional matrix (Figure 2) to categorize companies according to ESG rating and ESG sentiment.

The matrix intersects high/low ESG sentiment with high/low ESG ratings, thereby identifying four analytical configurations that help capture varying degrees of alignment or misalignment between institutional ratings and stakeholder-driven evaluations. It is worth to specify that in the matrix, a firm's ESG rating is classified as "low" whenever at least one of the two ratings considered (Sustainalytics or Refinitiv) places the firm in the lower performance tier. This prudential criterion reflects the heterogeneity identified in the quantitative assessment above and prevents the omission of potential risk signals emerging from a single rating provider.

3. Preliminary Results

The resulting matrix highlights four quadrants, each corresponding to a distinct company cluster, characterized by perceived coherence, hypocrisy, or ambiguity in the relationship between ESG ratings and sentiment. Specifically:

- *Perceived coherence*: This refers to companies exhibiting an alignment between ESG ratings and ESG sentiment. Such firms fall within Quadrant II (high ESG rating-high ESG sentiment) and Quadrant III (low ESG rating-low ESG sentiment).
- *Perceived hypocrisy*: This refers to companies located in Quadrant I (high ESG rating-low ESG sentiment). This cluster likely reflects situations in which ESG sentiment captures contradictions between communicated and actual ESG practices.
- *Perceived ambiguity*: This refers to companies located in Quadrant IV (low ESG rating-high ESG sentiment). This configuration may reflect cases in which ESG ratings appear insufficient to capture actual ESG performance. This misalignment may be driven by factors

related to the company (e.g., lobbying, alternative communication channels) or to stakeholders (e.g., a bottom-up appraisal based on non–company-driven elements).

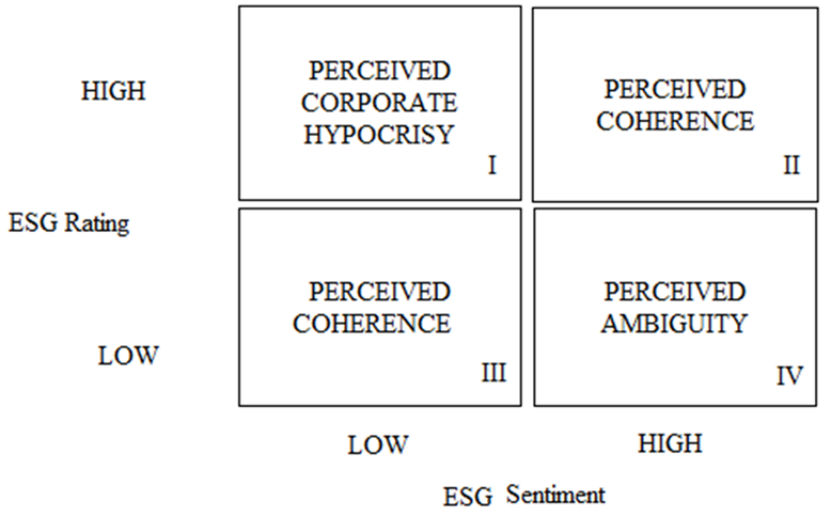

Figure 2. Analytic Matrix ESG rating-ESG sentiment, source: Authors' elaboration

Placing the firms in our panel within the analytical matrix, we identify 81 cases of alignment between ratings and sentiment: 78 falling into Quadrant II (high ESG rating-high ESG sentiment) and 3 into Quadrant III (low ESG rating-low ESG sentiment). Conversely, we observe 32 cases of misalignment between ESG ratings and sentiment. Specifically, 7 cases fall into the "ambiguity" configuration, characterized by high sentiment and low ESG ratings, and 25 cases fall into the "hypocrisy" configuration, characterized instead by high ESG ratings and low sentiment scores.

The next steps in our research involve exploring the causal mechanisms behind the observed alignments and misalignments, and identifying the conditions under which they emerge. Therefore, we will build on the matrix as a starting framework to identify representative cases for each quadrant. Then, for each selected firm, we will conduct an in-depth qualitative analysis based on company-related factors (e.g., narrative styles in ESG disclosure, presence of controversies, sectoral characteristics, communication strategies) and stakeholder-related factors (e.g., social activism, public reactions to specific events). Such investigation will include the examination of ESG reports and corporate communication materials, news and media coverage over the relevant period, the eventual presence of controversies or critical events not fully reflected in the ESG ratings, and the exploration of whether stakeholder sentiment reacts to specific triggers such as scandals, incidents, or other reputational shocks.

4. Contribution

This study is part of a wider research project that examines corporate ESG commitment by investigating alternative or complementary evaluative mechanisms to traditional ratings, with particular emphasis on stakeholder-generated metrics such as ESG sentiment.

Using a panel of global firms, we conducted a bivariate analysis to assess whether ESG sentiment aligns with formal ESG ratings. The observation of heterogeneous patterns across rating systems underscored the need for a qualitative perspective. In this direction, we proposed an original bidimensional matrix that categorizes companies according to ESG ratings and ESG sentiment, and highlights clusters of firms characterized by perceived coherence, hypocrisy, and ambiguity.

With this study, we seek to contribute to the debate on the evaluation of firms' ESG commitment, offering empirical and conceptual insights into how rating systems and stakeholder sentiment may jointly affect the credibility of corporate ESG practices. These findings could be of interest to companies, policy makers, and other stakeholders (e.g., media relations agencies).

The study could also contribute to shedding light on the key dynamics of ESG performance disclosure, highlighting cases of effective ESG communication, corporate hypocrisy, and corporate ambiguity. Accordingly, managers could complement traditional ESG ratings with stakeholder sentiment to identify gaps between communicated and perceived ESG practices, thereby supporting the formulation of more effective ESG communication strategies.

Keywords: ESG commitment; rating; sentiment

Psychological Ownership for Systemic Sustainability (POSS): An Integrated Theoretical Framework at the Intersection of Sustainability Management, Organizational Behaviour, and Business-Society Fields

Anna Maria Fellegara[1], Riccardo Torelli[2], Monica Veneziani[3]

1. Conceptual development

Contemporary organizations operate within an evolving landscape of stakeholder expectations and regulatory requirements for sustainable business practices. The Business Roundtable's 2019 statement, endorsed by over 180 CEOs, marked a watershed moment in corporate governance philosophy by explicitly rejecting shareholder primacy in favor of stakeholder capitalism (Harrison et al., 2020). This shift reflects broader transformations in capital markets, where Environmental, Social, and Governance (ESG) investments are projected to reach $50 trillion by 2025, driven by frameworks such as the EU's Corporate Sustainability Reporting Directive and IFRS Sustainability Standards (Shmelev & Gilardi, 2025). These developments position sustainability not as peripheral corporate social responsibility but as central to strategic management and competitive positioning. Despite this momentum toward stakeholder-centric business models, empirical evidence reveals a persistent implementation deficit. Recent studies indicate that nearly 50% of organizations identify lack of employee engagement as their primary barrier to achieving sustainability goals (World Economic Forum, 2024). This gap between strategic intent and operational reality suggests fundamental limitations in existing theoretical frameworks, particularly regarding the mechanisms through which sustainability strategies translate into employee behaviors and organizational outcomes.

While strategic management scholarship positions sustainability capabilities as potential sources of competitive advantage (Hart, 1995; Barney, 1991) and stakeholder theory advocates for multi-constituency governance (Freeman, 1984; Bridoux et al., 2021), these perspectives provide limited guidance on operationalization through employee-centered mechanisms. The resource-based view establishes that organizational resources become sources of sustained competitive advantage when they are valuable, rare, inimitable, and non-substitutable (Barney, 1991), and within this framework, sustainability capabilities have been identified as strategically significant resources (Hart, 1995). Dynamic capabilities theory extends this logic by emphasizing organizations' capacity to sense opportunities and threats, seize opportunities, and reconfigure resources to address evolving challenges (Teece et al., 1997). However, these frameworks have predominantly focused on organizational-level resources and capabilities, with limited attention to the psychological and behavioral foundations through which sustainability capabilities are enacted. Systematic reviews underscore this deficit: de Souza Barbosa et al. (2023) found that 87.75% of ESG integration studies rely exclusively on company-level database information, with

virtually no studies examining impacts from employees' perspectives. This critical gap constrains both theoretical advancement and practical implementation, suggesting that employee-level psychological processes may constitute critical yet undertheorized mechanisms through which sustainability capabilities emerge and are sustained.

This theoretical deficit is particularly evident in recent scholarship on corporate purpose, where strategic importance is increasingly recognized but implementation mechanisms remain unclear. Emerging research positions corporate purpose as a strategic driver rather than peripheral mission statement, with Malnight et al.'s (2019) empirical study identifying purpose as a fourth driver of high growth alongside revenue, industry selection, and mergers and acquisitions. Their analysis demonstrated that purpose-driven companies use organizational purpose to redefine competitive playing fields and expand into ecosystem approaches. However, Rigby et al. (2024) document widespread "purpose-washing," where companies articulate inspiring purpose statements but lack supporting organizational practices and governance structures. This disconnect reveals that while the strategic importance of purpose is increasingly recognized, mechanisms for authentic implementation—particularly how organizations translate purpose statements into everyday practices that meaningfully engage employees and shape their behavior—remain inadequately theorized. Understanding these implementation mechanisms requires attention to the psychological foundations of employee motivation and engagement.

Organizational behavior scholarship provides essential theoretical foundations for understanding these psychological mechanisms. Self-Determination Theory (SDT) identifies three fundamental psychological needs—autonomy, competence, and relatedness—that underpin intrinsic motivation and wellbeing (Deci & Ryan, 1985). Gagné and Deci's (2005) application to work settings established that autonomous motivation (intrinsic plus internalized extrinsic) predicts superior performance and wellbeing compared to controlled motivation, with recent longitudinal evidence demonstrating that organizations promoting high-quality motivation benefit all stakeholders through enhanced organizational health, customer satisfaction, and financial performance (Deci et al., 2017). Complementing SDT, Hackman and Oldham's (1976, 1980) Job Characteristics Model specifies five core job dimensions—skill variety, task identity, task significance, autonomy, and feedback—that produce critical psychological states of experienced meaningfulness, responsibility for outcomes, and knowledge of results. Spreitzer's (1995) psychological empowerment framework further demonstrates that empowered employees, experiencing meaning, competence, self-determination, and impact, exhibit reduced job strain, higher satisfaction, and better performance.

These established theories provide foundational mechanisms for understanding employee motivation and engagement. However, their application to sustainability contexts remains limited. While scholars recognize that sustainability work can provide meaningfulness and purpose, theoretical integration explaining how organizational sustainability strategies shape employee psychological states and subsequent behaviors is underdeveloped. Moreover, the role of governance structures in enabling or constraining these psychological processes has received insufficient attention. This gap is particularly significant given stakeholder theory's emphasis on participatory governance, yet the connection between governance structures and employee psychological mechanisms remains underspecified.

The question of how governance structures shape employee engagement connects directly to ongoing debates within stakeholder theory regarding authentic participation. Stakeholder theory has evolved from Freeman's (1984) original formulation to encompass multiple theoretical perspectives, yet Kujala et al.'s (2022) comprehensive review analyzing 90 articles on stakeholder engagement reveals high fragmentation with 75 different theoretical discussions. Critically, their analysis identified the "dark side" of stakeholder engagement: power asymmetries, exclusion of marginalized voices, and tokenistic participation that creates appearance of engagement without substantive influence. These findings challenge romanticized conceptions of stakeholder engagement and highlight that not all participatory practices produce genuine influence.

Authentic stakeholder engagement, Kujala et al. argue, requires not merely consultation but meaningful participation in decision-making processes that genuinely affects organizational outcomes.

This critique raises fundamental questions about operationalizing stakeholder governance. While normative arguments for stakeholder inclusion are well-established, empirical research documenting effective participatory mechanisms remains limited. Furthermore, the specific case of employees as stakeholders presents unique considerations: employees possess both formal organizational roles and stakeholder interests, creating distinctive opportunities and tensions. The conditions under which employee participation translates into authentic influence, and how such participation shapes employee attitudes and behaviors toward sustainability, represent important yet underexplored questions. These questions become particularly salient when considering the human rights dimensions of stakeholder engagement.

Recent Business & Society scholarship has emphasized human rights as a promising research direction, with implications for understanding employee stakeholder engagement. Schrempf-Stirling et al.'s (2022) analysis connects corporate human rights responsibilities to the UN Guiding Principles on Business and Human Rights (2011), which establish corporate responsibility to respect human rights through due diligence processes addressing impacts throughout value chains. The ILO's Decent Work framework complements this by emphasizing fair wages, secure employment, freedom of association, safe working conditions, and work-life balance as fundamental labor rights. These frameworks position worker wellbeing not merely as instrumental to organizational performance but as intrinsically valuable, raising questions about connections between worker wellbeing, organizational sustainability practices, and broader social outcomes.

Systematic reviews demonstrate connections between worker wellbeing and organizational sustainability. Alonso-Nuez et al. (2022) found that corporate concern for worker wellbeing facilitates organizational adaptation to contemporary challenges, with leadership practices directly affecting organizational health. However, these reviews also identify a critical gap: lack of holistic discourse connecting human resource management, labor wellbeing, and corporate social responsibility. Existing research tends to examine these dimensions in isolation rather than as integrated systems. Moreover, the preventive potential of worker wellbeing—how positive working conditions may prevent exploitation and rights violations—remains theoretically underdeveloped. Caruana et al.'s (2021) analysis of modern slavery in business contexts identifies this as a critical research frontier, noting the field's focus on reactive responses rather than proactive prevention through positive labor practices. Understanding these preventive mechanisms requires attention to how organizational environments shape worker identity and sense of responsibility.

Social Identity Theory provides crucial insights into how organizational environments shape worker identity and behavior. Developed by Tajfel and Turner in the 1970s-1980s, the theory explains how individuals derive self-concept from perceived membership in social groups. Ashforth and Mael's (1989) seminal application to organizational contexts defined organizational identification as "the perception of oneness with or belongingness to the organization," establishing that identification stems from categorization processes, group distinctiveness and prestige, salience of outgroups, and group formation factors. Recent theoretical advances emphasize that identity is dynamic and constructed through ongoing "identity work," multiple and contextually situated, both individual and collective, and shaped by organizational discourses and power relations (Brown, 2022). Ashforth et al.'s (2024) work on place identification demonstrates how physical and social workplace characteristics become incorporated into worker identity, extending traditional Social Identity Theory applications beyond abstract organizational membership to concrete workplace experiences.

For sustainability applications, the Social Identity Model of Pro-Environmental Action (SIMPEA) developed by Fritsche et al. (2018) proposes that pro-environmental behavior is

motivated when environmental threats are perceived, pro-environmental action is identity-congruent, and collective efficacy beliefs are present. Empirical research supports these connections: Shah et al. (2021) demonstrated that when employees identify with organizations engaging in corporate social responsibility, they exhibit more pro-environmental behaviors, amplified by peer advocacy. Norton et al.'s (2023) comprehensive review concludes that green organizational identity is crucial for sustained environmental behaviors, with social identity processes facilitating adoption of environmental values. Critically, their analysis found that collective organizational identity is a stronger predictor of environmental behaviors than individual environmental attitudes, suggesting the primacy of identity-based over attitude-based mechanisms.

Despite these advances, integration between Social Identity Theory and organizational sustainability research remains incomplete. While identity processes clearly influence sustainability behaviors, less is known about how organizations can intentionally shape sustainability-oriented identities through governance practices and workplace design. Furthermore, the relationship between organizational identity and other psychological constructs relevant to sustainability—particularly psychological ownership—has received limited theoretical attention. Yet psychological ownership theory suggests complementary mechanisms through which employees develop feelings of responsibility for organizational outcomes, potentially operating alongside identity processes to shape sustainability behaviors.

Psychological ownership theory offers additional insights into how employees develop feelings of responsibility toward organizational targets. Pierce, Kostova, and Dirks' (2001, 2003) foundational work defined psychological ownership as "the state in which individuals feel as though the target of ownership or a piece of that target is 'theirs.'" This feeling exists independent of legal ownership and applies to both tangible and intangible targets, developing through three routes: controlling the target, coming to know the target intimately, and investing the self in the target. Pierce and Jussila (2010) extended the theory to collective contexts, defining collective psychological ownership (CPO) as "the collectively held sense that this target is collectively 'ours.'" Critically distinct from individual psychological ownership, CPO emerges through three stages: individual psychological integration where objects become part of individuals' extended self; recognition of shared connection where individuals recognize others are also psychologically tied to the object; and interactive dynamics where verbal and nonverbal communication creates consensus transforming the construct from individual to group-level entity.

Recent theoretical advances have identified two distinct pathways from collective psychological ownership with important implications for organizational sustainability (Nijs et al., 2024). Route 1, perceived rights leading to exclusion, operates through the logic "we have the right to determine who can use what is ours," potentially producing negative intergroup outcomes including territorial conflicts. Route 2, perceived responsibilities leading to stewardship, operates through the logic "we are responsible for taking care of what is ours," producing positive prosocial behaviors including caring and responsibility for owned targets. This dual-route model suggests that while psychological ownership can channel toward exclusionary territoriality, it can alternatively channel toward stewardship of social and environmental outcomes. The critical question becomes: which organizational conditions amplify stewardship orientations while minimizing exclusionary tendencies?

Emerging research demonstrates psychological ownership's relevance for environmental stewardship specifically. Preston and Gelman (2020) found that psychological ownership is more powerful than legal ownership for environmental protection, with psychological owners showing greater willingness to protect natural areas, higher opposition to exploitation, and more hours donated to preservation. Li et al.'s (2022) conceptual development of environmental psychological ownership identifies antecedents including pro-environment investment, environmental self-efficacy, and environmental knowledge, with positive prediction of pro-environmental intentions. Wang et al. (2022) demonstrate that organizational psychological

ownership positively influences corporate green operations through social exchange mechanisms: when organizations satisfy employees' ownership motives (efficacy, identity, place), employees reciprocate with beneficial environmental behaviors including waste reduction, environmental management systems implementation, and voluntary environmental initiatives. These findings suggest that psychological ownership toward sustainability outcomes can be cultivated through intentional organizational practices.

However, critical questions remain unaddressed. First, while individual and collective psychological ownership have been separately theorized, their integration within organizational sustainability contexts is underdeveloped. Second, the organizational antecedents of collective psychological ownership toward sustainability remain unclear—specifically, which governance practices and structural arrangements facilitate development of collective ownership feelings toward sustainability outcomes. Third, the relationship between psychological ownership and organizational identity, both theoretically important for sustainability behaviors, has not been systematically integrated. Fourth, while the stewardship route of psychological ownership is theoretically promising, conditions that amplify stewardship while minimizing exclusionary tendencies require specification.

2. Theoretical gaps and research questions

The preceding literature review reveals several interconnected theoretical gaps that constrain understanding of employee-centered sustainability implementation. First, while strategic management theory recognizes sustainability capabilities as sources of competitive advantage and stakeholder theory provides normative arguments for participatory governance, these frameworks have not been integrated with psychological theories explaining how governance structures shape employee motivation and behavior. The psychological mechanisms mediating between organizational conditions and sustainability outcomes remain underspecified. Second, while Social Identity Theory and psychological ownership theory both demonstrate relevance for sustainability contexts, they have developed largely independently. Their integration could provide complementary insights: identity processes explain how employees internalize organizational values while psychological ownership explains how they develop feelings of responsibility. Yet theoretical frameworks integrating these constructs are absent. Third, research on stakeholder engagement has identified the "dark side" of tokenistic participation, yet positive models of authentic engagement remain underdeveloped. Specifically, the organizational practices that transform nominal participation into genuine influence, and how such authentic participation shapes employee psychological states and behaviors, require theoretical elaboration. Fourth, the preventive potential of worker wellbeing for avoiding exploitation and promoting positive sustainability outcomes has been noted but not systematically theorized. Existing frameworks tend toward reactive rather than proactive orientations, missing opportunities to position positive labor practices as foundational to sustainability strategies. Fifth, while corporate purpose has been identified as strategically significant, mechanisms for authentic implementation remain unclear. The gap between purpose statements and organizational realities suggests that theoretical frameworks connecting macro-level purpose to micro-level employee experiences and behaviors are needed.

These gaps converge around a central theoretical deficit: the absence of integrated frameworks explaining how organizational environments—particularly governance structures and participatory practices—shape employee psychological processes that in turn drive sustainability behaviors. Addressing this deficit requires theoretical integration across strategic management, organizational behavior, and Business & Society scholarship. This paper develops the Psychological Ownership for Systemic Sustainability (POSS) Framework to address these theoretical gaps through integration of the literatures reviewed above. The framework is guided by three overarching research questions:

RQ1: How do organizational governance structures and participatory practices shape employees' psychological ownership toward sustainability outcomes?

RQ2: Through what psychological mechanisms does collective psychological ownership toward sustainability translate into proactive socio-environmental behaviors?

RQ3: How can organizations operationalize stakeholder governance principles through employee-centered mechanisms that authentically integrate sustainability into strategic management?

By addressing these questions, the POSS Framework aims to bridge micro-level psychological-behavioural processes with macro-level sustainability outcomes, providing theoretically grounded and empirically testable propositions for authentic sustainability implementation through employee engagement.

3. Methodology

The POSS Framework was developed through an integrative theory-building approach that combines multiple streams of literature traditionally kept separate. The methodology followed an iterative process of literature review, theoretical gap identification, conceptual synthesis, and development of testable propositions.

The first phase involved a focused review of the strategic sustainability management, organizational behavior, and Business & Society literature. This review identified three principal gaps: the lack of attention to employee perspectives in sustainability research, insufficient operationalization of stakeholder governance, and limited integration between individual psychological-behavioural mechanisms and systemic organizational outcomes. The second phase integrated established theories into a coherent framework. Social Identity Theory provides the mechanism through which organizational cultures shape worker identity. Self-Determination Theory explains how organizational practices influence autonomous motivation. Collective psychological ownership theory illustrates how individual ownership feelings aggregate at the group level. Stakeholder theory provides the normative logic for participatory governance. The One Health approach offers a systemic lens for understanding interconnections among human, social, and environmental wellbeing. The third phase developed eight theoretical propositions linking worker wellbeing through psychological ownership to proactive socio-environmental behaviors and One Health outcomes. The propositions specify testable causal relationships and identify mediating mechanisms and moderating variables. Specifically, participatory governance practices moderate the relationship between wellbeing and psychological ownership, while the latter mediates the relationship between organizational conditions and sustainability behaviors. The framework also incorporates feedback loops that reinforce wellbeing. When employees experience that their sustainability behaviors have real impact, this strengthens their psychological ownership and motivation, which in turn contributes to their wellbeing through a sense of meaningfulness and self-efficacy. These positive reinforcement mechanisms distinguish the POSS Framework from linear unidirectional models.

4. First results

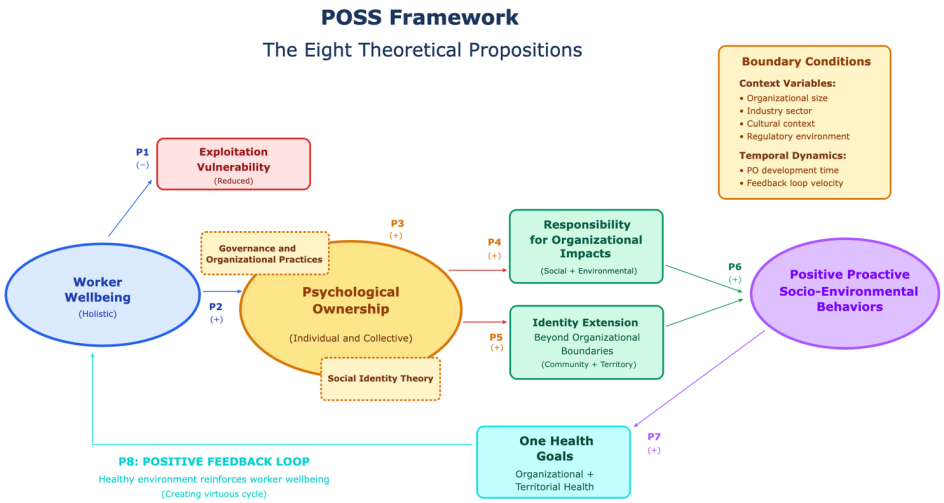

Figure 1. POSS Framework

The research led to the creation of the first draft of the POSS framework (Figure 1) and its eight founding propositions, which are listed below.

Proposition 1: Worker Wellbeing as Foundation

Worker wellbeing, encompassing physical, psychological, social, and economic dimensions, positively influences the development of collective psychological ownership toward organizational sustainability outcomes. This relationship is moderated by governance structures and organizational practices that enable worker participation. Self-determination theory establishes that wellbeing stems from satisfaction of autonomy, competence, and relatedness needs (Deci & Ryan, 1985). Workers experiencing wellbeing possess psychological resources enabling engagement with broader organizational concerns beyond immediate survival or self-protection (Conservation of Resources theory; Hobfoll, 1989). Systematic reviews demonstrate that corporate concern for worker wellbeing facilitates organizational adaptation and generates positive stakeholder impacts (Alonso-Nuez et al., 2022). However, wellbeing alone is insufficient; organizational structures must channel wellbeing into ownership. When participatory governance enables control, knowledge, and investment (the three routes to psychological ownership), wellbeing translates into felt ownership of sustainability outcomes. Wellbeing includes freedom from exploitation, forced labor, and hazardous conditions. Organizations ensuring worker wellbeing create cultures incompatible with modern slavery throughout value chains. This addresses Business & Society scholarship identifying modern slavery as critical corporate responsibility issue (Caruana et al., 2021).

Proposition 2: Social Identity Theory Mechanism

Organizational environments emphasizing sustainability distinctiveness and prestige enhance worker social identification with sustainability goals. This identification process, grounded in Social Identity Theory, mediates the relationship between organizational sustainability commitment and worker attitudes toward environmental and social responsibility. Ashforth and Mael (1989) established that organizational identification stems from distinctiveness, prestige, and group salience. When organizations authentically commit to

sustainability, positioning it as core to organizational identity rather than peripheral add-on, workers incorporate this into self-concept through social identification processes. Meta-analytic evidence demonstrates organizational identification's robust effects on attitudes and behaviors (Lee et al., 2015). For sustainability specifically, the Social Identity Model of Pro-Environmental Action (SIMPEA; Fritsche et al., 2018) shows that pro-environmental behavior increases when it is identity-congruent and collective efficacy exists. Norton et al.'s (2023) review confirms that green organizational identity is the strongest predictor of sustained environmental behaviors, surpassing individual environmental attitudes. The POSS Framework positions SIT as explaining how organizational environments shape worker identity, which then influences receptivity to developing psychological ownership of sustainability outcomes. Organizations with strong sustainability identity create contexts where sustainability ownership becomes psychologically meaningful and self-defining for workers.

Proposition 3: From Identity to Ownership

Social identification with organizational sustainability goals facilitates the development of collective psychological ownership of socio-environmental outcomes through enhanced perceived control, intimate knowledge, and self-investment in sustainability initiatives. This proposition bridges Social Identity Theory and psychological ownership theory. While SIT explains identification WITH the organization and its goals, psychological ownership represents deeper "OURS" relationship with specific targets—in this case, socio-environmental outcomes. Pierce and Jussila's (2010) three-stage emergence model explains this transition: (1) individuals develop psychological connection to sustainability outcomes; (2) they recognize others share this connection; (3) through interaction and communication, collective "OURS" emerges. Social identification provides the foundation—shared organizational identity—upon which collective ownership builds. Participatory governance practices operationalize this by providing the three routes: control through decision-making participation, knowledge through involvement in sustainability initiatives, and investment through time and energy devoted to sustainability goals. Research confirms that control, knowledge, and investment mediate relationships between organizational contexts and ownership development (Giordano et al., 2019).

Proposition 4: Ownership Generates Responsibility

Collective psychological ownership of socio-environmental outcomes activates felt responsibility for organizational impacts on stakeholders, communities, and ecosystems through the responsibility route of psychological ownership. Nijs et al.'s (2024) dual-route model establishes that psychological ownership operates through both rights-based and responsibility-based pathways. The POSS Framework hypothesizes that sustainability-focused organizational contexts amplify the responsibility route: when the target of ownership is socio-environmental outcomes (rather than territorial resources), ownership translates into stewardship rather than exclusion. Hernandez's (2012) stewardship theory defines stewardship as taking responsibility for collectively owned targets, acting in their best interest with long-term orientation toward care and maintenance. Mechanism: perceived group responsibility mediates the relationship between psychological ownership and stewardship behavior. Workers feeling "these outcomes are OURS" perceive responsibility for caring for them: "Taking care of what is 'ours' is taking care of 'ourselves.'" This proposition connects to Business & Society scholarship on corporate responsibility evolution (Carroll, 2021), showing how psychological mechanisms at the worker level can embody corporate responsibility commitments.

Proposition 5: Identity Extension to Broader Systems

Psychological ownership of organizational sustainability outcomes extends workers' identity boundaries to encompass stakeholders, communities, and ecosystems affected by organizational activities, creating expanded moral concern and relational accountability. Belk's (1988) concept of "extended self" establishes that possessions become part of self-concept. When workers develop psychological ownership of sustainability outcomes, their sense of self extends to include those outcomes and the systems they affect. Identity extension represents the psychological mechanism explaining how organization-level concerns become personally meaningful. Recent Social Identity Theory developments emphasize place identification (Ashforth et al., 2024) and identity work (Brown, 2022), showing that identities extend beyond organizational boundaries to include physical spaces, communities, and broader social systems. For sustainability specifically, environmental psychological ownership increases willingness to protect natural systems because they become psychologically integrated into self-concept (Preston & Gelman, 2020). This proposition explains how worker-level psychological processes connect to systemic outcomes: when workers' identities extend to affected stakeholders and ecosystems, they develop moral concern and relational accountability beyond narrow organizational boundaries. This bridges micro-level psychology with macro-level sustainability impacts.

Proposition 6: Proactive Behaviors

Felt responsibility for socio-environmental impacts and identity extension to broader systems motivate positive proactive socio-environmental behaviors, including organizational citizenship behaviors for the environment (OCBE), green innovation, stakeholder engagement, and advocacy for sustainability policies. Robertson and Barling's (2013) definition of OCBE as "individual behavior that is discretionary, not directly or explicitly recognized by the formal reward system, and that in the aggregate benefits the natural environment" establishes that pro-environmental behaviors can be proactive and voluntary. Integrated theoretical models combining Theory of Planned Behavior (Ajzen, 1991) and Norm Activation Model (Stern, 2000) explain up to 77% variance in pro-environmental behavioral intentions (Setiawan et al., 2020). TPB components (attitudes, subjective norms, perceived behavioral control) address self-interested motivations; NAM components (awareness of consequences, ascription of responsibility, personal norms) address pro-social motivations. The POSS Framework proposes that psychological ownership and identity extension create both motivational routes: ownership satisfies self-interested needs (efficacy, identity, place) while simultaneously activating pro-social motivations (responsibility, moral norms). Meta-analytic evidence confirms that organizational identification, green psychological climate, and perceived organizational support predict employee green behaviors (Katz et al., 2022). Psychological empowerment (meaning, competence, self-determination, impact; Spreitzer, 1995) enables proactivity. When workers feel empowered, they engage in proactive green behaviors including idea generation, promotion, and activist behavior for environmental causes (Zafar et al., 2025).

Proposition 7: One Health Outcomes

Proactive socio-environmental behaviors at the organizational level aggregate to contribute to One Health goals—the integrated optimization of human, animal, and ecosystem health—through multiple pathways including reduced environmental pollution, enhanced social wellbeing, sustainable resource management, and health-protective organizational practices. The One Health approach represents "an integrated, unifying approach that aims to sustainably balance and optimize the health of people, animals, and ecosystems" (One Health High-Level Expert Panel, 2022). It recognizes close interdependence among human, animal, and environmental health. Recent scholarship demonstrates synergies between One Health and ESG practices in organizational contexts (Oliveira & Gibbs, 2022). Organizations implementing One

Health principles show enhanced pandemic preparedness, improved antimicrobial resistance management, better food safety, more effective environmental protection, and strengthened stakeholder engagement. The POSS Framework proposes multi-level aggregation mechanisms: individual employee green behaviors aggregate to team environmental performance; team performance aggregates to organizational environmental outcomes; organizational practices influence industry standards and supply chain sustainability; sector practices contribute to policy change and societal sustainability (Zacher et al., 2023). This proposition positions organizational-level behaviors within broader systems frameworks, addressing calls for research bridging organizational and societal levels (Kaul et al., 2025).

Proposition 8: Feedback Loop to Wellbeing

Achievement of One Health outcomes and visible organizational sustainability impact creates feedback loops that reinforce worker wellbeing through experienced meaningfulness, collective efficacy, enhanced organizational identification, and satisfaction of self-determination needs, creating a virtuous cycle. Self-determination theory establishes that satisfaction of autonomy, competence, and relatedness needs enhances wellbeing (Deci & Ryan, 1985). When workers see their sustainability efforts producing real outcomes, this satisfies competence needs (efficacy), autonomy needs (self-directed action), and relatedness needs (contribution to collective goals). Research demonstrates bidirectional relationships between employee green behavior and wellbeing (Wang et al., 2021): green behavior enhances self-esteem, provides sense of meaning, aligns with personal values creating satisfaction, and enhances social identity. Positive emotions from sustainability achievement facilitate continued environmental engagement through resource gain spirals (Conservation of Resources theory).

Framework validation will occur through multiple empirical strategies. Quantitative studies can test propositions through structural equation models using multi-source survey data. Qualitative studies can explore the mechanisms through which psychological ownership emerges in specific organizational contexts. Comparative case studies can examine how different governance practices influence the development of collective psychological ownership. Longitudinal studies can trace the temporal evolution of feedback loops among wellbeing, psychological ownership, and sustainability behaviors.

Keywords: Well-being; psychological ownership; systemic sustainability

The Dynamic Balanced Scorecard for Sustainability in Emerging Sport Organizations: A Systems Thinking Case from an Italian Football Club

Giovanni Scire'[1], Giuseppe Macca[2]

1. Introduction

In recent years, sustainability has moved from a peripheral concern to a strategic mandate in sport management. The UN 2030 Agenda explicitly recognizes the potential of sport to contribute to sustainable development (United Nations, 2015), and scholars increasingly acknowledge that sport organizations generate significant economic, social and environmental impacts that must be governed rather than treated as unintended by-products of competition and entertainment. Yet empirical evidence repeatedly highlights persistent implementation barriers: limited managerial know-how, competing short-term priorities, fragmented accountability structures and a prevalence of narrative or symbolic initiatives over structured performance routines (Cury et al., 2023; McCullough et al., 2016; Schwarz et al., 2019). Sustainability is increasingly demanded, but it remains weakly embedded in the routines guiding planning, resource allocation and performance review, especially outside elite sport.

Within this broader debate, football has become a key laboratory for sustainability. UEFA and national associations have adopted long-term sustainability strategies that frame football as a lever for social and environmental change and call on clubs to align with ESG expectations (FIGC, 2023; UEFA, 2021). Case-based evidence on LaLiga's Social Fair Play programme (Fernández-Villarino, 2021) and on the management company of San Siro stadium during the COVID-19 crisis (Tettamanzi et al., 2024) shows how sustainability principles are gradually translated into governance, risk management and reporting tools, while also revealing tensions between ambitious narratives and everyday operational constraints.

A growing body of work frames sustainability in sport as a multi-dimensional construct encompassing environmental stewardship, social inclusion and economic resilience (Anagnostopoulos et al., 2014; François & Bayle, 2017; Lozano & Barreiro-Gen, 2023). Building on Lindsey's (2008) four forms of sustainability (individual, community, organisational, institutional), recent studies emphasise the need to distinguish short-lived projects from genuine capability-building. For football clubs, this implies moving from "CSR as initiatives" to sustainability as a governance problem: aligning objectives, stakeholders and management control over time. However, research documents both increasing institutional pressure (e.g. league roadmaps, ESG expectations) and persistent implementation gaps. Clubs often adopt selective initiatives while struggling to translate sustainability into targets, metrics and accountability routines(Moon et al., 2022; Nishida et al., 2024) .

Even when sustainability narratives are established, clubs frequently lack feasible performance architectures to integrate ESG goals into decision-making and management control (Agostino & Thomasson, 2025; Gallucci & Tipaldi, 2024). Existing frameworks are often calibrated for well-resourced organizations and focus on external reporting. For smaller and lower-tier clubs, reliant on limited staff, unstable revenues and volunteer work, the burden of

[1] Ricercatore, ECON-06/A, University of Palermo; giovanni.scire01@unipa.it – corresponding author

[2] Research Fellow, ECON-06/A, University of Palermo; giuseppe.macca@unipa.it

comprehensive certifications and reporting can be prohibitive, so sustainability risks remaining decoupled from planning and control, especially during transitions from amateur to professional status.

In response, both policymakers and researchers call for integrated management frameworks that bridge the gap between sustainability goals and routine operations. Stakeholder theory is particularly useful here: football clubs operate within ecosystems of passionate fans, sponsors, community groups, local authorities and leagues whose support and legitimacy are crucial (Hautbois & Desbordes, 2023). To maintain stakeholder legitimacy over time, clubs must embed sustainability into strategic planning, risk management and management control systems, not just into external communication. The challenge is one of integration and feasibility: environmental and social initiatives need to be tied to the metrics, incentives and decision cycles that actually guide behavior, while remaining manageable for organizations with limited analytical and administrative capacity.

To address this feasibility challenge, this work applies the Dynamic Balanced Scorecard for Sustainability (DBSCfS) (Bivona & Scirè, 2025) as an integrated, low-overhead performance architecture for emerging football clubs. The DBSCfS links sustainability objectives and KPIs across economic, social, environmental and stakeholder perspectives through explicit causal logic (systems thinking), enabling managers to discuss trade-offs, anticipate delayed effects and progressively align internal monitoring with external expectations (e.g., UEFA/FIGC roadmaps and ESRS/GRI logics) without reproducing their full reporting burden. Within this landscape, emerging football clubs in non-elite leagues represent a critical yet under-explored context. They are strongly embedded in their local communities and often carry explicit social missions, but operate with limited managerial capacity and face intense competitive and financial pressures. For these organizations, there is a lack of integrated, low-overhead performance systems that (i) respect their sustainability ambitions, (ii) remain realistic in terms of data and competences, and (iii) help develop the "managerial intelligences" (analytical, systemic, relational, digital) needed to govern sustainability in practice.

It is precisely this design gap, between high-level sustainability frameworks and the everyday realities of emerging clubs, that the application of the DBSCfS seeks to address. Against this backdrop, the present work-in-progress study applies the DBSCfS to an emerging, community-embedded Italian football club that has recently transitioned from amateur to professional status. By aligning governance, strategy and management accounting around sustainability objectives, the DBSCfS is conceived as an integrated, low-overhead performance architecture tailored to the constraints of non-elite clubs. Conceptually, the study contributes to the literature on sustainability and performance management in sport by proposing and field-testing a systems-thinking, stakeholder-oriented scorecard; methodologically, it illustrates a design-science intervention in an emerging club; and practically, it develops a replicable template for operationalizing sustainability in resource-constrained football organizations. Specifically, we ask how the DBSCfS can (i) mitigate mission drift during organizational transition, (ii) enable governance–strategy–management accounting alignment under resource constraints, and (iii) support the progressive implementation of UEFA/FIGC and ESRS/GRI-oriented sustainability programs at club level.

2. Conceptual framework: the Dynamic Balanced Scorecard for Sustainability in emerging football clubs

The Dynamic Balanced Scorecard for Sustainability (DBSCfS) builds on three main streams of literature: (i) sustainability and performance management in football, (ii) the Balanced Scorecard and its sustainability extensions, and (iii) the Dynamic Performance Management framework and stakeholder-oriented approaches to sustainability in sport. It leverages a systems-

thinking logic to connect strategic resources, performance drivers and sustainability outcomes through explicit cause–effect relationships.

2.1. Sustainability and performance management in football

Recent studies have examined how professional football organisations interpret and operationalise sustainability, often through corporate social responsibility (CSR) initiatives, environmental programmes and emerging ESG frameworks. Systematic and integrative reviews highlight both the breadth of club–community initiatives and persistent strategic and organisational barriers: CSR programmes are frequently driven by marketing and legitimacy concerns, implemented through foundations or community trusts, and only partially integrated into core decision-making and control routines (Nishida et al., 2024; Rith & Spinelli, 2024). Case evidence on Juventus FC further shows how CSR communication differs between sustainability reports and social media, reinforcing the idea that sustainability is often addressed at the level of disclosure rather than embedded in internal control systems (Profumo et al., 2024).

Federation- and league-level strategies build increasing institutional pressure for clubs to align with ESG expectations and formalise their sustainability governance (FIGC, 2023; UEFA, 2021). Empirical work documents how licensing regulations and institutional pressures drive the adoption of sustainability policies and environmental programmes (Adam et al., 2025; Fernández-Villarino, 2021; Kim & Jeong, 2025; Marrucci et al., 2023) and how composite indicators such as the S-Score can be used to assess financial sustainability and resilience (Evans, 2024). At the same time, research on governance and stakeholder relations emphasizes the centrality of fans, sponsors and local communities in co-producing sustainability outcomes, while also documenting heterogeneous and selective implementation (Hernández-Hernández et al., 2023; Kim & Jeong, 2025; Lozano & Barreiro-Gen, 2023; Mura et al., 2024). In the Italian context, studies on reporting practices and bibliometric mappings highlight growing attention to sustainability in football but also fragmented approaches and capability constraints, especially outside the top tier (Agostino & Thomasson, 2025; Gallucci & Tipaldi, 2024; Tettamanzi et al., 2024)Complementary work on compliance shows that even Serie A clubs' organisational models against corporate crimes (e.g. MOG 231/2001) are often opaque, suggesting that formal control systems do not automatically ensure effective governance (Aprile et al., 2025).

Overall, this literature frames sustainability in football as a strategic and governance issue rather than a set of isolated CSR campaigns. However, two gaps remain central to our study. First, most contributions focus on top-tier clubs, mega-events or league-level strategies, while emerging and lower-tier clubs, often operating with limited resources and volunteer staff, receive comparatively less attention (Agostino & Thomasson, 2025; Gallucci & Tipaldi, 2024). Second, existing studies concentrate on external CSR/ESG practices, communication and compliance, with limited attention to the internal performance architectures needed to embed sustainability into planning, budgeting and management control routines. The DBSCfS is designed to address these gaps by offering a sustainability-centric, systems-thinking scorecard tailored to an emerging, community-embedded club.

2.2. Balanced Scorecard and sustainability-oriented extensions

The DBSCfS first builds on the strategy-to-execution logic of the Balanced Scorecard (BSC), which links a concise set of objectives and indicators across multiple perspectives to the organisation's vision and long-term goals (Kaplan, 2009; Kaplan & Norton, 1992, 2007). In its original formulation, the BSC articulates performance through four perspectives—financial, customer, internal processes, and learning and growth—and uses cause–effect chains and strategy maps to align day-to-day actions with strategic priorities.

In the sustainability field, the BSC has been adapted by adding a dedicated sustainability perspective or integrating ESG goals into the traditional four perspectives (Figge et al., 2002; Hansen & Schaltegger, 2016, 2018). These architectures highlight the potential of scorecards to connect sustainability goals with resource allocation, target setting and performance review processes, making sustainability part of mainstream management control. Journeault's (2016) Integrated Scorecard (Figure 1), for instance, explicitly embeds sustainability into a multi-perspective scorecard and links strategic objectives to financial and non-financial indicators in support of corporate sustainability strategies.

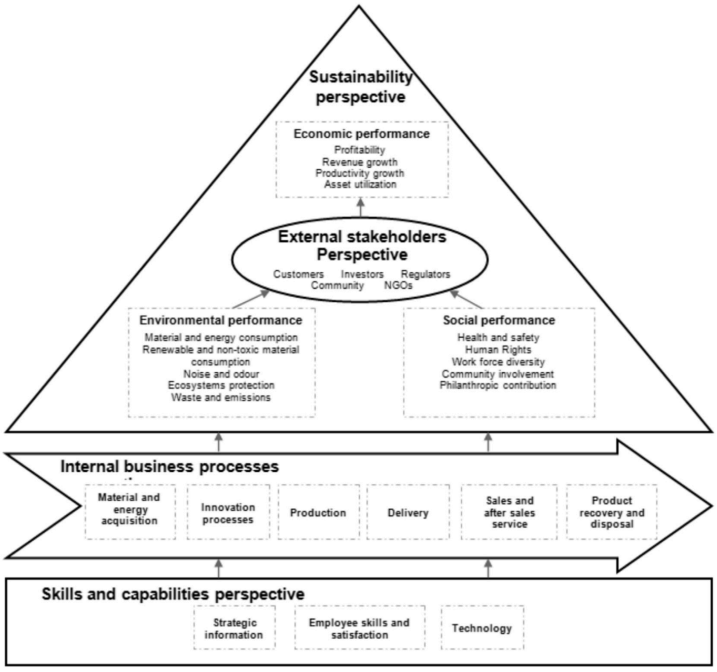

Figure 1. The Integrated Scorecard, a specific sustainability BSC. Source: Journealt (2016, p. 219)

More recent work reviews and refines SBSC architectures, stressing the need to adapt them to organisational contexts and sustainability priorities (Chehimi & Naro, 2024; Heebkhoksung et al., 2023). In sport settings, Balanced Scorecard-inspired models have been used to support strategic alignment and performance management, but typically focus on sporting, financial and customer-related outcomes, treating sustainability as just one dimension and assuming relatively high analytical and administrative capacity (Alnajjar & Suliman, 2023; Dimitropoulos et al., 2017; Lakatos et al., 2019).

The DBSCfS leverages these insights but departs from traditional SBSC approaches in two ways. First, it recenters the scorecard explicitly around sustainability by organizing objectives and indicators into three outcome perspectives—economic, social and environmental—supported by a Stakeholder perspective, rather than treating sustainability as an add-on. Second, it adapts the architecture to the constraints of emerging football clubs by enforcing parsimony (a limited number of KPIs per perspective), "data realism" (priority to data already collected in routine operations) and routine anchoring (linking review cadences to existing planning and budgeting cycles).

2.3. Dynamic Performance Management and the DBSCfS architecture

A further source of added value in the DBSCfS lies in its grounding in Dynamic Performance Management (DPM) (fig. 2), which combines system dynamics with management control to

support strategic learning in complex settings (Barnabè, 2011; Bianchi, 2016; Bianchi et al., 2015; Bianchi & Montemaggiore, 2008).

DPM emphasizes feedback structures, time delays and non-linearities, and uses causal maps and simplified simulation models to explore how policies unfold over time. In the context of sustainability, this dynamic lens helps avoid purely static dashboards by making visible how short-term decisions on, for example, ticket pricing, player recruitment, facility maintenance or community projects generate delayed consequences for revenues, fan loyalty, youth development or environmental impacts.

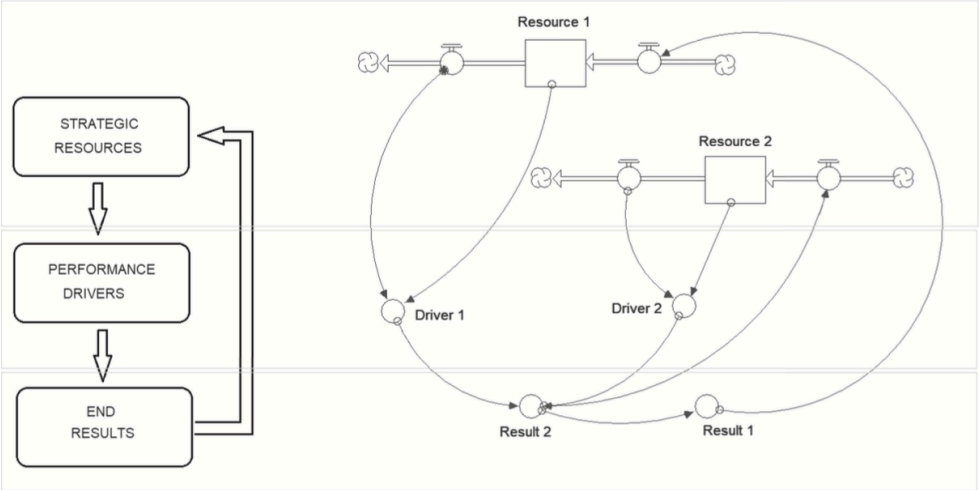

Figure 2. The Dynamic Performance Management framework. Source: Bianchi (2016, p. 73)

The DBSCfS adopts this logic by turning the scorecard into a causal architecture, where KPIs are explicitly linked through cause–effect relationships and feedback structures. By merging the dynamic perspective (Bianchi, 2016; Sterman, 2000) and the sustainability perspective (Chehimi & Naro, 2024; Figge et al., 2002; Journeault, 2016), the DBSCfS (Figure 3) also integrates a stakeholder-oriented view. Sport clubs are embedded in dense stakeholder networks that include fans, sponsors, local communities, municipalities, leagues and media (Freeman, 2010; Hautbois & Desbordes, 2023; Walker & Parent, 2010) and empirical work shows that sustainability in football is co-produced through these relationships (Anagnostopoulos et al., 2014; Kim & Jeong, 2025; Lozano & Barreiro-Gen, 2023).

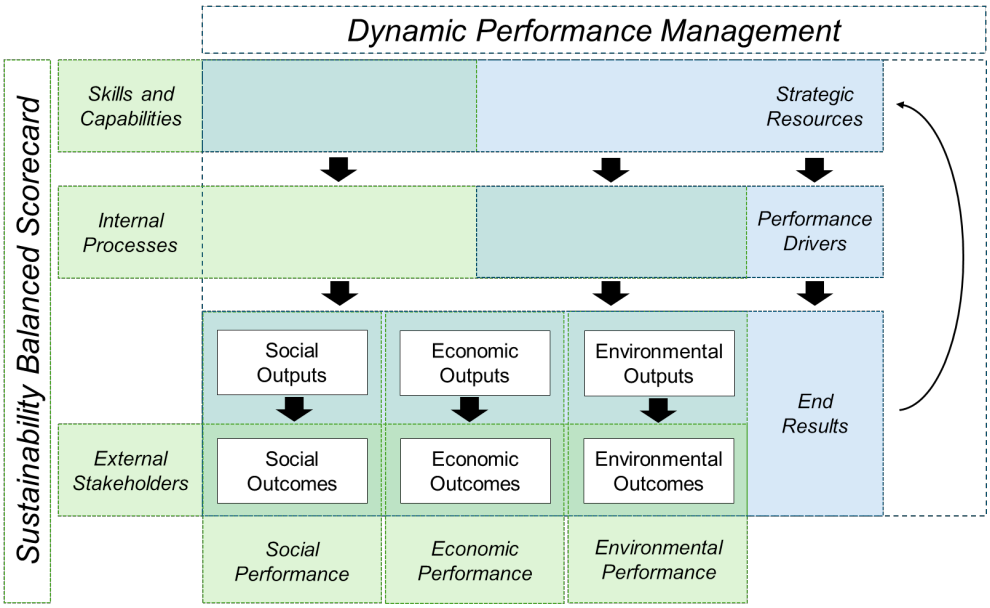

Figure 3. The Dynamic Balanced Scorecard for Sustainability. Source: Bivona & Scirè (2025)

In line with sustainability scorecard architectures and DPM logic, the DBSCfS makes stakeholder engagement explicit through a dedicated Stakeholder perspective, while treating skills/capabilities and internal processes as key enablers of sustainability performance. The DBSCfS is structured around four perspectives: (i) Economic, (ii) Social and (iii) Environmental performance outcomes, supported by (iv) a Stakeholder perspective (fans/community, sponsors and institutional partners). Within each perspective, objectives are linked to a small number of KPIs, targets, owners and review cadences, ensuring that the overall system remains low-overhead and manageable for non-elite clubs. Where possible, indicators are aligned with ESRS/GRI logics and emerging sustainability strategies in football, without reproducing their full complexity.

Available applications suggest that scorecards can support strategic alignment in football but are often calibrated for well-resourced organizations and rarely treat sustainability as the core integrative objective under resource constraints (Alnajjar & Suliman, 2023; Dimitropoulos et al., 2017; Lakatos et al., 2019). The DBSCfS responds to this gap by explicitly treating sustainability as the core integrative principle around which economic, social, environmental and stakeholder dimensions are organised, and by adapting the architecture to the realities of an emerging, community-embedded club. From a governance and learning standpoint, it is designed to cultivate four managerial intelligences—analytical, systemic, relational and digital—required to govern sustainability in emerging sport organizations. In sum, the DBSCfS is conceived as a framework-of-frameworks (Bivona & Scirè, 2025) that translates high-level sustainability principles and sport-specific evidence into a pragmatic, dynamic performance system tailored to the realities of emerging football organizations. This provides the conceptual basis for the design-science case study developed in the following sections.

3. Research design and empirical setting

This work-in-progress study adopts a qualitative, design-science single-case approach. Following design-science principles (Geerts, 2011; Hevner et al., 2004; Van Aken, 2005), we treat the Dynamic Balanced Scorecard for Sustainability (DBSCfS) as a management artifact iteratively designed and evaluated in collaboration with an emerging Italian football club. In line

with these principles, the study focuses on a relevant managerial problem (governing sustainability in an emerging club), develops and refines a solution artifact (the DBSCfS) and generates prescriptive design knowledge on how such an architecture can be implemented under resource constraints. The aim is not only to illustrate the framework, but to explore its practical feasibility through a case study (Hoeber & Shaw, 2017; Skinner et al., 2020; Yin, 2018) and its potential to activate managerial intelligence for sustainability under real-world constraints. The case is selected as a "critical" setting to stress-test feasibility, because organizational transition and resource constraints amplify risks of decoupling and mission drift. While this paper focuses on a single critical case in football, future research will extend the DBSCfS application to other emerging sport organizations (e.g., basketball/volleyball clubs and other sport organizations) to assess the robustness and transferability of the proposed architecture across sport sectors.

3.1. Empirical setting: an emerging community-embedded club

The empirical setting is Siracusa Calcio 1924 S.r.l., a community-embedded football club in Southern Italy that has recently transitioned from an amateur association to a professional limited-liability company and currently competes in Serie C, the third tier of Italian professional football. The club has alternated between professional and amateur tiers, with a recent trajectory marked by financial crisis, relegation, restart as an amateur association and a subsequent climb back through the regional leagues. This path has combined financial fragility, organizational restructuring and strong local support, as the club has remained a symbol of territorial identity and pride.

Today, the organization operates with limited managerial and financial resources but explicit ambitions to stabilize its position, consolidate its professional status and pursue sporting and organizational growth. Recently, the club has also been referred by the FIGC Federal Prosecutor to the National Federal Tribunal for administrative and financial violations related to late payment of players' wages and social-security contributions. This episode illustrates how emerging clubs, even when strongly embedded in their communities, remain exposed to governance and control weaknesses during league transitions and when facing new financial and regulatory challenges. This configuration—non-elite status, deep community embeddedness, transitional governance structure, resource constraints and recent governance tensions—makes Siracusa Calcio a particularly suitable case for stress-testing a sustainability-oriented performance architecture such as the DBSCfS.

3.2. Research phases and data collection

The research design unfolds in three main phases, combining exploratory engagement, structured inquiry and collaborative validation. Data are triangulated across (i) manager interactions, (ii) questionnaire responses and (iii) secondary sources (e.g., public financial and organizational documents and club communications).

Phase 1 – Exploratory engagement and problem validation

An unstructured exploratory meeting with club representatives from the marketing/management area was conducted to (i) understand current governance and planning routines, (ii) assess whether sustainability and community impact are perceived as strategic issues and (iii) verify interest in an integrated performance tool. This conversation confirmed both the strategic importance of community relations and long-term viability, and the absence of a structured system to monitor economic, social, environmental and stakeholder outcomes in an integrated way. On this basis, the DBSCfS was proposed as a potential guidance architecture and the club expressed willingness to engage in the subsequent phases.

Phase 2 – Questionnaire on planning, sustainability and performance monitoring

A short manager-oriented questionnaire (12 questions: nine closed, three open-ended) is administered to key decision-makers. Questions cover: (i) vision and organization of the club; (ii) performance and internal management; (iii) social commitment and territorial relations; and (iv) growth and sustainability perspectives. The questionnaire is designed to be completed in 10–12 minutes, minimizing response burden. Empirically, it provides a structured picture of planning and control practices and the implicit sustainability agenda; analytically, it offers input parameters for calibrating the DBSCfS to perceived priorities, constraints and stakeholder relationships. Closed answers will be summarized descriptively, while open answers will be analyzed through thematic coding to identify perceived priorities, constraints and expected benefits. This build–evaluate cycle is consistent with design-science research in accounting and management control, where artifacts are field-tested through case-based interventions before broader generalization (Geerts, 2011).

Phase 3 – DBSCfS instantiation and feedback session (planned)

Based on insights from Phases 1 and 2, and drawing on secondary sources (public financial data, federation documents, club communications and archival material where available), the research team will develop a first tailored version of the DBSCfS. This prototype will specify objectives, causal links and a concise set of KPIs across the four perspectives (economic, social, environmental, stakeholder), along with suggested targets, responsible roles and review cadences. The framework will be evaluated against feasibility (data availability and workload), clarity (shared understanding of objectives and links) and utility (perceived support to planning and monitoring routines).

A follow-up meeting with club managers is planned to present and discuss the prototype. The session will serve as a feedback and co-design workshop in which participants will be invited to assess the relevance and clarity of objectives and indicators, evaluate the feasibility of data collection, identify misalignments with existing routines and suggest adaptations to enhance usability. This iterative process will allow the DBSCfS to be refined into a locally grounded performance architecture, while generating qualitative evidence on how managers interpret sustainability, negotiate trade-offs and perceive the usefulness of an integrated tool. Where non-public information is used, data will be treated confidentially and reported in aggregated or anonymized form. At the current stage, Phase 1 has been completed, the questionnaire is being finalized, and the design of the DBSCfS prototype and validation workshop constitute the next steps.

4. Expected results and contributions

As this is a work-in-progress study, the empirical analysis is still underway. Nevertheless, the exploratory engagement and the design of the DBSCfS allow us to formulate some expected results and potential contributions at both theoretical and practical levels. In addition to conceptual contributions, we expect to deliver an implementable prototype (KPI set, causal map, ownership and review cadence) and to assess its feasibility with managers.

At the club level, we expect the DBSCfS to make sustainability more operationally visible and governable. By forcing the club to articulate a small set of objectives and KPIs across economic, social, environmental and stakeholder perspectives, the framework is expected to:

- clarify the trade-offs and complementarities between community-oriented initiatives, sporting ambitions and financial viability;

- reduce the current reliance on implicit knowledge and informal planning by introducing explicit targets, responsibilities and monitoring cadences;
- reveal feedback structures (e.g. how investments in youth development, facility management or fan engagement propagate over time into revenues, costs, legitimacy and risk) that are currently not systematically discussed;
- improve feasibility and accountability by linking each KPI to data sources already available at club level (e.g., administrative records, matchday operations, sponsor contracts) and to a lightweight review routine.

Initial insights from the exploratory meeting already suggest a high awareness of the club's social role and a parallel lack of structured tools for monitoring non-sporting outcomes. We therefore anticipate that the DBSCfS will act as a shared representation that helps managers from different areas (sporting, administrative, marketing, community relations) to negotiate priorities, align expectations and build a common language around sustainability. A key expected outcome is a clearer "line of sight" between initiatives, drivers, and outcomes, making sustainability discussable in regular planning and control meetings.

In relation to the three research questions, we expect that:

- regarding mission drift (RQ1), the DBSCfS will help reconnect the club's historic social mission with its current professional structure, by translating broad values (community identity, youth development, territorial embeddedness) into measurable objectives and initiatives;
- in terms of governance–strategy–management accounting alignment (RQ2), the framework will make explicit how sustainability-related choices (e.g. social programs, sponsor selection, facility upgrades) feed into the club's financial and sporting performance, and will highlight where existing accounting routines fail to capture these dynamics;
- with respect to UEFA/FIGC and ESRS/GRI alignment (RQ3), the DBSCfS will provide a lightweight platform that can host indicators and policies derived from these frameworks, without imposing their full reporting burden, thereby supporting progressive readiness for more formal assurance in the medium term. More concretely, we expect to identify a "minimum viable" subset of indicators and routines that can be progressively mapped onto external disclosure logics as capabilities mature.

From a theoretical standpoint, the study aims to contribute in at least three ways. First, it extends the emerging literature on sustainability and performance management in sport by proposing a club-level architecture that explicitly integrates sustainability into a dynamic, multi-perspective scorecard tailored to non-elite organizations. This responds to calls for tools that move beyond CSR talk and reporting towards recurring decision routines under realistic constraints. Second, it enriches the discussion on Balanced Scorecard applications in football by reframing the scorecard as a sustainability-centric, stakeholder-oriented structure, rather than a generic performance dashboard. In doing so, it bridges work on sustainability scorecards, Dynamic Performance Management and stakeholder theory within a single, football-specific framework. Third, by focusing on an emerging, community-embedded club, the study contributes to the still limited evidence on how lower-tier organizations operationalize sustainability, complementing research predominantly centered on elite clubs and major events.

Methodologically, the study illustrates how a design-science case study can be used in sport management and accounting research to co-design and test management control innovations with practitioners. The combination of exploratory interviews, a concise questionnaire and a feedback-oriented workshop is expected to yield rich insights on how club managers perceive sustainability, interpret stakeholder expectations and evaluate the usefulness of integrated performance tools. This, in turn, may inform future comparative designs involving multiple clubs or other sports. Importantly, the evaluation will focus on utility and feasibility (data availability, workload, clarity of causal links, and fit with existing routines), generating transferable design insights. In future work, we plan to replicate and adapt the DBSCfS in additional sport settings, using cross-case comparison to refine the design principles derived from the Siracusa case.

Finally, the project has practical implications for clubs and governing bodies. For clubs, the DBSCfS may serve as a replicable template to structure sustainability efforts without the immediate need for complex certifications or full-scale ESG reporting systems. For federations and leagues, the findings may inform the development of support toolkits that translate high-level strategies into actionable club-level routines, especially for organizations with limited administrative capacity. Overall, the expected contribution is to show that an appropriately calibrated Dynamic Balanced Scorecard for Sustainability can function as an enabling device for the managerial intelligence required to govern sustainability in emerging sport organizations.

Keywords: Sports governance; balanced scorecard; sustainability; systems thinking; stakeholder engagement; management control

Esplorare le dinamiche di un modello di business born-circular: evidenze da una PMI italiana

Antonio Sonetto[1], Roberta Costanzo[2], Laura Ferraro[3], Carmelo Arena[4]

1. Introduzione

L'Economia Circolare (EC) è considerata una delle leve strategiche più importanti per la transizione verso lo sviluppo sostenibile (Bourdin e Jacquet, 2025). Essa rappresenta una soluzione sistemica alle inefficienze generate dal sistema lineare, promuovendo lo sviluppo di un modello rigenerativo focalizzato sull'efficienza delle risorse, la minimizzazione dei rifiuti e i processi produttivi a ciclo chiuso (Upadhyay e Shukla, 2025). In questo contesto, le piccole e medie imprese (PMI) svolgono un ruolo cruciale (Vagnoni et al., 2025) poiché, non solo rappresentano la maggior parte delle imprese nei Paesi dell'Unione Europea (UE), ma sono anche responsabili di gran parte delle emissioni globali di gas serra (OECD, 2024). Attualmente, nel dibattito accademico è possibile identificare due tipi di imprese circolari: le cosiddette imprese "born-circular", cioè imprese che sono state intenzionalmente costruite intorno a principi circolari sin dalla loro nascita, e le cosiddette imprese "growing-circular", cioè imprese consolidate che passano da modelli di business lineari a modelli di business circolari (Zucchella e Urban, 2019).

Nonostante i potenziali benefici, il percorso verso la circolarità per le PMI è spesso caratterizzato da numerosi ostacoli (Rizos et al., 2016). Diversi studi esistenti in letteratura hanno identificato diversi fattori che possono facilitare o ostacolare l'adozione di modelli di business circolari da parte delle PMI. Tra i più importanti, si menzionano: le risorse finanziarie, il capitale tecnologico e umano, le collaborazioni con partner esterni, la pressione e le crescenti aspettative da parte degli stakeholder, le dinamiche di mercato, la cultura organizzativa, il quadro normativo in cui le imprese sono inserite e il supporto governativo (Assmann et al., 2023; Kok et al., 2013; Rizos et al., 2016). Tuttavia, la letteratura esistente si è concentrata prevalentemente su grandi aziende (Bocken et al., 2025; Lepore et al., 2025; Murali et al., 2025) o sulle PMI growing-circular, mentre il contesto delle PMI born-circular è stato ampiamente trascurato (Suchek et al., 2022). Quest'ultime spesso affrontano sfide sostanziali (Ahmadov et al., 2025; Rittershaus et al., 2023) che differiscono da quelle affrontate dalle prime (Cavallo et al., 2021) e che, per questo motivo, necessitano di una maggiore attenzione e di un maggiore approfondimento.

Partendo da questo presupposto, tale ricerca si inserisce in questo filone emergente con l'obiettivo di offrire una comprensione approfondita di come un modello di business born-circular si sviluppi, evolva e si mantenga nel tempo, identificando i fattori che ne sostengono il successo e quelli che ne ostacolano il pieno consolidamento. Pertanto, sono state formulate le seguenti domande di ricerca (RQs):

[1] Dottorando di ricerca, ECON-06/A, Università della Calabria; antonio.sonetto@unical.it – corresponding author

[2] Dottoranda di ricerca, ECON-06/A, Università della Calabria; roberta.costanzo@unical.it

[3] Assegnista di ricerca, ECON-06/A, Università della Calabria; laura.ferraro@unical.it

[4] Assegnista di ricerca, ECON-06/A, Università della Calabria; carmelo.arena@unical.it

RQ1: Come si struttura e si sviluppa il modello di business circolare di una PMI born-circular?

RQ2: Quali sono i fattori chiave che permettono il funzionamento efficace e la crescita dei modelli di business circolari nelle PMI born-circular?

RQ3: Quali ostacoli incontrano le PMI born-circular nel mantenere e consolidare il loro modello di business circolare?

Per rispondere a queste domande, questo studio analizza il caso di GATIM S.r.l., una PMI calabrese attiva nel trattamento degli pneumatici fuori uso. GATIM costituisce un esempio emblematico di impresa born-circular: nasce come modello di business circolare con l'obiettivo preciso di trasformare un rifiuto problematico, lo pneumatico a fine vita, in materiali riciclati ad alta qualità, destinati a una molteplicità di applicazioni industriali.

2. Stato dell'arte

L'attenzione accademica verso l'EC è cresciuta notevolmente negli ultimi anni. I principali contributi (vedi, ad esempio, Blomsma e Brennan, 2017; Geissdoerfer et al., 2017; Kirchherr et al., 2017) considerano l'EC come un cambiamento di paradigma verso un sistema economico rigenerativo che minimizza i rifiuti e ottimizza le risorse attraverso strategie come riutilizzo, riparazione, riproduzione e riciclo. In ambito aziendale, questo cambio di paradigma si traduce nell'adozione da parte delle imprese di modelli di business circolari che vengono adottati per sviluppare modelli di produzione e consumo sostenibile (Hofmann, 2019). A differenza dei modelli lineari, i modelli di business circolari mirano a chiudere i cicli di energia e materiali (Micheaux e Aggeri, 2016) e apportano notevoli vantaggi, tra cui: una riduzione significativa delle emissioni di gas serra, l'abbattimento dei costi operativi e la promozione di modelli di consumo basati sulla sufficienza (Hofmann e Zu Knyphausen-Aufseß, 2022; Mura et al. 2024). Tuttavia, la transizione da sistemi lineari a modelli circolari nelle PMI è influenzata da una combinazione di fattori abilitanti e ostacoli strutturali. Tra i principali driver, le risorse finanziarie rappresentano un fattore cruciale: sia i fondi pubblici (sovvenzioni, contributi, prestiti bancari e governativi), sia il capitale privato facilitano l'adozione di modelli di business circolari (Aranda-Usón et al., 2019; Jakhar et al., 2019; Pan et al., 2015; Ali e Johl, 2023; Kumar et al., 2025). Alle risorse finanziarie, si aggiungono le altre risorse interne, tangibili (tecnologie, impianti, sistemi automatizzati) e intangibili (competenze, reputazione, leadership), che supportano l'implementazione e il consolidamento dei modelli di business circolari (Chaudhuri et al., 2022; Farooque et al., 2022; Koh et al., 2017; Mangla et al., 2018; Bassi e Dias, 2019; Ozkan-Ozen et al., 2020; Chowdhury et al., 2022). Inoltre, anche l'accesso a conoscenze esterne e le reti collaborative con università, centri di ricerca e altre imprese facilitano l'apprendimento organizzativo e l'adozione di strategie circolari (Horbach, 2016; Tessitore et al., 2010). La letteratura esistente dimostra che anche i fattori di mercato e normativi spingono verso la circolarità: l'efficienza delle risorse, la riduzione dei costi e la risposta alla domanda di prodotti sostenibili rappresentano vantaggi competitivi; mentre regolamenti ambientali, politiche pubbliche e pressioni di clienti e partner incentivano l'adozione di pratiche circolari (Kuik et al., 2023; Rizos et al., 2016; Govindan e Hasanagic, 2018; Mehmood et al., 2021; Ranta et al., 2018; Ghisellini et al., 2016; Park et al., 2010; Khan e Haleem, 2021; Luthra e Mangla, 2018). Tra le principali barriere, invece, figurano limiti finanziari, conoscitivi e tecnologici, che ostacolano investimenti in nuove tecnologie, progettazione di prodotti e ristrutturazione della supply chain (Dervojeda et al., 2014; Kok et al., 2013; Rizos et al., 2016; Muller e Tunçer, 2013; Saharan et al., 2024; Takacs et al., 2022; Cantú et al., 2021). Allo stesso modo, fattori culturali, come la resistenza al cambiamento e l'avversione al rischio, riducono l'impegno verso la sostenibilità (Liu e Bai, 2014; Oreg, 2003). Inoltre, inefficienze normative e istituzionali, scarsa domanda di prodotti circolari e complessità logistiche e legali limitano l'adozione di modelli di

business circolari da parte delle PMI (Calogirou et al., 2020; Linder e Williander, 2017; Sarkis et al., 2010; Assmann et al., 2023).

Tuttavia, nonostante numerosi studi abbiano indagato i fattori interni o esterni che facilitano o ostacolano l'adozione di modelli di business circolari da parte dell'imprese, le PMI born-circular rimangono un fenomeno ancora scarsamente esplorato (Suchek et al., 2022). Queste imprese sono particolarmente interessanti perché i loro modelli di business sono progettati attorno ai principi circolari fin dall'inizio, guidati non solo dal perseguimento di obiettivi economici e finanziari, ma anche dall'impegno a implementare pratiche circolari attraverso strategie e approcci innovativi (Zucchella e Urban, 2019). Il loro status di newcomer rafforza la loro credibilità, poiché vengono percepite come parte della soluzione, piuttosto che come contributori di pratiche non sostenibili (Hockerts e Wüstenhagen, 2010). Fin dall'inizio, queste imprese sviluppano reti strette per co-creare soluzioni circolari, fungendo da orchestratori di ecosistemi circolari (Aarikka-Stenroos et al., 2021).

In tale ottica, la Stakeholder Theory (ST), l' Extended Resource-Based View (E-RBV) e la Dynamic Capabilities (DC) Theory offrono strumenti analitici utili per interpretare queste dinamiche, poiché permettono di comprendere come le imprese costruiscano relazioni di valore, accedano a risorse critiche e sviluppino capacità di adattamento necessarie per competere in contesti regolatori e tecnologici in continua evoluzione. Il presente studio applica questo framework teorico integrato per esaminare il caso di GATIM, contribuendo così a colmare un vuoto nella letteratura attraverso un'analisi empirica dettagliata.

3. Metodologia

Per perseguire l'obiettivo della ricerca, il presente lavoro adotta una metodologia di ricerca qualitativa, basata su un caso studio singolo. Il caso studio singolo è ritenuto particolarmente adatto per identificare e analizzare le relazioni tra variabili all'interno di processi complessi, indagando contemporaneamente l'influenza del contesto sociale (Shah e Corley, 2006). Tra le numerose tipologie di caso studio, si è scelto di optare per un approccio descrittivo-esplorativo per analizzare le peculiarità di una PMI circolare e le opportunità e gli ostacoli che incontra nelle sue operazioni (Yin, 1984).

La scelta dell'unità di analisi è ricaduta su GATIM, una PMI calabrese considerata un precursore dell'EC, dal momento che ha messo in pratica principi circolari ancor prima che il concetto trovasse ampia collocazione nel contesto accademico e istituzionale. Inoltre, l'azienda possiede importanti certificazioni ambientali e di qualità (tra cui: ISO 14001, ISO 9001 e IEA), che testimoniano l'impegno concreto nella gestione sostenibile dei processi produttivi. Infine, operando in Calabria, una delle regioni più povere del Mezzogiorno (Eurostat, 2024), ed essendo l'unica impresa locale specializzata nel trattamento degli pneumatici fuori uso e nel riutilizzo della gomma riciclata, GATIM rappresenta un contesto ideale per analizzare i fattori abilitanti e le potenziali barriere all'adozione di pratiche circolari, considerando le specificità territoriali, socio-economiche e istituzionali.

La raccolta dei dati si è articolata in diverse fasi. In primo luogo, sono state condotte interviste semi-strutturate con il CEO, due manager e quattro dipendenti, con l'obiettivo di ricostruire la storia dell'impresa, comprendere il suo modello di business ed esplorare i fattori abilitanti e gli ostacoli che l'impresa incontra nell'implementazione di pratiche circolari. Le interviste sono state condotte separatamente, in italiano, registrate e, successivamente, trascritte e analizzate utilizzando un approccio di codificazione tematica, che ha garantito la validità della ricerca aderendo al rigore metodologico (Kvale, 1995). Per garantire la triangolazione dei dati, le interviste sono state poi integrate con documenti ufficiali disponibili sul sito web dell'azienda e con dati finanziari, ricavati dal database AIDA e dai bilanci aziendali, che hanno permesso di comprendere la solidità economica dell'impresa e la capacità di finanziare progetti di innovazione.

4. Risultati e discussione

I risultati di questo studio mostrano che GATIM rappresenta un esempio significativo di impresa born-circular, in cui sostenibilità e performance economica sono strettamente integrate. Fondata circa venticinque anni fa con l'obiettivo di gestire e trattare pneumatici fuori uso, l'impresa ha da subito adottato processi meccanici per il recupero dei materiali, evitando trattamenti chimici o termici, e producendo granulati di gomma certificati e prodotti finiti derivati dai materiali riciclati. Il modello di business si basa su due principali flussi di ricavo: da un lato, l'azienda opera come soggetto certificato nel sistema nazionale di gestione degli pneumatici fuori uso, ricevendo remunerazioni dai consorzi autorizzati per la raccolta e il trattamento di questi ultimi; dall'altro, commercializza le materie prime secondarie e i prodotti finiti, a livello nazionale e internazionale. Questo duplice approccio mostra come, per GATIM, la sostenibilità non sia solo un imperativo ambientale, ma anche un driver diretto di valore economico e competitività.

Diversi fattori interni ed esterni concorrono allo sviluppo del suo modello di business circolare.

La solidità finanziaria dell'impresa, sostenuta da una gestione prudente e dal reinvestimento dei profitti, permette di finanziare investimenti tecnologici e progetti innovativi senza dipendere eccessivamente dal credito esterno, anche se la complessità burocratica rimane un ostacolo da superare.

Il capitale tecnologico gioca un ruolo centrale: gli investimenti in eco-innovazioni e tecnologie avanzate consentono di trattare gli pneumatici fuori uso con elevata precisione, riducendo scarti e contaminazioni, migliorando l'efficienza dei processi e creando opportunità di mercato innovative. In questo modo, la tecnologia diventa una leva strategica non solo per la qualità dei prodotti, ma anche per la competitività complessiva dell'impresa.

Il capitale umano e la cultura organizzativa si rivelano altrettanto cruciali. La leadership del CEO e del top management, profondamente orientata alla sostenibilità, guida le decisioni strategiche e promuove l'adozione di eco-innovazioni, mentre le competenze operative degli operatori rappresentano un know-how insostituibile per la gestione dei processi. L'investimento nella formazione, nella sicurezza e nel benessere dei dipendenti consolida una cultura condivisa della circolarità, che permea ogni fase della produzione e facilita l'innovazione continua.

Anche le collaborazioni esterne si confermano fondamentali per favorire eco-innovazioni e pratiche circolari. GATIM collabora con consorzi, associazioni di settore, fornitori e università, come dimostrato dalla partnership con l'Università di Granada per lo sviluppo di un calcestruzzo autoriparante. Tuttavia, la scarsità all'interno del territorio di reti consolidate di Open Innovation e di infrastrutture di ricerca e sviluppo (R&S), limita la possibilità di sviluppare eco-innovazioni congiunte, sottolineando l'importanza di ecosistemi dell'innovazione ben strutturati per supportare le PMI circolari. In tali ecosistemi emerge, inoltre, il contributo potenziale degli intermediari dell'innovazione, come gli incubatori di impresa, che collegano i "searchers" (organizzazioni che affrontano una sfida di open innovation) con i "solvers" (individui o entità in grado di fornire soluzioni), nel facilitare il co-sviluppo di eco-innovazioni circolari.

Il contesto istituzionale e regolamentare rappresenta al contempo un vincolo e un'opportunità. Le certificazioni ottenute dall'impresa (ISO 14001, ISO 9001, IEA e Remade in Italy) confermano la capacità di adattarsi alle normative e di trasformarle in vantaggi competitivi, mentre la complessità dei regolamenti e i continui cambiamenti richiedono continui investimenti in certificazioni e strumenti tecnici. I fondi pubblici e gli incentivi regionali rappresentano strumenti strategici per l'innovazione, ma le procedure complesse ne limitano spesso l'efficacia.

Infine, fattori sociali e culturali influenzano lo sviluppo del modello di business circolare. La percezione diffusa di minore qualità dei prodotti riciclati e la limitata consapevolezza sui benefici dell'EC tra clienti e imprenditori locali costituiscono barriere culturali rilevanti. Queste sfide richiedono strategie di educazione del mercato e sensibilizzazione per favorire una più ampia adozione della circolarità.

5. Conclusioni

I risultati di questo studio dimostrano che GATIM, in qualità di PMI born-circular, ha sviluppato un modello di business circolare capace di integrare i principi di sostenibilità ambientale con la creazione di valore economico. Tale modello emerge dall'interazione di molteplici fattori: il capitale finanziario garantisce stabilità operativa e possibilità di investimento; il capitale tecnologico assicura qualità produttiva, efficienza e performance ambientale; le collaborazioni esterne offrono conoscenze complementari e opportunità di sperimentazione. Il capitale umano e una struttura organizzativa orientata alla sostenibilità supportano l'implementazione quotidiana delle pratiche circolari, mentre fattori sociali e culturali, come lo scetticismo verso i prodotti riciclati, condizionano l'accettazione di mercato. Il sostegno governativo aumenta la capacità di innovazione, mentre il quadro normativo rappresenta allo stesso tempo sia un vincolo che un'opportunità, influenzando compliance e pianificazione strategica. Complessivamente, questo caso studio evidenzia come la circolarità, se incorporata fin dall'inizio, possa costituire un modello di business sostenibile e redditizio, capace di generare valore economico e promuovere pratiche di produzione e utilizzo delle risorse più responsabili.

Dal punto di vista teorico, lo studio contribuisce ad ampliare la comprensione delle PMI born-circular, un ambito ancora poco esplorato, identificando i fattori che ne facilitano o ostacolano lo sviluppo e distinguendo chiaramente le imprese born-circular dalle growing-circular. I risultati confermano, coerentemente con la ST, che una PMI born-circular può creare valore sociale e ambientale mantenendo solide performance economiche. In linea con l'E-RBV, invece, lo studio dimostra che il vantaggio competitivo non dipende solo dalle risorse interne, ma anche dall'integrazione strategica di risorse esterne, relazionali e ambientali. Infine, dal punto di vista della DC Theory, lo studio evidenzia l'importanza di riconfigurare costantemente le risorse per rispondere a cambiamenti normativi, variazioni di mercato e sfide ambientali, trasformandole in opportunità di creazione di valore.

Sul piano pratico, i risultati suggeriscono che i manager di una PMI born-circular dovrebbero adottare una gestione finanziaria prudente per facilitare l'accesso al credito, investire in eco-innovazioni per migliorare qualità ed efficienza dei prodotti, e sviluppare collaborazioni esterne per compensare il vincolo imposto dalla disponibilità limitata di risorse interne, facendo leva anche sull'attività svolta dagli intermediari dell'innovazione, così da ridurre i rischi legati a comportamenti opportunistici dei partner. Partendo da questi presupposti, la formazione del personale e l'integrazione delle idee dei dipendenti nei processi di innovazione sono cruciali, così come la capacità di accedere ai finanziamenti pubblici e di riconfigurare rapidamente le risorse in risposta ai cambiamenti normativi. Infine, le imprese dovrebbero promuovere iniziative pubbliche per migliorare la comprensione e l'accettazione dei prodotti circolari tra i consumatori.

Anche i policymaker possono trarre indicazioni importanti dal presente studio. In particolare, questi dovrebbero cercare di ridurre la complessità normativa, semplificare le procedure burocratiche per l'accesso al credito e ai fondi pubblici, investire in infrastrutture per la R&S e favorire ecosistemi collaborativi, ad esempio attraverso la realizzazione di incubatori o la concessione di finanziamenti per progetti di ricerca universitari. Questi suggerimenti potrebbero rilevarsi strategie importanti per favorire la transizione verso modelli di business circolari. Allo stesso modo, incentivi per la formazione dei lavoratori e campagne di sensibilizzazione sul valore dei prodotti circolari possono favorire ulteriormente la consapevolezza pubblica sui benefici delle pratiche circolari.

Il presente studio non è esente da limitazioni. Innanzitutto, prende in considerazione un unico caso, inserito in un contesto territoriale e settoriale specifico, e questo potrebbe limitare la generalizzabilità dei risultati. In secondo luogo, l'approccio qualitativo, basato su dati auto-riportati, può introdurre interpretazioni soggettive e bias di risposta. Infine, l'analisi si concentra principalmente su dinamiche aziendali e regionali, senza esplorare in profondità dimensioni

nazionali o internazionali. Queste limitazioni aprono diverse direzioni per ricerche future, come studi comparativi multi-case tra settori e regioni, analisi quantitative per testare empiricamente i fattori identificati, e indagini longitudinali per comprendere come le PMI born-circular evolvono in risposta a cambiamenti normativi, tecnologici e di mercato.

Parole chiave: Economia circolare; PMI; modelli di business circolari; caso studio

Value Logics and Collaborative Choices: How Private Firms Engage with Grand Challenges

Elena Pandini[1], Riccardo Torelli[2]

1. Introduction

In the current geopolitical landscape stronger partnerships are imperative to address global challenges. This need is emphasized by the European Investment Bank in its Global Impact Report (2025), which highlights the importance of cooperation in establishing sustainable connections for goods, people, and services. Such collaboration promotes sustainability, in fact, Grand Challenges are also partially reflected in the UN Sustainable Development Goals (SDGs) (Brammer et al., 2019). The concept of Grand Challenges (GCs) refers to global issues such as climate change, water scarcity and human rights protection. All these phenomena are characterized by distinctive elements: they are large in scale, complex, intractable, evaluative, uncertain, often consist of diverging and paradoxical interests, needs, and goals of different societal groups. Given these characteristics, GCs can plausibly be addressed only through collaborative action, asking for multi-stakeholder and multisectoral solutions (Brammer et al., 2019; Cloutier et al., 2025; Ferraro et al., 2015; George et al., 2016, 2024). Accordingly, the United Nations recognises cross-sectoral partnerships essential to address GC and particularly those linked to the SDGs (Vogel et al., 2022).

Effectively addressing GCs demands coordinated action at all levels. Public organizations today operate under pressure to optimize resource management, improve outcomes, and control costs. This creates the need for collaboration with private and nonprofit organizations, to achieve public goals (Cabral et al., 2019). The private sector is therefore considered crucial for sustainable development and plays a fundamental role in supporting public-sector efforts (OECD, 2021). Its importance is especially highlighted in SDG 17, that promotes multi-stakeholder partnership to advance the SDGs achievement (Zverev et al., 2023). Private sector actors may contribute to public value creation, sustainability and innovation not only for financial reasons, but also to pursue legitimacy or influence. Partnerships grounded in authentic commitment can generate greater value than traditional governance arrangements (Cabral et al., 2019). This suggests that moral and value-based motivations can be as significant as economic incentives in shaping collaborative responses to societal challenges, particularly within the context of Grand Challenges.

2. Relevance of the problem

Grand Challenges have become a central point of interest in organizational and management studies due to their global and multidimensional nature (Ferraro et al., 2015). Recent organizational literature defines cross-sector partnerships as a key mechanism to tackle these phenomena. Yet, the organizational difficulties they entail are not merely external contingencies but constitute an inherent part of challenges themselves (George et al., 2024).

[1] Ph.D. Candidate, ECON-06/A, Università Cattolica del Sacro Cuore; elena.pandini@unicatt.it – corresponding author

[2] Associate Professor, ECON-06/A, Università Cattolica del Sacro Cuore; riccardo.torelli2@unicatt.it

In particular, the complexity of Grand Challenges, and the persistent difficulty in effectively addressing them, arises largely from the multitude of actors involved and the interconnected ways in which they interact but also from their plural, value-laden, and deeply moral nature. Collaboration success thus requires alignment among heterogeneous actors (Cloutier et al., 2025; Ferraro et al., 2015; George et al., 2016). Consequently, despite widespread calls for cooperation, collaborative efforts often falter due to tensions stemming from diverging values, priorities, and practices among actors.

Private sector companies are increasingly called upon to engage with GCs, especially within global supply chains and they recognize that acting in isolation is ineffective (Ferraro et al., 2015). However, as Ferraro et al. (2015) observe, organizations themselves face unique internal constraints linked for instance to deep uncertainty regarding both future outcomes and the social recognition of their actions, as well as to the diverse interactions implicating potentially conflicting criteria of worth. Ultimately, the inherent complexity of the system conflicts with the short-term objectives that companies are typically expected to pursue.

This leads to new research opportunities: while literature acknowledges collaboration across sectors is a pivotal aspect of cross-sector partnerships, it offers a limited understanding of how tensions arising from divergent sectoral logics and decision-making approaches could be managed (Vogel et al., 2022). Management research has traditionally emphasized the economic aspects of collaboration, often overlooking the dimension of values and justification. However, approaches grounded solely in economic or technical considerations and assuming that actors are primarily guided by rational self-interest have shown limited effectiveness in addressing Grand Challenges (Cloutier et al., 2025; George et al., 2016). Cloutier et al. (2025) argue that research on these issues cannot be based exclusively on frameworks centred on efficiency or participation as previously suggested by Ferraro et al. (2015). Therefore, an approach that accounts for the plurality of moral perspectives and the diverse justifications that actors bring to collaborative efforts is needed. To this end, Cloutier et al. (2025) propose the Economies of Worth (EoW) framework. This perspective can be considered a suitable lens to examine which orders of worth are prioritized by actors to justify their decision- making in the context of GC.

3. Research objectives and research question

Understanding how to collaborate more effectively is crucial for addressing Grand Challenges. This recognition directly informs the research question, as prior studies have only begun to identify the organizational principles that support successful partnerships and help navigate the managerial tensions they entail (George et al., 2024).

Building on key insights emerging from the literature - namely, the growing engagement of companies in tackling Grand Challenges; the value-based difficulties inherent in cross-sector cooperation; and the recognition that existing collaborative forms (e.g. Public-Private Partnerships, Business–Nonprofit Partnership, Public-Private-People-Policy Partnerships) each entail specific trade-offs with no clear strategy guaranteed to produce effective outcomes (Brammer et al., 2019) - this study, which focuses on private firms perspective as they represent one of the key actors in tackling such challenges, seeks to answer the following research question: How do private firms evaluate different forms of collaboration in response to Grand Challenges, and which value logics or motivations influence their decisions?

More specifically, this study investigates which collaborative instruments private companies consider most appropriate for addressing large social and environmental issues, and which orders of worth are mobilized and come to dominate their collaborative decision-making.

This research offers an original contribution by examining why firms favour specific forms of collaboration. Understanding these motivations is critical, as effective cross-sector partnerships often depend on some degree of value alignment and compromise. Successful collaborations typically evolve through mutual learning and a certain degree of adaptation to the institutional

norms and practices of other sectors (Vogel et al., 2022). Similarly, Ferraro et al. (2015) emphasizes that effective collaboration relies on multivocality that is the capacity to accommodate multiple perspectives and interpretations, enabling actors with different value systems to coordinate without requiring full consensus.

4. Theoretical and methodological framework

Dominant studies on GCs have largely relied on institutional theory, emphasizing the role of norms, rules, and logics in guiding organizational behaviour toward societal concerns (Ferraro et al., 2015). The present research adopts a different theoretical lens by employing the Creating Shared Value (CSV) (Porter and Kramer, 2011) perspective and the Economies of Worth (EoW) framework (Boltanski and Thévenot, 2006). This theoretical shift is motivated by the observation that while CSV posits that firms can simultaneously generate economic value and address societal issues, assuming a win-win scenario, it tends to oversimplify complex social problems and assumes that business and social interests always align (Crane et al., 2014). The EoW framework offers a more nuanced and pluralistic perspective helping to understand how actors justify their actions based on different value orders, and how compromises or conflicts emerge when these justifications collide (Cloutier et al., 2025). This combination allows to understand the interplay between economic incentives and value considerations in cross-sector collaboration. Moreover, by combining EoW and CSV frameworks, this study also moves beyond overly simplified assumptions of collaboration, like those commonly found in stakeholder theory, which tend to presume alignment failing in accounting for tensions and negotiations dynamics at play (Ferraro et al., 2015).

Methodologically, a qualitative, inductive approach is adopted with semi-structured interviews as the primary data source. This allows insights to emerge directly from the raw data rather than being constrained by predefined methodological structures (Thomas, 2006). Given the limited availability of empirical studies, semi-structured interviews will be conducted. This approach facilitates conversational flexibility and mutual engagement, enabling participants to actively shape the dialogue (Yin, 2016). A purposive sample will be drawn up by reviewing the latest sustainability reports of companies listed in the STOXX 50 index. Firms will be selected if they explicitly report engagement in at least one partnership of any kind, targeting a Grand Challenge related to their core business operations. Within each selected company, Sustainability Managers will serve as key informants, given their central role in sustainability strategy and partnership management. Where responsibilities are shared or other relevant actors are indicated, a snowball sampling technique will be applied to include additional participants (Wanner and Miljand, 2025; Yin, 2016).

Data collection is currently ongoing and is expected to include 10–15 interviews. Key aspects to be investigated include organizational motivations for engaging with specific Grand Challenges, dynamics and values underpinning partnerships, expected impacts and objectives, emerging issues in collaboration and their possible causes. The theoretical framework serves as an orienting and interpretive guide rather than a prescriptive model. In this study, conceptual themes are identified inductively from the interviews and subsequently interpreted in light of the different “Worlds of Worth” identified in the EoW framework (i.e. inspired world, domestic world, world of fame, civic world, market world, industrial world) (Cloutier et al., 2025), in order to interpret the underlying meanings and values that shape managers’ collaborative preferences when addressing GCs.

5. Scientific contributions

This study seeks to provide contributions to the literature on Grand Challenges and cross-sector collaboration, advancing both theoretical understanding and practical implications. First,

due to the uncertain and evaluative nature of Grand Challenges it is not possible to determine in advance which forms of collaboration lead to the best outcomes (Brammer et al., 2019; Ferraro et al., 2015). By investigating which tools companies prefer and the reasons behind their choices, this research offers valuable insights into real-world organizational decision-making. Interviewees are expected to reveal practical constraints such as limited time, resources, or institutional support that may hinder the implementation of certain collaborative approaches, providing actionable knowledge for managers seeking to design more feasible and effective interventions. Understanding these motivations is particularly important given the evaluative nature of Grand Challenges, where multiple, often conflicting values coexist, and where economic incentives alone are insufficient to explain organizational behaviour (Cloutier et al., 2025; George et al., 2016). These insights have direct implications for managers and policymakers, helping practitioners anticipate potential sources of tension or alignment when forming cross-sector partnerships.

Additionally, this research offers an integrated view of multiple forms of collaboration within a single comparative framework. Whereas prior research has examined different forms of collaboration in isolation (Vogel et al., 2022), the present study addresses this fragmentation offering a holistic understanding of how different mechanisms contribute to addressing Grand Challenges. Such a comprehensive perspective is valuable for practitioners seeking to select collaborative instruments in ways that maximize social and environmental impact.

Taken together, these contributions advance understanding of how private firms engage with Grand Challenges. By highlighting the interplay between preferred tools, underlying values, and organizational constraints, the study offers actionable insights for managers and policymakers seeking to design value-aligned partnerships, balancing operational efficiency and societal impact, ultimately fostering sustainable value creation across sectors.

6. Expected results

Existing literature highlights the importance of fostering trust and interaction among cross-sector partners, particularly through individuals capable of bridging institutional logics.

These actors who are open-minded and have experience in other sectors are often able to promote mutual understanding (Vogel et al., 2022). While this is certainly a valuable avenue, further progress can be made through the research itself, particularly by conducting empirical investigations to uncover how systemic factors, rather than isolated individuals, can shape effective collaborative initiatives allowing them to move beyond the dominant view that attributes collaboration success to individual visionary agents.

Interviews are expected to reveal value-based compromises to foster alignment across actors. For instance, some firms may assign value to certain forms of collaboration by referring both to operational efficiency (market world) and to the pursuit of the common good (civic world). Such cases would illustrate points of convergence between different moral logics, showing how organizations draw on multiple justifications when making complex decisions. At the same time, constraints such as limited time, resources, or support may hinder engagement in more inclusive collaboration forms. These examples would offer valuable insights into how tensions between values, goals, and organizational constraints influence choices around engagement. More broadly, many firms are likely finding themselves negotiating between conflicting imperatives, such as the aspiration to do good and contribute to social progress versus the pressure to deliver short-term performance results.

These findings aim to contribute to the development of an analytical framework that can be extended to other actors including public institutions and NGOs. By adopting an integrative and comparative perspective this approach would enhance a deeper understanding of what is perceived as relevant, irrelevant, or desirable yet constrained by organizational barriers. These

insights can improve mutual understanding among stakeholders and ultimately foster more effective, value-aligned, and sustainable forms of collaboration in addressing Grand Challenges.

Assurance ESG e costo del debito: evidenze empiriche sulla credibilità dell'informativa di sostenibilità

Beniamino Sacco[1], Francesca Cappellieri[2], Antonio Ricciardi[3]

1. Obiettivi e domanda di ricerca

Negli ultimi anni, la crescente rilevanza delle tematiche ambientali, sociali e di governance (ESG) ha trasformato in profondità i sistemi di rendicontazione e controllo aziendale (Hazaea et al., 2022). L'adozione della Corporate Sustainability Reporting Directive (CSRD) (Direttiva UE 2022/2464 recepita con il D.Lgs. 125/2024) ha segnato un punto di svolta nell'evoluzione della disclosure di sostenibilità, imponendo alle aziende obblighi più stringenti in termini di trasparenza, comparabilità e affidabilità delle informazioni non finanziarie. Tale normativa, che sostituisce la precedente Direttiva 2014/95/UE NFRD (recepita in Italia dal D.Lgs. 254/2016), prevede l'estensione progressiva dell'obbligo di rendicontazione e, soprattutto, l'introduzione della revisione obbligatoria dell'informativa di sostenibilità da parte di un soggetto indipendente, dando origine alla nuova figura professionale del revisore della sostenibilità.

In questo quadro regolatorio, l'assurance dei bilanci di sostenibilità assume un ruolo strategico non soltanto come presidio di conformità, ma anche come strumento di legittimazione esterna verso gli stakeholder (Simnett et al., 2007).

Già Kolk & Perego (2010) in uno studio pionieristico su scala internazionale, hanno individuato i principali fattori che spiegano l'adozione dell'assurance dei report di sostenibilità, sottolineando come essa risponda a logiche di visibilità, pressione istituzionale e legittimazione sociale. Questo approccio anticipa la visione moderna dell'assurance come strumento di riduzione del rischio reputazionale, oltre che come segnale di responsabilità e trasparenza verso il mercato.

L'assurance contribuisce infatti ad accrescere la credibilità e l'affidabilità delle informazioni ESG, migliorando la percezione di trasparenza da parte degli stakeholder e potenzialmente incidendo sul rischio finanziario e sul merito creditizio (Casey & Grenier, 2014). L'attenzione verso questi temi è particolarmente rilevante nei settori Energy & Utilities, che, secondo la classificazione GICS (Global Industry Classification Standard), comprendono le imprese energetiche e quelle fornitrici di servizi pubblici essenziali, quali energia elettrica, gas e acqua. Questi settori sono caratterizzati da elevato impatto ambientale, intensità di capitale, alta visibilità pubblica e rilevanza regolatoria, fattori che amplificano l'esigenza di accountability e di assurance (Imperiale et al., 2023). All'interno di tale cornice, si propone di analizzare il legame tra il livello e la qualità dell'assurance dell'informativa di sostenibilità e il costo del debito delle imprese italiane appartenenti ai settori Energy & Utilities. L'obiettivo è comprendere se e in che misura un'assurance volontaria piuttosto che obbligatoria possa favorire una migliore valutazione ESG e un minor costo del capitale di debito, fungendo così da leva di fiducia finanziaria e da strumento di valorizzazione reputazionale verso il mercato e gli stakeholder (Dhaliwal et al., 2011). Il presente contributo intende esplorare il ruolo dell'assurance dell'informativa di sostenibilità come

determinante del rischio percepito e del merito creditizio aziendale e in particolare, nel settore Energy & Utilities. Lo studio si concentra sugli effetti finanziari, indagando la relazione tra l'assurance ed il costo del debito nel contesto istituzionale italiano.

Questo obiettivo si declina nelle presenti domande:

- RQ1. L'attività di assurance sul bilancio di sostenibilità contribuisce alla riduzione del costo del debito per le imprese?
- RQ2. L'assurance volontaria sul bilancio di sostenibilità è associata a una diminuzione del costo del debito più marcata rispetto all'assurance obbligatoria?

Le risposte a queste domande consentiranno di valutare se il processo di assurance possa essere interpretato come uno "strumento operativo aziendale" in grado di integrare sostenibilità, governance e strategia finanziaria.

L'analisi propone una prospettiva originale, che consente di osservare l'assurance come leva economico-finanziaria, e non solo come adempimento normativo o segnale di responsabilità sociale.

Inoltre, la ricerca valorizza la recente figura del revisore della sostenibilità, destinata a diventare parte integrante dei processi di governance e delle strategie di comunicazione finanziaria. L'obiettivo è comprendere se la qualità e l'esito dell'assurance possano costituire un indicatore anticipatore della solidità finanziaria e reputazionale, con effetti tangibili sul costo del capitale e sull'accesso ai finanziamenti sostenibili.

2. Revisione della letteratura

Sebbene la rendicontazione di sostenibilità sia ormai una prassi diffusa a livello globale, essa non sempre riesce a generare un adeguato livello di fiducia pubblica, a causa di problemi di completezza, coerenza e verificabilità delle informazioni (Fatemi et al., 2018); il tema cruciale è la credibilità delle informazioni contenute nei report di sostenibilità e del ruolo dell'assurance indipendente nel rafforzare la fiducia degli stakeholder nei confronti di tali documenti (García-Sánchez et al., 2023). La crescente eterogeneità nei formati di reporting e nella qualità dei dati forniti ha infatti alimentato dubbi sulla reale affidabilità delle dichiarazioni aziendali in materia ambientale e sociale. In risposta a tale deficit di fiducia, un numero crescente di imprese ha iniziato a corredare i propri report di sostenibilità con dichiarazioni di assurance indipendenti, redatte da revisori contabili o da consulenti specialisti, con l'obiettivo di accrescere la trasparenza e la legittimazione verso gli stakeholder (Gürtürk & Hahn, 2015).

Lo studio di Hodge et al., (2009) si propone dunque di colmare questa lacuna, analizzando sperimentalmente se e in che misura la presenza di un'assurance e il tipo di provider (società di revisione contabile vs. consulente specializzato) influenzino la fiducia degli utenti e le loro percezioni di credibilità rispetto alle informazioni di sostenibilità. I risultati dello studio mostrano che la presenza di un'assurance ha un effetto significativamente positivo sulla percezione di credibilità dei report, sia in termini di dati quantitativi che di dichiarazioni qualitative. Gli utenti attribuiscono maggiore affidabilità e attendibilità alle informazioni quando queste sono accompagnate da una verifica indipendente, rispetto ai report privi di assurance. Per quanto riguarda il tipo di assurance provider, i risultati indicano un effetto marginale ma significativo: i report sono percepiti come più credibili quando l'assurance è fornita da una società di revisione contabile, specialmente se di alto profilo (Big Four). Gli autori interpretano questa interazione come un segnale che gli utenti tendono ad associare maggiore fiducia ai revisori contabili per via della loro reputazione professionale e della familiarità con le formule linguistiche tipiche delle revisioni finanziarie.

Lo studio di Simnett et al., (2007) rappresenta uno dei primi contributi nell'analisi empirica del mercato internazionale dell'assurance volontaria sui report di sostenibilità, ponendosi l'obiettivo di comprendere i fattori che determinano la decisione delle imprese di ricorrere a un soggetto indipendente per la verifica delle informazioni non finanziarie e la scelta del tipo di

assurance provider. Gli autori collocano la loro indagine nel contesto del crescente sviluppo, a partire dai primi anni Duemila, della rendicontazione di sostenibilità come risposta alla maggiore consapevolezza globale sui temi ambientali e sociali, nonché alla percezione che il reporting finanziario tradizionale non fosse più sufficiente a rappresentare in modo completo il valore e la performance aziendale. In tale scenario, la verifica indipendente delle informazioni di sostenibilità assume un ruolo cruciale nel rafforzare la credibilità e la legittimazione delle imprese nei confronti degli stakeholder. I risultati evidenziano che la propensione a richiedere assurance è significativamente più alta per le imprese di maggiori dimensioni, appartenenti a settori ad alta visibilità e impatto ambientale o sociale.

Lo studio di Kolk & Perego (2010) rappresenta uno dei primi tentativi sistematici di analizzare, in chiave comparativa internazionale, i fattori che determinano l'adozione volontaria di dichiarazioni di assurance nei report di sostenibilità. Gli autori collocano la loro ricerca nel contesto dell'espansione delle pratiche di reporting ambientale e sociale e dell'emergere di una crescente richiesta di servizi di assurance non finanziaria. I risultati empirici confermano che la probabilità di adottare una dichiarazione di assurance è più elevata nei Paesi con orientamento stakeholder (code law), dove la responsabilità sociale è parte integrante delle aspettative istituzionali, e nei Paesi con sistemi legali deboli, dove la verifica esterna svolge una funzione sostitutiva rispetto a meccanismi di governance e controllo meno sviluppati.

Questi risultati indicano che la domanda di assurance emerge non solo come risposta a vincoli regolatori o reputazionali, ma anche come riflesso del contesto socio-istituzionale in cui le imprese operano. In uno studio successivo (Perego & Kolk, 2012), si conferma il ruolo delle istituzioni nazionali nella formazione delle pratiche di accountability e si riconosce l'importanza delle capacità gestionali e delle competenze professionali sia delle imprese che dei fornitori di assurance nel modellare la qualità e l'efficacia delle verifiche. Dal punto di vista settoriale, i tassi più elevati di assurance volontaria si riscontrano nei comparti ad alta visibilità o impatto ambientale, come oil & gas, utilities e chimica.

Gli autori mettono in luce i limiti del mercato dell'assurance, ancora frammentato e poco trasparente, e avvertono che la proliferazione di standard e provider eterogenei può compromettere la credibilità delle pratiche di verifica agli occhi degli stakeholder. Nonostante un miglioramento nel tempo, la qualità media delle assurance rimane modesta, suggerendo un rischio di adozione simbolica più che sostanziale, in linea con la logica dei "rational myths" descritta dalla teoria neo-istituzionale.

Al-Shaer & Zaman, (2018) verificano che la presenza di audit committee della sostenibilità tra gli organi societari aumenti la credibilità delle dichiarazioni non finanziarie, evidenziando come caratteristiche quali indipendenza, competenza finanziaria e intensità dell'attività svolta siano positivamente associate alla decisione di ricorrere all'assurance volontaria. I risultati mostrano che tali comitati esercitano un effetto incrementale rispetto agli altri meccanismi di governance, rafforzando la qualità percepita dell'informativa, anche attraverso la scelta di provider di assurance maggiormente qualificati.

Lo studio sperimentale di Reimsbach et al., (2018) dimostra che l'assurance esterna emerge come un fattore determinante: quando le informazioni di sostenibilità sono certificate da un verificatore indipendente, gli investitori attribuiscono maggiore credibilità e rilevanza decisionale a tali dati, valutano più positivamente la performance ESG dell'impresa e manifestano una maggiore propensione all'investimento. L'effetto positivo dell'assurance risulta attenuato nei report integrati, poiché la presenza dell'audit finanziario obbligatorio genera un "bias" cognitivo: gli investitori tendono a estendere la percezione di affidabilità anche alle informazioni ESG non verificate, sopravvalutandone la credibilità.

Di contro, uno studio di Alon & Vidovic, (2015) evidenzia che l'assurance non ha alcun effetto diretto e significativo sulla reputazione, poiché gli stakeholder non sembrano interpretarla come un segnale distintivo di maggiore affidabilità o impegno; è la performance, non l'assurance, a determinare il posizionamento reputazionale in ambito ESG.

Lo studio di Weber et al., (2010) analizza l'integrazione dei criteri di sostenibilità nei processi di credit risk management, dimostrando empiricamente che le performance economiche, ambientali e sociali delle imprese incidono in modo significativo sulla loro affidabilità creditizia. Inoltre, un recente studio di Chen & Wu (2024) ha analizzato le aziende quotate sul mercato di Taiwan e ha evidenziato che il costo del debito per le aziende che rilasciano rapporti di sostenibilità con assurance esterna è inferiore ad altri, il che può essere associato alla riduzione dell'asimmetria informativa tra un'azienda e le sue parti interessate. Tuttavia, viene evidenziato anche che l'assurance, da sola, non è sufficiente a determinare una riduzione del costo del debito. Al contrario, una maggiore copertura mediatica di notizie negative riguardanti la responsabilità sociale tende ad aumentarlo, indicando che tali notizie rappresentano un elemento rilevante nelle valutazioni dei creditori.

Nonostante la crescente letteratura sul legame tra performance ESG, assurance dell'informativa di sostenibilità e costo del capitale di debito, permangono rilevanti aree di incertezza che giustificano ulteriori approfondimenti empirici. Gli studi esistenti forniscono evidenza di un'associazione negativa tra disclosure ESG e costo del debito, attribuendo tale relazione principalmente alla riduzione delle asimmetrie informative e del rischio percepito dai finanziatori. Inoltre, a seguito dell'introduzione della figura del revisore della sostenibilità, emerge l'esigenza di analizzare l'assurance ESG non solo come strumento di compliance normativa o segnale reputazionale, ma come potenziale leva di governance finanziaria capace di incidere in modo misurabile sulle valutazioni del rischio di credito.

In particolare, valutare se e in che misura l'assurance volontaria produca un effetto incrementale rispetto a quella obbligatoria, configurandosi come un segnale di maggiore qualità della governance aziendale e di una maggiore attenzione alle tematiche sulla sostenibilità ambientale e sociale, soprattutto in settori ad alta intensità di capitale e di rischio ambientale e regolatorio, quali Energy & Utilities.

Viene proposta una lettura originale dell'assurance ESG come "strumento manageriale" integrato nei processi decisionali aziendali e nelle relazioni con il mercato del credito. Analizzando un campione di imprese italiane Energy & Utilities nel periodo 2017–2024, lo studio intende colmare il gap esistente attraverso (i) il confronto tra assurance volontaria e obbligatoria in una fase di transizione normativa, (ii) l'introduzione di proxy di qualità e credibilità dell'assurance e (iii) una valutazione dell'impatto dell'assurance sul costo del debito, contribuendo così in modo significativo al dibattito su sostenibilità, governance e mercati finanziari.

3. Metodologia della ricerca

La metodologia adottata nello studio si fonda su un approccio quantitativo finalizzato a indagare la relazione tra il livello di assurance dell'informativa di sostenibilità e il costo del debito delle imprese italiane appartenenti ai settori Energy & Utilities. La scelta di concentrarsi su tali comparti deriva dalle loro caratteristiche peculiari: elevata intensità di capitale, forte esposizione a rischi ambientali e sociali, alta visibilità pubblica e rilevante pressione normativa. Questi elementi rendono le imprese particolarmente sensibili alle dinamiche di disclosure ESG e ne fanno un contesto ideale per analizzare gli effetti dell'assurance sulle valutazioni espresse dal mercato del credito.

La prima domanda di ricerca viene affrontata mediante l'utilizzo del seguente modello panel:

$$COSTODEB_i = \alpha + \beta_1 ASSURANCE_i + \beta_2 ESGRATING_i + \beta_3 CONTROLLI_i + \varepsilon_i$$

L'analisi relativa alla seconda domanda di ricerca viene condotta attraverso l'implementazione del seguente modello panel:

$$COSTODEB_i = \alpha + \beta_1 TYPE\ ASSURANCE_i + \beta_2 ESGRATING_i + \beta_3 CONTROLLI_i + \varepsilon_i$$

Le variabili usate nel modello e le fonti di riferimento sono illustrate nella Tabella 1 che segue.

Categoria	**Variabile**	**Fonte**
Costo del debito	Oneri finanziari / debiti finanziari medi	Bilanci consolidati
Assurance	Si/no (1 se è presente; 0 assente)	Bilanci di sostenibilità / assurance statement
Type Assurance	Tipo di assurance (mandatory = 0; voluntary = 1)	Bilanci di sostenibilità / assurance statement
Rating ESG	Punteggio ESG complessivo e per dimensione (E, S, G)	MSCI / Sustainalytics / Refinitiv
Categoria	**Variabile di controllo**	**Fonte**
ROA	Reddito Operativo / Tot. Assets	Bilanci / Orbis
Leverage	Passivo / Patrimonio netto	Bilanci / Orbis
Size	ln (Revenue)	Bilanci / Orbis
ROE	Utile netto / Patrimonio Netto	Bilanci / Orbis
BigFour	Se una società Big Four revisiona il bilancio la variabile assume valore 1, 0 in caso contrario	Bilanci sostenibilità
Lvl. assurance	Se una società svolge un'assurance reasonable la variabile assume valore 1, 0 in caso contrario	Bilanci sostenibilità
Sustainability Committee	Se la società presenta un comitato di sostenibilità interno la variabile assume valore 1, 0 in caso contrario	Relazione di Corporate governance

Tabella 1. Descrizione delle variabili

Il campione è costituito da imprese italiane appartenenti ai settori Energy & Utilities, identificate secondo la classificazione GICS. Si analizzeranno sia aziende sottoposte all'obbligo sia aziende che diversamente svolgono l'attività di assurance volontariamente. Il periodo di osservazione considerato è 2017–2024, che include la fase di transizione normativa tra la DNF e la CSRD, permettendo di analizzare l'evoluzione della qualità dell'assurance e dei rating ESG nel tempo, e la transizione da volontaria a obbligatoria. L'analisi empirica si basa su dati panel e mira a stimare l'effetto dell'assurance sull'esito di costo oggetto di studio, tenendo conto dell'eterogeneità non osservata a livello di impresa e dei potenziali problemi di endogeneità associati alla decisione di adozione dell'assurance. In via preliminare, al fine di individuare la specificazione più appropriata del modello panel, viene condotto il test di Hausman, che consente di valutare la consistenza dello stimatore a effetti casuali rispetto allo stimatore a effetti fissi. In base ai risultati del test, si seleziona la specificazione ritenuta più idonea a controllare per le caratteristiche non osservabili invarianti nel tempo delle imprese analizzate.

La decisione di adottare l'assurance potrebbe essere influenzata da fattori osservabili e non osservabili che incidono simultaneamente sull'esito di costo, generando potenziali problemi di endogeneità e di auto-selezione. Per affrontare tali criticità, lo studio adotta un insieme di metodologie complementari. In primo luogo, viene implementato un approccio basato su variabili strumentali (Instrumental Variables, IV) al fine di testare e correggere l'eventuale endogeneità della variabile di assurance. La validità degli strumenti utilizzati è verificata attraverso test standard di rilevanza e di esogeneità, garantendo che essi risultino correlati con la decisione di assurance, ma non con il termine di errore dell'equazione di outcome.

In secondo luogo, viene applicata la metodologia del Propensity Score Matching (PSM), con l'obiettivo di ridurre i bias derivanti da auto-selezione. In particolare, le imprese che adottano l'assurance vengono abbinate a imprese non assicurate sulla base di un insieme di caratteristiche osservabili pre-trattamento, consentendo un confronto più appropriato tra gruppo trattato e gruppo di controllo e fornendo un'ulteriore verifica della robustezza dei risultati rispetto a problemi di endogeneità. Al fine di verificare la solidità dei risultati principali, viene condotta un'analisi di robustezza volta a distinguere tra assurance obbligatoria e assurance volontaria. A tal fine, viene stimata una specificazione alternativa che introduce la variabile TypeAssurance, codificata come 0 in presenza di assurance obbligatoria e 1 in caso di assurance volontaria.

L'analisi si articola in due fasi distinte. Nel primo step, il modello è stimato sull'intero campione di imprese, includendo una variabile dicotomica che cattura esclusivamente la presenza o l'assenza dell'assurance. Nel secondo step, l'analisi è limitata al sottocampione delle imprese che adottano l'assurance; all'interno di tale sottocampione viene stimato l'effetto specifico della volontarietà dell'assurance sull'esito di costo. Questa strategia consente di isolare l'impatto marginale dell'assurance volontaria rispetto a quella obbligatoria e di valutare se la natura volontaria dell'assurance produca effetti differenziati in termini di costo, rafforzando così l'interpretazione causale dei risultati empirici.

4. Risultati attesi

Sulla base della letteratura ci si attende che l'assurance dell'informativa di sostenibilità svolga un ruolo significativo nella riduzione del costo del debito per le imprese appartenenti ai settori Energy & Utilities. Tali settori, caratterizzati da forte esposizione a rischi ambientali, sociali e regolatori, rappresentano un contesto nel quale la qualità e l'affidabilità delle informazioni non finanziarie acquisiscono un peso determinante nelle valutazioni effettuate da banche, investitori istituzionali e altri finanziatori. In questo senso, la presenza di un'assurance indipendente può essere interpretata dai creditori come un segnale credibile della solidità del sistema di governance, della trasparenza informativa e dell'impegno dell'impresa verso una gestione responsabile dei rischi ESG.

Il primo risultato atteso riguarda quindi l'associazione negativa tra assurance e costo del debito: le imprese che presentano un report di sostenibilità accompagnato da una verifica esterna dovrebbero beneficiare di condizioni di finanziamento più favorevoli, grazie alla riduzione dell'asimmetria informativa e alla maggiore affidabilità delle metriche ESG comunicate al mercato. Ci si aspetta che tale effetto sia particolarmente evidente nelle imprese con profili di rischio più complessi o operanti in segmenti caratterizzati da maggiore sensibilità ambientale, in cui la qualità dell'informativa può incidere in modo sostanziale sulla percezione del rischio da parte dei finanziatori.

Un secondo risultato atteso concerne la distinzione tra assurance volontaria e assurance obbligatoria. Alla luce dei cambiamenti normativi introdotti dalla CSRD e dal relativo recepimento nazionale, ci si aspetta che l'assurance volontaria produca un effetto più marcato sulla riduzione del costo del debito rispetto all'assurance obbligatoria. L'assurance volontaria, infatti, può essere interpretata come un segnale credibile di impegno strategico verso la sostenibilità, non motivato da mere esigenze di conformità. Tale scelta deliberata suggerisce

all'esterno la presenza di una cultura aziendale orientata alla trasparenza e alla gestione responsabile dei rischi, elementi che possono tradursi in una più favorevole valutazione del merito creditizio. Al contrario, l'assurance obbligatoria potrebbe generare un effetto meno intenso, poiché percepita dai finanziatori come un adempimento di natura formale, volto principalmente a rispondere a prescrizioni regolamentari. In questo caso, il beneficio in termini di costo del debito potrebbe essere più contenuto e maggiormente differenziato in funzione della qualità del provider e della profondità del processo di assurance.

Infine, ci si attende che la relazione tra assurance e costo del debito non sia omogenea tra tutte le imprese del campione, ma vari in funzione di caratteristiche specifiche quali dimensione, leva finanziaria, performance economica e livello di rischio operativo. Le imprese più grandi, esposte a maggiore esposizione pubblica e con una più ampia base di stakeholder, potrebbero mostrare effetti più forti. Al contrario, le imprese più indebitate o caratterizzate da elevata volatilità dei risultati economici potrebbero trarre beneficio dall'assurance, ma in misura più attenuata se il loro profilo finanziario complessivo continua a esporle a rischi significativi.

In sintesi, ci si attende che l'assurance dell'informativa di sostenibilità agisca come una leva di riduzione del rischio percepito e come un indicatore di buona governance, contribuendo a migliorare il merito creditizio delle imprese e a ridurre il costo del debito.

5. Implicazioni teoriche e manageriali

Dal punto di vista teorico, i risultati attesi dello studio contribuiscono ad ampliare il dibattito sul ruolo dell'assurance come meccanismo di governance informativa e come leva per la riduzione del rischio percepito dagli stakeholder finanziari. La letteratura esistente ha ampiamente documentato l'importanza della disclosure ESG nel migliorare la trasparenza e la qualità informativa delle imprese, ma rimangono ancora poco esplorati gli effetti specifici dell'assurance sulla struttura del capitale e, in particolare, sul costo del debito.

L'assurance può essere interpretata come un dispositivo che riduce l'asimmetria informativa tra impresa e finanziatori, aumentando l'affidabilità delle informazioni ESG e migliorando la capacità degli stakeholder di valutare la continuità aziendale, la solidità del modello di business e l'effettiva gestione dei rischi non finanziari. Ne deriva una maggiore connessione tra performance ESG, credibilità della disclosure e outcome finanziari, confermando l'idea che la sostenibilità sia ormai parte integrante delle metriche di valutazione del rischio.

Dal punto di vista manageriale, i risultati attesi potrebbe avere implicazioni rilevanti per la governance aziendale e per la gestione strategica dei rapporti con il sistema finanziario. In primo luogo, le imprese possono considerare l'assurance non come un onere aggiuntivo, ma come un investimento capace di generare ritorni economici tangibili. Inoltre, si rafforzerebbe il dialogo con gli stakeholder finanziari, maggiormente improntato su dinamiche trasparenti e incentrate su rapporti fiduciari che potrebbero migliorare il merito creditizio, facilitando l'accesso ai finanziamenti a condizioni più vantaggiose.

Infine, se l'assurance risultasse effettivamente correlata a un minor costo del debito, ciò avvalorerebbe l'utilità delle recenti riforme introdotte dalla CSRD e dall'evoluzione della revisione della sostenibilità, rafforzando l'idea che una maggiore standardizzazione e qualità dei processi informativi possa produrre benefici concreti non solo a livello sociale, ma anche per il funzionamento dei mercati finanziari. In particolare, anche le imprese che non saranno soggette agli obblighi normativi previsti dalla CSRD potrebbero essere incentivate ad adottare forme volontarie di assurance come strumento strategico per migliorare l'accesso al mercato del credito. Ciò implicherebbe un progressivo rafforzamento dei sistemi di governance aziendale orientati alla sostenibilità e una crescente domanda di competenze specialistiche in ambito ESG, controllo e assurance non finanziaria. La figura del revisore della sostenibilità sarebbe chiamata a svolgere un ruolo sempre più centrale nei processi di certificazione e attestazione della credibilità informativa verso gli stakeholder aziendali.

6. Conclusioni

Il presente studio cerca di comprendere la relazione tra l'assurance dell'informativa di sostenibilità e il costo del debito delle imprese italiane operanti nei settori Energy & Utilities. In un contesto regolatorio in rapida evoluzione, segnato dall'introduzione della CSRD e dalla crescente attenzione dei finanziatori verso i fattori ESG, l'assurance emerge come un elemento potenzialmente decisivo nei processi di valutazione del rischio e nella determinazione delle condizioni di finanziamento. Le riflessioni teoriche elaborate, insieme alle evidenze offerte dalla letteratura internazionale, suggeriscono che un reporting di sostenibilità verificato da un soggetto indipendente possa contribuire a ridurre l'asimmetria informativa e a rafforzare la percezione di affidabilità dell'impresa, con possibili effetti positivi sul merito creditizio e, quindi, sul costo del capitale.

È tuttavia fondamentale sottolineare che la ricerca si trova ancora nella fase di raccolta e sistematizzazione dei dati, e le considerazioni finora esposte devono essere interpretate come risultati attesi, derivanti dall'impostazione teorica e dal modello concettuale adottato. Solo la successiva analisi empirica potrà confermare la solidità delle ipotesi formulate e quantificare con precisione l'effetto dell'assurance, nonché comprenderne le differenze legate al carattere volontario o obbligatorio e alla qualità del provider.

Guardando ai possibili sviluppi, il progresso della ricerca potrà articolarsi lungo diverse direzioni. In primo luogo, il completamento del dataset consentirà di verificare se le imprese che adottano volontariamente l'assurance, anticipando o superando gli obblighi normativi, ottengano un vantaggio più significativo in termini di costo del debito rispetto a quelle che vi ricorrono esclusivamente per conformarsi alle disposizioni imposte. Allo stesso modo, la disponibilità di informazioni più dettagliate sulla tipologia di assurance permetterà di indagare se livelli più elevati di profondità nella verifica, standard internazionali più rigorosi o il coinvolgimento di provider particolarmente qualificati incidano in modo differenziato sulle valutazioni dei finanziatori.

In prospettiva, una volta completata la fase empirica, il lavoro potrà evolvere verso analisi più ampie, includendo altri settori economici o confrontando la realtà italiana con contesti internazionali caratterizzati da diversi assetti normativi e istituzionali. Ciò consentirebbe di verificare la generalizzabilità dei risultati e di comprendere meglio come la sensibilità del mercato finanziario verso l'assurance ESG vari in funzione delle dinamiche di settore o delle strutture dei mercati del credito.

In conclusione, pur non essendo ancora giunta alla fase di validazione empirica, questa ricerca contribuisce a delineare un quadro teorico sul ruolo dell'assurance ESG nei rapporti tra imprese e sistema finanziario.

In the name of sustainability: auditors and the normativity construction

Silvia Pilonato[1], Eleonora Crusca[2], Daniele Gervasio[3]

1. Introduction and conceptual framework

Over the past two decades, sustainability reporting assurance has undergone significant development, yet it continues to be characterised by conceptual, methodological, and institutional fragility. Research has repeatedly highlighted that, unlike financial auditing—supported by decades of professional consolidation—sustainability assurance lacks shared methodological frameworks, consolidated professional boundaries, and homogenous expectations among providers, regulators, and report users. The result is an assurance field marked by persistent ambiguity, uneven practices, and substantial variation in objectives and outcomes.

A first stream of research has long questioned the substantive value of sustainability assurance. Some early studies argued that third-party statements may not add meaningful credibility to sustainability reports, functioning instead as symbolic mechanisms for enhancing legitimacy, reputation, or stakeholder trust without improving underlying performance (Ball et al., 2000; Owen et al., 2000; O'Dwyer & Owen, 2005). Subsequent empirical contributions have reinforced this argument, showing that companies may strategically select assurance providers and scopes that minimise scrutiny while maximising external perception of responsibility (Michelon et al., 2015; Cho et al., 2015). Even when assurance is mandated, providers may adopt narrow or procedural approaches that do not sufficiently reduce information asymmetry or guarantee reporting reliability. At the same time, research has increasingly recognised that sustainability assurance can generate organisational learning and foster more systematic attention to ESG processes. Assurers may stimulate reflection on data governance, internal controls, and cross-functional coordination, thereby supporting organisations in clarifying sustainability priorities (Baudot & Cooper, 2022; Boiral et al., 2020). These studies suggest that assurance's potential value lies not only in external accountability but also in shaping internal practices.

Yet, despite this potential, the field is characterised by methodological fragmentation. Providers—including accounting firms and specialist consultancies—tend to adopt diverse procedures, resulting in inconsistent assurance depth and limited comparability across engagements (Farooq & De Villiers, 2019). Furthermore, most assurance engagements historically rely on limited assurance, which provides weaker evidential guarantees than reasonable assurance and often falls short of addressing stakeholder expectations about the robustness of the disclosed information (Simnett et al., 2009). Recent work (Braam et al., 2025) suggests that limited assurance may not reduce CSR decoupling, raising the question of whether current assurance modalities can effectively respond to the credibility challenges associated with sustainability information. A further set of challenges arises from the intrinsic nature of sustainability information, which often includes qualitative narratives, forward-looking indicators, estimates, or metrics based on assumptions that lack established measurement norms.

This distinctiveness means that professional judgement plays a greater role than in traditional financial audits, increasing the complexity of assurance work and expanding the interpretive responsibility of auditors (Hickman & Cote, 2019). These limitations explain why sustainability assurance remains a field in which regulation alone cannot stabilise expectations. The introduction of the CSRD strengthens reporting obligations, imposes mandatory assurance, and introduces ESRS. However, organisational practices, professional judgement, and interpretive routines remain essential for transforming legal requirements into workable procedures.

This study adopts the concept of normativity developed by Bebbington et al. (2012), which interprets norms not as static prescriptions derived from regulatory texts, but as social constructions produced through practice. Normativity emerges when certain behaviours, routines, or interpretations become taken for granted and widely accepted within a field. In sustainability assurance, auditors play a critical role in producing such norms: they interpret ambiguous requirements, translate expectations into organisational processes, and help companies navigate complex reporting challenges.

Italy offers a particularly relevant context for examining this dynamic. Unlike most EU countries, Italy introduced mandatory assurance under the first European Directives on sustainability reporting. As a result, Italian auditors have been involved in sustainability assurance for several years, interacting with companies that vary widely in their maturity and organisational readiness. This early experience, combined with the strong guidance provided by national professional bodies (Consob, Assirevi), has contributed to shaping how sustainability assurance is understood and practiced in the Italian context. Understanding how auditors interpret and enact the CSRD within this landscape provides valuable insights into the broader European transition.

This work-in-progress study analyses how Italian auditors perceive and perform sustainability assurance in the context of the CSRD. Through interviews with practitioners and institutional actors, the study investigates the practical challenges they encounter, the interpretive work they undertake, and the ways in which they support firms in operationalising a rapidly evolving regulatory environment.

2. Non-financial reporting in Europe and the normativity landscape

Over the last few years, European institutions' commitment to sustainability has increased, shifting from a "voluntary and non-binding" approach to a legislative and regulatory one. The 2014/95/EU directive represented an important step towards the aim of "binding" companies to ethically virtuous behaviours and practices by requiring them to produce non-financial reports (NFRs) containing social and environmental information. The application of this directive was not uniform because the states differed in their adaptation or omission of its requirements, and because the directive itself came into effect at different times. Findings about this directive's results are contrasting.

Concerning assurance, the directive allowed the states to define whether NFRs should be subject to assurance by an independent third party and whether organisations that do not report adequately will be sanctioned. Owing to this discretionary approach, the member states adopted varying levels of assurance. However, the mandatory reporting assurance in Italy, France, and Spain did not seem to have any significant impact. For example, Gillet-Monjarret (2022) highlighted the different strategies for promoting the implementation of assurance missions aimed at legitimising the providers' new skills. Criticisms have also emerged in analyses of NFR assurance statements, indicating differences in their content, the processes executed, and the concrete implementation of standards (Gurtuk & Hahn, 2016). Recently, Braam et al. (2025) demonstrated that the effectiveness of CSR assurance in reducing CSR decoupling depends on both the assurance level and the type of provider. Specifically, reasonable assurance, when combined with either a broad assurance scope or an assurance provider from the auditing profession, significantly narrows the gap between CSR disclosures and actual performance. In

contrast, limited assurance—regardless of scope or provider—fails to prevent decoupling and mainly serves a symbolic legitimacy purpose. The authors argue that auditors, due to their adherence to professional standards, independence requirements, and reputational incentives, provide more credible assurance results than non-auditing providers. These findings suggest that only comprehensive assurance practices, especially those that go beyond minimum regulatory requirements, can meaningfully improve the credibility and dependability of CSR reports.

In Europe, a further step was the CSRD, which was approved by the EU Parliament in 2022. It aims to amend the previous directive by extending the reporting obligations to all large companies and companies with real estate securities admitted to trading in regulated markets, including small and medium enterprises. Many companies are thus required to provide the information necessary to understand their impact on sustainability issues and how these affect their business. Interestingly, an independent actor's assurance was introduced as a mandatory requirement, initially limited in scope and subsequently reasonable. In particular, the new directive demands a progressive approach to enhancing the assurance level by obligating a limited assurance engagement (Section 60 CSRD).

Moreover, the directive highlights the challenges auditors face. On the one hand, it would help ensure connectivity between the annual and CSR reports, given the (desired) consistency of financial and sustainability information, which is particularly important for sustainability information users. On the other hand, owing to the risk of further concentration of the audit market, there may be concerns about auditors' independence (Section 61 of the CSRD). Finally, the new CSRD requires sustainability reports to be prepared in accordance with the European Sustainability Reporting Standards (ESRS) adopted by the European Commission through delegated acts. Companies were required to apply the standards for the 2024 financial year when preparing their sustainability reports in 2025. However, in 2025, the EU adopted the first "Omnibus I" quick fix to the CSRD, introducing a "stop-the-clock" provision that delays the application of certain sustainability reporting deadlines. In parallel, the Commission proposed broader simplifications, including slimming and clarifying the ESRS, as well as politically debated options to narrow the scope (e.g., potentially to companies with more than 1,000 employees), while maintaining limited assurance in place for the initial phase. Further negotiations on the wider Omnibus package continue into late 2025 (EU 2025).

3. Sustainability reporting assurance and auditors' roles

Until the new EU directive, companies have voluntarily produced sustainability reports and have had complete discretion regarding assuring them. From the late 1990s, the importance of sustainability reporting assurance increased considerably, driven by regulation and standardisation, as well as by greater awareness of its role in a company's business. As revealed by the KPMG report (KPMG, 2024), the rate among the N100 (the largest 100 companies in each of 58 countries analysed) and the G250 (top 250 listed companies worldwide) companies had increased continuously from 2005, reaching 69% among the G250 and 54% among the N100 in 2024. Owing to market development and regulatory frameworks, these percentages are likely to continue to increase in the future. Despite the growing adoption of sustainability reporting assurance, it remains voluntary in several countries, and the market is open to various types of providers competing with one another (Farooq & DeVilliers, 2019). Moreover, the lack of consensus about who should conduct the assurance and how (i.e. the approach) it should be performed pose numerous challenges for the sector, for the providers, and for organisations (O'Dwyer, 2011; Farooq & De Villiers, 2019).

Faced with these challenges, researchers adopted different theoretical approaches to analyse them. These approaches emphasise different conceptions of the underlying motivations (Ramdhony, 2015) and the theoretical perspectives adopted (Farooq & De Villers, 2017; Venter & Van Eck, 2021; Yan et al., 2022). Generally speaking, sustainability assurance strengthens

stakeholder trust by communicating a firm's commitment to sustainability, or fosters a firm's legitimacy by responding to pressures stemming from its context. On the one hand, organisations should consider the interests of many stakeholders, and the assurance of sustainability reporting thus serves as a "signal" to reduce the uncertainty of the disclosed information. In this sense, assurance helps reduce the information asymmetry between firms and their stakeholders (Clarkson et al., 2019; García-Sánchez et al., 2019; Hassan et al., 2020; Lòpez-Santamaria et al., 2021) and it is used as a mechanism to enhance a firm's credibility and reputation (Beets & Souther, 1999; Birkey et al., 2016; Casey & Greiner, 2015; Cheng et al., 2015; Sierra García et al., 2022; Simnet et al., 2009). On the other hand, legitimacy theory explains how assurance is configured as a strategic tool companies can use to legitimise their activities and influence the community's perception of their behaviours (O'Dwyer et al., 2011; Martínez-Ferrero & García-Sánchez, 2017; Hickman & Cote, 2019). In the case of assurance, the acquisition of legitimacy may also put the mechanisms of isomorphism back into play. Particularly interesting for the present study is that changes are often driven by professionals, and "legitimated professional practices" may pressurize organizations to conform, as their staff can draw on networks and professional standards to guide them. Beyond traditional isomorphisms, critical approaches have also emerged over the years because some authors have doubted the ability of assurance to guarantee effective benefits for companies, since it has not been found to be associated with a higher market value for the report-issuing companies (Cho et al., 2014), while some have questioned the higher quality of the information communicated, suggesting, rather, a symbolic use of assurance as a tool to influence stakeholder perception (Michelon et al., 2015).

Therefore, faced with an increasingly complex and fragmented regulatory and political landscape (Silvola & Vinnari, 2021; Sonnerfeldt & Pontoppidan, 2020), the role of auditors in sustainability assurance extends far beyond that of neutral verifiers. One of the central tensions lies in auditors' dual identity as both independent monitors and embedded collaborators. While the traditional approach emphasises objectivity and external scrutiny, recent works suggest that assurance engagements often involve relational, iterative, and dialogic dynamics (Channuntapipat, 2020; Liu et al., 2024). The client–auditor relationship is further complicated by the institutional indeterminacy of sustainability itself. Without a universally accepted auditing framework or agreed-upon metrics, auditors are often required to exercise interpretive judgment, filling gaps between regulatory expectations and practical feasibility. O'Dwyer et al. (2011) and Malsch (2024) illustrated how auditors navigate this space by selectively adopting language and emphasis to meet diverse expectations—whether from clients, regulators, or the broader public.

In this contested space, auditors perform not only technical tasks but also symbolic and strategic functions. Michelon et al. (2019) demonstrate how assurance providers influence the likelihood of sustainability restatements, suggesting a deeper organizational impact than commonly assumed. At the same time, Gaudy and Malsch (2023) highlight how auditors engage in reputational positioning, balancing public claims of societal commitment with market-driven imperatives. Their study of audit firms' branding strategies reveals a deliberate effort to appear aligned with sustainability values while maintaining client-centric flexibility. The sustainability assurance engagement, therefore, becomes both a service and a performance—an arena where professional legitimacy, commercial strategy, and normative aspiration intersect. Power's (2003) foundational critique warned against the "ritualisation" of auditing—where assurance provides legitimacy through appearance rather than substance. In the sustainability field, this critique remains relevant, but its implications are less fixed. The field is still evolving, and the meanings of assurance, credibility, and accountability continue to be shaped. Auditors, in this context, are not just formalizing a pre-existing order; they are actively shaping it through interpretation, boundary-setting, and the daily practice of what is considered assurable.

Against this heterogeneous and unstable backdrop, understanding how the European legislative demands are being enacted in firms' everyday life is a demanding task. A critical entry point to understanding the impact of the CSRD on corporate practices is through the lens of

"normativity", which captures how norms—distinct from legal rules—emerge, stabilize, and influence action in organizational fields. The CSRD, while legally binding, also operates as a normative device by shaping expectations, codifying practices, and embedding institutional logics around sustainability reporting. Drawing on Bebbington et al. (2012), normativity in sustainability reporting should not be understood solely as compliance with legal or technical standards, but as a dynamic construct emerging from the interplay between actors, ideas, and institutional structures. The recent wave of sustainability regulation in the European Union illustrates a process of "normative institutionalization" whereby new reporting practices, initially perceived as external impositions, gradually acquire legitimacy and internal coherence within organizations. Bauernhofer et al. (2025) provide empirical evidence of this dynamic by analyzing how firms respond to CSRD requirements by anticipating them. Organizations are not merely adapting to top-down mandates; they are engaged in processes of meaning-making, internal alignment, and strategic reconfiguration—suggesting that normativity is not only imposed but also enacted and negotiated. This understanding is reinforced by Larrinaga et al. (2020), who emphasize that the institutionalization of sustainability assurance services reflects not only regulatory pressures but also cultural-cognitive processes and professional routines. The assurance process contributes to normativity by reinforcing what is considered credible, material, and legitimate in sustainability reporting.

4. Research Objectives

The study aims to deepen understanding of sustainability auditors' role during a transformative regulatory phase by addressing two interrelated objectives. The first is to explore the practical and interpretive challenges auditors perceive in implementing sustainability assurance under European directives. And the second is to analyse how audit firms adapt organisationally and professionally to provide sustainability assurance at scale. Overall, these allow us to understand how auditors act in practice, and thus to better depict normativity, since information about the practice works better than examining law itself.

These objectives are conveyed through two research questions:

RQ1: What challenges and ambiguities do auditors perceive in the implementation and development of sustainability assurance after the introduction of European directives?

RQ2: What practices do auditors adopt in implementing sustainability assurance, and how do these practices contribute to the construction of normativity within firms?

5. Methodology

This qualitative study is based on 24 semi-structured interviews conducted from June 2023 to March 2025. The sample includes partners, senior managers, ESG specialists from Big Four and smaller audit firms, as well as representatives from the local Chamber of Commerce, the Order of Chartered Accountants, and other national professional organizations.

Northern Italy was chosen because sustainability assurance has been especially important there due to its industrial structure and early implementation of assurance under the first European Directive (Legislative Decree 254/2016). Specifically, interviews examined: perceptions of NFRD and CSRD objectives; the shift from voluntary to mandatory assurance; audit procedures and anticipated changes under ESRS; interactions with companies; challenges related to materiality, data systems, and internal controls; and organizational adjustments within audit firms.

Each interview lasted between 30 and 60 minutes, was recorded with participants' consent, and transcribed. Analysis involved iterative coding and thematic synthesis (O'Dwyer, 2004; Ritchie & Lewis 2003). Themes were refined through multiple rounds of coding by all researchers to ensure consistency.

6. Preliminary findings

A prominent theme emerging from interviews is that firms find it difficult to understand the meaning and implications of sustainability reporting, especially those reporting for the first time. Therefore, auditors may be viewed as interpreters of regulatory ambiguity. Many interviewees noted that companies often viewed sustainability reporting primarily as a communication tool, oriented toward reputation or compliance, rather than as a mechanism for systematically measuring and reporting impacts.

Auditors often found themselves explaining: what sustainability reporting entails under ESRS; how double materiality must be assessed; what constitutes adequate evidence for assurance; how internal controls must be structured to support reliable reporting. Interviewees highlighted that double materiality is one of the most complex areas for companies. Both auditors and institutional representatives described confusion about how to identify which impacts are material and how sustainability topics should connect to financial performance. Auditors often had to help firms navigate the conceptual and procedural parts of this assessment. The interpretive work auditors perform is a crucial mechanism through which companies begin to develop a more structured understanding of sustainability reporting. This supports prior research that emphasises the role of professionals in supporting organisations in contexts of regulatory uncertainty (Sonnerfeldt & Pontoppidan, 2020).

A second key finding concerns auditors' involvement in organizational processes. Many companies lack proper systems for collecting sustainability data, and auditors often become involved in: identifying relevant data sources; evaluating the adequacy of internal controls; explaining what documentation is required; encouraging cross-functional coordination; clarifying the relationship between sustainability and financial information. This is especially clear in medium-sized firms, where sustainability reporting systems are often basic. Auditors' support helps companies create reporting practices that meet regulatory standards, even if firms initially have limited technical knowledge about sustainability reporting. Several interviewees observed that assurance work can drive ongoing organizational change, encouraging firms to examine internal processes, clarify responsibilities, and deepen their understanding of how sustainability issues impact operations and strategy. This aligns with literature indicating that assurance can promote organizational learning (Baudot & Cooper, 2022; Boiral et al., 2020).

A third point relates to changes within audit firms. To address increasing demand, audit firms have expanded their sustainability functions. All participating firms reported establishing dedicated sustainability assurance units, implementing extensive internal training programs, hiring professionals with multidisciplinary backgrounds, and developing internal guidelines aligned with Assirevi documents and European standards. Firms also emphasized that sustainability assurance teams are organizationally separate from financial auditors, although collaboration is expected to grow as reporting standards become more integrated. Several auditors described sustainability assurance as a "new frontier" that requires ongoing professional development, given the evolving regulatory landscape and the complexity of concepts like double materiality and impact assessment.

Overall, across interviews, it becomes evident that auditors influence not only reporting practices but also the evolving expectations of what qualifies as acceptable sustainability disclosures. Through repeated interactions, explanations, and methodological choices, auditors help firms to understand and translate into practices: interpretations of materiality; documentation requirements; data quality thresholds; expectations for internal controls; reporting boundaries and formats. In doing so, auditors participate directly in the construction of normativity, as described by Bebbington et al. (2012). Their practices fill the gaps left by ambiguous regulations and gradually shape consistent routines within organisations.

7. Discussion and expected contributions

The findings highlight that the transition from voluntary to mandatory sustainability assurance involves more than compliance. Auditors' experiences reveal that the CSRD introduces clear regulatory obligations, but significant interpretive work is needed to operationalise them across companies with varying levels of maturity.Auditors serve as intermediaries between regulation and organisational practice, helping firms translate the abstract principles of ESRS into concrete processes. This is especially critical because sustainability reporting differs significantly from financial reporting in its reliance on narratives, estimates, and forward-looking information. The study also shows that assurance providers play a crucial institutional role. Their practices—developed through experience, discussion, and professional guidance—shape emerging norms in the field. As these practices are repeated across engagements, they contribute to stabilising expectations and supporting the institutionalisation of sustainability assurance.

The study deepens the understanding of sustainability assurance by emphasizing the interpretive and developmental roles of auditors, demonstrating how they help shape reporting norms through their practice. Furthermore, by examining Italy's initial experience with mandatory assurance, the study offers insights that predict challenges other EU Member States may face during CSRD implementation. Finally, the findings provide guidance for policymakers, regulators, and standard setters on the challenges auditors face and the support companies require to meet regulatory expectations.

Further analysis will deepen the comparison between audit firm types and explore internal organisational processes in greater detail. The next phase will include triangulation with documentary evidence and additional analysis of interview data to refine theoretical insights on normativity in sustainability assurance.

La valutazione del rischio strategico d'impresa tra governance, strategia e performance: un framework integrato per l'Enterprise Risk Management sostenibile

Francesca Magli[1], Andrea Amaduzzi[2], Paola Orlandini[3]

1. Il rischio strategico nella tradizione aziendalistica italiana e internazionale

La nozione di rischio ha assunto, nel corso dell'evoluzione della disciplina economico-aziendale, un rilievo sempre crescente, diventando una componente intrinseca e strutturale della gestione d'impresa. Già nella prospettiva della dottrina italiana, il rischio veniva concepito non solo come minaccia, ma come elemento fisiologico del sistema aziendale, capace di influenzarne gli equilibri e la vitalità. In questo senso, il contributo di Umberto Bertini rappresenta un riferimento fondativo: il rischio è fattore endogeno, strettamente connesso alle scelte di governo, alle condizioni ambientali e ai processi decisionali, la cui anticipazione e gestione costituiscono un prerequisito per la continuità aziendale e per la capacità competitiva (Bertini, 1987). Tale quadro concettuale ha fornito linfa alla successiva formalizzazione dei modelli di Enterprise Risk Management (ERM) (Amoroso e Orlandini, 2024).

Parallelamente, in ambito internazionale, la gestione del rischio ha conosciuto una evoluzione da funzione specialistica, connessa prevalentemente alla dimensione assicurativa o alla finanza, a processo integrato nella governance e nella strategia aziendale. Il COSO Internal Control Framework (1992), il COSO ERM (2004) e, soprattutto, il suo aggiornamento del 2017 hanno ridefinito la natura del Risk Management come processo trasversale, parte integrante del governo d'impresa, capace di influenzare la definizione della strategia, il monitoraggio delle performance e la generazione di valore nel lungo periodo. L'ERM tende così a ricondurre in un unico sistema le diverse categorie di rischio — operativo, finanziario, reputazionale, di compliance e, in modo sempre più evidente, strategico (COSO, 2017).

In questo quadro, il rischio strategico occupa una posizione particolare. Esso deriva dalle scelte di indirizzo, dalle opzioni di posizionamento e dalle decisioni che determinano l'assetto competitivo presente e futuro dell'impresa. La sua natura è bidimensionale: identifica sia le minacce derivanti da strategie non adeguate, sia le opportunità connesse all'incertezza strategica e al cambiamento. Proprio per la sua origine, esso è il rischio più difficile da identificare e valutare, poiché dipende da fattori spesso poco strutturati, qualitativi, non storicizzabili, legati sia alle dinamiche dell'ambiente sia ai processi cognitivi e decisionali del management.

1.1. Le determinanti del rischio strategico

La letteratura individua tre principali determinanti del rischio strategico. La prima determinante è legata all'incertezza del contesto esterno, caratterizzata da complessità, volatilità e discontinuità. Per incertezza ambientale si intendono complessità del mercato, discontinuità tecnologiche, dinamiche competitive imprevedibili, fenomeni esogeni come shock geopolitici,

crisi sanitarie, cambiamenti normativi o climatici. I principali framework internazionali ne offrono una formalizzazione chiara; per esempio il COSO ERM 2017 definisce il rischio strategico come l'effetto di "changes in the external environment", includendo eventi emergenti, innovazioni tecnologiche, pressioni normative, crisi geopolitiche e fenomeni climatici (COSO, 2017) e la ISO 31000:2018 identifica il rischio come "effetto dell'incertezza sugli obiettivi", enfatizzando la necessità di includere variabili ambientali nella valutazione del rischio (ISO 31000, 2018).

La seconda determinante deriva dalle decisioni strategiche dell'impresa, essendo il rischio strategico radicato nella natura stessa della strategia. Tra le scelte di posizionamento e configurazione strategica troviamo le decisioni relative a diversificazione, innovazione, internazionalizzazione, investimenti, governance e struttura di controllo. La letteratura strategica e di corporate governance riconosce il rischio generato dalle scelte deliberate dal management, ad esempio il COSO ERM 2017 considera il rischio strategico come esito di un possibile "misalignment between chosen strategy and risk appetite". Secondo Porter, la strategia competitiva implica rischi intrinseci legati alla scelta di un posizionamento (Porter 1980; 1985). Mintzberg evidenzia come il fallimento nella formulazione/implementazione della strategia rappresenti una fonte primaria di rischio (Mintzberg , 1994) e Amoroso e Orlandini mostrano come il rischio strategico emerga dalle opzioni di sviluppo, dagli investimenti, dai percorsi di crescita e dalle logiche di posizionamento (Amoroso e Orlandini, 2025).

La terza determinante riguarda la dimensione cognitiva, comportamentale e organizzativa del processo decisionale. Le scelte strategiche non derivano solo dalle informazioni disponibili, ma soprattutto da come esse vengono interpretate, ovvero dai processi cognitivi e decisionali. Rientrano tra questi i bias manageriali, i limiti informativi, la capacità di previsione, la cultura del rischio, la qualità delle informazioni e dei sistemi di accounting a supporto del processo decisionale. Amoroso e Orlandini mettono in relazione il rischio strategico con la capacità degli organi di governance di interpretare il contesto e guidare la strategia. A livello internazionale Kahneman C Tversky (1979) mettono in luce i bias cognitivi che influenzano la percezione del rischio (overconfidence, availability bias, anchoring), March C Shapira (1987) evidenziano come il management sviluppi una "risk perception" distinta dai modelli oggettivi, generando potenziali asimmetrie decisionali; Kaplan C Mikes (2012) sottolineano che lo strategic risk è strettamente dipendente dal "managerial judgment" (Kahneman e Tversky, 2013; Kaplan, and Mikes, 2012; March and Shapira, 1987).

Ne deriva un rischio dalla natura intrinsecamente multidimensionale e sistemica, che richiede strumenti analitici capaci di integrare approcci qualitativi e quantitativi, prospettive interne ed esterne, e soprattutto un forte allineamento con i processi di governance e di definizione della strategia.

1.2. Rischio strategico, governance e sostenibilità

Il rischio strategico è strettamente intrecciato alla governance. Gli organi societari — in particolare il Consiglio di Amministrazione — hanno la responsabilità di definire il risk appetite, valutare la coerenza tra strategia e profilo di rischio, monitorare gli scostamenti e garantire che i sistemi informativi e di controllo forniscano una visione integrata dei rischi materiali. La sostenibilità, intesa come capacità dell'impresa di mantenere un equilibrio duraturo tra performance economiche, sociali e ambientali, richiede una piena integrazione tra ambizione strategica, esposizione al rischio e creazione di valore nel lungo periodo.

Il framework COSO 2017 sottolinea come l'ERM debba essere integrato non solo nei processi operativi, ma anche nella formulazione della strategia e nella definizione degli obiettivi, prevedendo che la valutazione del rischio strategico guidi scelte quali l'allocazione del capitale, la selezione dei progetti di investimento e innovazione, le decisioni di internazionalizzazione e

diversificazione, le politiche di sostenibilità e di transizione green, la definizione delle metriche di performance strategica.

2. Obiettivi

Alla luce di questo quadro concettuale, l'articolo si propone tre principali obiettivi.

Obiettivo 1 — Ricostruire il fondamento teorico del rischio strategico integrando dottrina italiana e framework internazionali

L'intento è evidenziare come la prospettiva sistemica della dottrina economico-aziendale italiana— con particolare riferimento al pensiero di Bertini e ai contributi più recenti (Bertini, 1987; Amoroso e Orlandini, 2024) anticipi e arricchisca le moderne concezioni del rischio strategico presenti nei modelli COSO e ISO. Viene proposta una lettura sinottica che mette in evidenza affinità, divergenze e complementarità.

Obiettivo 2 — Elaborare una definizione integrata di rischio strategico

Una definizione che tenga conto della dimensione strategica (coerenza delle scelte di posizionamento), organizzativa (cultura del rischio, qualità del management), cognitiva (bias, capacità predittive), ambientale (complessità, discontinuità, shock), informativa (ruolo dell'accounting strategico e dell'integrazione dei dati).

Obiettivo 3 — Proporre un framework applicativo per la valutazione del rischio strategico d'impresa

Il contributo dell'articolo mira a colmare un gap metodologico offrendo una mappatura delle fonti del rischio strategico; un modello di valutazione integrata che combina indicatori qualitativi e quantitativi; un processo in cinque fasi che integra governance, strategia e sistema di controllo; linee guida per l'allineamento tra risk appetite, pianificazione strategica e indicatori di performance; un output finale sotto forma di Strategic Risk Dashboard utile al top management e agli organi di governo.

3. Quadro metodologico e framework applicativo

La metodologia si sviluppa attraverso un approccio qualitativo che integra un'analisi della letteratura scientifica internazionale su ERM, rischio strategico, strategic management e corporate governance (COSO, ISO 31000, studi di Mikes, Kaplan, Taleb ecc.), un'analisi della dottrina italiana classica e contemporanea e un'esame dei modelli di governance e dei principi di controllo interno previsti da normative nazionali ed europee (TUF, codice di corporate governance, Modello 231, normative vigilanza Banca d'Italia ecc.).

Il framework proposto deriva da un processo di sintesi critica delle metodologie già esistenti e delle lacune individuate. Si compone di cinque fasi:

- Fase 1 — Identificazione dei driver di rischio strategico: Attraverso strumenti quali SWOT, PESTEL, analisi competitiva e trend analysis.
- Fase 2 — Valutazione qualitativa della rilevanza strategica dei rischi: Con l'utilizzo di matrici di impatto-probabilità, questionari Delphi, interviste ai dirigenti, analisi dei bias cognitivi.
- Fase 3 — Valutazione quantitativa del rischio strategico. Basata su:
  - indicatori di posizionamento competitivo;
  - misurazioni della volatilità dei mercati;
  - simulazioni Monte Carlo applicate a scenari strategici;
  - indicatori economico-finanziari (VaR strategico, sensitività dei flussi di cassa, stress test).
- Fase 4 — Allineamento con governance e risk appetite: Attribuzione dei rischi alle responsabilità dei board committee; definizione dei limiti di tolleranza; integrazione nei KPI e nei KRI (Key Risk Indicators).

- Fase 5 — Costruzione della Strategic Risk Dashboard: Con rappresentazione grafica, sintetica e integrata dei principali rischi strategici, del loro trend e del loro impatto sugli obiettivi aziendali.

Il quadro metodologico prevede la possibilità di applicare il framework a imprese industriali, aziende pubbliche, gruppi multinazionali, PMI innovative.

L'applicazione empirica può essere effettuata mediante casi studio, simulazioni, o analisi dei piani industriali delle aziende quotate.

4. Contributi teorici attesi

Il lavoro contribuisce alla letteratura in almeno quattro direzioni:

- Rielabora il concetto di rischio strategico integrando il pensiero sistemico italiano con i framework internazionali, offrendo una definizione aggiornata e multidimensionale.
- Chiarisce il legame strutturale tra rischio strategico, governance e sostenibilità, mostrando come la strategia sia luogo originario del rischio e come la governance ne debba garantire la gestione integrata.
- Propone un modello concettuale che ricompone in una cornice coerente elementi conoscitivi, decisionali e organizzativi.
- Colma un gap nella letteratura sull'ERM, che spesso trascura o sottostima la dimensione strategica rispetto a quella operativa o finanziaria.

Il framework sviluppato consente alle imprese di dotarsi di un processo strutturato per identificare, valutare e monitorare il rischio strategico; migliorare la qualità delle decisioni strategiche attraverso l'integrazione di informazioni qualiquantitative; rafforzare il ruolo della governance nella definizione del risk appetite e nel monitoraggio dell'esposizione al rischio; integrare maggiormente pianificazione strategica, sistemi di controllo e reporting; rendere più coerenti e trasparenti i processi decisionali, favorendo la creazione di valore sostenibile. L'adozione del modello produce benefici quali migliore allineamento tra strategia e rischi, maggiore resilienza ai cambiamenti ambientali, maggiore credibilità nei confronti degli stakeholder, miglioramento della comunicazione interna e del coordinamento tra funzioni, possibilità di integrare la valutazione del rischio strategico nei reporting ESG e nella rendicontazione non finanziaria. Il modello apre a diverse linee di ricerca ed in particolare a applicazione empirica su campioni ampi di imprese, analisi comparata tra settori, esplorazione del ruolo dell'intelligenza artificiale e dei modelli predittivi nella valutazione del rischio strategico, integrazione del framework nei sistemi di performance management e nelle balanced scorecard evolute.

5. Conclusione

Il contributo proposto intende valorizzare sia l'eredità teorica della disciplina italiana, sia le metodologie più avanzate dell'ERM, per offrire una prospettiva integrata e applicabile sulla valutazione del rischio strategico. In un contesto caratterizzato da crescente incertezza e complessità, la capacità delle imprese di identificare, comprendere e gestire il rischio strategico diventa una leva fondamentale per il successo competitivo, la sostenibilità del business e la qualità della governance.

How and why do football clubs disclose sustainability? A preliminary investigation of leading Italian clubs

Silvia Cosimato[1], Nunzia Capobianco[2], Roberto Vona[3], Federica Grumetti[4], Silvia Verde[5]

1. Introduction

In recent decades, public concern and awareness regarding organizations' environmental and social impacts have increased significantly (Hoerber, 2025). Consequently, scholars, practitioners, and policymakers have examined the paradigms of sustainability and sustainable development extensively. The discourse on these paradigms originated with the Brundtland Report (1987), which defined sustainable development as the necessity and the ability of meeting present needs without compromising the ability of future generations to do the same. Subsequent initiatives, such as Agenda 21, the Convention on Biological Diversity, the Framework Convention on Climate Change, the Paris Agreement, and the 2030 Agenda, have furthered these efforts. These developments have prompted organizations to enhance their long-term positive impact on society and the environment while minimizing negative management effects (García-Sánchez et al., 2021; Stojanović-Blab and Blab, 2024). Despite this progress, research on sustainability remains fragmented, and sectors such as sports continue to lag behind.

In sport management, sustainability is defined as sports organizations' ability to lower or minimize the negative economic, environmental, and social impacts of their activities while trying to maximize, at the same time, positive outcomes for stakeholders and society (Doustaly and Zembri-Mary, 2024).

Most research on sports sustainability is still focused on the environmental sphere of sustainability (McCullough et al., 2020), neglecting the influence that sports organizations have on the social and economic spheres.

The sports industry faces frequent crises, misconducts, and scandals (e.g., bullying, harassment, alimentary and psychological disorders, etc.). These incidents create unsafe environments for athletes and supporters. They also highlight a need for improved sustainability-oriented regulations at both individual and institutional levels (Breitbarth et al., 2023; Safarpour et al., 2025). Breaking the culture of silence is essential for professional and non-professional sports to achieve full sustainability maturity. Promoting public awareness and openness around such issues is vital (Verschuuren, 2021; Stokowski and Carter, 2025). To help accomplish this, European sports organizations are starting to apply sustainability disclosure regulations. In Europe, these are mainly based on the Non-Financial Reporting Directive[6] (NFRD) and the Corporate Sustainability Reporting Directive (CSRD), which replaced the NFRD in 2024.

The CSRD is a directive issued to transform the sustainability reporting into a real governance opportunity, driving organization in disclosing non-financial information about

[6] This Directive, enacted in 2017, states that EU public interest entities characterized by a specific size and financial criteria must disclose non-financial information, including diversity data.

environmental and social risks, opportunities, and impacts. This directive is based on comprehensive and detailed reporting requirements, including: 1) the principle of double materiality, 2) the integration of sustainability information into management reports; mandatory external assurance, 3) digital tagging of reported data, and 4) the obligation to report in line with the European Sustainability Reporting Standards (ESRS). These standards "encompass a wide range of environmental, social, and governance issues, including climate change, biodiversity, and human rights" (Raimo et al., 2025, p.5), emerging from the long-lasting debate on the International Sustainability Standards Board (ISSB) and the Global Reporting Initiative (GRI), intended to align EU and global reporting standards (Hummel and Jobst, 2024; Hristov and Searcy, 2025).

Although sustainability communication and disclosure have gained momentum in sport management, attention to the social dimension of sustainability remains limited (Trail and McCullough, 2020; Rith and Spinelli, 2024). To address this gap, the present study analyzes how football clubs approach sustainability disclosure, with a particular focus on the communication of their commitment to the social dimension of sustainability. Accordingly, the research is guided by the following questions: 1) Do major Italian professional football clubs comply with the CSRD and the ESRS? 2) What sustainability-related themes are most frequently disclosed?

In doing so, an inductive thematic analysis (Terry et al., 2017) has been conducted to identify the main themes at the core of the communication material they disclose. The thematic analysis has been conducted on the official documents published by a sample of Italian football clubs. As a result, the analysis of the achieved results will support policymakers and sports managers in strategically approaching sustainability and its disclosure through the institutionalization of specific practices dedicated to boosting social sustainability.

This paper has been organized as follows. The first section is dedicated to defining the theoretical background of the study, while the second section is dedicated to describing the applied methodology. The third and fourth sections are dedicated to the presentation and discussion of the achieved findings. Implications, limitations, and future research close the paper.

2. Theoretical background

2.1. Why a sustainable approach to sport and football management matters?

Currently, the sports industry is a major contributor to socio-economic development, generating several tangible and intangible benefits (Kim and Kim, 2024). These stem mainly from this industry's high economic impact (Tettamanzi et al., 2024); thus, it accounts for $521bn, including material infrastructures, licensed products, services, and events (Deloitte, 2024). Together with the economic impact, this industry also has important positive and negative societal and political outcomes. The positive ones are mainly personal and team success, national pride, international reputation, personal emancipation, social cohesion and inclusion, and gender equality (Ekholm and Dahlstedt, 2022). The negative ones are corruption, doping, alimentary and mental disorders, misconduct, discrimination, exclusion, and political propaganda or boycott (Zare and Géczi, 2024). The existence of these outcomes has led scholars and policymakers to devote growing attention to Corporate Social Responsibility (CSR) and to the way it can better contribute to enhancing the social dimension of sustainability in sport management (Robertson et al., 2025). This is possible by challenging misconduct and inspiring decision-making through the most common principles of business ethics, CSR, and social sustainability. However, the way sports organizations approach ethics, responsibility, and sustainability is often influenced by local and organizational culture (Räsänen, 2023). Together with this, the so-called "culture of silence" (Mitchell, 2012), or the reluctance to speak up and speak out about misconduct and abuses, characterizes the sports industry, and in particular football, hindering their commitment toward the principles of social sustainability. The so-called culture of silence is currently impacting athletes' mental and physical well-being, as well as organizational efficiency within and outside

of sport's specific contexts (Manley et al., 2016). To counteract this situation, institutions and sports organizations should promote the incorporation of sustainability-oriented practices in mainstream sport management strategies (Tettamanzi et al., 2024). This calls for a holistic approach based on the implementation of "green practices, promoting social responsibility, and ensuring financial stability (…) to shape a more sustainable future for the sports industry and the planet as a whole" (Safarpour et al., 2025, p.5).

To build a positive impact on the playground and beyond, as well as to achieve a wide societal involvement in sustainable causes, sports organizations should take a step forward and institutionalize specific and holistic sustainability-oriented programs (Wall-Tweedie and Nguyen, 2018).

2.2. Football clubs' approach to sustainability reporting and disclosure

As stated, the sports industry and the football sector have been increasingly committed to sustainability over time. This has pushed them to rethink their processes and activities, organizing them according to the sustainability paradigm, sustainable development's principles, and ESGs (Agostino and Thomasson, 2025). To support this paradigm shift, the main leagues (e.g., FIFA and UEFA) have issued specific criteria and guidelines to make football practice and infrastructures as sustainable as possible (Konstantopoulos and Manoli, 2024).

The football industry is currently populated by a growing number of clubs that tend to merely reinvest profit or assume losses to finance new player transactions to maximize the possibility of winning the league, more than to maximize profits (Kwon and Kwak, 2022; Agostino and Thomasson, 2024). This makes clubs "more sensitive to financial troubles since unexpected and negative shocks (e.g., injuries to key players, drop-out of key sponsors, relegation, and global catastrophes) would immediately deplete cash" (Tettamanzi et al., 2024, p.261). This challenge mainly affects the smallest ones, which tend to suffer more than larger ones due to their endemic lack of resources, limited expertise, and less organized crisis management (Kwon and Kwak, 2022).

To support sport organizations' transition towards financial sustainability, some regulations have been enacted (Breitbarth et al., 2023). For example, to counteract football clubs' financial misconduct and ensure their economic sustainability, the UEFA (Union of European Football Associations) issued the Financial Fair Play (FFP), a regulation that supports clubs in conducting economic activities properly, ensuring them equal opportunity to win and maintain financial stability. This measure states that "clubs should at least report their financial results as meeting the break-even principle and meeting the accounting standards applicable in the country of the competition" (Yusmita and Hafiz, 2023, p.128). It is worth noting that the FFP is not mandatory; consequently, clubs can decide whether to enact and to what extent to implement it.

Together with the FFP, the Sustainable Finance Disclosure Regulation (SFDR), issued by the EU in 2019 and enacted in 2021, supports clubs in regulating the sustainability of their financial activities.

Apart from the financial sustainability, football clubs are also starting to invest in environmental and social sustainability initiatives, working, for example, to reduce the environmental impact of events in terms of energy and water consumption or waste management. However, the way leagues and clubs address these issues remains fragmented and far from being institutionalized (Daddi et al., 2022).

To date, the growing public pressure is pushing clubs also towards a deeper commitment to social sustainability, which is related to the main "umbrella" dimensions of football equity and inclusion (Teplitz, 2025), and its issues (e.g., gender diversity, assaults and scandals, equity, inclusion, bullying, etc.) (Clarkson and Philippou, 2024). Even though there is growing public interest in football social accountability, not all teams are concretely involved in such initiatives, and, above all, not all teams are open and willing to disclose their social sustainability efforts.

However, some clubs and leagues (e.g., La Liga) are increasingly working on equity and inclusion by implementing community-based initiatives and integrating sustainability into their decision-making process and strategic planning (Chopra et al., 2024).

To support clubs in sustainability disclosure, the EU recently issued "more comprehensive and detailed reporting requirements, such as the principle of double materiality, the integration of sustainability information into management reports, mandatory external assurance, digital tagging of reported data, and, crucially, the obligation to report in line with the European Sustainability Reporting Standards (ESRS)" (Raimo et al., 2025, p.5). The ESRS are based on several environmental, social, and governance issues (e.g., climate change, biodiversity, human rights, etc.), which are also related to the International Sustainability Standards Board (ISSB) and the Global Reporting Initiative (GRI). Even though this makes these standards able to strictly align and interact with European Union and global reporting standards (Raimo et al., 2025), few are the football clubs and leagues that voluntarily enact them.

Apart from the standards mentioned before, to address and disclose social commitment, clubs can count on specific "tools" (e.g., the sustainability report, corporate websites, or social media) to share information about their sustainable initiatives. Moreover, they can voluntarily decide to approach disclosure following specific directives and regulations, such as the Corporate Sustainability Reporting Directive (CSRD) or the Corporate Sustainability Due Diligence Directive (CSDDD), the GRI standards, and the ESGs. In 2022, to further complement these, the EU issued the CSDR, which replaced the NFRD to make sustainable reporting equivalent to financial reporting, being standardized, relevant, and reliable (Croenenberg, 2024). In particular, the clubs that enact CSRD must also respect the ESRS, integrate sustainability information in the management reports, respect the external assurance requirement, and share digital tagging of the reported information (Hummel and Jobst, 2024).

Finally, the CSDDD is intended to promote the integration of responsible and sustainable standards and practices in corporate value chains, enhancing accountability mechanisms to adhere to transparency and reporting standards.

3. Methodology

Research approach and method

This study aims to recognize the main themes at the core of the major Italian football clubs' sustainability disclosure. In doing so, the analysis will be conducted by comparing whether and how the sample clubs, the professional ones that participate in the Italian Premier League (Serie A), approach sustainability reporting and disclosure.

Drawing on the study's purpose, an inductive qualitative thematic analysis (Terry et al., 2017) has been implemented to identify and analyse the recurrent patterns of meaning identified in a specific dataset (Braun and Clarke, 2006). In doing so, a wide range of textual materials (e.g., sustainability reports, news, posts, etc.) has been analysed to identify the themes important in the description of the phenomenon under investigation, which are those that mostly recur in the selected textual resources used by the Italian football clubs to disclose sustainability commitment.

The sample textual resources were analysed by implementing an open-ended iterative search process (Finfgeld-Connett and Johnson 2013), based on: (1) searching, (2) sorting, (3) selecting, (4) acquiring, (5) reading, (6) identifying, and (7) refining.

Searching was conducted by reviewing titles and keyword occurrences to determine whether the documents' content aligns with the main topics of this study. Then, the retrieved texts were sorted and selected for screening to identify the final sample. January 2021 was set as the starting period from which the published textual material would be collected, because it represents the enactment year of some sustainability-oriented regulations (e.g., the SFDR). Other inclusion criteria were the publishing language (Italian) and the authorship (Serie A clubs).

The internal validity of the analysis was ensured by data triangulation, achieved by comparing different sources of data to confirm information gathered through corporate websites and social media. Triangulation is essential to cross-validate the achieved findings, comparing, validating, and corroborating them through multiple data sources (Denzin and Lincoln 2011).

Specific content units (or 'observation' in inferential statistics) were defined, while the sentence was considered the unit of analysis to set the limits on the information to be considered. Two researchers worked independently and checked the texts to correct any eventual coding errors. As stated, to ensure internal validity, data were triangulated (Houghton et al. 2013) to test the observations of the thematic analysis and reduce researchers' subjective influence.

4. Prelimary results

The preliminary analysis of the sample document and online textual resources (e.g., corporate websites and social media articles and posts) has confirmed the results of previous research, according to which the Serie A lags behind the other European major leagues (e.g., La Liga, Premier League, Bundesliga, Ligue 1) (Piedepalumbo et al., 2024). This is because Serie A clubs do not strategically approach sustainability, but rather still consider it as something voluntary and episodic.

The preliminary analysis made it possible to recognize that Italian football clubs have achieved different sustainability levels, characterized by different commitment, initiatives, and tools, as well as different disclosure strategies. It follows that the sustainability maturity level of these clubs ranges from initial to complete; thus, the different stages have been defined as beginner, elementary, satisfactory, and complete (Meza-Ruiz et al., 2017).

It is worth noting that to achieve a complete sustainability maturity, clubs must not only address all three dimensions of sustainability but also use the main tools and measures to operationalize and communicate their social sustainability-oriented effort. Drawing on these considerations, it is possible to classify the 20 analyzed Italian clubs as follows.

Only two clubs (Juventus and A.C. Milan) have reached complete sustainability maturity because, over time, they have enacted initiatives intended to address economic, social, and environmental sustainability. They have also developed and published the corporate Ethics Code, and incorporated their CSR effort into the sustainability strategy, disclosed in the Sustainability Report. In particular, Juventus has approached sustainability and social sustainability disclosure following the European CSRD and the ESRS (European Sustainability Reporting Standards).

A singular situation characterizes a club named Cagliari, which in the past realized and published the sustainability report, while recently has switched to a less complete approach to sustainability disclosure, publishing just the Ethical Code.

Three clubs (Bologna, Roma, Udinese) have demonstrated a satisfactory level of sustainability commitment and disclosure, being involved in the first enactment of the main principles of the UEFA sustainability principles. However, the effort these clubs put into sustainability and social sustainability is still far from being institutionalized.

Most of the major Italian clubs have demonstrated an elementary level of sustainability maturity; thus, these eleven clubs have decided to report their effort in a specific sphere of sustainability through the Ethic Code (Atalanta, Fiorentina, Lazio, Napoli, Pisa, and Verona), or the CSR strategy (Como, Genova, Inter, Parma, and Sassuolo).

Finally, some clubs (Cremonese, Lazio, Lecce, and Torino) have been classified as beginners because they do not approach sustainable initiatives holistically and strategically. Thus, they report just about punctual initiatives pointing to contribute to a specific sustainable and/or responsible project, often ideated and promoted by other organizations (e.g., supporting environmental protection, inclusion, gender diversity, etc.).

These preliminary results, which will be further supported by the results of the thematic analysis, demonstrate that very few of the Italian major clubs have strategically approached

sustainability, doing so at an individual and voluntary level, not following any directive or official guideline.

The two most mature clubs (Juventus and A.C. Milan) are also those with the most formalized business organization, and with a long-lasting effort to address sustainability and social sustainability issues. In particular, Juventus has established a specialized team dedicated to sustainability and strategic planning, as well as a sustainability committee responsible for achieving sustainability KPIs (Key Performance Indicators) and goals. This makes the club a national pioneer in implementing and disclosing social responsibility and sustainability efforts (Profumo et al., 2024). It follows that Juventus' sustainability effort has led the club to achieve the Best Social Performance category and the third best role model of the global sustainability index of sport organisations (Global Sustainability Benchmark in Sports, 2022).

5. Implications and final remarks

The debate around football sustainability has been intensified in recent years, attracting the interest of people, practitioners, and policymakers at a global level (Trail and McCullough, 2020). Thus, growing research has highlighted that "sport and sustainability are increasingly being linked together in efforts to promote environmental stewardship and social responsibility" (Safarpour et al., 2025, p.3). Integrating sustainability into sport management and practice is not only aimed at reducing their environmental impact (e.g., emissions, climate change, natural resource consumption, etc.) but also to inspire and engage communities in socially responsible initiatives.

Drawing on these considerations, this paper investigated the approach of Italian football clubs to the disclosure of sustainability and, in particular, of social sustainability. Even though this represents a preliminary investigation, which will be further exploited by a punctual thematic analysis, it offers an initial snapshot of how the Italian football clubs address sustainability, focusing on their commitment to social sustainability initiatives. In doing so, the achieved results demonstrated that Italian football clubs' commitment towards sustainability is still fragmented. Thus, few clubs have demonstrated a fully mature or strategically oriented approach to it and a focus on socially sustainable initiatives, while most of them are still trying to develop a sustainability-oriented mindset, for example, enhancing their compliance with the main national and international regulations and standards. This also represents a permanent challenge for institutional actors (e.g., the national league, government, etc.), who should be more open and proactively oriented to support clubs, especially the smallest ones, in their ameliorative journey towards complete sustainability maturity (Meza-Ruiz et al., 2017). This opens to interesting implications, which can support managers and policymakers in better addressing 1) the main issues that affect football at the societal level (e.g., education, racism, inclusion, diversity, mental health, medical costs, etc.), and 2) the effects that football can have on the other two spheres of sustainability, the economic and environmental one.

This study does not come with any limitations. Thus, the main ones are related to the preliminary nature of this contribution, which is the first step of a wider and deeper research, and to the low level of generalizability of the achieved findings. This limitation will be addressed by conducting further cross-country comparative analyses.

Does it Pay to Be Good in Italy? Exploring the Relationship Between ESG Performance and CFP

Alberto Sinatra[1], Elisa Rita Ferrari[2], Giuseppe Davide Caruso[3]

1. Introduction

In recent years, the issue of corporate sustainability has become central to scientific and managerial debate, due to the evolution of European regulations, the growing attention of institutional investors, and the systematic inclusion of ESG (Environment, Social, Governance) factors in capital allocation processes.

Despite the spread of ESG metrics, the literature does not converge on the actual impact of sustainability on corporate financial performance.

The most authoritative reviews (Margolis & Walsh, 2003; Friede, Busch & Bassen, 2015) show mixed results: while many research report a positive correlation, there is also evidence of no or negative correlations attributed to the costs of responsible initiatives, the difficulty of measurement, or different time horizons of impact.

This fragmentation points to an open question: to what extent does ESG performance represent a robust determinant of corporate profitability, especially in regulated contexts characterized by high stakeholder pressure, such as Europe.

Furthermore, the most recent literature emphasizes the importance of focusing on the ESG scores of individual companies, rather than composite market indices, to avoid aggregation and mis-measurement problems (Berg, Kolbel & Rigobon, 2022).

In light of these considerations, this study analyzes the relationship between ESG performance and profitability indicators (ROA, ROE, ROI) of companies included in the MIB ESG Index for the period 2021-2025. The objective is to test the hypothesis that better ESG performance is associated with significantly higher financial performance, ceteris paribus, consistent with the view that sustainable practices generate reputational advantages, risk reductions, and more effective stakeholder relationship management (Porter & Kramer, 2006; Luo & Bhattacharya, 2006).

The expected contribution is twofold: on the one hand, the work contributes to the academic debate by providing updated evidence on a market characterized by strong regulatory pressure and significant changes in reporting standards. On the other hand, it addresses one of the most significant methodological issues in ESG studies: the choice of reliable corporate metrics, in this case represented by ESG scores from specialized agencies, avoiding the misuse of composite market indices.

2. Literature Review and Theoretical Framework

2.1. Conceptual evolution: from CSR to ESG

[1] Dottore di ricerca, ECON-06/A, Università degli Studi di Enna "Kore"; alberto.sinatra@unikorestudent.it – corresponding author

[2] Professoressa associata, ECON-06/A, Università degli Studi di Enna "Kore"; elisarita.ferrari@unikore.it

[3] Ricercatore, ECON-06/A, Università degli Studi di Catania; gdcaruso@unict.it

The scientific debate on corporate social responsibility has its roots in the late 1960s, but it was with the contributions of Carrol (1979) that the concept of Corporate Social Responsibility (CSR) took on a structured and multidimensional form, articulated in economic, legal, and ethical components. In this initial phase, however, CSR remained a predominantly normative construct, lacking systematic mechanisms for assessing its economic effects. In the 1990s, Wood (1991) proposed the Corporate Social Performance (CSP) framework, with the aim of overcoming the vagueness of CSR through the introduction of observable and measurable elements. CSP represents a first attempt to translate social responsibility into verifiable policies, processes, and results.

The next step – decisive for empirical literature – came with the introduction of the ESG paradigm, promoted by the UN in 2005 through Who Cares Wins. ESG differs from both CSR and CSP in its more markedly financial orientation: it has become the tool with which investors assess the risks, opportunities, and management quality of companies.

This transformation has a twofold effect: on the one hand, it creates a common language between management and financial markets; on the other, it introduces the complex issue of measurability, as ESG scores vary significantly depending on the methodologies adopted and the rating agencies (Chatterji et al., 2016; Berg, Kolbel & Rigobon, 2022).

2.2. Empirical evidence on the ESG-CFP relationship

There are numerous studies on the relationship between sustainability and financial performance, covering very different periods, methodologies, and contexts.

One of the most recurrent findings in meta-analyses (Orlitzky, Schmidt & Rynes, 2003; Busch & Bassen, 2015) is the prevalence of a positive association between sustainability initiatives and financial performance, especially in studies that adopt indicators capable of assessing returns in relation to the risk incurred by the company, rather than in purely accounting or absolute terms. However, the most recent literature tends to introduce greater caution.

Studies such as Awaysheh et al. (2020) highlight that a significant portion of empirical analyses produce null or statistically insignificant results, suggesting that the ESG effect is not automatic and that the benefits may depend on contingent factors: sector, internal governance, quality of disclosure, regulatory shocks, or phases of the economic cycle.

There is also evidence of negative relationships, especially in the short term, attributed to the costs of implementing complex environmental or social practices (Baron, Harjoto & Jo, 2011). This perspective, known as the "trade-off view," holds that ESG can temporarily reduce profitability, especially if sustainable initiatives are not integrated into strategic processes or if they respond more to compliance logic than to actual competitive opportunities.

A crucial point concerns measurement.

The study by Berg, Kobel & Rigobon (2022) highlights that convergence between ESG rating agencies is surprisingly low, with correlations often not exceeding 0.6. This methodological divergence has direct consequences on empirical studies, as it can generate different results depending on the agency used, a factor that explains part of the inconsistency observed in the literature.

Furthermore, a growing body of research emphasizes the need to use ESG scores at the company level, rather than market indicators or aggregate indices, to reduce the risk of distortion arising from sector compositions or capitalization-based weightings.

3. Theoretical framework

The interpretation of the possible link between ESG performance and economic and financial results can be understood through a combination of institutional and informational dynamics that influence both corporate behavior and investor perception.

First, Legitimacy Theory offers a relevant interpretative key: according to Suchman (1995), organizations operate within a system of normative and social expectations on which their "license to operate" depends. In contexts such as Europe, characterized by high regulatory pressure on sustainability, companies develop ESG practices to demonstrate compliance with these expectations and preserve their institutional legitimacy.

This process reduces reputational risk, mitigates potential tensions with stakeholders and authorities, and can contribute to more stable economic results in the medium term, reflecting positively on indicators such as ROA and ROE.

At the same time, Signaling Theory (Spence, 1973) helps us understand how ESG scores published by rating agencies serve as signals about the quality of governance, risk management capabilities, and strategic orientation of a company. The literature shows that these signals significantly influence investor behavior, reducing information asymmetries and contributing to lower capital costs (Chatterji et al., 2016; Christensen, Serafeim & Sikochi, 2022).

In markets where sustainability is an integral part of decision-making processes, a high ESG score is interpreted as an indicator of reliability and transparency, with direct implications for the financial valuation of the company.

These two perspectives, institutional and informational, do not operate separately, but reinforce each other: the search for legitimacy drives companies to develop ESG practices, while their structured communication through scores and ratings allows the market to recognize and evaluate these efforts.

Sustainability thus becomes a mechanism through which the company builds credibility externally, improves risk management, and consolidates trust-based relationships with investors. In this sense, ESG is not simply a set of ethical practices, but a strategic device that mediates the relationship between companies, institutions, and the market, measurably influencing their financial performance.

Development of the research hypothesis

The set of dynamics described in the previous paragraph allows us to formulate a clear theoretical rationale for hypothesizing a positive association between ESG performance and economic and financial results.

On the one hand, Legitimacy Theory suggests that companies that adopt practices consistent with institutional and regulatory expectations receive implicit recognition that reduces the risk of sanctions, disputes, regulatory pressure, and reputational damage (Suchman, 1995).

In a context such as Europe, characterized by significant developments in the regulatory framework on sustainability, this legitimacy takes on a particularly important role: companies that demonstrate a credible commitment to ESG are more aligned with the demands for transparency and social responsibility, with positive implications for operational stability and the continuity of economic results.

On the other hand, the signaling mechanisms described by Signaling Theory suggest that ESG scores represent, in the eyes of investors, summary indicators of management quality, the soundness of internal processes, and the company’s ability to anticipate and manage emerging risks (Spence, 1973).

ESG assessments carried out by specialized agencies help to reduce information asymmetries and provide reliable signals on corporate environmental, social, and governance policies, thus influencing both portfolio decisions and the cost of capital (Chatterji et al., 2016; Christensen, Serafeim & Sikochi, 2022).

In this context, companies with high ESG scores are often perceived as less risky and more transparent, with possible positive effects on financial performance.

These two perspectives – institutional and informational – converge in suggesting that sustainability is not just a set of ethical or philanthropic initiatives, but a strategic lever that affects

value creation through risk management, uncertainty reduction, stakeholder relationship strengthening, and corporate reputation improvement.

This implies that, at least in theory, an improvement in ESG performance should be reflected in stronger economic results, especially when considered through operating profitability indicators such as ROA, ROE, and ROI, which are sensitive to the combined effects of management effectiveness, operating efficiency, and credibility with investors.

In light of these considerations, this study formulates the following research hypothesis:

H1: Better ESG performance is associated with significantly higher financial performance. This hypothesis will be tested empirically, using panel data relating to companies belonging to the MIB ESG Index in the period 2021-2025, with the aim of verifying whether the theoretical framework outlined is reflected in the economic and financial results observed in a market particularly sensitive to sustainability issues, such as the Italian market.

4. Data and Sample

The empirical analysis is based on a dataset constructed through several steps that are methodologically consistent with the recommendations of the ESG-CFP literature. Since the MIB ESG Index was introduced in 2021 and is subject to quarterly review, the first step involves constructing the index composition for each quarter, following an approach similar to that adopted in studies requiring dynamic tracking of ESG indices (Derwall et al., 2005; Statman & Glushkov, 2009). This procedure allows us to distinguish between companies with stable presence and companies subject to turnover, reducing the risk of distortions due to transitory effects or idiosyncratic shocks.

The final sample consists exclusively of companies present in all quarters since the creation of the index.

This choice is consistent with the recommendation in ESG literature to limit structural heterogeneity and reduce reverse endogeneity problems attributable to short-term changes in the composition of indices. Companies with a stable presence are, in fact, a more suitable subset for assessing structural and non-episodic relationships between sustainability and economic and financial performance.

Data on the main Corporate Financial Performance (CFP) indicators – ROA, ROE, ROI – are extracted from the AIDA database. The use of annual accounting indicators is well established in ESG-CFP literature, which considers these measures particularly suitable for capturing the operational efficiency and internal profitability of a company, unlike stock returns, which are more sensitive to market dynamics and speculative components (Orlitzky, Schmidt & Rynes, 2003).

The main independent variable is the ESG Score at company level provided by specialized agencies.

This choice is supported by extensive literature that warns of the limitations of using aggregate indices as proxies for corporate sustainability. Relevant studies on the subject show that market-level ESG indices incorporate exogenous components (capitalization, sector structure, weightings) that distort the CSR/ESG measurement of the company (Berg, Kolbel & Rigobon, 2022; Chatterji et al., 2016).

Furthermore, measurement at the company level reduces mis-measurement problems and allows for a more accurate analysis of the relationship between ESG and financial performance, in line with the latest methodologies adopted in empirical studies on sustainability.

To test the research hypothesis, the empirical analysis involves conducting OLS regressions separately for each year within the considered period. This approach is widely used in studies aiming to reduce the influence of intertemporal shocks or unobservable structural changes and allows us to isolate the association between environmental, social and governance (ESG) performance and economic and financial results within each financial year.

This approach does not assume homogeneity of effects over the entire time period.

Using annual regressions also mitigate the risk of confounding factors arising from systemic events, regulatory changes or macroeconomic dynamics that could affect multiple years of observations simultaneously. Therefore, analyzing each year as an independent cross-section avoids the overlap of heterogeneous temporal effects, which is a particularly relevant issue in ESG-CFP studies where the estimated relationship can vary significantly in response to changes in the institutional context (Awaysheh et al., 2020; Eccles, Ioannou & Serafeim, 2014).

At the same time, the separate estimate enables us to observe how the ESG-CFP coefficient evolves over time and verify whether the association is stable, increasing or decreasing, or statistically insignificant in certain years. This temporal perspective is particularly useful during a period characterized by significant regulatory transitions in the field of sustainability.

Overall, the adopted strategy enables a more granular and transparent evaluation of the relationship between the ESG Score and financial performance. It ensures the robustness of the sample definition and aligns with the best methodological practices recommended by contemporary literature, particularly when the aim is to capture year-on-year variations rather than estimate an aggregate average effect.

5. Methodology

The empirical analysis adopted in this study is based on the estimation of a series of independent OLS regressions, conducted separately for each year of the period 2021-2025. This methodological configuration allows for a precise assessment of how the association between ESG performance and economic and financial results varies over time, preventing the estimates from being jointly influenced by macroeconomic shocks, regulatory changes, or heterogeneous market conditions between the years considered, as widely recommended in studies that favor within-year analysis to mitigate unobservable exogenous effects (Petersen, 2009; McWilliams & Siegel, 2000)

The decision not to adopt a traditional panel model stems from two fundamental methodological requirements: (i) to observe the stability or variability of the ESG-CFP coefficient over time, in line with research highlighting how the link between sustainability and performance can change depending on the regulatory context and economic cycle (Awaysheh et al., 2020; Eccles, Ioannou & Serafeim, 2014); (ii) to reduce the possibility that systemic events – such as inflation and regulatory revisions – generate spurious correlations between different years, a risk explicitly reported in the applied econometric literature (Woolridge, 2010).

For each year t, the following cross-section equation is estimated:

$$CFP_i^{(t)} = \alpha_t + \beta_t + ESG_i^{(t)} + \varepsilon_i^{(t)}$$

where $CFP_i^{(t)}$ represents, alternatively, ROA, ROE, or ROI of company i in year t while $ESG_i^{(t)}$ indicates the ESG Score assigned in the same period. The coefficient ßt measures the association between sustainability and financial performance within the year, allowing for a comparable and methodologically transparent analysis of the evolution of the ESG-CFP relationship over time. The use of accounting indicators as measures of Corporate Financial Performance is consistent with established literature, which highlights their ability to represent the operational efficiency and internal profitability of the company, reducing the influence of speculative components typical of market returns (Orlitzky, Schmidt & Rynes, 2003; Margolis & Walsh, 2003).

On this point, numerous studies confirm that ROA and ROE are robust proxies for analyzing the effects of ESG strategies on corporate performance (Waddock & Graves, 1997; Barnett & Salomon, 2012).

The annual regressions are also replicated by progressively including a set of control variables – including company size, financial leverage, and sector – in line with methodological recommendations aimed at reducing the risk of omitted variable bias (Roberts & Whited, 2013). This procedure allows us to isolate the effect associated with ESG scores more accurately, ensuring that the estimates do not reflect persistent structural differences between companies.

This approach is also consistent with the literature on ESG measurement, which points out that, despite their heterogeneity across agencies, company scores are the most appropriate tool for analyzing the ESG-CFP relationship, avoiding the distortions generated by aggregate indices and their weighting by capitalization (Chatterji et al., 2016; Berg, Kolbel & Rigobon, 2022).

Overall, the strategy adopted allows us to explore the ESG-CFP relationship from a comparative time perspective, verifying the robustness and stability of the coefficient ßt throughout the entire period considered and allowing us to interpret any variations in light of regulatory, institutional, and macroeconomic changes that have taken place in the Italian and European context.

6. Implications

The expected results of this study have significant implications at the scientific, managerial, and regulatory levels.

On the scientific side, the study helps to clarify the role of ESG performance as a possible determinant of corporate profitability in a context – that of Italy – characterized by strong regulatory pressure and the growing integration of sustainability factors into investors' decision-making processes.

Empirical evidence supporting a positive relationship would reinforce the idea that sustainability is a strategic lever capable of generating value through better risk management, greater transparency of information, and stronger institutional legitimacy.

From a managerial perspective, the analysis aims to provide useful guidance for listed companies: a stable presence in the MIB ESG Index could be interpreted not only as a reputational signal, but also as an element associated with better economic results in the medium term, encouraging more substantial investments in environmental, social, and governance practices.

Finally, in terms of public policy and regulatory debate, the study aims to contribute to assessing the effectiveness of ESG indices as market tools for promoting the reallocation of capital towards more sustainable companies, offering useful insights for reflecting on the consistency between mandatory disclosure, standardization of metrics, and the overall functioning of financial markets.

The integration of sustainability into SME strategy: an Italian case study

Fabio Nappo[1], Federico Schimperna[2], Sara Gigli[3]

1. Purpose

In the contemporary globalized economy, Environmental, Social and Governance (ESG) issues affect stakeholders' investment choices (Amstrong et al., 2020; Huang et al., 2022; Casciello et al., 2025), creating pressure on companies to commit to a sustainable behaviour (Gray et al., 2006; Paolone et al., 2022). The term ESG first appeared in 2004, in a United Nations (UN) report (Mahmood et al., 2025). In the most used frameworks, pollution, emissions, biodiversity, energy consumption, water usage, and waste management are examples of environmental factors. Social factors include human rights, workforce issues, gender rights, discrimination, and inequality; while governance factors cover the issues concerning management and the board (Loizzo and Schimperna, 2022).

Over the years, many studies investigated i) the effects of incorporating sustainability issues into corporate strategy and behaviour; and ii) why and how to make this inclusion. Focusing on the first perspective, the relationship between corporate sustainability and financial performance is one of the most interesting aspects investigated by researchers. In particular, positive correlation was found by various studies that highlighted how proactive environmental and social policies are often associated with higher financial returns and competitive advantages (Burnett and Hansen, 2008; Erhemjamts et al., 2013; Rodgers et al., 2013; Gallego-Álvarez et al., 2015). Moreover, it should be noted that sustainability can lead to economic benefits thanks to the creation of unforeseen opportunities (Fombrun et al., 2000; Cheng et al., 2014).

Moving to the second point, according to Lozano et al. (2015), the introduction of sustainability considerations into corporate strategies and behaviour relies on many supporting theories, among them the agency theory, the evolutionary theory, the resource-based view (RBV) theory, the stakeholder theory, and the social contract theory. The agency theory describes the agency relationships between the principal, who engage and transfer authority, and the agent, who acts on behalf of the principal (Jensen and Meckling 1976). In this scenario, the introduction of sustainability considerations can help meet the principal's expectations, allowing costs to be reduced and benefits/profits to be increased. The evolutionary theory suggests that the most profitable companies drive the least profitable ones out of the market (Nelson and Winter, 1982). Thus, companies are encouraged to develop medium- to long-term strategies that also consider sustainability to strengthen their market position.

Moving to RBV theory, it considers the company as an entity with interlinked internal resources that provide it with a competitive advantage (Penrose, 1959; Conner and Prahalad, 1996). The selection and development of valuable and proactive internal resources is essential to keep pace with market demands. In this scenario, when internal resources perceive new sustainability-related needs, they become a driver of change in corporate strategy and behaviour. Focusing on the stakeholder theory, companies must meet the needs of many stakeholders

[1] University of Cassino and Southern Lazio; f.nappo@unicas.it – corresponding author

[2] University of Cassino and Southern Lazio; federico.schimperna@unicas.it

[3] University of Cassino and Southern Lazio; sara.gigli@unicas.it

(Freeman, 1984). For this reason, given that society in general is demanding ever greater attention to environmental and social issues, companies are called upon to make a positive contribution in these areas.

Lastly, according to the social contract theory, companies have an ethical obligation to enhance societal welfare (Coase, 1937; Hasnas, 1998). Therefore, companies have an obligation towards society, including from a sustainability perspective, considering that society itself is ultimately responsible for granting or revoking the "operating licence". Additionally, focusing on how to include and implement sustainability and ESG factors in a company, Eccles et al. (2012) suggested that it should be based on: i) reframing the company's identity; ii) codifying the new identity; and iii) building a supportive organisational culture.

More in detail, the first step – reframing the company's identity – is composed of leadership commitment and external engagement. Through leadership commitment, it is possible to drive the change, while the external engagement strengthens the company's mechanisms of execution, as pressure from stakeholders drives the company to improve its quality constantly. The second step – codifying the new identity – means creating internal support for the new identity through employee engagement and implementation mechanisms. Overall, the codification of a sustainable company's new identity will strengthen (or establish) a culture based on trust, changeability, and innovation. Thus, the final output is an open, supportive corporate culture that embraces change from a sustainability perspective.

In light of the above considerations, our research question is as follows: How does an Italian SME operating in the flour industry integrate sustainability principles into its strategy and behaviour?

2. Design/methodology/approach

To answer our research question, we conducted an exploratory case study on a small and medium-sized Italian enterprise (SME) operating in the flour industry. The Yin's (2014) case study methodology allows us to identify and acknowledge the relationships between variables in complex processes (Shah and Corley, 2006; Lombardi et al., 2019). This methodology is entirely suitable for this research because a case study is functional when "a how or why question is being asked about a contemporary set of events over which the investigator has little or no control" (Yin, 2014, p. 14).

According to Yin's methodology, a research protocol has been designed to ensure reliability. In particular, we defined the people to be interviewed, the average expected length of each interview, and the questions to be asked. Data were collected from semi-structured interviews with the company's board members. We opted for this tool because a semi-structured interview envisages "prepared questioning guided by identified themes in a consistent and systematic manner interposed with probes designed to elicit more elaborate responses" (Qu and Dumay, 2011, p. 246). The interviews have followed a closed-ended multiple-choice questionnaire with some open-ended items.

We analysed the retrieved data following the framework by Lombardi et al. (2019). The choice of this framework depends on its ability to provide an analytical structure that can be transferred to other contexts. Following this framework, we examine the analysed SME (who), the objectives pursued (what), the strategic motivations behind integrating sustainability (why), and the processes implemented to achieve them (how). To achieve investigator triangulation, we discussed the results together. Then, we produced a draft of the results; lastly, we discussed it with the respondents to validate our findings.

3. Findings

The analysed company is an Italian SME operating in the flour milling sector. Particularly, it transforms wheat into flour. Its production activity is located in central Italy, but the company also exports its products to Asia and America (who dimension).

The company is currently in the early stages of its sustainability journey, having integrated this dimension into its mission and strategy in less than three years. More specifically, the company has decided to innovate its internal processes to strengthen transparency, enhance stakeholder engagement, and foster long-term value creation. In addition, it considered it useful to start preparing a non-financial report on a voluntary basis. Even if the company is not legally required to disclose sustainability-related information to the market, it chooses to do so proactively to enhance communication with its stakeholders and demonstrate the positive results achieved beyond its financial performance (what dimension).

The strategic motivations behind integrating sustainability are different. Firstly, in response to the increasingly articulated expectations expressed by its stakeholders, the company initiated a broader process of organisational and managerial innovation. This evolution reflects a shift from a purely economic and financial perspective to a more integrated view of value creation, in which social, relational, and operational aspects are also considered relevant drivers of performance. The firm has therefore revised some of its internal processes, strengthening monitoring and coordination mechanisms. Such actions are consistent with the strategic intent described in the What dimension, where the role of stakeholder pressure and emerging sustainability needs is recognised as a catalyst for change.

In parallel, with the objective of improving communication quality with stakeholders, the company decided to prepare a voluntary non-financial disclosure. Although the analysed SME is not subject to any regulatory obligation regarding sustainability reporting, management acknowledged that providing structured information on non-financial outcomes could enhance transparency, credibility, and dialogue with external audiences. This initiative enables the firm to present the positive non-financial results achieved, which would otherwise remain partially invisible when relying solely on traditional financial documentation. Therefore, the introduction of a voluntary sustainability report represents not only a response to stakeholders' interests but also a strategic tool to convey the broader contribution generated by the company and to strengthen its positioning as a responsible and forward-looking market actor.

Secondly, the CEO considers integrating sustainability as a means of achieving competitive advantage. In a period where most companies in the same sector and of similar size do not integrate sustainability in their core business and practices, immediately meeting the new needs of stakeholders and being proactive could be a key element for business competitiveness (why dimension).

The analysed SME demonstrated a strong sensitivity toward environmental and social issues. Over the past three years, the company has undertaken several investments to integrate sustainability into its operations and governance. First, resources have been allocated to enhance internal processes and infrastructure, including the installation of a 500-kW photovoltaic system designed to reduce the company's reliance on non-renewable energy sources. Secondly, the company has also funded research activities, such as a research grant in the field of sustainability reporting, demonstrating its willingness to develop knowledge and tools that support its transition.

Regarding human capital, the company places particular emphasis on worker well-being, considering it a core element of its ethical and managerial philosophy. Continuous training courses are regularly organised to enhance employees' skills and stimulate engagement in sustainability-related practices. These actions reflect a broader strategic approach that recognises personnel as a fundamental driver of organisational performance and innovation.

Although ESG targets have not yet been fully defined, the company is currently working to establish them. During this transitional phase, performance is monitored through periodic reporting to top management and through internal information systems. In addition, the enterprise holds several product-quality certifications, such as UNI EN ISO 9001:2015, UNI EN ISO 22005,

and IFS (International Featured Standards), which contribute to strengthening market credibility and stakeholder trust, despite the absence of a designated sustainability manager, a role currently assumed directly by the CEO.

Regarding disclosure, since 2024, the company has voluntarily published a sustainability report aligned with the GRI standards, positioning itself among the first firms in its sector to adopt this practice. The process proved challenging, especially in the initial stages, mainly due to difficulties in collecting complete and comparable data. Reporting activities are supported by the CEO through a top-down management approach, and significant economic and professional resources have been devoted to structuring the reporting system as well as to broader ESG projects. Overall, the main limitation identified concerns the reliability and availability of non-financial data necessary for comprehensive disclosure. For the future, the company aims to enhance the process in place to better achieve its strategic objectives by improving its sustainability performance and communication (how dimension).

4. Originality/value

This study makes a valuable contribution to the debate on integrating sustainability into companies' managerial strategies. In particular, our study shows that in order to respond to the ever-increasing and pressing sustainability demands of the market and stakeholders, SMEs are also seeking to adapt their strategies and behaviour. Furthermore, it differs from other studies as it shows some practices that can be implemented by an SME in order to innovate in terms of sustainability. Thus, these findings are valuable for managers, investors, academics, and policymakers, as they help them understand the emerging ESG practices relating to SMEs.

However, it has the following five limitations: i) it relies on a single case study approach; thus, the findings are difficult to generalize; ii) data collection was carried out solely through a questionnaire with a limited number of questions; iii) the limited number of respondents; iv) the focus on a specific sector; and v) the consideration of the only Italian national context. Future research aims to overcome these limitations, considering a broader number of SMEs operating in different sectors and nations to gain a deeper understanding of their specific strategies and approaches. Moreover, future research will focus on trying to understand whether there are any major differences in the introduction of sustainability practices between SMEs and large/listed companies, and if so, what these differences are.

Auditing in the Age of Climate Risk: A Mixed-Methods Review of Climate-Related Assurance Research

Gaetano Rago[1], Grazia Marcello[2], Simone Sessa[3]

1. Introduction and background

Over the last two decades, the intersection between climate change and auditing has emerged as a critical research field, reflecting the growing awareness that climate-related risks and sustainability information must be subject to reliable assurance mechanisms. The increasing societal and regulatory demand for transparency and accountability in environmental performance has prompted companies to disclose non-financial and sustainability information that is material to investors, regulators, and other stakeholders.

Furthermore, Climate change is increasingly framed as a source of material financial risk, through both physical and transition channels, which affects firms' cash flows, access to finance and cost of capital. In this context, external assurance on sustainability and climate-related disclosures is expected to enhance the credibility of non-financial reporting, mitigate information asymmetries and reduce the risk of greenwashing in capital markets (Simnett et al., 2009; Perego and Kolk, 2012).

The expansion of sustainability reporting and the diffusion of voluntary assurance engagements have stimulated a growing body of research on the market for sustainability assurance services, the role of different assurance providers (audit firms vs. non-audit specialists) and the quality of assurance statements. Prior studies show that external assurance can strengthen stakeholder confidence and organizational legitimacy, but they also highlight heterogeneous assurance practices, varying levels of assurance and persistent concerns about professionalism, independence and the actual value added of these engagements (Cohen and Simnett, 2015; Farooq and De Villiers, 2017; Boiral et al., 2019). These tensions are particularly salient for climate-related information, where measurement uncertainty is high and the underlying risk exposures are complex, forward-looking and scenario-dependent.

Existing contributions have analysed how external assurance affects the credibility of sustainability reports, how auditing and assurance standards are applied to non-financial information, and how climate-related disclosures contribute to corporate accountability and risk management (Tang and Demeritt, 2018; Li et al., 2019; Dutta and Dutta, 2021). Yet, empirical and conceptual integration is still limited: most studies focus on voluntary assurance practices, on a narrow set of jurisdictions, or on selected industries, while less attention has been devoted to the evolving interplay between climate-related financial risks, regulatory developments and the institutionalization of assurance practices (Farooq and De Villiers, 2017; Hazaea et al., 2021; Zhou, 2022).

Against this background, this paper systematically reviews and maps the scientific production at the intersection of climate change and auditing. The overarching objective is to develop a systematic and integrated overview of the scholarly literature up to the end of 2024, tracing its origins, current configuration, and emerging developments across accounting, auditing,

[2] Ph.D. Candidate, ECON-06/A, University of Salerno; gmarcello@unisa.it

[3] Ph.D. Candidate, ECON-06/A, University of Salerno; sisessa@unisa.it

finance and sustainability research. In this perspective, the study is guided by two main research questions.

First, we ask how scientific output on climate change and auditing has evolved over time, which scholars, institutions and countries have been most active in this domain, and which contributions have achieved the greatest international visibility in terms of citations (RQ1).

Second, we investigate which core themes and research streams have been explored so far, whether empirical work has predominantly adopted quantitative or qualitative designs, and which avenues appear most promising for future research on climate-related auditing and external assurance (RQ2).

To address these questions, we employ a mixed methods research design (Nicolò et al., 2023; Latella and Veltri, 2024; Marzi et al., 2024; Ferraro et al., 2025), combining quantitative bibliometric techniques (Aria and Cuccurullo, 2017) with qualitative content analysis. This integrated approach enables a broad and systematic mapping of the field and makes it possible to identify the most influential publications, intellectual foundations, research clusters and emerging themes. At the same time, it provides a structured basis for advancing and orienting the scholarly debate on climate change and auditing, responding to recent calls for more structured and interdisciplinary syntheses of the assurance literature, with particular attention to climate related risks, external assurance and the evolving role of auditors and other assurance providers (Cohen and Simnett, 2015; Farooq and De Villiers, 2017).

The evolution of scientific output in this area shows a clear upward trend from 2018 onwards, in parallel with the diffusion of global and regional regulatory frameworks for climate-related reporting, such as the recommendations of the Task Force on Climate-related Financial Disclosures (TCFD), the EU Corporate Sustainability Reporting Directive (CSRD) and the International Sustainability Standards Board's IFRS S2 Climate-related Disclosures (TCFD, 2017; Directive (EU) 2022/2464; IFRS Foundation/ISSB, 2023). These initiatives explicitly foreground climate-related financial risks and opportunities and, in the case of the CSRD, progressively introduce mandatory external assurance on sustainability information. Against this backdrop, a comprehensive mapping of the literature on climate change and auditing is timely and necessary to understand how academic research is interpreting, supporting or challenging these regulatory and professional developments. The present study forms part of a work-in-progress project that will subsequently be extended to cover additional years and cross-country comparisons. The findings provide an updated and integrated overview of scholarly work on climate-related auditing and external assurance and offer valuable insights for the design and implementation of more robust assurance practices, standards, and regulatory frameworks. These results contribute to the theoretical advancement of the field by clarifying how auditing and assurance address climate related financial risks, disclosure quality and corporate accountability. They also enhance professional practice by supporting auditors, assurance providers and regulators in strengthening the credibility of climate related reporting.

The originality of this work lies in its methodological approach, which employs a bibliometric lens, complemented by content analysis, to critically examine the literature at the intersection of climate change and auditing. By synthesizing insights across accounting, auditing, sustainability, and climate-finance research, the study bridges the gap between academic debate and professional practice, offering a nuanced understanding of how climate-related auditing and assurance practices are evolving and how they can be effectively designed, contextualized, and implemented across different institutional and regulatory settings.

2. Methodology

The study is based on a three-stage mixed methods research design that combines a Systematic Literature Review (SLR), bibliometric analysis and qualitative content analysis. This protocol is intended to ensure transparency in the identification and selection of the relevant

literature and, at the same time, to provide both a structural and an interpretive understanding of research on climate change and auditing.

In the first stage, a SLR is conducted following the PRISMA framework, which structures the review process into the phases of identification, screening, eligibility and inclusion. The initial corpus of documents is retrieved from the Scopus database based on a structured search string that captures the intersection between climate change, sustainability, auditing and external assurance. Inclusion and exclusion criteria are then applied to select peer reviewed journal articles and reviews that fall within the scope of the study. The resulting set of publications constitutes the analytical foundation for both the bibliometric and the content analysis.

In the second stage, a bibliometric analysis is carried out using the R package Bibliometrix and its Biblioshiny web interface (Aria and Cuccurullo, 2017), which support the management, visualisation and evaluation of large bibliographic datasets. Performance analysis and science mapping techniques are employed to examine the evolution of scientific production, the most productive authors, institutions and countries, and the most influential contributions. Co-authorship, co-citation, bibliographic coupling and keyword co-occurrence analyses are used to reconstruct the intellectual structure of the field and to identify its main thematic clusters, thereby addressing RQ1.

In the third stage, a manual content analysis is performed on a subset of core documents within the main clusters identified by the bibliometric mapping. Using a structured coding scheme, the analysis investigates how climate related auditing and external assurance are conceptualised, which types of climate related risks and disclosures are examined, and which methodological and theoretical approaches are adopted. This qualitative step deepens and contextualises the bibliometric findings, providing richer insights into the substantive content of the literature and contributing to the answer to RQ2.

Our methodological approach is informed by the guidelines of (Zupic and Čater, 2015), (Donthu et al., 2021) and (Mukherjee et al., 2022), as well as by recent applications of scientific mapping techniques in accounting and sustainability research (Nicolò et al., 2023; Ferraro et al., 2025), which emphasise the advantages of combining quantitative and qualitative procedures for achieving a systematic understanding of academic fields. Consistent with this literature, the three-stage protocol adopted in this study is designed to ensure a reliable and reproducible analysis, supported by both statistical and textual evidence.

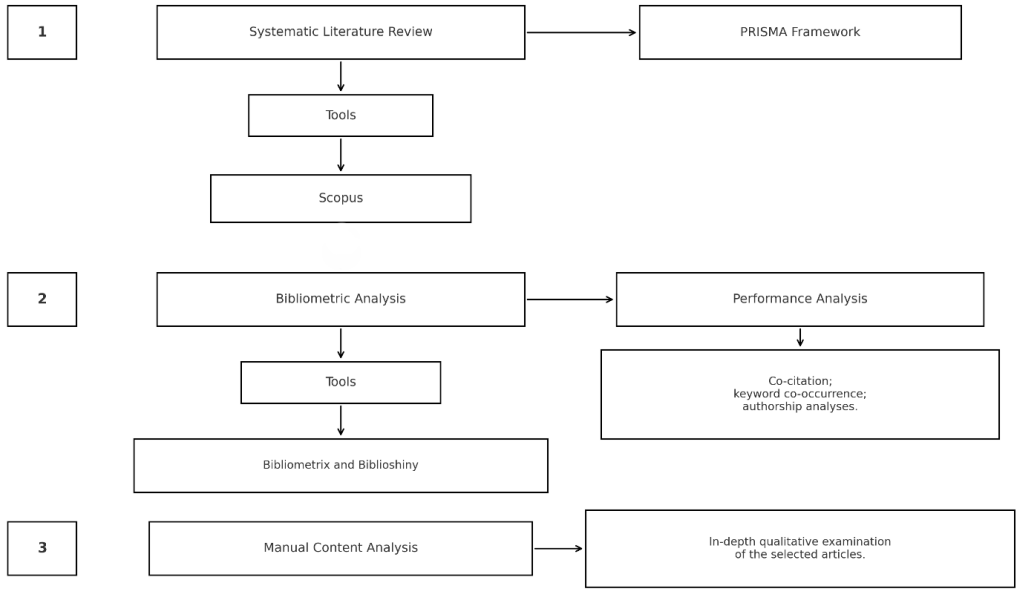

Figure 1. The research protocol

2.1. Data collection

The first step consists of a SLR conducted with reference to the PRISMA guidelines for systematic reviews (Moher et al., 2009; PRISMA Statement, 2020; Page et al., 2021). The search was carried out on the Scopus database, using a structured query that combines climate related terms ("climate change", "carbon", "greenhouse", "sustainability", "environment*") with auditing and assurance related keywords ("audit*", "assur*", "external assurance", "independent assurance").

The time window considered runs from 2000 to 2024 and the search is restricted to subject areas linked to accounting, auditing, business, management and finance. Only peer reviewed journal articles and reviews written in English are retained. After removing duplicates, the records are screened on the basis of titles, abstracts and keywords to exclude documents that do not deal with the intersection between climate (or climate related issues) and auditing or assurance. The remaining papers are read in full to verify their coherence with the research scope and the two RQs. Additional relevant studies are identified through reference list checking and citation tracking. The final set of publications constitutes the corpus used for the subsequent bibliometric and content analyses.

2.2. Bibliometric analysis

In the second step, the selected corpus is examined through a bibliometric analysis, which mainly addresses RQ1. Following the indications of (Zupic and Čater, 2015), (Donthu et al., 2021), (Mukherjee et al., 2022), and recent applications in accounting and sustainability research (Nicolò et al., 2023; Ferraro et al., 2025), we combine performance analysis and science mapping.

The analysis is implemented in R using the Bibliometrix package and the Biblioshiny web interface (Aria and Cuccurullo, 2017). Descriptive indicators such as annual scientific production, average citations per article, most productive authors, institutions and countries, most relevant journals and most cited papers are computed to assess the growth and maturity of the field.

To reconstruct the intellectual and thematic structure of the literature, we then apply document level bibliographic coupling. This technique groups articles that share common references and thus allows us to detect clusters of conceptually related contributions and the main

research streams on climate change and auditing. Where useful, keyword co-occurrence analysis is also employed to explore how climate related risks, assurance practices and auditing concepts are combined in the existing body of work.

2.3. Content analysis

To complement the quantitative mapping and address RQ2, a qualitative content analysis was conducted on a subset of core articles drawn from the main clusters identified in the bibliometric analysis. The selection focused on the most influential (highly cited) and the most recent contributions within each cluster, in order to capture both foundational and emerging perspectives.

Following the qualitative procedures suggested by (Kuckartz, 2014), we developed a coding scheme that combined deductive categories (e.g. types of climate-related risks considered, nature of the audited or assured information, characteristics of the assurance engagement, methodological approaches) with inductive theme development. This allowed us to examine how the literature conceptualises the role of auditing in climate governance, how external assurance practices are designed and justified, and which theoretical and methodological lenses are mobilised.

The integration of SLR, bibliometric techniques and content analysis strengthens the robustness of the findings: quantitative patterns observed in the mapping of the field are contextually interpreted within the broader academic debate, while qualitative insights are grounded in a systematically constructed corpus. The study is a work in progress, and future developments will extend the analysis to additional databases (e.g. Web of Science, WOS) and, where feasible, triangulate bibliometric and content-based evidence with practice-oriented insights, for example through interviews with audit and assurance professionals.

3. Results and discussion

3.1. Descriptive trends

Preliminary bibliometric evidence shows a marked increase in annual scientific production on climate change and auditing from 2018 onwards, in parallel with the introduction of major sustainability reporting frameworks and the growing salience of ESG issues in policy and practice.

Citation patterns indicate that the earliest contributions, published between 2008 and 2013, are predominantly conceptual and normative in nature, laying the foundations for subsequent empirical work. More recent papers have begun to accumulate citations at an increasing rate, signalling the consolidation of the field and its growing visibility in the wider accounting and sustainability literature.

From a geographical perspective, the most prolific countries in terms of publication output include the United Kingdom, Australia and China, alongside other European jurisdictions. These are contexts where non-financial reporting and climate-related disclosure frameworks are either well established or rapidly evolving. Co-authorship and institutional collaboration networks remain largely regionally clustered, with relatively limited cross-regional integration. This suggests significant potential for future comparative and joint research projects that systematically explore differences in institutional settings, regulatory regimes and climate risk exposure.

3.2. Thematic clusters

The document-level bibliographic coupling analysis reveals three main thematic clusters that structure the literature on climate change and auditing.

Cluster 1: Carbon accounting and assurance practices

This cluster gathers studies focusing on auditing and assurance methodologies applied to carbon accounting, greenhouse gas (GHG) emissions verification and broader sustainability assurance engagements. Contributions in this stream examine the quality and scope of assurance, differences between audit firms and specialist assurance providers (e.g., Big Four vs non-Big Four), and the implementation of standards such as ISAE 3000, ISAE 3410 and ISO 14064 in carbon-related engagements. Particular attention is paid to how assurance contributes to the credibility of carbon information and to the mitigation of information asymmetries and greenwashing risks in carbon-intensive sectors.

Cluster 2: Governance, regulation and audit quality

The second cluster explores how governance structures and regulatory developments shape climate-related assurance and audit quality. Studies in this stream analyse the role of boards, audit committees and internal control systems in overseeing climate risk disclosures, as well as the implications of regulatory changes (e.g. mandatory climate-related reporting, stewardship codes, assurance requirements) for auditor independence and professional judgement. This cluster links climate-related assurance to broader discussions on risk management, internal control and the integration of climate considerations into corporate governance frameworks.

Cluster 3: Sustainability reporting, accountability and stakeholders

The third cluster connects auditing and assurance to wider accountability mechanisms, integrated reporting practices and stakeholder engagement. Scholars often draw on legitimacy, stakeholder and institutional perspectives to explain why firms voluntarily seek external assurance on sustainability and climate-related information, and how this process contributes to maintaining or restoring organisational legitimacy. Particular emphasis is placed on the communicative function of assurance statements, stakeholder perceptions of assurance credibility, and the extent to which climate-related auditing can support informed judgement by investors, regulators and civil society.

Taken together, these clusters suggest that climate-related auditing research is organised around the interplay between technical assurance practices, governance and regulation, and broader accountability and stakeholder dynamics.

3.3. Conceptual and methodological observations

Across the three clusters, the preliminary analysis indicates a gradual shift from descriptive and conceptual contributions towards more empirically oriented and methodologically diverse studies. Early work tends to discuss the potential role of auditing and assurance in sustainability and climate governance in mainly normative terms, whereas more recent contributions employ survey-based evidence, archival data, content analysis and experimental designs to investigate audit quality, assurance materiality, user perceptions of credibility and market reactions to climate-related assurance.

At the same time, the field remains fragmented. While accounting and sustainability studies often mobilise well-established theoretical lenses such as legitimacy, stakeholder and institutional theories, audit-oriented research less frequently integrates insights from climate science, environmental governance or risk management. This limits the extent to which climate-related auditing is connected to the underlying physical and transition risks that firms face. The bibliometric mapping also highlights the dominance of Anglo-Saxon and European contexts, with

relatively few studies focusing on developing and emerging economies, despite their high vulnerability to climate change and the growing relevance of climate finance in these regions. Addressing these gaps represents a promising avenue for more interdisciplinary and geographically diversified research.

3.4. Discussion and theoretical implications

The combined bibliometric and content analyses suggest that auditing plays a dual role in the climate change discourse. On the one hand, it operates as a technical mechanism for enhancing the reliability, comparability and transparency of climate-related disclosures. On the other hand, it performs a symbolic function by signalling commitment, reinforcing corporate legitimacy and shaping stakeholder trust in firms' climate strategies.

From a theoretical standpoint, the emerging literature can be read through the lens of legitimacy and accountability perspectives. Climate-related auditing and external assurance are portrayed as mechanisms through which firms respond to institutional and societal pressures, align their reporting practices with evolving expectations and seek to secure or renew their social licence to operate. Nonetheless, the degree to which accountability is effectively enhanced depends on the scope of the engagement, the assurance level and the independence and expertise of the assurance provider. The predominance of limited assurance engagements, and the variability in assurance practices across providers and jurisdictions, indicate that a "credibility gap" may persist.

These preliminary findings are consistent with prior work that calls for more rigorous and harmonised climate-related assurance standards and for clearer guidance on the integration of climate risks into financial and non-financial audits. The growing attention to regulatory initiatives such as the CSRD, the ISSB climate standards and the IAASB's exposure drafts on sustainability assurance points to a transition from predominantly voluntary assurance regimes towards more mandatory and standardised frameworks. This evolution is likely to reshape both assurance practices and academic research agendas, opening up new questions on the effectiveness, costs and unintended consequences of climate-related auditing.

4. Conclusions and future developments

This study offers an initial mapping of the research field at the intersection of climate change and auditing, based on a combination of SLR, bibliometric analysis and qualitative content analysis. The preliminary results point to a rapidly expanding body of literature, characterised by growing conceptual diversification and increasing methodological sophistication. The three main thematic clusters identified in the bibliometric mapping reflect how the academic community is progressively addressing the contribution of auditing and external assurance to climate accountability, transparency and governance.

Our interpretation of these findings is informed by legitimacy and accountability perspectives, which provide a coherent lens for understanding how climate-related auditing and assurance contribute to organisational trust and social licence to operate. The study extends existing reviews on sustainability assurance by focusing specifically on climate-related information and by connecting auditing practices to the broader governance mechanisms and regulatory developments that underpin climate disclosure.

Given its nature, the project has several planned extensions. Future developments will:

- expand the dataset to include publications from 2025 onwards and incorporate additional databases (e.g. Web of Science);
- conduct longitudinal analyses to track the evolution of themes, methods and theoretical approaches over time;

- integrate cross-country comparisons to examine how institutional and regulatory differences shape climate-related auditing and assurance;
- and enrich the content analysis with practitioner perspectives, for instance through semi-structured interviews with auditors and assurance providers, in order to triangulate bibliometric evidence with practice-oriented insights.

The contribution of the final study is twofold. From an academic perspective, it will provide a structured and up-to-date overview of the climate change auditing literature, clarifying its intellectual foundations, mapping its main research streams and highlighting gaps and priorities for further investigation. From a practical perspective, it will inform regulators, standard-setters, audit firms and policymakers about the evolution of climate-related assurance practices and their role in supporting credible and decision-useful climate disclosures.

In conclusion, auditing is increasingly recognised as a key component of climate accountability infrastructures. As sustainability information, and climate-related disclosures in particular, become subject to stricter regulatory oversight and higher stakeholder scrutiny, the audit and assurance function is likely to play a decisive role in ensuring the transparency, reliability and legitimacy of climate-related reporting. This research contributes to that understanding and lays the groundwork for future interdisciplinary and empirically grounded studies on climate change and auditing.

Keywords: Climate change; auditing; content analysis; sustainability assurance

Rischi e costi delle strategie di fornitura: una revisione bibliometrico-sistematica della letteratura

Simone Camillieri[1]

1. Problema di ricerca

Il crescente livello di instabilità geopolitica ed economica, proprio degli ultimi decenni, ha mostrato la sua rifrazione anche con riguardo ai mercati di fornitura: si è, così, assistito a un ripensamento del ruolo e della rilevanza strategica che il procurement ha all'interno delle imprese (Blome e Schoenherr, 2011; Giunipero et al., 2018). Se, in passato, la funzione acquisti ha ricoperto una veste prevalentemente operativa ed esecutiva – ossia un ruolo limitato principalmente al soddisfacimento dei fabbisogni produttivi e alla negoziazione del loro prezzo di acquisto --, oggi, le imprese iniziano a riconoscerle una valenza strategica a sostegno della flessibilità operativa, della competitività e della capacità di resilienza economica (Nair et. al, 2015).

Un tale avanzamento sul piano teorico, tuttavia, non trova, ad oggi, un riscontro pratico, come si può evidenziare da una prima analisi esplorativa della letteratura; nelle pratiche aziendali, infatti, le decisioni di fornitura continuano ad essere valutate prevalentemente sulla base di metriche di breve periodo fondate su costi diretti e immediatamente rilevabili; siffatta prassi ha, invero, giocato un ruolo preminente nel generare una valutazione distorta delle effettive conseguenze economico-finanziarie indotte dalle strategie di fornitura (Johnson et al., 2013; Giunipero et al., 2018).

L'acme del problema risiede nella difficoltà strutturale che molte imprese incontrano nel rendere visibili, tracciabili e misurabili i fattori di rischio lungo la catena di fornitura e, dunque, tradurli in vere e proprie configurazioni di costo (Ronchi et al., 2012). Sebbene l'affermazione di normative sempre più stringenti in materia di responsabilità sociale e ambientale, molte aziende non dispongono ancora di strumenti adeguati tanto a rilevare con certezza le pratiche dei fornitori, quanto a quantificare in modo sistematico i rischi a esse associati (Villena e Dhanorkar, 2020; Chen, 2022).

A ciò si aggiunga che talune tipologie di rischio – come quelli reputazionali, tecnologici o legati alla perdita di conoscenza interna – sono per loro natura difficilmente esprimibili attraverso metriche quantitative tradizionali. Si tratta, infatti, di rischi caratterizzati da elevata incertezza e da impatti che si distribuiscono nel tempo e su una pluralità di voci reddituali (Reitzig e Wagner, 2010; Hansen et al., 2016; Pattanayak et al., 2019; Dhingra e Krishnan, 2020). Quanto appena delineato provoca, altresì, un disallineamento temporale tra la manifestazione del rischio e quella del costo; viene, quindi, a determinarsi una complessità per ciò che concerne la corretta individuazione del nesso causale che intercorre tra la scelta di fornitura e le conseguenze economiche, operative e strategiche, poiché gli effetti economici tendono a manifestarsi in fasi successive rispetto alle decisioni strategiche che li hanno originati (Larsen et al., 2013; Holweg et al., 2011; Larsen et al., 2013; Waltho et al., 2019; Zhou et al., 2021).

Seppur, a una prima valutazione, talune strategie di fornitura – quali, in particolare, il global sourcing e il low-cost country sourcing – possano apparire vantaggiose in termini di risparmio sui costi diretti di acquisto, tuttavia, come emerge dalla letteratura, ad esse, una volta intervenuto il processo valutativo, possono essere associati una molteplicità di costi nascosti; questi sono

[1] Dottorando di ricerca, ECON-06, Università di Pisa; simone.camillieri@unipi.it – corresponding author

riconducibili, ad esempio, a ritardi operativi, alle maggiori complessità logistiche, all'intensificazione dei tempi e delle risorse necessarie per l'espletamento di specifiche attività, ai problemi di qualità e alle difficoltà di coordinamento e comunicazione inter-organizzativa, i quali, risultando difficili da rilevare e ricondurre causalmente ai processi di fornitura, vengono spesso assorbiti da centri di costo generali (Weber et al., 2010; Holweg et al., 2011; Min e Kim, 2011; Gray et al., 2020). Siffatte configurazioni di costo, invero, non sembrano dipendere tanto dalla distanza geografica tra azienda acquirente e fornitori, quanto da fattori strutturali legati alla complessità organizzativa, all'introduzione di nuove interfacce di coordinamento e all'allungamento dei flussi informativi (Larsen et al., 2013). Emerge inoltre che, se non coerentemente allineate con gli obiettivi definiti a livello corporate, tali strategie di fornitura tendono ad amplificare la complessità gestionale e a generare inefficienze operativo-strategiche che si traducono in ulteriori configurazioni di costo difficilmente rilevabili e riconducibili ai processi di fornitura (Lin, 2020).

Con riferimento ai costi della qualità, errori di stima dei costi di prevenzione, valutazione, controllo e gestione possono generare rischi non rilevati in fase di pianificazione e programmazione, con effetti rilevanti tanto sul piano operativo quanto su quello strategico (Pattanayak et al., 2019). Inoltre, sebbene i costi di insuccesso della qualità possano essere, almeno in parte, prevenuti tramite attività di prevenzione, monitoraggio e audit, tali pratiche - oltre a rappresentare ulteriori componenti reddituali negative spesso non ricondotte causalmente ai processi di fornitura - non garantiscono di per sé necessariamente la piena accuratezza informativa, potendo risultare affette da asimmetrie e distorsioni sistemiche (Short et al., 2016).

Ulteriori contributi evidenziano come nei modelli di pianificazione e programmazione aziendale non vengano spesso incorporati i costi potenziali derivanti da comportamenti opportunistici di natura sociale o ambientale da parte dei fornitori, con una conseguente sottovalutazione del rischio reputazionale quale componente strutturale del costo complessivo di fornitura (Dhingra e Krishnan, 2020).

Con particolare riferimento alla dimensione ambientale, le decisioni di localizzazione, le attività di trasporto e logistica, nonché le stesse configurazioni delle reti di fornitura generano impatti ambientali rilevanti – tra il 50 e il 70 % delle emissioni industriali è, invero, riconducibile alla supply chain (Waltho et al., 2019, p. 306) - spesso non adeguatamente rilevati nei modelli contabili tradizionali. In tale prospettiva, i rischi ambientali non si configurano più come semplici esternalità, ma assumono la forma di nuovi costi emergenti, destinati ad aumentare di rilevanza con l'adozione di strumenti regolatori quali carbon tax, sistemi cap-and-trade e il Carbon Border Adjustment Mechanism (CBAM) (Waltho et al., 2019; Zhou et al., 2021). La letteratura evidenzia tuttavia come il perseguimento congiunto di obiettivi di efficienza operativa e di sostenibilità ambientale possa generare benefici sinergici e favorire miglioramenti simultanei delle performance ambientali ed economico-operative (Azevedo et al., 2012; Gouda e Seranga, 2018).

Un nodo trasversale a tali evidenze riguarda il ruolo della condivisione dei flussi informativi lungo la catena di fornitura. Il coordinamento tra flussi informativi qualitativi e quantitativi favorisce la riduzione dei rischi e dei costi ambientali e sociali (Khan et al., 2016), mentre l'efficacia della disclosure dipende dall'interazione tra pressioni istituzionali e meccanismi coerenti di controllo e coordinamento inter- e intra-organizzativo (Villena e Dhanorkar, 2020). In assenza di tali meccanismi, la trasparenza informativa tende ad assumere un carattere prevalentemente opportunistico.

A ciò si aggiungono i limiti strutturali dei sistemi di programmazione e controllo, che continuano a privilegiare la riduzione dei costi direttamente rilevabili a discapito della capacità di evitare costi futuri e incerti (Ellram e Tate, 2020). Poiché tali costi non vengono rilevati ex-ante nei sistemi di programmazione, essi restano sistematicamente esclusi dai sistemi di controllo, generando disallineamenti decisionali, conflitti inter-funzionali e comportamenti opportunistici orientati al breve periodo, con conseguente esclusione del costo complessivo di fornitura dai

meccanismi di misurazione, valutazione delle performance e incentivazione aziendale (Murfield et al., 2021).

Sul piano organizzativo, emerge infine come la responsabilità di individuazione e rilevazione dei costi e dei rischi non possa essere attribuita a una singola funzione aziendale. Sebbene il procurement sia direttamente coinvolto nelle attività di selezione, valutazione e monitoraggio dei fornitori (Nair et al., 2015), il suo contributo strategico risulta effettivo solo in presenza di una reale integrazione con i processi di pianificazione e programmazione aziendale. In assenza di tale integrazione, si osserva una marcata disomogeneità nella percezione dei fattori di rischio da parte delle differenti funzioni aziendali (Huq et al., 2020).

Si può, dunque, affermare che, a fronte di una crescente attenzione teorica con riguardo ai temi della rilevazione e gestione dei fattori di rischio lungo la catena di fornitura, permane una significativa carenza di modelli interpretativi e operativi in grado di spiegare in modo sistematico attraverso quali meccanismi tali dimensioni si traducano in configurazioni di costo e come possano essere efficacemente integrate nei processi decisionali e nei sistemi di programmazione e controllo.

In particolare, risulta ancora lontana una visione sistematica delle differenti configurazioni di costo di fornitura, nonché delle loro determinanti che ne spieghino tanto l'insorgenza quanto la manifestazione. In assenza di una chiara comprensione di quali siano i driver sottostanti, risulta, invero, complesso approfondire le logiche di analisi e gestione strategica di suddetti costi. Dalla letteratura esaminata emergono altresì lacune interpretative con riferimento alle dinamiche organizzative, relazionali e comportamentali che influenzano i processi di produzione, interpretazione e utilizzo delle informazioni di costo nei processi di fornitura.

La distanza tra ciò che la letteratura riconosce come significativo e ciò che le imprese riescono effettivamente a rilevare, misurare e governare rappresenta, quindi, il principale nodo focale del presente studio; il fine della ricerca, infatti, volge all'identificazione di un quadro concettuale atto a ricomporre la frammentazione esistente tra rischio, costo e strumenti di pianificazione, programmazione e controllo a supporto della valutazione e del governo delle decisioni strategiche di fornitura.

2. Gli obiettivi e le domande di ricerca

Alla luce delle evidenze emerse da un primo studio esplorativo della letteratura – quali il persistente disallineamento tra la crescente complessità strutturale e relazionale dei processi di fornitura e la capacità delle imprese di rilevare, misurare e governare in modo sistematico i rischi e i costi a essi associati -, il presente studio si propone di sviluppare una ricostruzione integrata dei principali fattori di rischio e delle corrispondenti configurazioni di costo nelle strategie di fornitura. In tale senso, si presterà particolare attenzione proprio a quelle dimensioni operative, organizzative, informative e ambientali che hanno la tendenza a sfuggire ai tradizionali modelli di contabilità direzionale, ancora prevalentemente orientati a configurazioni di costo direttamente osservabili nel breve periodo.

Tuttavia, lo studio non intende limitarsi al tema della rilevazione e misurazione dei costi di fornitura, ma mira altresì ad approfondire le logiche di gestione strategica di tali costi attraverso la ricostruzione delle principali determinanti (cost driver) che ne spiegano l'insorgenza e la manifestazione. Inoltre, lo studio intende indagare le ragioni strutturali, organizzative, sociali e relazionali che rendono complessa l'integrazione dei costi di fornitura nei sistemi di pianificazione, programmazione e controllo e, di conseguenza, ne ostacolano la gestione strategica.

Sulla base di quanto summenzionato, lo studio è, dunque, guidato dalle seguenti domande di ricerca:

RQ1. Quali principali ambiti tematici, configurazioni concettuali e traiettorie evolutive emergono nella letteratura sulla rilevazione, misurazione e gestione dei rischi e dei costi nei processi di fornitura?

RQ2. In che modo la letteratura ha concettualizzato il nesso tra fattori di rischio e configurazioni di costo nei processi di fornitura, e quali determinanti causali, convergenze interpretative, ambiguità concettuali e lacune di ricerca emergono da tale analisi?

RQ3. In che modo i rischi e i costi di fornitura sono stati integrati nei sistemi di pianificazione, programmazione e controllo a supporto delle decisioni strategiche di fornitura, e quali condizioni organizzative, informative e socio-relazionali ne influenzano tanto l'adozione quanto l'efficacia?

3. La metodologia di ricerca

A fronte di un ambito di studio caratterizzato da forte frammentazione teorica e da un'elevata eterogeneità disciplinare, il presente studio adotterà un approccio metodologico di revisione della letteratura di tipo bibliometrico-sistematico (Bibliometric-Systematic Literature Review, o B-SLR) (Marzi et al., 2024). Tale approccio, infatti, appare idoneo a cogliere e, al contempo, combinare le potenzialità caratteristiche dell'analisi bibliometrica – funzionale all'individuazione dei nuclei tematici, delle traiettorie evolutive e delle connessioni concettuali tra i diversi contributi disciplinari (Zupic e Cater, 2015; Donthu et al., 2021) -- con la profondità interpretativa propria della revisione sistematica della letteratura (Tranfield et al., 2003; Durach et al., 2017; Snyder, 2019).

Al fine di garantire coerenza rispetto agli obiettivi di ricerca, nonchè trasparenza e replicabilità, la raccolta degli articoli è stata condotta attraverso un protocollo strutturato, utilizzando il database Scopus, selezionato in quanto quest'ultimo rappresenta una delle principali banche dati bibliografiche a livello internazionale per ampiezza di copertura, qualità delle fonti indicizzate e rilevanza nei campi del management accounting (Tranfield et al., 2003; Snyder, 2019).

La costruzione della stringa di ricerca è stata articolata in due macro-blocchi semantici combinati tramite operatore booleano AND: il primo volto a intercettare le differenti tipologie di costo discusse in letteratura (tra cui, ai meri fini esemplificativi, hidden costs, transaction costs, cost of quality, environmental e sustainability costs), includendo sia formulazioni consolidate sia varianti terminologiche emergenti; il secondo orientato a delimitare il contesto di analisi ai processi di supply chain e procurement (come ad esempio supply chain, sourcing, purchasing, procurement). L'utilizzo del campo TITLE-ABS-KEY ha di fatto consentito di focalizzare la ricerca sugli articoli in cui tali concetti risultano centrali nel contributo scientifico.

L'applicazione della query ha restituito un dataset iniziale di 9.484 contributi, successivamente ridotto a 1.713 mediante criteri preliminari di inclusione ed esclusione (Marzi et al., 2024), quali la limitazione all'area disciplinare Business, Management e Accounting, ai soli articoli pubblicati in lingua inglese su riviste scientifiche, allo stato finale di pubblicazione e al periodo 2010-2025. Si precisa che la delimitazione temporale, fissata al periodo 2010–2025, risponde all'esigenza di focalizzare l'attenzione sulla letteratura più recente e rilevante rispetto alle trasformazioni contemporanee dei processi di procurement e delle relazioni buyer–supplier, caratterizzate da una crescente complessità, dalla diffusione del global sourcing, e più recentemente, dall'emergere di tematiche legate alla sostenibilità.

Al fine di garantire un livello adeguato di qualità scientifica, sono state successivamente considerate esclusivamente riviste classificate nel primo quartile Scimago e con un rating AJG pari o superiore a 2, riducendo il corpus a 570 articoli pubblicati su 32 riviste di riferimento (Marzi et al., 2024). Tuttavia, una fase successiva di screening, basata sulla lettura di titoli, abstract e parole chiave, ha evidenziato la necessità di escludere una quota rilevante di articoli non coerenti con gli obiettivi della ricerca. In particolare, sono stati esclusi contributi caratterizzati da

un'impostazione prevalentemente ingegneristica, focalizzati su modelli di ottimizzazione matematica o approcci quantitativi orientati alla risoluzione di problemi operativi, ma privi di un esplicito collegamento al management accounting. Sono stati altresì esclusi studi che, pur trattando tematiche affini, non affrontavano in modo diretto il problema della concettualizzazione, misurazione e utilizzo delle informazioni di costo nei processi decisionali di procurement e nelle relazioni buyer–supplier.

Il processo di selezione ha condotto a un sottoinsieme di 103 articoli ritenuti maggiormente pertinenti rispetto al dominio di ricerca. Tali contributi sono attualmente oggetto di una fase approfondita di analisi qualitativa, basata sulla lettura integrale dei full paper, finalizzata a definire in modo più rigoroso il dataset finale di ricerca e a ricostruire in maniera sistematica le principali traiettorie evolutive della letteratura.

Una volta definito il dataset finale, l'analisi si articolerà in due momenti complementari. In un primo momento, al fine di intercettare i filoni di ricerca più recenti e le principali configurazioni concettuali emergenti connesse ai rischi e ai costi di fornitura, lo studio si focalizzerà, rispettivamente, sulle tecniche quantitativo-bibliometriche di "bibliographic coupling" e di "co-word analysis" (Donthu et al., 2021). Si deve, tuttavia, sottolineare come nella B-SLR tali analisi non sono, in verità, concepite come sostitutive della revisione sistematica, bensì come suo necessario completamento, in quanto la sola bibliometria consente di descrivere le relazioni quantitative tra i contributi, ma non di interpretarne in profondità i contenuti teorici e i meccanismi causali sottostanti (Zupic e Cater, 2015; Paul e Criado, 2020). Per rispondere a tale esigenza, pertanto, in un secondo momento la revisione sistematica consentirà di analizzare in modo critico i contributi selezionati, mettendo in luce convergenze, ambiguità concettuali, discontinuità teoriche e lacune di ricerca in relazione ai processi di rilevazione, misurazione e gestione dei rischi e dei costi nascosti nelle strategie di fornitura (Tranfield et al., 2003; Durach et al., 2017; Snyder, 2019; Williams et al., 2021).

4. I risultati attesi

Il presente studio intende individuare e mappare i principali cluster teorici e le traiettorie evolutive della ricerca sul tema della rilevazione, misurazione e gestione dei rischi e dei costi nelle strategie di fornitura. Segnatamente, un primo risultato atteso dalla ricerca risiede nello sviluppo di un quadro sistematico e integrato di quali siano i rischi e i costi insiti nei processi di fornitura. In tal senso, lo studio si propone di far emergere uno schema teorico in grado di spiegare le diverse configurazioni di costo di fornitura, con il fine ultimo di ridefinire il concetto di "costo totale di fornitura". Invero, solo rappresentando i diversi rischi e i costi di fornitura all'omogeno valore monetario, le aziende possono essere in grado di confrontare fornitori diversi e valutare, nonché governare, efficacemente le proprie strategie di fornitura attraverso la misurazione e gestione del complessivo costo di fornitura.

Al fine di passare dalla misurazione alla gestione dei costi di fornitura, lo studio mira, inoltre, a far emergere le dinamiche organizzative, operative, informative e relazionali che ruotano intorno ai processi di fornitura, con il fine ultimo di superare la frammentazione concettuale esistente e comprendere le determinanti (cost driver) che spiegano l'insorgenza e la manifestazione di suddetti costi. In tal senso, la presente ricerca – attraverso la ricostruzione dei principali driver di costo - si propone di sviluppare un modello di riferimento in grado di far emergere quali costi siano a reale valore aggiunto (interno/esterno) per l'azienda e quali, invece, risultino a non valore aggiunto come conseguenza di ridondanze o inefficienze.

Lo studio fornirà, altresì, una ricostruzione dei principali aspetti relazionali, comportamentali e sociali che influenzano i processi di produzione, interpretazione e utilizzo delle informazioni di costo nei processi di fornitura e, incidentalmente, condizionano l'efficace rilevazione, misurazione e gestione del costo totale di fornitura. In questo modo sarà possibile sviluppare un quadro concettuale utile a comprendere in che modo, nelle pratiche aziendali, il costo totale di

fornitura possa essere concretamente integrato nei sistemi di pianificazione, programmazione e controllo, al fine di una sua corretta gestione.

5. Le implicazioni teoriche e manageriali

Per quanto attiene più strettamente al piano teorico, la ricerca si propone di offrire un contributo nel campo dell'economia aziendale, attraverso una revisione bibliometrico-sistematica della letteratura in merito alla rilevazione, misurazione e gestione dei fattori di rischio e delle differenti configurazioni di costo riconducibili alle decisioni strategiche di fornitura. In particolare, la B-SLR consentirà di ricostruire in modo integrato lo stato delle conoscenze, chiarendo ciò che la letteratura attualmente conosce – nonché ciò che rimane inesplorato – in relazione alla loro natura, alle cause che li generano, alle modalità di rilevazione adottate e alle pratiche attraverso cui tali dimensioni vengono gestite.

Tale approccio metodologico permetterà inoltre di contribuire alla ridefinizione del concetto di "costo totale di fornitura": componenti finora trattate in modo frammentario e marginale saranno, pertanto, analizzate secondo una prospettiva sistematica.

Infine, il lavoro consentirà di mettere in luce i limiti strutturali dei modelli decisionali e dei sistemi di programmazione e controllo tradizionali, ancora fortemente ancorati a metriche di breve periodo e a configurazioni di costo immediatamente osservabili, offrendo le basi per lo sviluppo di modelli interpretativi più coerenti con la natura socio-tecnica della contabilità direzionale.

Con riguardo, invece, al piano pratico-manageriale, i risultati attesi della ricerca potranno supportare le imprese nella chiara identificazione dei principali fattori di rischio e delle configurazioni di costo nascosto, insite nei processi di fornitura, favorendone – in coerenza con la crescente complessità dei contesti competitivi - l'integrazione nella progettazione di sistemi di pianificazione, valutazione e governo delle strategie di fornitura. Segnatamente, l'individuazione delle principali configurazioni di costo nascosto e delle condizioni che ne ostacolano la rilevazione potrà fornire – attraverso un'integrazione sistematica tra grandezze strategiche, operative, economico-finanziarie e ambientali – indicazioni operative utili tanto al miglioramento dei processi di selezione e valutazione dei fornitori, quanto alla ridefinizione dei sistemi di pianificazione, programmazione e controllo, nonché alla comprensione delle determinanti organizzative e operative che generano costi a non valore aggiunto lungo la catena di fornitura.

Parole chiave: Approvvigionamento; catena di fornitura; costo di fornitura; rischio di fornitura; costi nascosti; Total Cost of Ownership; contabilità direzionale; sostenibilità

Economia circolare e valorizzazione dei beni comuni: il valore delle al-leanze strategiche nel settore olivicolo-oleario

Patrizia Pastore[1], Silvia Tommaso[2], Antonio Ricciardi[3]

1. Introduzione

Il comparto olivicolo-oleario riveste per l'Italia grande rilievo economico. A livello mondiale, l'Italia è il secondo produttore di olio d'oliva, rappresentando circa il 15% della produzione mondiale totale (dopo la Spagna, con una quota dominante del 45%) e il secondo Paese esportatore con il 20% delle esportazioni globali di olio d'oliva (anche in questo caso, dopo la Spagna, le cui esportazioni di olio d'oliva costituiscono un sostanziale 60% del totale mondiale) (Ismea, 2023). Si caratterizza per elevati standard qualitativi (si contano 42 DOP e 8 IGP per gli oli d'oliva; 4 DOP per le olive da tavola) e per una forte tipicità territoriale: si contano oltre 500 cultivar con caratteristiche organolettiche uniche, modellate da clima, suolo e tecniche agronomiche locali.

Nonostante il rilevante valore economico, ambientale, sociale e culturale del settore olivicolo-oleario, le pratiche agricole intensive associate alla produzione di olio di oliva generano considerevoli impatti ambientali: degrado del suolo, impoverimento della materia organica, sfruttamento eccessivo di acqua ed energia, inquinamento e squilibrio ecologico in casi di gestione impropria del suolo e dei ferti-lizzanti, delle acque di vegetazione e delle sanse (Ncube et al., 2024). Inoltre, in questo settore si genera una grande quantità di scarti e residui inevitabili di lavorazione (residui di potatura, fogliame) e sot-toprodotti (sansa, acque di vegetazione e di processo, nocciolino) che generano problematiche ambien-tali e gestionali e comportano elevati costi di stoccaggio e di smaltimento (Kounani et al., 2024).

Aanalogamente a quanto accade per altri settori, anche le aziende del settore oleario sono esortate ad allineare le proprie attività agli obiettivi di sviluppo sostenibile contemplati dalla Strategia europea sull'economia circolare e dal Piano di azione Agenda 2030 per lo Sviluppo Sostenibile delle Nazioni Unite. Questo allineamento richiede il miglioramento della compatibilità ambientale e l'implementazione di strategie e azioni volte a rendere più sostenibili vari aspetti della produzione. L'impatto ambientale dell'industria olivicolo-olearia può essere significativamente ridotto attraverso la transizione verso l'e-conomia circolare. Questo potrebbe tradursi in pratiche più sostenibili, come la gestione efficiente del suolo e delle risorse idriche, il riutilizzo e il riciclo dei residui di potatura, la valorizzazione dei sot-toprodotti della lavorazione delle olive (come il nocciolino e la sansa) convertendoli in prodotti di alto valore, e l'adozione di tecnologie che riducono il consumo energetico.

L'adozione di pratiche di economia circolare nella filiera olivicolo-olearia può risultare complessa per le piccole e medie imprese (Pmi) e richiede l'adozione di un approccio eco-sistemico per affrontare i necessari cambiamenti strutturali e organizzativi della produzione. Esse richiedono investimenti che implicano costi significativi e che sono più sostenibili finanziariamente se realizzati congiuntamente con altre imprese. Le relazioni collaborative interorganizzative tra Pmi, come reti aziendali, consorzi, organizzazioni di produttori e simili,

[1] Professoressa associata, ECON-06A, Università della Calabria; patrizia.pastore@unical.it – corresponding author

[2] Professoressa associata, ECON-06A, Università della Calabria; silvia.tommaso@unical.it

[3] Professore ordinario, ECON-06A, Università della Calabria; antonio.ricciardi@unical.it

possono contribuire a rendere praticabili modelli di business sos-tenibili, favorendo anche la transizione verso un'economia circolare. Esiste una vasta letteratura sul te-ma delle reti strategiche aziendali interorganizzative e sull'importanza che queste forme di aggregazione hanno per le capacità di investimento delle imprese, in particolare delle Pmi. Tradizionalmente, questo modello organizzativo consente alle imprese aggregate e/o in rete di operare nei mercati con la competi-tività di un'impresa medio-grande senza sacrificare la propria autonomia e flessibilità (Pastore et al., 2020; Peterman et al., 2020), di condividere gli investimenti e di frazionare i rischi correlati (Håkansson e Snehota, 1995).

Sulla base di queste premesse, l'obiettivo della ricerca è quello di individuare le caratteristiche dei beni comuni generati da pratiche di economia circolare nell'ambito del settore olivicolo-oleario e di indagare il ruolo della cooperazione interaziendale nel facilitare l'implementazione di pratiche di economia circo-lare sulla scorta dei concetti di "beni comuni" come oggetto (Common-Pool Resources o Commons) e di "comune" come principio per regolarli e governarli, enunciati dalla Premio Nobel per l'economia (2008) Elinor Ostrom. Lo scopo è quello di approfondire in che misura gli accordi cooperativi tra le Pmi del settore olivicolo-oleario, interpretati alla luce della Teoria dei Commons e dell'azione collettiva auto-organizzata e autogovernata di Ostrom, favoriscono una gestione collettiva ed efficiente dei flussi di materiali, dei sottoprodotti e della capacità di carico ambientale nell'ambito dell'economia circolare.

2. Framework teorico e obiettivi

Il tema centrale dello studio della Ostrom «è il modo in cui un gruppo di soggetti economici che si trovano in una situazione di interdipendenza possono auto-organizzarsi per ottenere vantaggi col-lettivi permanenti, pur essendo tentati di sfruttare le risorse gratuitamente, evadere i contributi o co-munque agire in modo opportunistico» (Ostrom, 1990, p.51).

Le riflessioni della Ostrom prendono le mosse, negli anni '60, da un dibattito nelle scienze sociali che cerca di dare una risposta convincente al problema del governo delle risorse naturali comuni (ad esempio, oceani, laghi, foreste, ma anche sistemi di irrigazione, pascoli montani, zone di pesca) per impedire il loro sovrasfruttamento da parte degli individui e, soprattutto, per garantire la loro sos-tenibilità economica nel lungo periodo. All'origine del dibattito vi era l'articolo del biologo ecologista Garrett Hardin, The Tragedy of the Commons (1968), secondo il quale gli individui che utilizzano una risorsa condivisa (i commons, appunto), agendo in modo autonomo e perseguendo il proprio inter-esse, finiscono inevitabilmente per sovrautilizzarla, portandola al deterioramento e, a lungo termine, alla distruzione. Pertanto, l'unico modo per evitare tale tragedia era la privatizzazione della risorsa o la sua proprietà pubblica (Hardin, 1968). La Ostrom ha dimostrato che le comunità, intese come l'insieme di appropriatori e di utilizzatori di spazi o risorse collettive (commons), sono in grado «a certe condizioni», di autogestire sistemi di risorse complessi in modo soddisfacente (ovvero efficiente per se stessi) e sostenibile (per le risorse) anche per periodi molto lunghi (Vollan e Ostrom, 2010). Nel pensiero di Elinor Ostrom, per certe condizioni, si intendono (Tab.1): la conoscenza, la fiducia e la comunicazione tra i componenti di una comunità, ritenuti fondamentali per la buona riuscita dell'autoregolamentazione; l'esistenza di sistemi di regole (c.d. istituzioni) conosciute, accettate e condivise dai membri della comunità e che gli stessi sono in grado di fare rispettare da tutti i compo-nenti del gruppo, applicando sanzioni predefinite a coloro che non le rispettano; la non interferenza di un'autorità esterna, come per esempio lo Stato, che si sovrappone alle persone appropriandosi di scelte che non è in grado né di fare né di far rispettare.

Nell'approccio teorico di Ostrom (1990, 2007), i beni comuni si riferiscono a risorse naturali con-divise (ad esempio i bacini idrografici, boschi, sistemi di irrigazione, ecosistemi marini e costieri, ecc.) o alla proprietà e all'uso del suolo, al patrimonio storico-culturale e ambientale, o a risorse artificiali nella forma di infrastrutture fisiche (ad esempio acquedotti, vie di comunicazione, ecc.) o di risorse immateriali (come la conoscenza pubblica, la scienza aperta, il

libero scambio di idee) all'interno di specifici contesti locali o aree geografiche. L'ampia ricerca empirica e teorica di Ostrom ha dimostrato come i beni comuni possano essere gestiti in modo efficiente dalle comunità locali senza fare rifer-imento ai tradizionali diritti di proprietà, alla gerarchia o all'intervento statale. Gli utilizzatori locali (ap-propriators), avendo una maggiore vicinanza e familiarità con le risorse comuni sfruttate, possono in certe circostanze essere in grado di preservarle, stabilendo regole di gestione flessibili e cambiando tali regole in base alle conoscenze che provengono dal loro utilizzo, anche in condizioni di informazione incompleta riguardante la natura stessa del bene. Inoltre i costi sostenuti dalla comunità, per vigilare sul corretto uso del bene e per punire chi trasgredisce a tali regole, tendono a essere inferiori ai costi della regolamentazione pubblica o privata. Dunque, tali beni comuni possono essere efficacemente governati attraverso l'adozione di protocolli di proprietà comune (accordi diversi dalla proprietà privata o dall'amministrazione statale) fondati su azioni collettive auto-organizzate e auto-governate, in base ai quali si instaura una relazione specifica tra -da un lato- coloro che supervisionano le risorse e contribu-iscono al loro mantenimento, riproduzione e sviluppo e -dall'altro- i loro utilizzatori (Hesse e Ostrom, 2001, p.54).

Ciò considerato la ricerca sostiene, e si propone di dimostrare, che le alleanze strategiche tra Pmi, nella forma di reti di imprese, consorzi, organizzazioni di produttori e simili possono contribuire a ren-dere praticabili modelli di business sostenibili, favorendo anche la transizione verso un'economia cir-colare nell'industria olivicolo-olearia. In particolare, dopo aver individuato le risorse e i beni comuni prodotti nell'ambito di pratiche di economia circolare nel settore olivicolo-oleario, la ricerca intende rispondere alle seguenti domande di ricerca:

RQ1: i beni comuni del settore olivicolo-oleario possono essere qualificati come Common-Pool Resources e governati secondo i principi di progettazione istituzionale individuati da Elinor Ostrom

RQ2: la cooperazione tra Pmi del settore olivicolo-oleario, interpretata alla luce dei principi di governance dei Commons di Elinor Ostrom, contribuisce a facilitare l'implementazione di pratiche di economia circolare.

3. Metodologia

L'approccio metodologico adottato si fonda su una revisione sistematica della letteratura combinata con la somministrazione di un questionario on line ad aziende del settore olivicolo-oleario. Per com-prendere se e come gli accordi cooperativi tra le Pmi del settore olivicolo-oleario possono contribuire ad una efficace gestione dei flussi di materiali e della capacità di carico ambientale (elementi fondamen-tali del modello circolare) nonché alla valorizzazione di residui e sottoprodotti generati dalla produzione olivicolo-olearia garantendo la tutela dei beni comuni, è stata condotta una revisione siste-matica della letteratura (RSL). Inoltre, utili indicazioni sono state ottenute dall'analisi e interpretazione dei risultati di un questionario somministrato a 219 aziende del settore olivicolo-oleario nelle regioni Calabria, Campania, Sicilia, Puglia (dove si rileva una maggiore presenza di olivicoltori e di produttori di olio).

La fase di RSL ha seguito un processo replicabile e trasparente (Tranfield et al., 2003) e ha con-sentito di individuare gli studi esistenti, selezionare e valutare i contributi rilevanti, analizzare e sintetiz-zare i dati, raggiungere conclusioni chiare sugli aspetti noti e d'identificare potenziali gap di ricerca sull'argomento (Denyer e Tranfield, 2009, Kraus et al., 2020). Per condurre l'analisi, sono state seguite le linee guida di Denyer e Tranfield (2009) e il framework PRISMA (Liberati et al., 2009). La raccolta dei documenti è stata effettuata utilizzando i database Scopus e WoS. La seguente stringa di ricerca è stata applicata a titoli, abstract e parole chiave:

("strategic alliance*" OR "collaboration*" OR "joint venture*" OR "aggregation*" OR "coopera-tive*" OR "consortium*" OR "interorganizational" OR "business network*" OR "partnership" OR "industrial symbiosis" OR "resource synergy") AND ("circular econom*" OR "circular bioeconom*" OR "circular bio-econom*" OR "bioeconom*" OR "bio-econom*" OR

"waste" OR "waste valoriza-tion" OR "by-product*" OR "byproduct*" OR "mill wastewater" OR "olive mill wastewater" OR "leaves" OR "pruning" OR "olive cake" OR "olive stone*" OR "pomace*") AND ("agriculture" OR "agri-food" OR "agri-industrial" OR "olive" OR "olive oil" OR "oil mill*" OR "olive mill*" OR "olive industry" OR "olive supply chain" OR "olive farming" OR "olive processing")

Dopo aver ristretto la ricerca agli articoli di riviste peer-reviewed redatti in lingua inglese e classificati nelle categorie "Business", "Management" ed "Economics", sono stati recuperati 94 risultati da Scopus e 33 da WoS, per un totale iniziale di 127 articoli. Dopo la rimozione dei duplicati, il numero è stato ri-dotto a 107. Successivamente, attraverso lo screening di titoli, abstract e parole chiave, sono stati esclusi ulteriori 37 articoli, portando il totale a 70. Lo screening finale dei testi integrali ha determinato l'esclusione di altri 4 documenti. Pertanto, il campione finale è composto da 66 articoli.

Il questionario è stato elaborato e successivamente validato mediante revisione di esperti e test pi-lota (Elangovan e Sundaravel, 2021) nell'ambito di un Progetto PRIN PNRR (bando 2022) in corso di sviluppo (di cui questo contributo è parte integrante) e somministrato tramite il programma LimeSur-vey ad aziende olivicole e a frantoi delle 4 regioni del Sud Italia succitate, con l'obiettivo di raccogliere dati sulle pratiche di gestione dei sottoprodotti di frantoio, di individuare i principali ostacoli e facilita-tori dell'adozione di pratiche di bioeconomia circolare nel settore olivicolo-oleario nonché di compren-dere se le aggregazioni tra le Pmi del settore rappresentano un meccanismo di governance efficace per promuovere l'implementazione di tali pratiche.

L'analisi descrittiva dei risultati della somministrazione del questionario ha consentito di comprendere le pratiche di gestione e valorizzazione di residui e sottoprodotti adottate dagli olivicoltori e dai produttori di olio e, conseguentemente, l'impatto di tali pratiche sulla tutela dei beni comuni.

4. Economia circolare e beni comuni nel settore olivicolo-oleario

L'economia circolare rappresenta una risposta strategica all'esigenza delle Pmi di fronteggiare la transizione verso modelli produttivi sostenibili, che si estende alla gestione e alla conservazione dei beni comuni.

Nel settore olivicolo-oleario i beni comuni si riferiscono, alle risorse naturali (suolo fertile, acqua pulita, biodiversità del paesaggio olivicolo), ai marchi territoriali (DOP/IGP), ma anche agli scarti e ai residui di lavorazione (acque vegetative e di processo, fogliame, residui di potatura) nonché ai sotto-prodotti (sansa, polpa, nocciolino) della filiera[4], che possono essere trasformati in nuove risorse, utili e ad alto valore aggiunto, e possono essere valorizzati in impieghi alternativi, (re-)integrandoli nei cicli produttivi di altre imprese o in processi industriali successivi di altre aziende e settori, in ottica di sim-biosi industriale (Sgambaro et al., 2024).

[4] Le risorse comuni identificano una classe di beni definiti dalle seguenti caratteristiche (Ostrom et al., 1994; Ostrom, 2009): a) la non rivalità nel consumo: il singolo agente può godere della loro esistenza, indipendentemente dall'aver contribuito o meno alla loro creazione e dall'ammontare del suo conferimento: il consumo di questi beni è compatibile, cioè non rivale, con il consumo degli stessi da parte di altri agenti; b) la difficile escludibilità dei potenziali beneficiari: non sussistono restrizioni o limiti che impediscono il pieno godimento di questi beni a tutti. Sotto questo aspetto, l'uso improprio di questi sottoprodotti (per esempio lo sversamento incontrollato delle acque di vegetazione) da parte di un frantoio danneggia la qualità del suolo e dell'acqua per l'intera comunità, riducendone la disponibilità futura (rivalità). Analogamente, è difficile o costoso escludere gli attori (olivicoltori, frantoiani, agricoltori) dall'accesso al suolo e all'acqua che vengono compressi dagli scarichi (difficile escludibilità).

L'attuazione di pratiche di economia circolare rappresenta un'opportunità strategica per il settore olivicolo-oleario per chiudere i cicli delle risorse. Da queste pratiche si possono generare energia, combustibili, biomateriali, concimi e mangimi, composti bioattivi riducendo l'impatto ambientale su suoli e acque (derivante da smaltimenti impropri), migliorando l'efficienza delle risorse e trasformando un problema di gestione e smaltimento (la gestione degli scarti rappresenta una parte significativa dei costi di produzione) in significative opportunità economiche e competitive, creando nuove filiere e valore aggiunto (Donner e Radić, 2021).

Ad esempio, il fogliame e i residui delle potature possono essere valorizzate energeticamente ed essere utilizzate come legna da ardere o per produrre cippato o biochar (carbone vegetale) oppure possono es-sere destinate all'impiego in impianti di conversione energetica. I sottoprodotti come la sansa (tradizionalmente destinata ai sansifici per l'estrazione di olio di sansa) e gli scarti come i noccioli pos-sono essere usati come fertilizzanti e ammendanti per i terreni migliorandone la struttura e la fertilità oppure possono essere trasformati in biomassa per il riscaldamento e in biocarburanti, riducendo il bi-sogno di (e la dipendenza da) combustibili fossili: l'energia prodotta può essere fornita a frantoi e strutture limitrofe che necessitano di calore, in ottica di simbiosi industriale. I residui e i sotto-prodotti della lavorazione sono ricchi di nutrienti (digestato, biomassa di scarto delle olive, sansa) e possono essere compostati o trattati per diventare biocarbone e fertilizzanti naturali (anche da fornire a settori agricoli locali), migliorando la qualità e la fertilità dei suoli e riducendo la dipendenza da fertilizzanti e prodotti chimici di sintesi. Le acque reflue di frantoio opportunamente trattate possono essere riuti-lizzate per l'irrigazione o per scopi industriali secondari, riducendo il prelievo e l'inquinamento idrico e al tempo stesso promuovendo il risparmio idrico nelle regioni con carenza idrica tipiche delle aree oliv-icole. Gli scarti della produzione di olio d'oliva possono essere convertiti in materiali di origine biologi-ca. La biomassa dei noccioli d'oliva, inoltre, è sempre più studiata come fonte per la produzione di bi-oplastiche o materiali compositi. Le industrie focalizzate sul packaging sostenibile possono collaborare con i produttori di olio d'oliva per reperire questi materiali, riducendo la necessità di materie plastiche derivate dal petrolio. Dalle acque vegetative e di processo si estraggono polifenoli e altri composti bio-attivi la cui gestione è complessa ma che sono materie prime pregiate per le industrie farmaceutiche, cosmetiche e nutraceutiche che li utilizzano per le loro proprietà antiossidanti e antimicrobiche. Questi esempi ci dicono come il settore olivicolo-oleario possa beneficiare di modelli circolari che migliorano l'efficienza (nell'uso) delle risorse, riducono l'impatto ambientale (minori volumi di rifiuti prodotti e dei relativi costi di smaltimento), favoriscono l'autosufficienza energetica delle singole imprese locali.

Sotto questo profilo, l'economia circolare offre nuove opportunità per aumentare la competitività delle Pmi olivicolo-oleari e favorisce la sostenibilità della filiera e dei territori di riferimento. Quest'ultima, a sua volta, contribuisce alla tutela, alla conservazione e alla valorizzazione dei beni comuni, garanten-do la resilienza e la competitività dell'intera filiera nel contesto della transizione ecologica globale.

Di fatto, le pratiche di economie circolare consentono di chiudere i cicli delle risorse e dell'ambiente nell'ecosistema agricolo, offrendo al contempo un metodo di smaltimento sostenibile per gli scarti del settore oleario e creando nuove fonti di reddito per i produttori. L'economia circolare emerge dunque come alternativa sistemica, mirata a mantenere prodotti, componenti e materiali al loro massimo valore e utilità tramite pratiche di riuso, riciclo, rigenerazione e valorizzazione. La sua efficacia non dipende solo dall'innovazione tecnologica ma, strategicamente, dalla governance, cioè dalle regole e dai mecca-nismi di gestione che guidano l'azione collettiva.

5. Azione collettiva e autogoverno dei beni comuni

La transizione verso pratiche di economie circolare richiede un approccio sistemico, fondato sulla collaborazione tra olivicoltori, agricoltori, imprese, ricerca e comunità locali. Seguendo

l'approccio di Ostrom, la gestione sostenibile dei beni comuni rappresentati dalle risorse olivicole-olearie e l'innovazione tecnologica e gestionale del settore possono attuarsi efficacemente attraverso istituzioni cooperative, fondate sulla collaborazione e sul coordinamento fra Pmi, che possono sviluppare pratiche operative e regole proprie evitando la "tragedia dei beni comuni" (il degrado per eccessivo sfruttamento). Inoltre, le Pmi aggregate in rapporti cooperativi formali aumentano le opportunità di implementare strategie e pratiche di economia circolare e di simbiosi industriale. Conseguentemente, si aprono nuove opportunità di business, aumento della competitività, guadagni economici, riduzione dei volumi dei rifiuti prodotti e dei relativi costi di gestione e smaltimento e miglioramento delle prestazioni ambientali, sia per le singole imprese che per le aggregazioni di cui esse fanno parte.

Ostrom (1990) ha dimostrato che le comunità locali sono in grado di auto-organizzarsi per gestire i beni comuni in modo efficace e sostenibile attraverso Istituzioni di Azione Collettiva, identificando otto Principi guida, fondamentali per la loro riuscita (Tab.1). Applicati alle aziende olivicolo-olearie locali, significa stabilire regole chiare e condivise su chi appartiene alla comunità produttiva, su chi può accedere alle risorse (oliveti, acqua, marchi territoriali) e su come vengono utilizzate e gestite le risorse comuni, evitando conflitti (le aziende sanno chi ha diritto a cosa), sovrasfruttamento (di suolo, oliveti, risorse idriche, ecc.) e favorendo la sostenibilità ambientale.

Il modello di Ostrom dimostra che l'efficacia delle pratiche di economia circolare nella filiera olivicolo-olearia non è solo una questione di tecnologia ma di anche di istituzioni di autogoverno che garantiscono cooperazione, sostenibilità e competitività lungo tutta la catena del valore. Gli otto principi per la gestione dei beni comuni applicati alle aggregazioni e alle reti di Pmi del settore olivicolo-oleario servono a definire regole condivise, partecipazione attiva e sistemi di monitoraggio che tutelano e valorizzano le risorse collettive per la prosperità del territorio.

Principi Ostrom	Definizione	Applicazione all'economia circolare nelle reti di imprese olivicolo-olearie	Beneficio "circolare" e per i beni comuni
1. Chiara definizione dei confini	Definizione dei confini della coprogettazione, con riferimento all'ampiezza del contesto territoriale interessato (confini geografici), ai soggetti che hanno diritto di utilizzare le risorse collettive e alle modalità d'uso delle stesse (confini sociali), alle problematiche sociali affrontabili con la co-progettazione (confini tematici).	Definire chiaramente i membri legittimati a partecipare (aziende olivicolo-olearie locali, cooperative, consorzi, famiglie di produttori), ad utilizzare e beneficiare dei sottoprodotti (per esempio: un consorzio di frantoi e olivicoltori che conferisce la sansa a un unico biodigestore o impianto di compostaggio). identificare con precisione quali risorse sono incluse e fanno parte del bene comune (oliveti, terreni, frantoi, marchi collettivi, sottoprodotti come sansa e acque di vegetazione).	Riduce i rischi di comportamenti opportunistici (free-riding) e di smaltimento illegale, assicurando che i sottoprodotti rimangono nel ciclo,
2. Congruenza tra le regole di appropriazione e di fornitura e le condizioni locali	Tenuto conto delle specificità economiche e sociali del contesto territoriale, definizione delle regole per regolare interessi non immediatamente convergenti, orientare l'utilizzazione delle risorse e garantire un adeguato accesso ai servizi (appropriazione) e la realizzazione delle necessarie attività di produzione dei servizi (fornitura).	Chiarire le regole di accesso (chi può raccogliere, trasformare o commercializzare l'olio e in quali quantità). Adattare regole di produzione e trasformazione alle specificità territoriali (clima, varietà di olive, tradizioni). Stabilire regole di valorizzazione (per esempio l'uso della sansa per fertilizzanti e bioenergia) di riuso e riciclo adattate al territorio, al tipo di cultivar (ad esempio: compostaggio della sansa, riutilizzo acque reflue in agricoltura), alle tecnologie locali, alla tipologia di rifiuto prevalente e alle esigenze agronomiche del territorio (ad esempio: un sistema di compostaggio efficiente dove l'agricoltura è dominante).	Massimizza l'efficienza e l'accettazione, ad esempio privilegiando il compostaggio in zone ad alta necessità di sostanza organica nel suolo
3.Metodi di decisione collettiva	Definizione di processi decisionali improntati alla collegialità nonché delle politiche di gestione delle risorse e delle attività collettive. I produttori e gli utilizzatori dei servizi realizzati, devono poter contribuire a definire, e all'occorrenza modificare, le regole che orientano la funzionalità complessiva del sistema operativo istituito dalla coprogettazione, adattandole al contesto specifico e ai cambiamenti sistemici	Coinvolgere i produttori e tutte le Pmi nelle scelte su qualità, marketing, gestione delle risorse e innovazione nonché sulle innovazioni circolari (biogas, packaging sostenibile, economia di scarto). Creare consorzi che coinvolgono frantoiani, olivicoltori, aziende nutraceutiche e università locali nella definizione di standard di qualità dei sottoprodotti.	Garantisce che le pratiche di economia circolare (ad esempio la creazione di una bioraffineria) rispondono ad esigenze concrete e sono percepite come eque da tutti i beneficiari.
4. Monitoraggio condiviso	Definizione di sistemi di monitoraggio sulle condizioni d'uso delle risorse collettive e sui comportamenti di coloro che usufruiscono dei servizi collettivi, in modo da garantire comportamenti cooperativi e un mutuo monitoraggio tra i soggetti.	Creare sistemi di controllo condivisi sulla qualità dell'olio, sull'uso sostenibile delle risorse e sul rispetto delle regole di filiera. Creare sistemi di tracciabilità per verificare riduzione rifiuti, efficienza energetica e riuso dei sottoprodotti nonché per monitorare la destinazione finale di sansa e acque di vegetazione, verificando che non vengano smaltite illegalmente ma valorizzate.	Assicura la responsabilità e la qualità dei materiali secondari (ad esempio, certificare il compost da sansa).
5. Sanzioni graduate	Previsione di sanzioni (a seconda della gravità e del contesto della violazione) per coloro che violano le norme operative condivise all'interno di logiche di autogoverno al fine di garantire un credibile impegno del rispetto delle regole da parte degli utilizzatori. Monitoraggio e sanzioni non sono intraprese da autorità esterne ma dai partecipanti stessi.	Premiare i frantoi che aderiscono a standard di economia circolare (ad esempio, con certificazioni di sostenibilità o tariffe di conferimento agevolate). Prevedere penalità proporzionate per chi non rispetta gli standard di qualità, o le regole di marchio collettivo, o le regole ambientali e di sostenibilità (ad esempio: uso improprio di risorse comuni).	Promuove la conformità e la trasformazione del comportamento verso la circolarità.
6. Meccanismi di risoluzione dei conflitti	Le reciproche e intense relazioni sollecitano l'attivazione di meccanismi idonei per trattare in modo rapido i possibili conflitti all'interno del gruppo degli utilizzatori delle risorse o che possono insorgere tra destinatari dei servizi e operatori.	Istituire comitati/tavoli di mediazione interni alla rete per gestire divergenze su investimenti o utilizzo dei sottoprodotti o per risolvere eventuali dispute tra aziende.	
7. Minimo livello di riconoscimento dei diritti di organizzarsi - Riconoscimento da parte di autorità esterne	Utilizzatori e fornitori delle risorse collettive hanno diritto di auto-organizzarsi e di codificare i propri comportamenti cooperativi in vere e proprie istituzioni, che non sono contestabili da autorità governative esterne.	Supporto istituzionale: leggi e politiche che riconoscono e sostengono legalmente i modelli di business circolari, le cooperative di riuso e i partenariati pubblico-privati. Ottenere certificazioni ambientali (ISO 14001, EMAS) e riconoscimento istituzionale per pratiche circolari, così da rafforzarne legittimità e accesso a fondi.	
8. Organizzazioni articolate su più livelli	La dimensione organizzativa della coprogettazione richiama la necessità di sviluppare un sistema di governance policentrico (proporzionate all'ampiezza dei contesti territoriali e alla molteplicità dei temi sociali ed economici affrontati) che comprende soggetti privati e pubblici chiamati a tradurre in scelte e azioni e le soluzioni identificate per la comunità e il territorio di riferimento.	Strutturare la rete e la sua governance su più livelli: cooperative locali, consorzi regionali, associazioni nazionali, fino alle reti europee per l'economia circolare. Frantoio-azienda agricola (micro-ciclo) che riutilizza i residui della potatura; Consorzio di frantoi (meso-ciclo): che gestisce la sansa per energia; Politiche regionali (macro-ciclo), che supportano la ricerca e l'innovazione.	Collegando le azioni locali a quadri istituzionali più ampi, si risolvono problemi di scala e logistici

*Tabella 1. I principi progettuali per governare i beni comuni (*Ostrom, 1990) e applicazione all'economia circolare nel settore olivicolo-oleario. F*onte: Ns adattamento da Ostrom (1990), p.90.*

In accordo con Hess e Ostrom (2007), i beni comuni prodotti collettivamente e con il contributo anche finanziario dei soggetti interessati richiedono costante impegno e forte azione collettiva (Sandler, 1992; Dietz et al., 2003), cooperazione costruttiva delle imprese partner (Marshall, 1927) e solidi meccanismi di autogoverno (Hess e Ostrom, 2007), oltre a un livello elevato di capitale sociale da parte dei soggetti interessati (Koka e Prescott, 2002; Poppo e Zenger, 2002; Sumo et al., 2016), che li spinge a fare cose l'uno per l'altro, reciprocamente (Putnam, 2000).

Applicare i principi di Ostrom alle aggregazioni e alle reti olivicolo-olearie significa costruire un sistema di governance partecipato, che integra sostenibilità ambientale, innovazione circolare e valorizzazione del territorio e garantisce competitività globale. Come rilevato dagli studiosi dell'azione collettiva (Ahrne e Brunsson, 2008; Dietz et al., 2008; Berkowitz e Dumez, 2016; Ahrne et al., 2017) è possibile rinvenire la presenza di queste condizioni nella co-gestione adattiva di beni, servizi e risorse comuni attraverso l'autogoverno e le azioni collettive (Araral, 2014) intraprese nell'ambito degli accordi cooperativi e di partnership strategica tra imprese, siano essi di natura informale, formale, contrattuale o proprietaria.

6. Risultati

Allo stato attuale, l'analisi combinata della RSL e delle risposte ai questionari ha rilevato, da un lato, tipologia e caratteristiche dei beni comuni nel settore olivicolo-oleario e, dall'altro lato, le principali forme di collaborazione adottate a supporto dell'implementazione di pratiche di economia circolare. Tra queste, emerge il modello della rete collaborativa/contratto di rete (Zucchella e Previtali, 2019; Howard et al., 2022), un sistema di cooperazione tra attori che operano nello stesso settore o area geografica, capace di favorire scambi virtuosi di risorse, conoscenze ed expertise. Seguono le collaborazioni tra aziende di settori diversi finalizzate alla simbiosi industriale (Poponi et al., 2023; Kleinpeter et al., 2024), che riducono i costi operativi e a migliorano l'efficacia e l'efficienza dei processi circolari. Risultano inoltre frequentemente coinvolti i settori correlati alla trasformazione dei prodotti agricoli e agroalimentari, come le industrie cosmetica e farmaceutica.

Infine, si rilevano strategiche le partnership pubblico-private (Yin et al., 2024), in cui le istituzioni locali supportano le Pmi nell'adozione di pratiche circolari attraverso assistenza normativa, infrastrutturale e finanziaria.

Nel complesso, i risultati ad oggi disponibili indicano che le forme di rete di organizzazioni come alleanze strategiche, contratti di rete, consorzi, organizzazioni di produttori (tra aziende dello stesso settore, lungo la catena del valore, in partnership con enti pubblici, o basate su caratteristiche tematiche o settoriali) sono un fattore chiave per il successo della transizione verso modelli di produzione circolari nel settore olivicolo-oleario (Velasco-Muñoz et al., 2021) e offrono alle Pmi del settore nuove opportunità per aumentare la propria sostenibilità e competitività.

7. Conclusioni, implicazioni, originalità

Le Pmi del settore olivicolo-oleario stanno diventando centrali nella transizione verso l'economia circolare, e possono rappresentare un esempio replicabile in altri comparti agro-alimentari. Non solo l'olio d'oliva viene valorizzato, ma l'integrazione di sostenibilità ambientale, valorizzazione dei sotto-prodotti in impieghi alternativi, innovazione tecnologica e collaborazione interaziendale e territoriale generano valore economico, sociale e ambientale.

La transizione verso modelli di economia circolare, soprattutto quando supportata da processi di collaborazione tra imprese, istituzioni e attori della catena di fornitura, genera molteplici benefici economici, competitivi, ambientali e sociali ed effetti sistemici positivi.

Tra i vantaggi più frequentemente documentati si annoverano: un uso più efficiente delle risorse naturali; una significativa riduzione dei rifiuti; l'aumento della competitività aziendale; l'emergere di nuove opportunità di business (Ciccullo et al., 2021). La valorizzazione dei sottoprodotti crea nuove fonti di reddito e sostiene l'occupazione locale, anche in comparti innovativi quali la bioenergia, la cosmetica sostenibile o le industrie agroalimentari rigenerative (Donner et al., 2021). Dal punto di vista sociale, la collaborazione tra stakeholder eterogenei promuove l'inclusione sociale, lo sviluppo di competenze condivise e il rafforzamento delle economie locali. Una cooperazione ben strutturata lungo la filiera accresce altresì la trasparenza, migliora la tracciabilità e funge da stimolo per l'innovazione tecnologica attraverso la condivisione della conoscenza (Anugrah et al., 2024).

Nonostante il suo potenziale, sia la letteratura che la verifica empirica, sottolineano come la transizione verso l'economia circolare sostenibile nel settore olivicolo deve superare alcune sfide, in parte connesse alla frammentazione del settore olivicolo, caratterizzato da imprese di ridotte dimensioni. Tra queste, in particolare:

- necessità di politiche di supporto e di incentivi pubblici per promuovere progetti di economia circolare e sostenibilità, per sostenere gli investimenti in tecnologie innovative e per sviluppare infrastrutture adeguate:
- complessità logistiche per il recupero, il trasferimento e la gestione di materiali e sottoprodotti;
- creazione di impianti comuni destinati allo stoccaggio, alla manipolazione o alla trasformazione di residui e sotto-prodotti;
- promozione della ricerca per l'estrazione di composti ad alto valore e diffusione di tecnologie nelle aziende frantoiane, spesso di piccole dimensioni;
- formazione e cambiamento culturale, strutturale, organizzativo e gestionale;
- barriere normative o burocratiche, specialmente nell'ambito della gestione dei rifiuti e della classificazione dei sottoprodotti riutilizzabili;
- mercato ancora poco sviluppato per i sottoprodotti valorizzati;
- difficoltà di coordinamento tra attori eterogenei, i quali spesso presentano obiettivi e capacità divergenti;
- promuovere la collaborazione tra i vari attori della filiera (agricoltori, imprese, ricerca, consumatori, comunità locali) per creare valore condiviso.

Tali sfide fanno emergere con forza la necessità di nuovi modelli organizzativi che consentano agli operatori di collaborare, condividere risorse e competenze, e accedere con maggiore facilità ai mercati e ai finanziamenti pubblici. Un approccio efficace per supportare la crescita e la competitività delle Pmi agricole e olearie, aiutandole a raggiungere performance più elevate, si basa sulle alleanze strategiche tra Pmi.

Implicazioni

L'economia circolare rappresenta un nuovo paradigma per lo sviluppo sostenibile, capace di trasformare i modelli produttivi e di consumo in un'ottica rigenerativa.

Lo sviluppo di questa ricerca potrebbe offrire utili contributi sia alla teoria che alla pratica nel contesto dell'adozione dell'economia circolare nel settore olivicolo-oleario. In primo luogo, lo studio fornisce una comprensione più approfondita di come diverse forme di aggregazione interaziendale, come reti collaborative, alleanze di filiera e simbiosi industriale, possono facilitare l'implementazione di pratiche di economia circolare e, attraverso l'identificazione degli ulteriori settori coinvolti nelle relazioni simbiotiche, evidenzia il potenziale delle collaborazioni intersettoriali per migliorarne la sostenibilità. Da un punto di vista pratico, lo studio suggerisce

che le Pmi del settore olivicolo-oleario possono trarre vantaggio dalle pratiche di economia circolare, impegnandosi in collaborazioni interaziendali e sfruttando i sistemi di gestione della conoscenza.

Tuttavia, ciò richiede un ecosistema abilitante composto da regole chiare, meccanismi di governance efficaci, supporto politico e una volontà condivisa di superare le sfide tecniche e organizzative. I benefici sono significativi, ma devono essere bilanciati da un approccio sistemico e ben gestito ai rischi associati. Sotto questo profilo, i decisori politici e i leader del settore sono incoraggiati a sostenere tali iniziative attraverso la creazione di quadri che facilitino la cooperazione attraverso la condivisione e lo scambio di conoscenze, competenze, risorse, attività, investimenti, pratiche agricole sostenibili.

Lo sviluppo dello studio può avere diverse implicazioni che potrebbero interessare regolatori, professionisti e accademici. La conferma che le aggregazioni e le reti di Pmi migliorano l'implementazione di pratiche di economia circolare può imprimere un rinnovato slancio al modello italiano del contratto di rete. Questo strumento giuridico è stato concepito per favorire forme di cooperazione strutturata tra Pmi che, sulla base di obiettivi condivisi e sfruttando le reciproche complementarietà, realizzano un progetto comune, senza compromettere la propria flessibilità e autonomia giuridica e patrimoniale ma superando efficacemente alcune criticità legate alle loro ridotte dimensioni.

Decisori politici e istituzioni italiane potrebbero progettare incentivi e meccanismi di supporto adeguati per assistere le Pmi, le loro reti e i loro facilitatori (ad esempio, incubatori o associazioni): 1) nell'innovare i propri modelli di business secondo i principi dell'economia circolare e nella direzione di comportamenti più cooperativi, soprattutto in quei contesti in cui la propensione alla cooperazione è minore; 2) nell'identificare nuove aree di collaborazione tra aziende, incoraggiate dalle opportunità derivanti da strategie di bioeconomia circolare e simbiosi industriale; 3) nel promuovere forme di governance collaborativa che possono aumentare gli investimenti e la condivisione dei rischi, semplificando le procedure amministrative e, attraverso scambi interorganizzativi di risorse, aumentare la produttività e la sostenibilità della produzione semplificando l'accesso alle risorse.

Originalità

Lo studio qui presentato ha inteso applicare il concetto di autogoverno dei commons di Elinor Ostrom alle alleanze strategiche tra Pmi, spostando un paradigma nato per la gestione comunitaria di risorse naturali condivise(acqua, foreste, pascoli) verso un ambito socio-economico diverso, quale è la cooperazione tra attori economici privati (alleanze e aggregazioni strategiche) e verso un modello produttivo agricolo-industriale che punta alla sostenibilità e alla cooperazione, trasformando scarti, residui e sottoprodotti dell'olivicoltura in risorse comuni e creando un modello di governance circolare. Nelle aziende olivicole-olearie circolari le risorse comuni sono sottoprodotti e scarti (sanse, acque di vegetazione, potature), che diventano materie prime condivise per biogas, compost, biomateriali, ecc.. Ostrom studiava comunità locali che riuscivano a gestire risorse comuni senza ricorrere né al mercato puro né allo Stato centrale ma mediante regole auto-prodotte, condivise e rispettate dai membri, evitando la "tragedia dei commons". Ciò considerato, in questo studio si intende riconoscere che anche le imprese, come le comunità locali, hanno bisogno di istituzioni auto-organizzate per gestire risorse immateriali comuni (conoscenza, innovazioni, relazioni, reputazione) e che le Pmi del settore olivicolo-oleario, anziché competere in modo isolato, possono creare regole comuni per la raccolta, il trattamento e la redistribuzione dei sottoprodotti, per condividere know-how, coordinare investimenti, rendere praticabili modelli di business sostenibili, modelli di produzione circolari e pratiche di simbiosi industriale. Non si tratta solo di gestire scarti, ma di condividere conoscenza, tecnologie e fiducia. La stessa fiducia tra aziende diventa essa stessa un common da preservare.

Parole chiave: Reti di imprese; alleanze strategiche; economia circolare; settore olivicolo-oleario; commons; azione collettiva auto-organizzata e autogovernata

Rethinking inventory through a sustainability lens: an Italian perspective

Giampiero Palazzo[1], Lorenzo Ligorio[2]

1. Introduction

In recent years, supply chains have attracted growing interest in academics (Wong et al., 2024). Technological developments, intensification of global competition, market volatility, and increasing attention to environmental, social, and governance (ESG) issues have led to a series of changes in managers' management and decision-making approaches (Lu et al., 2024).

The OECD Supply Chain Resilience Review highlights that, despite the diversification of global trade, import concentration is increasing and relocation could significantly reduce global GDP (OECD, 2025). According to the report, resilience is built by strategically managing risks through agile, adaptable, and internationally coordinated supply chains.

With the consolidation of Industry 4.0, companies have progressively integrated advanced digital technologies that significantly impact the various phases of the supply chain, from procurement planning to product delivery to the customer (Caputo et al., 2025). Digital tools such as blockchain, business intelligence, artificial intelligence, and big data analytics strengthen management's decision-making capabilities, improving control, operational agility, and predictive analytics (Awan et al., 2021; Chae et al., 2014; Sullivan and Fosso, 2024).

Within this context, inventory management is a crucial issue. Hofer et al. (2012) analyzed that lean inventory management improves financial performance by reducing costs. Furthermore, strong governance that is aware of the risks of supply chain disruption, often exacerbated by events such as the COVID-19 pandemic or geopolitical instability, can redesign the global supply chain (Roscoe et al., 2022). In particular, the Russia-Ukraine war has disrupted the supply of key raw materials, including energy and agricultural products (Tollefson, 2022). The conflict has produced significant negative effects on the manufacturing, transport, and agri-food sectors, exacerbating inflationary pressures. This requires a reconfiguration of supply chains and logistics in response to shortages, sanctions, and social dynamics (Bednarski et al., 2025). Finally, data management within inventory plays a key role. Strong mediation of information processed through digital technologies improves the quality of decision-making (Awan et al., 2021).

At the same time, sustainability has become a pillar of supply chain governance. Principles such as the circular economy guide processes toward waste reduction and resource reuse, generating competitive advantages and meeting regulatory and social expectations (Kristoffersen et al., 2021). This push is reinforced by the latest European directives, in particular the Corporate Social Responsibility Directive (CSRD) and the Corporate Sustainability Due Diligence Directive (CSDDD), which are pushing corporate boards to strengthen reporting and control practices throughout the entire sustainable supply chain (Velte, 2025). On the other hand, the "Stop the Clock" directive and recent votes in the European Parliament highlight a trend toward raising the thresholds for the application of regulations. Thus, society finds itself in a rapidly and constantly evolving regulatory environment. In this regard, Nicolo et al. (2025) show that companies

[1] Ph.D. Candidate, ECON-06/A, University of Salento; giampiero.palazzo@unisalento.it – corresponding author

[2] Researcher, ECON-06/A, University of Salento; lorenzo.ligorio@unisalento.it

included in the omnibus package are slightly better prepared in terms of sustainability reporting than those excluded from it.

Several gaps emerge from the literature. First of all, although there are studies that analyze how sustainability practices influence corporate performance (Hofer et al., 2012), there is a lack of clear evidence on how companies' approach to sustainability specifically affects inventory management performance, particularly average days of inventory. Furthermore, empirical analyses of ESG factors that may influence this indicator are limited, with most studies focusing on related aspects, such as transportation, waste management, or reverse logistics, rather than on internal inventory dynamics (Bouchery et al., 2012; Wu et al., 2017). Finally, there is a lack of studies exploring sectoral differences and dynamics in this regard, leaving it unclear whether and how the effect of sustainability on inventory management varies across industries with different operating characteristics.

In the light of the gaps identified, this study aims to empirically analyze the impact of sustainability practices, both in terms of governance structures and sustainability reporting along the supply chain, on the average inventory levels of Italian companies, taking into account sector-specific characteristics. The objective is to assess whether sustainability can be considered a determinant of internal operational performance.

The study is expected to make a twofold contribution. First, it expands the existing literature by integrating the strands of sustainability and inventory management. Second, it provides empirical evidence on the role of sustainable governance and experience in sustainability reporting as possible drivers of operational efficiency, thus providing a basis for the development of more robust theoretical models and the definition of more targeted policy and managerial implications.

This study, adopting the theoretical framework of Resource-based view theory (RBV) formulated by Barney (1991), proposes to empirically analyze how companies' approach to sustainability disclosure affects inventory management, with particular reference to average days of inventory. Furthermore, the analysis aims to explore any sectoral differences and dynamics that exist in this regard.

2. Methodology

This research used a quantitative approach to analyze the sustainability determinants that affect the average inventory levels of companies and to explore the sectoral differences and dynamics that drive them. Specifically, this study uses panel regression analysis to analyze the sustainability factors that influence average inventory levels.

First, a sample of companies was established for analysis. Following (Pizzi et al., 2020), a sample of italian Public Interest Entities (PIEs) was extracted from Bureau Van Dick's AIDA database, a comprehensive data archive that collects financial information on Italian companies. The analysis focuses on the Italian context, chosen in consideration of the significant regulatory transition, which sees the transition from the NFRD to the CSRD and the introduction of the new European Sustainability Reporting Standards (ESRS). Therefore, Italian companies represent a relevant case study for observing both compliance with the new requirements and the ability to adapt organizationally to the new provisions (Nicolo et al., 2025). The sample therefore consists of 178 units of analysis. The time frame analyzed ranges from 2019 to 2023, for a total of five years.

As regards the dependent variable, the average inventory level indicator, expressed in days, was extracted from the AIDA database. It represents the average time that a company holds its stocks before selling them.

The independent variables included governance characteristics, ESG policy, reporting experience, and Global Reporting Initiative (GRI) indicators. For the latter, following Ligorio et al. (2024), a score was calculated by taking the average value of the GRI standard indicators

related to the supply chain, reported by companies in their sustainability reports, and the total number of available supply chain indicators. The reports were downloaded from the companies' websites. The formula is as follows:

$$SC_{score} = \frac{\sum_1^n GRI\ SC\ indicators\ disclosed}{Total\ GRI\ SC\ indicators}$$

Governance characteristics refer to board size, the percentage of women on the board, the percentage of independent directors, and the presence of a sustainability committee, expressed as a binary variable (Beji et al., 2021; Endrikat et al., 2021). These data were extracted from sustainability reports.

ESG policy refers to the presence within a company of a code of conduct for suppliers, aimed at assessing and ensuring compliance with ethical, environmental, and social standards, thereby helping to reduce risks (Li and Lee, 2024). This variable is expressed as a binary variable.

Finally, reporting experience refers to the total number of years that a company has been producing sustainability reports (Caputo et al., 2021).

The model is shown as follows:

$$\text{InventoryAvgit} = \beta 0 + \beta 1\text{SCscoreit} + \beta 2\text{BSit} + \beta 3\text{WBit} + \beta 4\text{IBit} + \beta 5\text{Comit} + \beta 6\text{ESGpolicyit} + \beta 7\text{REit} + \alpha\text{i} + \varepsilon it$$

where:

- $InventoryAvg_{it}$ represents the average inventory indicator, expressed in days;
- $SCscore_{it}$represents the supply chain indicator score;
- BS_{it} represents board size, measured as the total number of board members;
- WB_{it} represents board diversity, measured as the percentage of women and underrepresented groups on the board;
- IB_{it} represents the number of independent administrators on the board;
- Com_{it} reflect the presence of a sustainability committee within the governance structure, where 1 = the company has a sustainable committee, and 0 = it does not;
- $ESGpolicy_{it}$ represents the existence of a code of conduct for suppliers, where 1 = the company has a code of conduct, and 0 = it does not;
- RE_{it} represents the company's experience in sustainability reporting, measured by the number of years of reporting.

For the purposes of an analysis that can guarantee greater accuracy and consistency in estimates, the Hausman test is performed to choose between the application of fixed effects or random effects (Conca et al., 2021). In this way, endogeneity problems are limited.

3. Expected results

Evidence from companies listed on the European market shows that sustainable board governance significantly improves sustainable supply chain reporting (Velte, 2025). Therefore, the study is expected to show how the sustainability variables considered have a significant influence on average inventory levels, suggesting that ESG governance may also play an important role in inventory management. In particular, it is expected that a higher level of supply chain sustainability reporting, measured through the SCscore, will be associated with improved corporate performance (Solano et al., 2023). Companies that invest in sustainability practices tend to improve collaboration with suppliers, transparency of information flows, and the efficiency of logistics processes, with a positive impact on the capacity to plan and reduce unnecessary stock. More transparency in information flows makes demand planning and strategic supplier

management easier, improving alignment between production and sales (Vasista and AlAbdullatif, 2017).

Board characteristics may also be linked to inventory management efficiency. A higher proportion of women on board, as well as a higher proportion of independent administrators, are often associated with greater attention to control, transparency, and sustainability issues, which may be reflected in more careful and disciplined operating practices (Akhter and Hassan, 2024; Arora, 2022). Similarly, the presence of a sustainability committee and the adoption of a formal ESG policy could help to guide the company towards more structured decision-making processes that are consistent with efficiency objectives, promoting a more rational use of resources and a reduction in average inventory (Li and Lee, 2024).

Finally, it is hypothesized that experience in ESG reporting is a further indicator of organizational maturity in monitoring and managing internal performance (Caputo et al., 2021). Companies with a longer history of non-financial reporting tend to develop more advanced control systems, which can translate into more accurate inventory management. Furthermore, this increases the ability to support strategic decisions consistent with efficiency and sustainability objectives (Velte, 2025). In this sense, sustainability is a multidimensional factor, capable of integrating governance, operations, and economic performance in a synergistic approach. Furthermore, integrating ESG practices into decision-making processes can increase a company's responsiveness to market fluctuations and unexpected events, such as supply chain disruptions or regulatory changes.

Overall, the expectation is that greater integration of ESG practices, both in governance and in operational processes, will be associated with lower average inventory levels, suggesting that sustainability can act not only as a reputational leverage but also as an asset capable of creating efficiency and resilience within the supply chain.

4. Implications

Given the results, this study has a multitude of implications for academics, managers, and policymakers, providing numerous insights for both theoretical exploration and the development of more informed practical and policy strategies.

First, from a resource-based view theory perspective, the research contributes to the literature on the role of sustainability in supply chain performance, particularly in terms of average inventory levels. The study highlights that, compared to existing literature which tends to focus on the effects of sustainability mainly in the external stages of the supply chain, such as outbound logistics and waste management, the results indicate that sustainable practices also have a measurable impact on internal inventory management processes.

Furthermore, the research opens the way for further investigation into the mediating role of digital technologies in linking sustainability and inventory management, trying to confirm the RBV assumption that the competitive advantage of companies emerges in the presence of non-imitable resources.

In terms of managerial implications, this study offers several insights into inventory management, verifying how the adoption of sustainable practices impacts supply chain efficiency throughout the various steps of the process. The analysis highlights the intersectoral differences between companies. This strengthens the idea that sectors with long production cycles and a strong dependence on raw materials could benefit from technological investments in inventory planning, management, and traceability, while sectors with high turnover could focus more on advanced collaboration practices with suppliers. Therefore, managers can focus on the characteristics of their own sector rather than resorting to standardized solutions.

In addition, the use of advanced digital tools provides useful guidance to decision-makers for supplier selection, suggesting that ESG practices are not only a reputational issue but can improve delivery reliability and reduce the risk of supply chain disruption.

Finally, the implications of this study are particularly relevant for policymakers. Showing that sustainable practices have a measurable effect on inventory levels, the research provides evidence for developing regulations that encourage efficient and sustainable inventory management. To this end, tax incentives or guidelines could be developed for companies that adopt sustainable inventory management practices. Sectoral differences highlight the need for tailored policies and the creation of sector-specific standards, which allow better comparability between companies and promote transparency.

Furthermore, the results suggest opportunities for the public sector to support digitization initiatives that mediate the relationship between sustainability and inventory management, reducing environmental impact and improving the efficiency of the territorial supply chain.

Sustainability Assurance and Disclosure Quality in the Italian Agri-Food Sector

Gaetano Rago[1]

1. Introduction and research objectives

The entry into force of the Corporate Sustainability Reporting Directive (CSRD) in January 2024 marked a turning point in the regulation of sustainability reporting in Europe, significantly broadening the scope of obligated companies and introducing a phased requirement for external assurance, moving from limited to reasonable assurance by 2028. In parallel, the proposals contained in the Omnibus I package (February 2025), aimed at reducing administrative burdens and compliance costs through higher thresholds and greater application flexibility, have generated uncertainty regarding the future depth, comparability, and credibility of ESG disclosures. In this context, sustainability assurance, understood as the independent verification of ESG information by qualified third parties, has assumed a crucial role in reducing information asymmetry, mitigating greenwashing risks, and enhancing the reliability of sustainability reports (Rossi and Tarquinio, 2017; Larrinaga et al., 2020; Borgato and Marchini, 2021; Mio et al., 2024). The Italian agri-food sector provides a particularly compelling context for analysis. It is characterized by high environmental and social materiality (climate change, land and water use, biodiversity, labor conditions along the supply chain) (Briamonte et al., 2024; Cromwell et al., 2025), substantial national economic relevance (significant contribution to GDP and employment) (Fortunati et al., 2020; Betti et al., 2025), and complex supply chains that span from primary production to processing and distribution (Contò et al., 2019). The ownership and governance structures are predominantly composed of family-owned businesses, agricultural cooperatives, and SMEs, embedded within an institutional fabric defined by relational networks, strong regional identities, and a civil law legal tradition (Tarangioli et al., 2024).

Despite the strategic role of the agri-food sector in the green transition, studies specifically focused on assurance of sustainability for Italian agri-food firms remain limited (Betti et al., 2025). For this reason, the present study addresses this gap by examining the relationship between the characteristics of external assurance and the quality of ESG disclosure. More precisely, it examines how assurance level, the use of recognised assurance standards, and the choice of provider are associated with disclosure quality in Italian agri-food companies, distinguishing the effect of the mere publication of a sustainability report from the incremental effect of external assurance, while considering the institutional and regulatory specificities of the Italian context. Accordingly, the research question guiding this study is as follows: How do the various characteristics of sustainability assurance relate to the quality of ESG disclosure in the Italian agri-food sector during the initial implementation phase of the CSRD, and what implications arise for regulatory policy and corporate practice?

2. Theoretical backgroynd and hypothesis development

To address the research question, three complementary theoretical perspectives are employed: Legitimacy Theory (Suchman, 1995), Stakeholder Theory (Freeman, 1984), and Agency Theory (Jensen and Meckling, 1976).

[1] Ph.D., ECON-O6/A, University of Salerno; grago@unisa.it – corresponding author

According to Legitimacy Theory (Suchman, 1995), organizations continuously seek social approval by striving to operate within boundaries deemed acceptable by society. In the field of sustainability, legitimacy pressures stem from regulatory constraints, stakeholder expectations, media scrutiny, and evolving societal norms on environmental and social matters (Cho et al., 2015; Deegan, 2002). Sustainability reporting and its assurance are thus viewed as tools for managing legitimacy (Simnett et al., 2009; Boiral, 2013). Through the publication of ESG information and its independent verification, firms signal their conformity to socially accepted norms and values. In this framework, higher levels of assurance act as stronger signals of commitment and credibility, reducing perceptions of managerial discretion in the selection and presentation of information (Martínez-Ferrero and García-Sánchez, 2017). In the Italian agri-food sector, legitimacy pressures are particularly intense due to its high environmental impact and the strong cultural ties to food quality and origin (Belletti and Marescotti, 2011). This perspective leads to the following hypothesis:

H1: Firms that obtain higher levels of assurance exhibit higher-quality sustainability disclosure.

Stakeholder Theory (Freeman, 1984; Mitchell et al., 1997) shifts the focus from broad societal expectations to the demands of specific stakeholder groups that possess power, legitimacy, and urgency in their claims. Investors, customers, suppliers, workers, local communities, NGOs, and regulators have diverse information needs and may exert varying degrees of pressure on firms to produce reliable and comparable sustainability information (Manetti and Becatti, 2009; Boiral et al., 2020). From this viewpoint, sustainability assurance can be interpreted as a response to the demands of stakeholders seeking credible information (Simnett et al., 2009). The adoption of internationally recognized assurance standards (e.g., ISAE 3000, AA1000AS, ISSA 5000) and the engagement of providers with established reputational capital, such as those belonging to the Big 4, strengthen the signal of reliability to sophisticated stakeholders such as institutional investors, major retailers in the agri-food chain, or certification bodies (Mangieb and Sarr, 2025). In the agri-food sector, the complexity of supply chains increases the demand for verifiable information on environmental and social impacts. Firms may thus employ recognized standards and reputable providers to meet such expectations and differentiate themselves through disclosure quality. This perspective leads to two additional hypotheses:

H2: Firms that adopt internationally recognized assurance standards exhibit higher-quality sustainability disclosure than those using proprietary or non-standardized approaches.

H3: Firms that engage Big 4 assurance providers exhibit higher-quality sustainability disclosure than those relying on other types of providers.

Agency Theory (Jensen and Meckling, 1976; Eisenhardt, 1989) conceptualizes the information problem as a principal–agent relationship between managers (agents) and shareholders or financial stakeholders (principals), highlighting how the former possesses superior information and may have incentives to select, distort, or omit information to maximize their own objectives. From this perspective, sustainability reporting serves as a mechanism to reduce information asymmetry, while external assurance functions as a governance tool that constrains managerial opportunism and enhances the reliability of disclosed information (Simnett et al., 2009). Assurance may also yield economic benefits, such as reduced cost of capital (due to lower information risk), better access to sustainable finance instruments, enhanced reputation, and reduced exposure to regulatory sanctions (Hummel and Schlick, 2016).

In the Italian agri-food sector, the prevalence of family-owned and cooperative firms introduces agency configurations that differ from the classical model, potentially reducing the separation between ownership and management but generating specific accountability needs towards members, shareholders, or local communities (Gasson and Errington, 1993). However, as firm size increases, so does organizational complexity, the distance between owners and managers, and public visibility, thereby raising agency costs and external scrutiny. In such

contexts, assurance may become particularly relevant as both a governance and signaling mechanism (Krasodomska et al., 2025). This leads to the final hypothesis:

H4**:** The relationship between assurance characteristics (level, standard, and provider type) and sustainability disclosure quality is stronger in larger firms, which face higher agency costs and stakeholder scrutiny than smaller firms.

Overall, the three theoretical perspectives converge in suggesting that more "robust" assurance characteristics (greater depth, recognized standards, reputable providers) are associated with higher-quality ESG disclosure. At the same time, they indicate that this relationship is moderated by stakeholder structure, governance features, and firm size within a highly dynamic sectoral and regulatory context such as that of the Italian agri-food industry during the implementation phase of the CSRD.

3. Methodology

3.1. Sample selection and data sources

The empirical analysis employs a cross-sectional design focusing on fiscal year 2024 to examine the relationship between sustainability assurance characteristics and disclosure quality in the Italian agri-food sector. The sample selection process followed a multi-stage approach to identify relevant companies while ensuring data availability and quality. Data were collected from multiple sources between July and October 2025, when complete 2024 reporting information was available.

Financial and structural data were obtained from the AIDA database (Bureau van Dijk), which provides comprehensive information on Italian companies. Sustainability reports were retrieved directly from annual reports and company websites, with particular attention to obtaining the most recent reports corresponding to the 2024 fiscal year. Assurance statements were extracted from these reports, with detailed coding of assurance characteristics including level, standards used, and provider identity.

The study population was defined using NACE Rev. 2 codes corresponding to agri-food activities: 01 (Crop and animal production), 02 (Forestry and logging), 03 (Fishing and aquaculture), 10 (Manufacture of food products), 11 (Manufacture of beverages), 462 (Wholesale of agricultural raw materials), 463 (Wholesale of food and beverages), 4711 (Retail sale in non-specialized stores with food predominating), and 472 (Retail sale of food in specialized stores).

From the initial universe, we applied a structured sequence of screens to derive the analytic sample (see Table 1). First, we retained only entities with active legal status. Second, we restricted the frame to corporations and cooperatives, excluding sole proprietorships and partnerships whose governance structures and reporting practices are not comparable. Third, we imposed a size criterion of at least 1,000 employees to concentrate on organizations with sufficient resources and stakeholder salience to engage meaningfully with sustainability reporting; this threshold also aligns with ongoing Omnibus discussions that envisage higher CSRD applicability parameters. Finally, we verified the availability of complete information for fiscal year 2024. The resulting sample comprises 73 companies, representing the largest enterprises in the Italian agri-food sector.

Selection Criteria	Number of Companies	Reduction
Initial population (agri-food sector)	1,022,410	-
Active legal status	960,820	-61,590
Capital companies and cooperatives	120,288	-840,532
≥1,000 employees	1,101	-119,187
2024 data available	73	-1,028
Final sample	**73**	**-1,022,337**

Table 1. Sample selection process

3.2. Variable construction and coding

The reporting indicator (Report present) equals 1 if a stand-alone sustainability report or an integrated report with identifiable sustainability sections is available, and 0 otherwise. The assurance level (AQ2) is coded from the assurance statement. The standards indicator (AssurStd) equals 1 when the statement explicitly references ISAE 3000 Revised, ISAE 3410 for greenhouse gas assertions, AA1000AS, or ISSA 5000, and 0 otherwise. The provider indicator (ProvBig4) equals 1 for engagements conducted by one of the Big 4 audit firms and 0 for other providers.

The disclosure quality index assigns one point for explicit alignment with at least one recognized reporting standard, one point for the presence of a content index, one point for disclosure of Scope 1 and Scope 2 emissions with at least partial disclosure of Scope 3, and one point for quantitative climate targets. Components are coded as binary indicators to maximize transparency and replicability. A codebook defines each rule and records borderline cases, with traceability links to the underlying document excerpts. Inter-coder agreement is assessed on a subsample using standard reliability procedures in content analysis (Krippendorff, 2018).

Financial controls are derived from the corporate database and harmonized to fiscal year 2024 (or the latest available year when 2024 financial data are not yet reported). Size is proxied by the natural logarithm of total assets (ln_Assets); leverage is measured as total debt over total assets; profitability is captured by return on assets (ROA). All continuous variables are winsorized at conventional percentiles to contain the influence of outliers.

3.3. Dependent variable: Disclosure Quality Index (DQI-4)

The primary dependent variable is a Disclosure Quality Index (DQI-4) constructed specifically for this study. The index follows an additive approach with a 0–4 scale, where one point is awarded for each of the following elements present in a company's sustainability disclosure:

- Alignment with recognized standards: evidence of reporting according to at least one of the following frameworks: Global Reporting Initiative (GRI), International Sustainability Standards Board (ISSB), or European Sustainability Reporting Standards (ESRS).

- Content index: inclusion of a structured index that explicitly links specific disclosures to the corresponding standards or framework requirements.
- Comprehensive emission coverage: disclosure of Scope 1 and Scope 2 greenhouse gas emissions, plus at least partial disclosure of Scope 3 emissions.
- Quantitative climate targets: establishment of specific, measurable climate targets, such as those validated through the Science Based Targets initiative (SBTi) or equivalent credible frameworks.

For companies not publishing a sustainability report (non-reporters), all DQI-4 components are coded as 0. This approach follows Clarkson et al. (2008) in avoiding the selection bias that would result from analyzing only reporting companies, which is particularly important given the early-stage adoption context.

3.4. Independent variables: assurance characteristics

Three primary independent variables capture different dimensions of sustainability assurance:

- AQ2: an ordinal variable measuring the level of assurance obtained: 0 = no assurance; 1 = limited assurance; 2 = reasonable assurance. This coding reflects the hierarchy of assurance engagement depth and resulting confidence levels.
- AssurStd: a dummy variable coded 1 if the assurance engagement references recognized assurance standards (ISAE 3000/3410, AA1000AS, or ISSA 5000), and 0 otherwise. This variable captures the methodological rigor of the assurance process.
- ProvBig4: a dummy variable coded 1 if the assurance provider is one of the Big 4 accounting firms (Deloitte, PwC, EY, or KPMG), and 0 for other providers. This variable test whether provider reputation and resources are associated with disclosure quality.

3.5. Control variables

Several control variables are included to account for alternative explanations and potential confounding factors:

- ln_Assets: natural logarithm of total assets, serving as a proxy for company size. Larger companies typically face greater stakeholder scrutiny and have more resources for sustainability initiatives.
- Leverage: total debt over total assets, controlling for financial structure and potential risk exposure that might influence reporting decisions.
- ROA: return on assets, measuring profitability, which may affect both resources available for sustainability reporting and strategic priorities.
- Report present: dummy variable coded 1 if the company publishes a sustainability report, 0 otherwise. This variable separates the effect of merely reporting from the incremental effect of assurance characteristics.
- Sector fixed effects: dummy variables based on 2-digit NACE codes to control for sector-specific factors that might influence both assurance adoption and disclosure practices.

3.6. Empirical models

The baseline empirical model is specified as follows: $DQI4_i = \alpha + \theta Report_present_i + \beta_1 AQ2_i + \beta_2 AssurStd_i + \beta_3 ProvBig4_i + \gamma_1 ln_A_i + \gamma_2 Leverage_i + \gamma_3 ROA_i + \mu NACE2 + \varepsilon_i$

Where:

- θ captures the marginal effect of publishing a sustainability report, independent of assurance decisions;

- β1, β2, β3 measure the incremental associations of assurance characteristics with disclosure quality;
- μNACE2 represents sector fixed effects that control for unobserved sector-level heterogeneity;
- εi is the error term.

This specification allows us to distinguish between the decision to report (which may reflect basic compliance or initial engagement with sustainability transparency) and the additional effect of assurance characteristics (which may reflect deeper commitment to credibility and stakeholder accountability). To further explore whether firm size conditions these relationships, additional models including interaction terms between assurance variables and ln_Assets are estimated as part of the robustness analysis.

3.7. Estimation strategy and statistical approach

The empirical analysis proceeds in a structured sequence. First, we present descriptive statistics for all variables, including means, standard deviations, and ranges, to characterize the sample and provide context for the multivariate analysis. This descriptive analysis highlights the distribution of disclosure quality, assurance adoption rates, and company characteristics in our sample.

Second, we conduct correlation analysis to examine bivariate relationships between variables and identify potential multicollinearity issues. The correlation matrix provides initial evidence regarding the relationships between assurance characteristics and disclosure quality before controlling for other factors.

Third, we estimate multiple regression models using Ordinary Least Squares (OLS) with robust standard errors (Eicker–Huber–White). The use of robust standard errors addresses potential heteroskedasticity concerns. We estimate three nested models: Model 1 includes only the report dummy and control variables; Model 2 adds the assurance level variable; Model 3 includes all assurance characteristics. This sequential approach allows us to observe how the addition of assurance variables affects model fit and coefficient stability.

Fourth, we perform diagnostic tests to validate model assumptions and ensure result reliability. These include Variance Inflation Factor (VIF) tests to check for multicollinearity, Breusch–Pagan tests for heteroskedasticity, and examination of residual distributions for normality. These diagnostics are reported alongside the main regression results.

3.8. Robustness checks and additional analyses

To assess the robustness of our findings and address potential methodological concerns, we conduct several supplementary analyses that are reported in the Results section:

- Subsample analysis of reporting companies: we re-estimate our models using only the subsample of companies that publish sustainability reports (n = 45). This analysis tests whether the relationships between assurance characteristics and disclosure quality hold within the population of reporting companies, excluding the contrast with non-reporters.
- Inverse Probability Weighting (IPW): to address potential selection bias in the reporting decision, we implement a two-stage approach. First, we estimate a logistic regression model predicting the probability of reporting based on company characteristics (size, sector, profitability). Second, we use the inverse of these predicted probabilities as weights in the main regression analysis. This approach provides evidence on whether selection into reporting affects our estimated relationships.
- Alternative DQI specifications: we test the sensitivity of our results to alternative operationalizations of disclosure quality. Specifically, we estimate models using a modified DQI

that excludes the climate targets component (resulting in a 0–3 scale), examining whether our findings are robust to this measurement variation.

- Winsorization of outliers: we re-estimate models after winsorizing continuous variables at the 1st and 99th percentiles to assess whether extreme values disproportionately influence our results.
- Sector-specific analyses: we explore whether the relationships between assurance and disclosure quality vary across different agri-food subsectors by estimating models with interaction terms between assurance variables and sector dummies.

4. Preliminary results and discussion

Based on completed data collection and preliminary analysis, initial evidence points to the following key results (final statistical validation is in progress).

Primary effect of reporting. The coefficient for Report present (θ) is expected to be positive and highly significant, indicating that the decision to publish a sustainability report is itself associated with a substantial increase in the disclosure quality score.

Incremental effect of assurance level. The coefficient for AQ2 (β1) is expected to be positive and statistically significant, suggesting that moving from no assurance to limited assurance, and from limited to reasonable assurance, is associated with incremental improvements in disclosure quality, holding reporting constant.

Role of standards and providers. The coefficients for AssurStd and ProvBig4 (β2, β3) are expected to display positive but potentially weaker or only marginally significant associations, indicating that, while relevant, the specific standard or provider brand may be secondary to the fundamental decision to obtain a higher level of assurance in this context.

Importance and role of firm size. The control variable for firm size (log assets) is expected to be positively and significantly related to DQI-4, consistent with resource-based and stakeholder pressure arguments. In line with H4, preliminary analyses also explore whether the association between assurance characteristics and disclosure quality is stronger for larger firms, which face higher agency costs and more intense stakeholder scrutiny.

Hypothesized Relationship	**Expected Sign**	**Theoretical Rationale**
H1: Assurance Level → Disclosure Quality	Positive (+)	Legitimacy signaling, deeper verification processes
H2: Use of Standards → Disclosure Quality	Positive (+)	Methodological rigor, professional norms
H3: Big4 Provider → Disclosure Quality	Positive (+)	Reputational capital, technical expertise
H4: Firm Size x Assurance Characteristics → Disclosure Quality	Positive (+)	Higher agency costs and stakeholder scrutiny in larger firms

Table 2. Expected direction of key relationships

4.1. Potential Scientific Value and Contributions

This work-in-progress study is positioned to offer several contributions to academia and practice:

- Theoretical contribution. By testing established theories (Legitimacy, Stakeholder, Agency) in the under-researched context of Italian agri-food, the study may reveal boundary conditions or contextual moderators of these frameworks, particularly concerning the role of family ownership and cooperative governance.
- Empirical contribution. The study provides early, sector-specific evidence on the CSRD's "on-the-ground" implementation, focusing on assurance quality rather than mere adoption. The construction and application of the DQI-4 index offer a replicable tool for assessing the comprehensiveness of ESG disclosure.
- Practical and policy implications. The findings are expected to inform Italian agri-food companies about the potential disclosure benefits associated with different assurance choices. For regulators and standard setters (e.g., CONSOB, EFRAG), the study can shed light on the real-world interplay between reporting mandates and assurance markets. For assurance providers, it highlights the factors that may drive quality differentiation in a specific sector.

4.2. Limitations of research design

Several limitations of the research design should be acknowledged. First, the cross-sectional nature of the analysis limits causal inference; we can identify associations but cannot definitively establish causality between assurance characteristics and disclosure quality. Second, the sample size of 73 companies, while adequate for the planned analyses, limits statistical power for detecting small effects and constrains more complex model specifications (e.g., extensive interaction terms). Third, the DQI-4 measure, while transparent and replicable, represents a relatively narrow operationalization of disclosure quality and may not capture all relevant dimensions of ESG reporting. Fourth, data availability constraints meant that we could only include companies with complete data for 2024, potentially introducing selection bias if data completeness is correlated with disclosure practices.

5. Conclusions and future developments

This research is actively in progress. The data collection and coding phase is complete, and preliminary statistical analyses have been conducted. The immediate next steps involve finalizing the regression diagnostics, completing all planned robustness checks, and deepening the interpretation of results within the Italian institutional context.

The study offers initial empirical evidence on the association between sustainability assurance characteristics and disclosure quality in the Italian agri-food sector during the early CSRD adoption phase. Preliminary findings highlight the fundamental importance of the decision to report, which appears to show the strongest association with disclosure quality. Beyond this basic decision, assurance level emerges as a significant factor, with higher assurance levels corresponding to better disclosure quality. Firm size consistently matters, reflecting both greater stakeholder pressure and higher resource availability, and may also condition the strength of the relationship between assurance characteristics and disclosure outcomes.

The Italian agri-food sector presents a distinctive context where traditional business structures and sector-specific sustainability challenges intersect with evolving regulatory requirements. As sustainability reporting becomes increasingly institutionalized, understanding how different types of organizations respond to assurance incentives will be crucial for developing effective policies and practices.

The findings of this work-in-progress contribute to the growing literature on sustainability assurance by providing sector-specific evidence from an important but understudied context. They also offer practical insights for companies navigating new reporting requirements, for

assurance providers developing service offerings tailored to complex value chains, and for policymakers designing regulatory frameworks that balance simplification with the need for credible, decision-useful ESG information. As CSRD implementation progresses, continued research will be needed to track evolving practices and outcomes in sustainability assurance and disclosure, including longitudinal analyses and designs that more explicitly exploit regulatory shocks such as the Omnibus I package.

L'Internal Dealing come meccanismo di segnalazione della governance sostenibile: analisi delle reazioni del mercato

Camilla Falivena[1], Alessandro Giosi[2], Silvia Testarmata[3], Beatrice Meo[4]

1. Introduzione

Nel contesto regolamentare italiano, il termine Internal Dealing identifica le operazioni di compravendita sui titoli di una società quotata poste in essere da amministratori, sindaci, dirigenti con responsabilità strategiche e persone a essi collegate. In virtù della posizione di particolare rilievo rivestita tali soggetti, le operazioni di acquisto o vendita sui titoli della società assumono, infatti, un ruolo rilevante per il mercato anche in termini informativi. Per tale ragione, la normativa italiana, in coerenza con l'indirizzo europeo, ha posto in capo a questi soggetti l'obbligo di comunicare al mercato tempestivamente qualsiasi operazione di acquisto/vendita compiuta sui titoli della loro società (art. 114, 7° comma T.U.F. e artt. 152 sexies e seguenti del Regolamento Emittenti Consob 11971/99). L'obbligo di renderle pubbliche sussiste al fine di offrire agli investitori un valore segnaletico circa la percezione che le persone rilevanti hanno sulle prospettive della società e si presume siano operazioni effettuate nel rispetto della normativa vigente e sulla base del set informativo disponibile al mercato. Questo aspetto, a livello nazionale, permette di distinguere tale fattispecie dall'insider trading, invece qualificato come condotta illecita da parte di chi effettua operazioni di acquisto/vendita sui titoli di una società quotata avendo a disposizioni informazioni riservate. Nonostante l'obbligo di disclosure, persiste comunque un certo grado di asimmetria informativa, che suggerisce un possibile contenuto informativo delle operazioni di compravendita condotte dagli insider.

Il potenziale ruolo segnaletico dell'Internal Dealing si inserisce nel dibattito internazionale volto ad esplorare la capacità predittiva delle operazioni di compravendita poste in essere da insider sui rendimenti anomali sia nel breve sia nel medio periodo (Baker et al., 2025). Nel mercato italiano, caratterizzato da strutture proprietarie concentrate, presenza di gruppi familiari e sistemi di governance eterogenei, il contenuto informativo delle operazioni degli insider può risultare particolarmente rilevante. Infatti, in coerenza con la teoria dei mercati efficienti sviluppata da Fama (1970), una forte efficienza dei mercati riflette anche l'informazione privata, rendendo impossibile l'estrazione di extra-profitti attraverso l'uso di informazioni riservate. Pertanto, le evidenze empiriche sui rendimenti anomali associati alle operazioni degli insider costituiscono pertanto test diretti della validità empirica dell'efficienza forte. Se a seguito delle operazioni condotte dagli insider si registrano ritorni superiori alla media, l'ipotesi di mercato efficiente in forma forte risulta smentita.

A tal proposito, lo studio di Bajo e Petracci (2006) mostra come variazioni significative nelle partecipazioni degli insider siano associate a rendimenti anomali positivi nei mesi successivi, con effetti maggiori nel caso degli acquisti rispetto alle vendite. Gli autori evidenziano, inoltre, ritardi nella comunicazione delle operazioni alla Consob, segnalando una discrepanza tra quadro regolamentare e comportamento empirico. In aggiunta, Barucci et al. (2006) analizzando l'attività

degli insider nel mercato italiano e le strategie di trading immediatamente successive a variazioni di prezzo, evidenziano che gli insider tendono ad acquistare dopo ribassi e a vendere dopo rialzi, suggerendo un utilizzo opportunistico dell'informazione, coerente con strategie di feedback trading, e un ruolo determinante del timing delle comunicazioni. Le analisi del mercato italiano mostrano quindi che, nella pratica, gli insider appaiono in grado di estrarre valore dalle informazioni private prima che tali informazioni siano incorporate nei prezzi, suggerendo l'esistenza di potenziali rischi informativi.

Con l'obiettivo di contribuire e aggiornare il dibattito in materia, il presente studio, attraverso la lente teorica della signaling theory, esplora se e in che modo la disclosure relativa alle operazioni di Internal Dealing sia percepita dal mercato come un segnale delle performance prospettiche della società. Nello specifico, l'assunzione alla base è che le operazioni di Internal Dealing caratterizzate dall'acquisto delle azioni possano dare al mercato un segnale positivo con riferimento alle performance future, mentre operazioni di vendita possano essere percepite come un segnale di sfiducia.

Le caratteristiche istituzionali del contesto italiano rafforzano l'applicazione della signaling theory poiché, in presenza di concentrazione proprietaria e di forte sovrapposizione tra proprietà e controllo, il potenziale segnale emesso dagli insider risulta spesso più credibile. Tale analisi intende, inoltre, leggere il fenomeno in termini di sostenibilità della governance all'interno del paradigma ESG (Mason, 2020). La reazione del mercato può essere, infatti, intesa anche come proxy della credibilità della governance e della buona condotta dei soggetti rilevanti che ricoprono ruoli chiave (Mollet et al., 2013).

2. Letteratura di riferimento

La letteratura specificamente dedicata all'Internal Dealing, come definito da Borsa Italiana, risulta estremamente limitata, in quanto tale denominazione assume un significato tecnico soltanto nel contesto italiano. In Italia, infatti, la disciplina dell'Internal Dealing si è sviluppata con caratteristiche peculiari rispetto alle normative internazionali, dando luogo a una produzione scientifica ristretta, relativamente datata e circoscritta prevalentemente al campo finanziario. Tra i contributi più rilevanti in questo ambito si collocano gli studi di Barucci et al. (2006), Tardivo et al. (2006) e Bajo e Petracci (2006), che forniscono le principali evidenze disponibili circa l'informatività delle operazioni degli insider nel contesto italiano. Barucci et al. (2006) mostrano che gli insider italiani assumono comportamenti sia riconducibili alla tradizionale ipotesi dell'asimmetria informativa, sia a strategie trading discrezionale. Dalla loro analisi emerge che questi tendono a comprare azioni sottovalutate, con basso rapporto market-to-book, ma tendono ad acquistare dopo un rendimento positivo nell'anno precedente, agendo come positive feedback traders. In questo modo sfruttano i movimenti di mercato a breve termine, comprando dopo un calo dei prezzi e vendendo dopo un aumento dei prezzi, seguiti da un parziale price reversal. Il mercato risponde almeno in parte alle loro operazioni, generando ritorni anomali nel breve periodo. Allo stesso modo, lo studio di Tardivo et al. (2006) conferma che le compravendite degli insider italiani risultano profittevoli e che gli operatori sono in grado di ottenere extra-rendimenti, tanto immediatamente quanto nei mesi successivi alla transazione. Attraverso l'impiego dell'event study dal punto di vista metodologico, gli autori riscontrano che il mercato attribuisce un contenuto informativo alle comunicazioni degli insider, in particolare agli acquisti, interpretati come segnali relativamente credibili di sottovalutazione del titolo. A loro volta, Bajo e Petracci (2006) analizzano le variazioni significative della partecipazione detenuta dagli insider, evidenziando che incrementi della quota azionaria sono generalmente seguiti da rendimenti anomali positivi particolarmente concentrati tra il primo e il terzo mese successivo all'operazione, mentre riduzioni della partecipazione tendono ad anticipare rendimenti negativi. Il segnale è più forte quando l'insider detiene già una posizione di controllo superiore al 50 per cento, suggerendo che la discrezionalità e la qualità informativa delle operazioni siano maggiori per insider con

elevato potere di controllo ed elevata influenza nella definizione delle strategie. Nel complesso, le evidenze che emergono dal contesto italiano sono piuttosto consistenti nell'affermare la presenza di abnormal return e di reazioni del mercato collegate a operazioni di compravendita condotte da persone di rilievo nella gestione della società. In particolare, gli acquisti costituiscono il segnale informativo dominante in presenza di asimmetrie informative significative.

A livello internazionale, il dibattito viene portato avanti nell'ambito nei filoni di ricerca più ampi sull'insider trading e sulle operazioni finanziarie, genericamente definite, portate avanti dagli insider. Una recente revisione bibliometrica della letteratura sull'insider trading ha individuato sei principali cluster tematici: : i) efficienza del mercato, contenuto informativo e comportamento degli insider; ii) Corporate Governance, caratteristiche degli insider e pratiche di insider trading; iii) regolamentazione e compliance; iv) fusioni e acquisizioni e altri eventi significativi; v) rendicontazione finanziaria, annunci degli utili e informativa volontaria; vi) comparazioni tra mercati e Paesi (Baker et al., 2025). Cruciale e con una crescita costante è il tema relativo al legame tra insider trading, corporate governance e asimmetria informativa. Nella prospettiva teorica classica, l'ipotesi dell'asimmetria informativa resta dominante; pertanto, la posizione prevalente è quella in base alla quale gli insider negoziano sulla base di informazioni private e il mercato reagisce in modo adattivo, incorporando progressivamente tali informazioni nei prezzi (Doffou, 2007). Tuttavia, modelli più recenti hanno ampliato il quadro interpretativo, considerando motivazioni alternative alle operazioni degli insider, come esigenze di liquidità, cicli di vita patrimoniale, forme alternative di compenso e meccanismi di segnalazione strategica non direttamente collegati all'informazione privilegiata (Baker et al., 2025).

A partire dagli anni Settanta e Ottanta, studi pionieristici come quelli di Seyhun (1986) hanno dimostrato che gli insider sono in grado di conseguire rendimenti anomali sfruttando un vantaggio informativo e che gli acquisti degli insider costituiscono segnali più affidabili delle vendite, poiché meno influenzati da esigenze di diversificazione o liquidità. Dalle loro analisi emerge che i rendimenti anomali sono concentrati nel periodo immediatamente successivo alle operazioni, ma appaiono anche persistenti nel medio termine, soprattutto quando si considerano transazioni di dimensione significativa o condotte da insider di alto livello gerarchico. Tale evidenza è stata confermata, anni dopo, da Gurgul and Majdosz (2007), i quali, studiando il mercato polacco, hanno osservato rendimenti anomali nei giorni precedenti e successivi alla disclosure, mentre le vendite non mostrano particolare contenuto informativo. Inoltre, hanno riscontrato che strategie di imitazione delle operazioni degli insider non replicano sistematicamente gli extraprofitti, suggerendo che parte dell'informazione alla base delle operazioni non risulti trasferibile agli outsider. Questo risultato contrasta con le osservazioni di Lei et al. (2014) sul mercato statunitense, dove gli insider agiscono come value investor nell'indirizzare le decisioni di investimento degli outsider, ottenendo rendimenti anomali significativi in positivo.

Sono state, inoltre, osservate variazioni di prezzo e di volume di scambio economicamente significative, le quali riflettono, rispettivamente, i cambiamenti nelle aspettative di consenso del mercato e i cambiamenti nelle aspettative dei singoli investitori (Ryna, 2005).Tuttavia, le compravendite che generano una risposta significativa nel prezzo non sono necessariamente le stesse che generano grandi movimenti nel volume di scambio, suggerendo che l'impatto sul prezzo e sul volume possono essere indipendenti.

Nei mercati europei anglosassoni, in particolare nel Regno Unito, ricerche successive hanno approfondito il ruolo del contesto informativo dell'impresa. Ryan (2005), ad esempio, mostra che l'impatto delle operazioni dei manager ai livelli più alti è anche funzione della dimensione: in imprese caratterizzate da dimensioni ridotte, bassa copertura analitica e reporting finanziario meno dettagliato, le operazioni dei soggetti di rilievo generano reazioni di prezzo più intense, coerenti con una forte asimmetria informativa. Viceversa, quando il mercato è già ben informato, la reazione tende ad attenuarsi, suggerendo che il contenuto informativo marginale dell'operazione sia inferiore.

Come evidenziato da Baker et al. (2025), negli anni più recenti sono aumentati gli studi di tipo comparativo. Nello specifico, Dardas e Güttler (2011) analizzano otto mercati europei, documentando che effetti significativi a seguito dell'annuncio di operazioni di compravendita portate avanti da soggetti in rilevanti nella metà di essi. In linea con le evidenze già emerse in studi precedenti, gli acquisti costituiscono, anche in questo contesto, il segnale più informativo. Gli autori confermano inoltre la validità dell'insider hierarchy hypothesis, secondo cui la posizione dell'insider - esecutivo o non esecutivo, membro del board o del top management – incida sulla capacità informativa per il mercato.

Sul fronte regolamentare, il recente studio di Cline et al. (2021) fa il punto sullo stato di avanzamento della regolamentazione in materia, sottolineando che la severità delle norme sull'insider trading dipende anche dai valori culturali nazionali, in particolare dal grado di individualismo. Secondo questa prospettiva, è soprattutto l'adozione corretta della regolamentazione a contribuire positivamente allo sviluppo finanziario, suggerendo che la capacità informativa delle operazioni di compravendita condotte dagli insider si inserisce in un quadro più ampio di determinanti istituzionali.

In termini normativi, gli Stati Uniti hanno storicamente sviluppato un quadro particolarmente stringente, basato sulla Rule 10b-5 del Securities Exchange Act del 1934 e sulla Rule 14e-3, che proibisce il trading su tender offer information anche in assenza di violazione di un dovere fiduciario. discute estesamente Il modello statunitense si distingue per la combinazione tra disclosure tempestiva, responsabilità estesa ai "tippee" e severe sanzioni penali e civili Doffou (2003). A livello europeo, la Market Abuse Directive (MAD, 2003) e successivamente il Market Abuse Regulation (MAR, 2016) hanno perseguito un obiettivo di armonizzazione, imponendo requisiti di comunicazione uniformi e ampliando i poteri delle autorità di vigilanza nazionali. Tuttavia, l'impatto delle riforme regolamentari non è stato omogeneo. Pattitoni et al. (2013), concentrandosi sull'Italia, mostrano che gli insider continuano a conseguire rendimenti anomali anche dopo la Direttiva Europea sull'abuso di mercato e che i blackout period autoimposti risultano frequentemente violati, specialmente in prossimità di eventi societari rilevanti.

La letteratura teorica ha inoltre identificato diversi modelli interpretativi utili per comprendere perché e in che misura gli insider riescano a generare rendimenti anomali. Il paradigma dell'asimmetria informativa, sviluppato in parallelo agli studi empirici statunitensi, interpreta gli insider come possessori di un vantaggio informativo strutturale, che utilizzano per operare scelte di timing superiori rispetto agli operatori ordinari. L'approccio agency-based suggerisce invece che l'insider trading possa ridurre o aumentare i conflitti tra manager e azionisti (Padilla, 2002). Per alcuni autori, consentire agli insider di negoziare può favorire l'allineamento degli incentivi e promuovere una maggiore efficienza allocativa, mentre per altri può amplificare i rischi di espropriazione e compromettere la fiducia degli investitori (Enriques et al., 2025). Infine, l'insider hierarchy hypothesis propone che la posizione dell'insider all'interno dell'organizzazione determini il grado di accesso alle informazioni critiche, la credibilità percepita del segnale e la reazione conseguente del mercato. Questa ipotesi è stata confermata sia da studi italiani sia da quelli europei e statunitensi, evidenziando come le operazioni condotte dai top executives abbiano effetti più marcati rispetto a quelli dei membri non esecutivi o degli insider periferici.

Nonostante gli importanti contributi accumulati negli ultimi decenni, emergono tuttavia diversi gap significativi nella letteratura. In primo luogo, gli studi italiani sull'Internal Dealing sono limitati temporalmente e non coprono in maniera sistematica gli effetti delle normative più recenti, in particolare del Regolamento Europeo sull'abuso di mercato. In secondo luogo, nonostante la crescente attenzione ai profili gerarchici degli insider, restano ancora poco esplorate le implicazioni delle dinamiche interne di governance e gli aspetti contestuali che possono contribuire alla capacità informativa. Infine, mancano analisi che permettano di osservare il fenomeno anche in termini di sostenibilità della governance.

3. Metodologia

Il campione oggetto di analisi include le operazioni di Internal Dealing pubblicate sul sito di Borsa Italiana negli ultimi dodici mesi e identificate come l'evento intorno al quale esplorare le reazioni del mercato. La fonte impiegata, che rappresenta il canale istituzionale attraverso cui gli emittenti adempiono agli obblighi di disclosure sulle operazioni di compravendita delle azioni della società che coinvolgono persone rilevanti, consente di disporre di dati omogenei in termini di struttura informativa e tempistica di comunicazione. Dal dataset originario sono state escluse le operazioni riferibili a banche e istituzioni finanziarie, poiché soggette anche a una disciplina specifica che compromette la comparabilità con le altre società quotate.

Per ciascuna operazione sono stati estratte le seguenti informazioni: i) la data in cui è avvenuta l'operazione, la cui pubblicazione deve avvenire entro i 3 giorni successivi; ii) il nominativo dell'insider o persona a lui vicina; iii) il ruolo ricoperto dall'insider; iv) il volume scambiato; v) il valore dell'operazione. Nella costruzione del campione, sono state eliminate le operazioni che presentavano missing data. Invece, in presenza di compravendite ravvicinate, della medesima tipologia (acquisto o vendita), compiute dallo stesso soggetto e comunicate unitariamente (o richiamate nell'annuncio di un'operazione successiva), tali movimenti sono stati ricondotti a un'unica operazione di compravendita assegnata alla prima data utile. Il ricorso a questa aggregazione, coerente con quanto applicato nella letteratura empirica, evita la duplicazione artificiale di segnali informativi e gli associati effetti confondenti nella valutazione dei ritorni anomali. La distinzione tra operazioni singole e multiple, nel modello di valutazione, è stata formalizzata tramite la creazione di una variabile dummy, pari a 0 per le operazioni singole e a 1 per quelle multiple, così da consentirne l'impiego come variabile di controllo nell'analisi. Laddove, invece, nello stesso giorno siano state effettuate operazioni della stessa tipologia ma poste in essere da soggetti distinti, con ruoli e volumi diversi, le operazioni sono state considerate come evento unico nell'event study, al fine di evitare duplicazioni nella misurazione dei rendimenti intorno alla data dell'operazione, e come eventi separati nell'analisi di regressione.

La prima parte dell'analisi, in linea con la letteratura di riferimento (Bajo & Petracci, 2006), si è concretizzata nella conduzione di un event study, per il quale il rendimento atteso per ciascuna società è stato misurato utilizzato il modello tradizionale. Per ogni operazione sono stati acquisiti, tramite la banca dati Orbis, i prezzi giornalieri dei 200 giorni precedenti e successivi alla data dell'operazione, nonché i rendimenti del mercato di riferimento, così da costruire le serie necessarie alla stima dei rendimenti anomali.

$$R_{it}^{*} = \alpha + \beta\, Rm_t + \varepsilon_{it}$$

dove R_{it} indica il rendimento del titolo osservato al tempo t, Rm_t è il rendimento di un indice azionario ponderato al momento, e α, β e ε sono parametri stimati su un periodo di "comportamento normale", il periodo di stima che comprende i rendimenti registrati nei 200 giorni antecedenti la data dell'evento e i 15 giorni successivi.

Gli abnormal return per l'applicazione dell'event study sono stati determinati, per ogni titolo i , come la differenza tra i rendimenti osservati intorno al giorno dell'evento, t = 0 , e il rendimento atteso definito come sopra.

$$AR_{it} = R_{it} - R_{it}^{*}$$

L'abnormal return misura la differenza tra i rendimenti condizionati all'evento e i rendimenti incondizionati attesi all'evento. La somma dei ritorni anomali permette di determinare i Cumulative Abnormal Return (CAR), i quali indicano l'impatto cumulativo di un evento (come un annuncio societario) sui rendimenti anomali (superiori o inferiori alle attese) di un titolo finanziario, aggregando i rendimenti anomali giornalieri su un periodo (finestra d'evento) per

quantificare l'effetto totale dell'evento sul prezzo del titolo nel tempo, aiutando a capire se il mercato ha reagito in modo significativo.

$$\text{CAR} = \sum_{t=ta}^{tb} ARt$$

dove ta e tb rappresentano l'intervallo di osservazione. L'event study è stato condotto attraverso il t-test, volto a testare le seguenti ipotesi:

H0 : non ci sono ritorni anomali all'interno del periodo di osservazione, quindi i CAR = 0.
H1: ci sono ritorni anomali all'interno del periodo di osservazione, quindi i CAR ≠ 0.

Nell'ambito del presente studio, le finestre di osservazione adottate per l'event study sono:
- t=0: il giorno dell'evento
- [-3, 0], [-2, 0], [-1, 0], [0, 1], [0,2], [0,3]: per tenere conto del possibile ritardo nella comunicazione dell'operazione al mercato.
- [-5,0], [0, 5]: per testare le ipotesi su un periodo molto breve, in linea con la letteratura di riferimento.
- [-5, +5], [-10, +10], [-15, +15]: per testare le ipotesi su un periodo medio-lungo.

Non si è ritenuto opportuno allargare la finestra di osservazione oltre i 15 giorni, in quanto nel database sono state osservate diverse operazioni di Internal Dealing a distanza di 15 giorni.

La seconda parte dell'analisi è stata a identificare quali variabili di controllo spiegano meglio la reazione del mercato attraverso un'analisi di regressione cross-sectional, descritta dal seguente modello, nel quale i CAR rappresentano la variabile dipendente. Sono state utilizzate variabili riferite all'operazione (DealVolume, DealValue), alla dimensione dell'azienda (lntotasset), alla performance economico-finanziaria dell'azienda (EBITDA margin, EPS, CF per share, BV per share), al mercato di riferimento (la volatilità degli ultimi 360 giorni).

$$CAR_i = 0 + \beta_1 \text{DealVolume} + \beta_2 \text{DealValue} + \beta_3 \text{lntotasset} + \beta_4 \text{EBITDAmargin} + \beta_5 \text{EPS} + \beta_6 \text{CFpershare} + \beta_7 \text{BVpershare} + \beta_8 360\text{volatility} + \beta_i$$

La scelta delle dimensioni da includere nel modello è coerente con la letteratura di riferimento (Dardas & Guettler, 2011; Tardivo & Bresciani, 2011) e di includere sia elementi specifici dell'operazione, sia elementi strutturali dell'azienda.

Entrambe le analisi sono state condotte differenziando le operazioni di acquisto da quelle di vendita. Questo approccio consente di verificare se, come suggerito dalla letteratura (Bajo & Petracci, 2006), le operazioni di acquisto generino segnali più forti e persistenti rispetto alle vendite, e se l'effetto delle variabili finanziarie e di mercato incida in maniera statisticamente significativa tra le due categorie.

4. Risultati preliminari

Lo studio include 2.728 osservazioni, riferite a 120 operazioni di Internal Dealing messe in atto nell'ultimo anno da parte di soggetti di rilievo afferenti a società quotate. La ripartizione tra operazioni di acquisto e operazioni di vendita presenta le caratteristiche descritte nelle Tabelle 1 e 2.

Operazioni di acquisto	**N**	**Mean**	**Std. Dev.**
AR	1.581	-.0008	.0224
CAR	1.581	-.0092	.0725
DealVolume	1.581	312.395,69	1.884.957,21
DealValue	1.581	359.660,28	1.140.618,64

Tabella 1. Statistiche descrittive operazioni di Internal Dealing basate sull'acquisto di azioni

Operazioni di vendita	**N**	**Mean**	**Std. Dev.**
AR	1.147	.0004	.0191
CAR	1.147	-.0148	.0535
DealVolume	1.147	15.069,37	22.393,03
DealValue	1.147	283.596,1	550.540,83

Tabella 2. Statistiche descrittive operazioni di Internal Dealing basate sulla vendita di azioni

L'analisi condotta mette in luce una serie di evidenze tra le diverse finestre temporali e le due tipologie di operazione. L'analisi basata sul t-test per valutare la significatività dei CAR nelle diverse finestre attorno alla data dell'operazione evidenzia che le operazioni di acquisto e quelle di vendita presentano comportamenti sistematicamente differenti e in contrasto con le evidenze disponibili in letteratura. Infatti, in quasi tutte le finestre temporali analizzate, i risultati indicano che gli acquisti generano CAR mediamente negativi, ma non statisticamente significativi. L'analisi delle operazioni di cessione delle azioni da parte degli insider presenta una fotografia opposta. In quasi tutte le finestre temporali emerge una reazione positiva e statisticamente significativa del mercato. Tale risultato va contro la prospettiva avanzata da alcuni studiosi di insider trading opportunistico, che normalmente produrrebbe CAR negativi per le vendite e CAR positivi per gli acquisti. L'effetto potrebbe, invece, trovare spiegazione nella percezione di irrilevanza informativa delle operazioni di vendita da parte del mercato.

Le tabelle 3 e 4 sintetizzano i principali risultati dell'event study per ciascuna finestra temporale, con riferimento a ciascuna tipologia di operazione.

Event window	**Mean**	**T**	**p-value**
(-15, +15)	-.0092	-5.039	<.001
(-10, +10)	-.0069	-3.343	<.001
(-5;+5)	.0037	-1.516	.065
(-5;+0)	-.0076	-2.407	.008
(-3; 0)	-.0052	-1.513	.066
(-2; 0)	-.0033	-.880	.190
(-1; 0)	-.0022	-.528	.299
0	-.0006	-.122	.451
(0; 1)	-0.0002	-.061	.476
(0; 2)	.0017	.454	.325
(0;3)	.0014	.393	.347
(0;5)	.0007	.205	.419

Tabella 3. Risultati T-Test per Internal Dealing basato sull'acquisto di Azioni (n=1581)

Event window	**Mean**	**T**	**p-value**
(-15, +15)	.0148	9.349	<.001

(0;5)	.0161	5.542	<.001

Tabella 4. Risultati T-Test per Internal Dealing basato sulla vendita di azioni (n=1147)

Risultati contrastanti tra l'acquisto e la vendita delle azioni emergono anche dall'analisi di regressione. Con riferimento agli acquisti, nessuna variabile di controllo risulta statisticamente significativa nella spiegazione dei CAR, sia in generale, sia con riferimento a specifiche finestre temporali (0; -3,0; 0,+3; -5,0; 0,5; -5,+5; -10;+10; -15,+15).

Al contrario, nell'ambito delle vendite, l'analisi di regressione mostra un elevato potere esplicativo e statisticamente significativo (p<.001) di tutte le variabili di controllo relative alla performance finanziaria dell'azienda e alla volatilità del mercato di riferimento.

Le figure 1 e 2 sintetizzano i risultati dell'analisi di regressione.

5. Conclusioni

In conclusione, i risultati mostrano un'evidente asimmetria tra acquisti e vendite. In particolare, gli acquisti non generano reazioni significative, in contrasto con la letteratura, mentre le vendite producono CAR positivi e statisticamente rilevanti in quasi tutte le finestre temporali. I risultati suggeriscono, quindi, che il mercato interpreta le vendite come segnali deboli o non informativi, sollevando interrogativi sulla capacità segnaletica dell'Internal Dealing e sul suo ruolo nella governance sostenibile.

Dal punto di vista teorico, questo dibattito assume rilevanza nell'ambito della signaling theory, la quale offre un quadro concettuale per analizzare situazioni in cui individui informati (signalers) trasmettono informazioni private a soggetti meno informati (receivers) attraverso azioni osservabili e costose (Connelly et al., 2025). Con riferimento alle operazioni di Internal Dealing, l'azione osservabile coincide con l'acquisto o la vendita di strumenti finanziari dell'emittente, mentre il costo del segnale deriva dall'impiego di risorse finanziarie e

dall'aumento del rischio idiosincratico dell'investitore interno. Gli acquisti da parte di azionisti di controllo o dirigenti con responsabilità strategiche sono difficili da imitare in assenza di informazione positiva, e pertanto il mercato li interpreta come segnali robusti sulla qualità attesa dell'impresa. Le vendite, al contrario, presentano motivazioni più eterogenee, riducendone la capacità segnaletica. La signaling theory consente inoltre di chiarire i meccanismi attraverso cui la regolamentazione può amplificare o attenuare il contenuto informativo delle operazioni. Se gli obblighi di disclosure sono tempestivi e uniformi, l'azione osservabile del signaler giunge rapidamente al mercato. Tuttavia, ritardi nella comunicazione possono permettere agli insider di estrarre maggiori benefici dall'asimmetria informativa, riducendo la capacità del mercato di distinguere segnali informativi da segnali opportunistici. Come dimostrato da Barucci et al. (2006), gli insider delle società italiane sfruttano strategicamente la tempistica della disclosure, effettuando acquisti immediatamente comunicati, mentre ritardano le vendite laddove possibile. Tali dinamiche riducono la trasparenza effettiva e creano condizioni prossime a un equilibrio di pooling, nel quale segnali informativi e non informativi diventano più difficili da distinguere.

Tuttavia, nell'epoca contemporanea, le reazioni del mercato richiedono di adottare anche la lente della sostenibilità, con un focus sulla governance, quale proxy della credibilità dell'azienda e della buona condotta dei soggetti rilevanti che ricoprono ruoli chiave.

Parole chiave: Internal Dealing; event study; signalling theory

Rating ESG di cantiere: benefici, criticità e costi dei cantieri sostenibili

Laura Martiniello[1], Leonzio Capparelli[2], Marco Vargiu[3]

1. Introduzione

Considerati i notevoli impatti di natura ambientale, sociale ed economica (ESG), associati alla costruzione e alla manutenzione delle infrastrutture, un approccio sostenibile alla loro progettazione appare essenziale per facilitare il raggiungimento degli Obiettivi di Sviluppo Sostenibile fissati dalle Nazioni Unite (Navarro et al., 2019). Secondo alcuni autori, la sostenibilità è diventata la questione più importante per il settore edile nel XXI secolo (Dobson et al., 2013). Con l'aumento del livello di consapevolezza dell'opinione pubblica e delle misure normative, gli stakeholders del settore richiedono strumenti che possano essere di supporto nella valutazione delle opzioni di investimento, al fine di identificare alternative sostenibili e implicazioni finanziarie della loro inclusione nel ciclo di vita dell'investimento (Goh & Yang, 2014). In forza delle suddette esigenze, il D.Lgs. 36/2023 introduce esplicitamente l'obbligo per le stazioni appaltanti di includere nel processo valutativo anche criteri legati alla prassi ESG. Inoltre, nel febbraio 2025, l'Ente Italiano di Normazione (UNI), in collaborazione con l'Associazione Infrastrutture Sostenibili (AIS), ha emanato una Prassi di Riferimento volta ad individuare strategie, indicatori, e buone pratiche al fine di valutare la sostenibilità dei cantieri delle infrastrutture. L'attenzione rivolta alla sostenibilità degli appaltatori è incentrata su un sistema di rating strutturato, basato su 32 indicatori che coprono aspetti ambientali, economici e sociali. Studi precedenti hanno messo in evidenza il bisogno di identificare e di misurare gli aspetti di costo legati alle dimensioni ESG lungo tutto il processo di costruzione delle infrastrutture, compresa la fase ancestrale di progettazione (Goh & Yang, 2014; Navabakhsh & Tamiz, 2013). Kim & Chang (2022), sul tema, hanno segnalato che la necessità di dover disporre di una metodologia chiara per la definizione di un rating ESG per le opere edili. Allo stesso tempo però, altri autori si sono adoperati per la possibile individuazione di un set di criteri e di strategie volti alla determinazione del rating ESG del settore edile, specificatamente del sottosettore dedicato all'edilizia abitativa (Battisti, 2023). L'Introduzione dell'UNI/PdR 172:2025, consente di usufruire di una metodologia condivisa per la determinazione del rating di sostenibilità di cantiere sia in fase di progettazione che in fase di realizzazione.

La Prassi di Riferimento declina la sostenibilità del cantiere sotto i tre pilastri portanti dell'ESG: dal punto di vista economico, puntando l'attenzione su un uso sapiente delle risorse, al fine di incentivare, il più possibile, il riutilizzo delle materie prime e le logiche di economia circolare; dal punto di vista ambientale, mirando alla minimizzazione degli impatti di cantiere, attraverso il contenimento delle emissioni di CO2 e degli agenti inquinanti, prevedendo, inoltre, un corretto trattamento e/o smaltimento dei residui di lavorazione; dal punto di vista sociale,

[3] Dottorando di ricerca, ECON-06/A, Università Mercatorum; marco.vargiu_7842@studenti.unimercatorum.it – corresponding author

mettendo al centro, sin da subito, la comunità che interagirà con il cantiere e, soprattutto, con l'opera finale che il cantiere è chiamato a realizzare.

La sostenibilità di cantiere viene, quindi, valutata in due fasi ben distinte quella di progettazione e quella di realizzazione.

In questo lavoro verrà approfondita la determinazione del rating di cantiere in fase progettuale, attraverso un caso di studio che analizza modalità e criticità di attribuzione del rating ESG di cantiere in fase di progettazione.

Il lavoro quindi, oltre ad evidenziare il parziale superamento del gap della letteratura, relativo all'assenza di un'unanime metodologia di valutazione delle performance ESG dei cantieri italiani, colmato con la recentissima introduzione dell'UNI/PdR 172:2025, mette in luce le best practices, le modalità che consentono la determinazione del rating ESG di cantiere in fase progettuale e le principali criticità ancora presenti per una consistente diffusione di questa prassi.

Quanto rilevato in questa fase, ci consente di formulare le seguenti domande di ricerca.

RQ1: Quali sono i benefici attesi dalla progettazione sostenibile del cantiere?

RQ2: Quali sono le criticità riscontrate nell'applicazione di tale metodologia di rating?

RQ3: Quali sono le principali componenti di costo che un appaltatore dovrà sostenere in fase di realizzazione per rendere il cantiere sostenibile e meritevole di un rating ESG elevato?

RQ4: Quanto è diffuso il rating ESG di cantiere. Il calcolo del rating avviene esclusivamente sulla base di quanto previsto dall'UNI/PdR 172:2025?

Il presente lavoro è ad oggi "in progress". È stata già condotta l'analisi della letteratura, la redazione del questionario alla base delle interviste e condotta un'intervista con la referente del rating di cantiere della società scelta come caso studio. Nel successivo full paper sarà possibile integrare il lavoro con ulteriori evidenze sottoforma di approfondimenti ed interviste per presentarlo nella sua forma definitiva.

L'obiettivo del presente lavoro è comprendere l'effettiva diffusione del rating di sostenibilità di cantiere in fase progettuale e di valutarne le criticità e i benefici collegati alla sua determinazione. Inoltre, la ricerca, si propone di indagare la componente onerosa, e quindi relativa ai costi, legata all'effettiva realizzazione di un cantiere sostenibile.

2. Letteratura

La sostenibilità (ESG), intesa come propensione alle best practice ambientali (E), sociali (S) e economiche (G), rappresenta ormai un elemento fondamentale di molti settori economici per i suoi importanti impatti su persone ed organizzazioni. Studi recenti evidenziano che i fattori ESG incidono positivamente sul valore aziendale, e ancora che i tre pilastri di sostenibilità possono essere implementati quali strategie volte alla prevenzione dei fattori di rischio e possono fungere da vantaggio competitivo, nonché da strategie di successo sostenibile (Chang & Lee, 2022; Deng & Cheng, 2019; Xie et al., 2019). La letteratura esistente identifica, quale fondamento teorico, alla base della sostenibilità, la teoria degli stakeholder (De Matteis et al., 2025; Li et al.,2021; Peng & Isa, 2020). La teoria degli stakeholder, quale pilastro dell'odierna dottrina, prevede che l'azienda, oltre al perseguimento degli obiettivi degli azionisti, deve soffermarsi sulla creazione di valore per tutti gli stakeholders che influenzano o che sono influenzati dall'azienda, quali portatori di interessi (Freeman, 1984, 2010). La letteratura, quindi, amplifica l'importanza degli ESG, sorretti dal framework teorico della Stakeholder theory. Secondo Moats & DeNicola (2021) e Rose (2020), gli ESG influenzano il comportamento delle aziende e la loro capacità di creare valore a lungo termine per gli stakeholder. Secondo Wang (2024), la teoria degli stakeholder suggerisce che, a cospetto di solide performance ESG, le aziende possono ottenere il consenso degli stakeholder interni ed esterni, per i quali viene, inoltre, prevista la soddisfazione delle proprie esigenze. Inoltre, secondo Signori et al. (2021), la maggiore attenzione alle tematiche ESG nelle aziende, sottolineata dalla diffusione, in molti settori, dei rating di sostenibilità, è associata ad un maggior valore aggiunto creato per la collettività, nella prospettiva della Stakeholder theory.

Tale maggior valore è ascrivibile alla performance ESG, la quale conduce alla crescita aziendale di lungo periodo derivante da minori costi espliciti, maggiore efficienza operativa e benefici reputazionali e competitivi (Daugaard & Ding, 2022). In letteratura innumerevoli sono gli studi che si sono occupati di analizzare la relazione esistente tra i fattori ESG e i diversi driver di valore aziendale, spesso in specifici settori di attività. Si pensi alla relazione studiata tra i fattori ESG e la sempre più ascendente intelligenza artificiale (Bifulco et al., 2025; Sætra, 2023; Macpherson et al., 2021;) e ancora la presenza dei fattori ESG in settori di attività, quali il settore finanziario (Chaudhry et al., 2025; Mandas et al., 2023; Bătae, 2020), il settore dell'energia rinnovabile (Parashar et al., 2025; Kandpal et al., 2024; Lu & Li, 2024), il settore dell'industria chimica (Ren et al., 2024; Tutko,2023), il settore delle Pubbliche Amministrazioni (Besenyei, 2024), il settore edile (Liu et al., 2021; Li et al., 2018; Xue et al., 2018; Hojjati et al., 2017). Proprio con riferimento al settore edile, Dubey et al. (2023) rilevano che la sostenibilità nell'ambito delle costruzioni assume sempre più importanza, in quanto la progettazione e la contestuale realizzazione di edifici ed infrastrutture generano ingenti impatti sull'ambiente e sulle società. Secondo Xue et al. (2018), lo sviluppo di infrastrutture attira in misura sempre maggiore l'attenzione degli stakeholders, quali il legislatore, studiosi di differenti materie e cittadini. La letteratura, in tal senso, attribuisce un ruolo cruciale al coordinamento e all'efficace collaborazione dei principali stakeholders per lo sviluppo di infrastrutture sostenibili (Liu et al., 2021; Li et al., 2018; Berawi, 2016). Dunque, come sostenuto da Hosny et al. (2022), la sostenibilità rappresenta uno degli aspetti più significativi nello sviluppo delle infrastrutture. Le costruzioni nell'ambito dei trasporti sono importanti per la circolazione sia delle merci che dei passeggeri. Ulteriori infrastrutture, come quelle energetiche e le telecomunicazioni, sono legate agli sforzi di modernizzazione, volti ad aumentare la capacità del settore produttivo. Inoltre, le componenti accessorie di alloggi e strutture abitative, come la fornitura di acqua potabile e servizi igienico-sanitari, sono orientate all'accrescimento del livello di benessere della comunità (Vitri & Herman, 2019). Secondo Liu et al. (2021), la sostenibilità dell'infrastruttura conferisce la possibilità di assicurare le proprietà di sicurezza, validità e durabilità della stessa nel lungo periodo. Rispetto alla costruzione di edifici, le iniziative atte alla progettazione e realizzazione di infrastrutture richiedono una pianificazione più complessa, investimenti finanziari più elevati, un maggiore impegno tecnico e differenti tipologie di risorse (Hosny et al., 2022). La letteratura concorda sulla centralità della tematica sostenibile nella fase ancestrale di progettazione di opere infrastrutturali, soprattutto in considerazione del suo impatto lungo tutto il processo di costruzione e sull'utilizzo dell'output finale (Xue et al., 2018). Precedenti studi hanno messo in luce l'esigenza di sistemi di rating ESG integrati, nel settore delle costruzioni e delle infrastrutture (Dubey et al., 2023; Hosny et al., 2022). Come sostenuto da Berardi (2012), il settore delle costruzioni rimane estraneo rispetto alla misurazione delle performance e, nonostante diversi studi abbiano proposto metodologie diverse all'attribuzione di un rating di sostenibilità, il loro utilizzo risulta scarsamente diffuso nella prassi. I sistemi di rating di sostenibilità sono stati interessati da un'importante evoluzione, da indicatori singoli a indicatori complessi e multidimensionali (Sanad et al., 2025). Secondo gli autori, parte della letteratura si è concentrata su indicatori di sviluppo sostenibile, focalizzando la ricerca sul soddisfacimento dei bisogni odierni senza compromettere la possibilità di soddisfare quelli futuri (Hosny et al., 2022; Xue et al., 2018). AbouHamad & Abu-Hamd (2019) analizzano la performance ESG attraverso l'approccio basato sugli aspetti economici alla sostenibilità, utilizzando il Life Cycle Cost Assessment (LCCA), attraverso la valutazione dei costi relativi a sistemi di costruzione alternativi. Liu et al. (2021) mettono in comparazione la metodologia basata sulla teoria Triple Bottom Line (TBL) con il framework POP (Product, Organization, Process), ponendo l'attenzione sulla mancanza di una valutazione multidisciplinare integrata. Ulteriori indicatori, quali l'Envision Rating System (ERS) e l'Infrastructure Sustainability Council of Australia (ISCA) framework includono criteri più ampi di misurazione della sostenibilità, ma riportano lacune in termini di capacità di ottimizzazione (Sanad et al., 2025; ISI (Institute for Sustainable Infrastructure), 2018).

Alla luce di tali considerazioni, si rileva un'elevata frammentazione della letteratura sulla misurazione della performance di sostenibilità nella progettazione e realizzazione di infrastrutture, nonché l'esigenza di uno strumento di rating multidisciplinare. A tal proposito, l'Ente Italiano di Normazione (UNI), in collaborazione con l'Associazione Italiana per la Sostenibilità delle Infrastrutture (AIS) ha pubblicato la prassi di riferimento UNI/PdR 172:2025 orientata a definire le strategie e gli indicatori qualitativi e quantitativi utili alla valutazione della sostenibilità del cantiere di un'opera infrastrutturale, sia nella fase progettuale che in quella realizzativa. Tale processo valutativo si articola nell'esame delle strategie atte a perseguire quattro obiettivi: (i) contenimento delle emissioni di CO2, (ii) tutela e salvaguardia degli elementi naturali e storici, (iii) riuso e riciclo e (iv) riduzione degli impatti sulla comunità, sull'ambiente sociale e sull'ambiente esterno. Attraverso l'attribuzione di un punteggio alle strategie prescelte per ottemperare agli obiettivi prefissati, ponderato in relazione ad una scala di priorità. La Prassi di Riferimento conduce al computo di un rating di sostenibilità che tenga conto delle dimensioni E, S e G, sia in fase progettuale che realizzativa, nonché gli approcci digitali afferenti ad entrambe. Tale sistema di valutazione delle performance di sostenibilità risponde alle esigenze di uno strumento comprensivo delle dimensioni ESG, come emerso dalla corrente letteratura.

3. Metodologia

Il presente lavoro adotta un approccio metodologico di tipo ibrido suddiviso in tre fasi comprensive dello studio della letteratura, dell'analisi di casi studio e di un questionario. La prima fase di studio della letteratura fornisce il fondamento teorico alla presente ricerca. La metodologia del caso studio, sviluppato nella seconda fase, è generalmente utilizzata per comprendere le possibili relazioni che emergono all'interno di processi complessi (Shah e Corley, 2006). Tale approccio è stato ampiamente utilizzato nell'analisi di progetti di costruzione e infrastrutturali e viene solitamente impiegato per esaminare eventi reali contemporanei e per investigare un fenomeno nel suo contesto specifico quando le relazioni tra il fenomeno stesso e il contesto non risultano chiaramente definite (Taylor et al., 2011; Scapens, 2004). Inoltre, il caso di studio rappresenta il metodo di ricerca privilegiato per rispondere alle domande "come" e "perché" (Yin, 2018). Al fine di garantire la generalizzazione dei risultati della ricerca sono analizzati due distinti casi con ad oggetto attori di rilievo internazionale nel campo della progettazione e monitoraggio delle iniziative infrastrutturali, di cui nel lavoro corrente è presentato il risultato delle prime evidenze emerse. L'utilizzo di interviste semi-strutturate consente di approfondire gli aspetti specifici che emergono nel corso del dialogo con i soggetti intervistati il cui scopo è raccogliere valutazioni e osservazioni non emerse nella fase di progettazione e che potranno incidere in modo determinante sullo sviluppo successivo del progetto (Adams, 2015).

L'ultima fase della metodologia si sviluppa attraverso un questionario con domande chiuse a risposta multipla sottoposto alle società facenti parte dell'OICE [4], associazione delle organizzazioni di ingegneria, di architettura e di consulenza tecnico economica, direttamente coinvolte nella gestione di progetti infrastrutturali di rilievo. L'implementazione di tale metodologia strutturata è ampiamente diffusa nella ricerca sulla gestione delle infrastrutture e costruzioni, nonché tra i ricercatori autorevoli del settore (Babatunde e Perera, 2017). Inoltre, al fine di carpire ulteriori elementi di carattere qualitativo, le società sottoposte al questionario sono incoraggiate a fornire ulteriori punti di vista ed elementi sotto forma di risposte aperte. I risultati del questionario sono analizzati utilizzando la Principal Component Analysis (PCA), quale metodo statistico multivariato che combina le informazioni provenienti da diverse variabili osservate sugli stessi soggetti in un numero inferiore di variabili. Tale metodologia costituisce un

[4] L'OICE è l'associazione di categoria, aderente a Confindustria, che rappresenta le società italiane operanti nei settori dell'ingegneria, dell'architettura e della consulenza tecnico-economica.

metodo efficace e versatile per estrarre le informazioni essenziali da complessi set di dati multivariati (Greenacre et al., 2022). Nel presente studio, l'analisi PCA è utilizzata per valutare le criticità e i benefici attesi riconducibili all'implementazione di un sistema di misurazione delle performance di sostenibilità, nonché per valutare le principali componenti di costo afferenti all'utilizzo di rating ESG.

4. Prime evidenze empiriche

Il primo caso di studio ha ad oggetto le attività di progettazione sostenibile e rating di sostenibilità svolte da una società di ingegneria da considerarsi tra le eccellenze italiane in ambito di opere infrastrutturali. Nello specifico, l'attività peculiare verte sulle attività di programmazione, progettazione, realizzazione, verifica e avviamento operativo delle opere, con un forte ruolo nei sistemi ferroviari e nelle opere civili nazionali e internazionali, nonché nella mobilità integrata. Al momento si ritiene di tenere riservata l'identità della società attenzionata, che comunque rappresenta un pioniere della misurazione della performance sostenibile dei cantieri infrastrutturali.

L'analisi condotta è incentrata, oltre che sull'analisi di documentazione fornita dall'azienda sulla base di accordi di riservatezza, dalla realizzazione di un caso studio relativo all'attribuzione del rating di cantiere in fase di progettazione in base alla metodologia proposta dalla Pdr Uni 72:2025.

È stata condotta un'intervista basata su domande aperte a due dirigenti della divisione preposta all'attribuzione del punteggio di sostenibilità ambientale, sociale ed economica dei cantieri infrastrutturali in fase progettuale. La qualifica ricoperta dai soggetti intervistati consente di disporre di un set informativo realmente rappresentativo delle pratiche di settore, volte alla misurazione della sostenibilità di cantiere. Tuttavia, le informazioni di cui si dispone non sono sufficienti, allo stato attuale, per la completa trattazione degli obiettivi del lavoro. Per questo motivo, saranno condotte ulteriori interviste e saranno esaminati ulteriori documenti già richiesti alla società, al fine di predisporre le adeguate analisi finali per rispondere alle domande di ricerca del lavoro. Inoltre, si prevede un ulteriore caso di studio al fine di rilevare rigorose evidenze metodologiche ed empiriche da una base informativa maggiormente articolata.

Le informazioni di cui si dispone, consentono di porre l'attenzione su tre macro-temi fondamentali legati alla sostenibilità di cantiere in fase di progettazione, ossia: le metodologie di calcolo del rating di sostenibilità ESG dei cantieri in fase di progettazione e i relativi benefici e aspetti critici; la componente dei costi legata alla determinazione del rating di sostenibilità ESG dei cantieri in fase di progettazione; la propensione degli appaltatori all'adozione del rating di sostenibilità ESG in fase di realizzazione

Con riferimento alla domanda di ricerca RQ1: "Quali sono i benefici attesi dalla progettazione sostenibile del cantiere?", in primo luogo, dall'intervista condotta è stato possibile rilevare come la fase di progettazione e la fase di realizzazione dei cantieri di opere infrastrutturali siano nettamente distinte tra loro. In particolare, nel caso di determinazione del rating di sostenibilità ESG dei cantieri, la fase di progettazione non è in grado di cogliere alcun aspetto della successiva fase di realizzazione ma questa fase è fondamentale per assicurare la successiva sostenibilità del Cantiere.

In particolare, i benefici di una progettazione redatta in ottica di sostenibilità sono da ricercarsi in un forte stimolo alla sostenibilità per tutti gli operatori coinvolti nel processo di realizzazione dell'infrastruttura ed in particolare, nell'orientamento dell'appaltatore, quando diverso dal progettista, alla realizzazione di concrete pratiche di sostenibilità già previste fin dall'impostazione iniziale del progetto.

Inoltre, l'attività di analisi sin ora condotta permette di desumere che la sostenibilità di cantiere in fase progettuale conduca le società, che ne fanno adozione, a godere di numerosi benefici. Infatti, le società del settore infrastrutturale attente alle pratiche e alle metodologie

sostenibili possono ricavare innumerevoli benefici reputazionali, nonché, essere in grado di generare benefici ambientali e benefici sociali, con particolare riferimento a quelli relativi al personale e alla sicurezza. Le prime evidenze empiriche segnalano l'importanza dell'attribuzione di un rating ESG per rafforzare l'impegno alla sostenibilità dei cantieri da parte di società di progettazione e degli appaltatori.

Con riferimento alla domanda di ricerca RQ2 "Quali sono le criticità riscontrate nell'applicazione di tale metodologia di rating?", dalle interviste preliminari condotte si evince che è "relativo" parlare di criticità legate alla valutazione del cantiere sostenibile in fase di progettazione. Tale prima evidenza, secondo quanto affermato dagli intervistati, deriverebbe dalla facoltà prevista, per le società del settore, di adottare quanto previsto dalla UNI/PdR 172:2025 e, di conseguenza, dai 32 indicatori da essa previsti per valutare lo stato degli obiettivi sostenibili. Gli intervistati affermano che le eventuali difficoltà che potrebbero emergere dall'applicazione della misurazione delle performance di sostenibilità mediante la PdR in oggetto, riguarderebbero unicamente il reperimento delle informazioni necessarie per calcolare gli indicatori scelti. Quanto affermato deriva principalmente dalla stessa Prassi di Riferimento, in quanto per ciascun obiettivo è sufficiente adottare almeno uno dei 32 indicatori disponibili, ne consegue che la complessità varia in funzione della tipologia di indicatore selezionato e non degli obiettivi in sé. Inoltre, è stato possibile evincere che le criticità si concentrano, perlopiù, sugli indicatori quantitativi, i quali si fondano su dati precisi e modalità di calcolo definite, mentre le metriche di matrice qualitativa sono caratterizzate da una maggiore flessibilità imputabile alla discrezionalità nel processo di valutazione.

Alla luce di ciò, si evince che le criticità riscontrate in fase progettuale del cantiere sostenibile sono riconducibili all'accessibilità e alla disponibilità dei dati necessari alla stima del rating ESG, in quanto le difficoltà riguarderanno poi l'effettiva capacità di applicare in concreto nel cantiere quanto teoricamente previsto in fase di progettazione. Nondimeno, si ritiene che la progettazione sostenibile debba essere sufficientemente sfidante per stimolare gli appaltatori a comportamenti sostenibili, ma non tale da essere irraggiungibile o troppo onerosa per essere intrapresa.

Con riferimento alla domanda di ricerca Rq3: "Quali sono le principali componenti di costo che un appaltatore dovrà sostenere in fase di realizzazione per rendere il cantiere sostenibile e meritevole di un rating ESG elevato?", le prime evidenze empiriche indicano che la componente onerosa risulta più attenuata in fase progettuale rispetto alla fase realizzativa. Il rating ESG in fase progettuale può essere facilmente introdotto dalle società di progettazione, in quanto l'applicazione della UNI/PdR 172:2025 non genera aggravi di costi. Si ritiene che le informazioni a disposizione di una società di progettazione siano "sufficienti" a redigere una progettazione sostenibile senza sostenere costi aggiuntivi.

Sul punto si specifica che in sede di interviste preliminari, gli intervistati hanno affermato che la componente di costo legata alla valutazione della sostenibilità di cantiere è notevolmente inferiore rispetto alla fase di realizzazione. Gli intervistati, inoltre, hanno affermato che per loro, allo stato, non è possibile esprimersi circa la quantificazione della componente onerosa legata alla fase di realizzazione. Inoltre, sempre a parere degli intervistati, il costo della sostenibilità, in fase di realizzazione, è legato alle fasi tecniche di cantierizzazione, soprattutto nelle fasi di approvvigionamento e di smaltimento dei materiali.

Con riferimento alla domanda di ricerca Rq4: "Quanto è diffuso il rating ESG di cantiere. Il calcolo del rating avviene esclusivamente sulla base di quanto previsto dall'UNI/PdR 172:2025?" non ci sono ancora elementi sufficienti per rispondere a tale domanda. Una survey tra gli operatori di settore ed in particolare rivolta alle principali società di ingegneria e progettazione associate all'OICE che conta in Italia più di 350 società fra società di ingegneria, architettura, studi professionali, società di consulenza e imprese strutturate potrebbe permettere di comprendere quanto è diffusa questa prassi ed assicurarne ulteriore diffusione.

5. Conclusioni

Alla luce di quanto esposto, si ritiene che il presente lavoro, al momento ancora sotto forma di extended abstract, opportunamente integrato con il secondo caso di studio e con i risultati attesi dal questionario sottoposto a società attive nel settore della progettazione socie dell'OICE, possa offrire importanti evidenze metodologiche e teoriche agli attori interessati.

Ulteriori considerazioni sulla sostenibilità del cantiere in fase di realizzazione consentiranno di beneficiare di una visione integrata dell'oggetto e di adottare approcci univoci alle performance ESG. Inoltre, il lavoro sarà in grado di favorire la diffusione di questa prassi presso le società di ingegneria e le imprese di costruzioni facendo cogliere i benefici ottenibili dalla progettazione e realizzazione di cantieri sostenibili, nonché di individuare i costi necessari per la performance ESG affinché gli stessi possano essere recepiti nei bandi di gara e dare luogo a punteggi premiali. Si ritiene infatti che solo il riconoscimento dei costi della sostenibilità, come già in passato avvenuto per i costi della sicurezza, possa assicurare una buona diffusione delle prassi di sostenibilità sui cantieri.

Appare doveroso sottolineare i limiti del presente studio. Primo tra tutti, il ricorso ad interviste semi-strutturate, nonostante queste lascino spazio alla soggettività dell'operatore intervistato, carpendo ulteriori nozioni non espressamente menzionate nelle domande poste, le stesse implicano il rischio di una ristretta rilevanza empirica. I rischi legati alla scarsa generalizzabilità dei risultati sono parzialmente mitigati dalla metodologia utilizzata, dunque da differenti casi studio e da un questionario sottoposto alle società dell'associazione di categoria OICE. Invero, la selezione non volontaria del campione di ricerca ne assicura la rappresentatività e la dimensione consistente dello stesso risulta sufficiente a supportare analisi statistiche robuste.

Dallo studio della letteratura corrente emergono potenziali linee di ricerca future, orientate ad approfondire la sostenibilità di cantiere nella fase realizzativa, aspetto che, nel presente lavoro, è stato considerato solo parzialmente e sulla base delle informazioni fornite volontariamente dai soggetti coinvolti. L'attenzione rivolta a tale fase consentirà agli studiosi e agli operatori del settore di ottenere una completa comprensione delle determinanti della performance di sostenibilità lungo tutta la vita del cantiere infrastrutturale, incoraggiando il perseguimento di approcci integrati alle tematiche ESG.

How Organizational Intelligence Within Corporate Governance Shapes Overbidding in Acquisitions

Arianna Molinaroli[1], Carlotta D'Este[2]

1. Introduction

Strategic expansion through mergers and acquisitions (M&A) represents one of the most consequential decisions firms undertake, yet it is also among the most exposed to managerial biases and valuation uncertainty. Empirical research highlights that acquisition outcomes are highly sensitive to information asymmetries, incentive structures, and the mechanisms that shape managerial judgment during deal evaluation. For example, compensation-related incentives have been shown to influence executives' propensity to engage in value-reducing transactions (Grinstein and Hribar 2004), while ownership concentration can amplify or mitigate these distortions depending on the governance environment (Bhaumik and Selarka, 2012). Evidence also indicates that competitive processes do not automatically discipline bidding behavior and may instead intensify escalation dynamics (Boone and Mulherin, 2008). Against this backdrop, our study seeks to explore whether, and to what extent, the organizational intelligence embodied in the board of directors can help mitigate managerial overpayment in acquisitions, thereby contributing to firms' sustainable competitiveness.

Indeed, the board integrates human, intellectual, and relational capital that shapes decision quality and supports financial sustainability. Prior research documents that board characteristics influence reporting quality and the integrity of firm-level information (Aifuwa and Embele 2019; Alves 2023) as well as firms' financing conditions (Anderson et al., 2004). Yet, despite the growing recognition of the board's monitoring function, relatively little is known about how board-level capabilities affect bidding discipline in M&A transactions. This represents a notable gap, especially in light of recent contributions showing that more accurate information environments improve deal pricing (Hashim et al. 2024). From this perspective, this paper aims to assess whether stronger board monitoring reduces the likelihood of excessive bidding, as more independent, competent, and structurally robust boards are better able to perform monitoring and advisory functions over executives.

The study advances current research by bridging insights from corporate governance and M&A literature and by linking them to a growing body of work that examines how internal decision structures shape strategic outcomes. Preliminary findings indicate that board independence is positively associated with overbidding, suggesting that formal governance attributes may not necessarily translate into effective monitoring and that a more fine-grained approach to board characteristics and country-level institutional specificities may help shed further light on this phenomenon. Our work thus contributes to the existing literature by questioning the assumption that formal board independence automatically leads to more effective monitoring of strategic decisions such as acquisition pricing.

2. Literature review and hypotheses development

[1] Ph.D., ECON-06/A, Università Cattolica del Sacro Cuore; arianna.molinaroli@unicatt.it – corresponding Author

2.1. Overbidding and agency problem

Overbidding in mergers and acquisitions refers to the situation in which acquiring firms offer a purchase price that substantially exceeds the economically justified valuation of the target, potentially harming shareholder wealth. The literature identifies several determinants of this behavior, ranging from managerial misjudgments to inadequate governance systems and biased decision-making processes (Hashim et al., 2024).

A central theoretical strand links overbidding to auction dynamics, particularly the Winner's Curse. In competitive bidding environments, where firms hold similar information sets, the bidder offering the highest price is likely to overpay relative to the target's true economic value, ultimately turning the "winner" into a "loser" as post-acquisition returns fail to materialize (Bartov et al., 2020). This risk intensifies under conditions of uncertainty, increasing the likelihood that firms will submit inflated bids (Boone and Mulherin, 2008).

Another factor that may influence incentives to overbid concerns accounting rules. In the early 2000s, regulatory changes in the accounting treatment of goodwill altered managerial incentives. The shift from systematic amortization to annual impairment testing led some managers to perceive that higher acquisition prices, and thus higher goodwill, would not immediately erode earnings. Although initially seen as an opportunity to justify higher bids, subsequent evidence demonstrated that excessive goodwill does not necessarily translate into sustainable value and may exert negative pressures on stock performance over time (Boone and Mulherin, 2008).

Beyond market dynamics and accounting incentives, behavioral finance provides an additional explanatory framework centered on managerial overconfidence. This cognitive bias leads decision-makers to overestimate their competencies and the likelihood of achieving successful outcomes (Lin et al., 2020). Overconfident managers are prone to overstate expected synergies, underestimate risks, and endorse overly optimistic valuations of the target firm. Roll's (1986) Hubris Hypothesis formalizes this intuition, suggesting that managerial arrogance can drive acquisitions that are not justified by fundamentals. Empirical evidence shows that deals influenced by managerial overconfidence tend to exhibit poorer medium- and long-term performance, with substantial value destruction for acquiring-firm shareholders, thus hindering firms' financial sustainability. The negative effects of overconfidence are particularly pronounced in weak governance environments, where monitoring mechanisms lack the strength to curtail impulsive or biased managerial decisions (Twardawski and Kind, 2023).

In this respect, it has been observed that the effectiveness of corporate governance plays a crucial role in constraining such behavior, regardless of whether overbidding stems from market dynamics, accounting incentives, or managerial biases. Accordingly, a prominent body of work attributes overbidding to agency conflicts arising from the misalignment between managers and shareholders. Managers may pursue acquisitions not to maximize shareholder value, but to obtain private benefits such as enhanced prestige, visibility, bargaining power, or the opportunity to expand the firm under their supervision (Hashim et al., 2024). Compensation schemes may further reinforce these incentives, as executives can receive bonuses contingent on deal completion or post-acquisition performance, regardless of long-term value creation (Grinstein and Hribar, 2004). These dynamics become particularly problematic when governance mechanisms fail to effectively monitor or constrain managerial behavior, enabling opportunistic bidding strategies. In some cases, managers may escalate bids to prevent competitors from acquiring the target, even when such strategies are not supported by economic fundamentals, behaviors consistent with the entrenchment hypothesis, prompting executives to primarily preserve or strengthen their position within the firm (De Bodt et al., 2018).

2.2. Corporate governance mechanisms and executive discretion

From an agency theory perspective, prior studies consistently emphasize how the board of directors serves as a central mechanism for shaping managerial conduct so that it converges with shareholder objectives (Alfraih, 2016; Alzeban, 2020; Jensen, 1993). Within this framework, an effective board plays a key role in scrutinizing and constraining executives through its oversight responsibilities (Alzoubi, 2014). In this context, it has also been noted that the presence of blockholders modifies the principal-agent relationship by influencing monitoring incentives and managerial discretion (Bhaumik and Selarka, 2012).

In addition, the resource-based view outlines how diversity in a firm's human capital can drive competitive advantage, leading to increased profitability, productivity and innovation (Nerdrum and Erikson, 2001), thus emphasizing how the integration of directors' diverse capabilities and skills can contribute to effective decision-making (van Knippenberg et al., 2020; Dezsö and Ross, 2012), as they enhance a firm's knowledge base and knowledge-sharing practices. The combined effects of these attributes can play a central role in nurturing human capital (Smriti and Das, 2022). In line with this view, internal corporate governance characteristics may substantially influence managerial overbidding.

The role of board size

Although a larger board is often expected to broaden the expertise available to the firm, the empirical literature offers mixed evidence on its actual impact (Wellalage et al., 2012). Board size may affect managerial effectiveness in opposing ways: while an increase in the number of directors may dilute efficiency due to greater organizational complexity, it may simultaneously enhance decision-making by incorporating a wider set of competencies. A stream of studies contends that expanding the board can hamper its functioning, as coordination becomes more demanding, decision processes lengthen, and the board's advisory capacity weakens (Tampakoudis et al., 2018), also undermining the monitoring role of outside directors (Jensen, 1993; Tochia and Calabrò, 2016). Nevertheless, an opposing body of research highlights the potential benefits of larger boards, outlining that a greater number of directors can introduce a wider set of viewpoints and strengthen supervisory capacity thanks to more diverse backgrounds and expertise (Zheng and Tsai, 2019). Our first hypothesis follows:

H1: The board size negatively affects the acquirer's propensity to overbid in acquisition deals

The role of independent directors

Among the attributes that characterize board members, the independence of directors is widely regarded as one of the most influential. From an agency theory perspective, outside independent directors are expected to act as more effective monitors of managerial opportunism (Fama and Jensen, 1983), as their autonomy enhances their ability to carry out oversight responsibilities compared to insiders, who are generally less inclined to challenge executive decisions (Alves, 2023). While internal directors may have incentives to withhold unfavorable information for personal benefit (Aifuwa and Embele, 2019), independent directors are motivated to encourage more transparent financial reporting to strengthen the firm's overall information environment (Goh et al., 2016). Their desire to cultivate and maintain a reputation as competent decision controllers further increases their willingness to question the CEO and to exercise rigorous monitoring, helping them protect themselves from reputational consequences associated with poor-quality oversight (Carcello et al., 2002; Fama and Jensen, 1983). Thus, we hypothesize that:

H2: Board independence negatively affects the acquirer's propensity to overbid in acquisition deals

The role of female directors

A more gender-diverse board is associated with strengthened monitoring and advisory capacities (Groening, 2019), as well as with richer cultural integration, broader cognitive frames, and enhanced legitimacy of corporate actions (Hillman et al., 2007), ultimately supporting more informed and effective decision processes (Loukil et al., 2019). Prior research further indicates that female directors tend to adopt a more diligent oversight style, showing stricter monitoring, higher meeting attendance, and greater collegiality, which collectively help mitigate agency-related concerns (Birindelli et al., 2020). Their atypical career trajectories, together with higher educational attainment and advanced training (Hillman et al., 2007), managerial competencies, and stronger long-term and stakeholder-oriented perspectives (Sarkar and Selarka, 2021), have also been linked to enhanced strategic judgment (Loukil et al., 2019). We hence hypothesize the following:

H3: Board gender diversity negatively affects the acquirer's propensity to overbid in acquisition deals

The role of board committees

Prior research highlights that board committees constitute an important governance mechanism, as they enhance the board's ability to monitor managerial actions (Anderson et al., 2004; Hadani et al., 2011; Safari et al., 2021). Their monitoring capacity stems from the specific responsibilities delegated to them. These committees operate independently of the full board, holding separate meetings guided by their own agendas and formal charters (Reeb and Upadhyay, 2010). Since board committees tend to be composed of a majority of independent directors (Klein, 1998), they may further strengthen the board's monitoring capacity and influence managerial decision-making, thereby shaping the relationship between board independence and organizational outcomes. Accordingly, when board structure is examined through the lens of the presence of board committees, the traditional arguments regarding advantages of larger versus smaller boards may require reconsideration. Building on this perspective, the present study revisits the link between board architecture and managerial overbidding, explicitly accounting for the number of committees, some of which are mandated by regulatory bodies and national stock exchanges. Based on the above, we hypothesize that:

H4: The number of board committees negatively affects the acquirer's propensity to overbid in acquisition deals

The role of controlling shareholders

Due to their greater ability to oversee managers, the presence of controlling shareholders may help alleviate the traditional agency conflict (Bhaumik and Selarka, 2012; Chen et al., 2009; Zou et al., 2008). Nevertheless, they may simultaneously advance objectives that diverge from those of minority owners, thereby giving rise to principal-principal conflicts (Peng et al., 2011; Wang and Shailer, 2015). Furthermore, large shareholders typically hold a significant portion of their personal wealth in a single firm, which is found to prompt risk-averse behavior (Bodnaruk et al., 2008; Dyck and Zingales, 2004), and to hinder their propensity to engage in acquisition activities. In this perspective, M&A potential benefits and losses are evaluated carefully (Worek, 2017) to limit exposure to uncertainty, which in turn reduces their likelihood of pursuing M&A deals.

In addition, firms with highly concentrated voting rights may approach acquisitions differently due to financing constraints: blockholders' preference for debt financing (Ellul, 2008) and cash payments to avoid diluting voting power (Faccio and Masulis, 2005) may attenuate overbidding propensity. We therefore hypothesize that:

H5: Concentrated ownership negatively affects the acquirer's propensity to overbid in acquisition deals

3. Methodology

3.1. Sample selection

The hypotheses were tested on a final sample of 47 acquisition transactions. This study represents the first stage of an ongoing research project.

Given the exploratory nature of the study and the data-intensive research design, in this initial phase, we identified a starting sample of 100 acquisitions from the Zephyr database, selected prior to the analysis of outcome variables and intended solely as a basis for data construction. The sample selection was based on the following eligibility criteria. First, only transactions classified as "completed" by the database were included. Second, we focused on acquisitions accounted for in accordance with IFRS 3 and involving IFRS-adopter acquirors and target firms to ensure consistency of accounting standards. We then excluded transactions that did not result in a full change of control. Due to data availability requirements, transactions lacking information on deal value, net equity, and post-acquisition total assets were excluded. This sequential screening process resulted in a final sample of 47 acquisitions.

Firm-level data were retrieved from different sources. In particular, data on acquisitions were gathered from Zephyr, financial data from Orbis, while corporate governance data were manually collected from companies' annual financial reports or corporate governance reports.

3.2. Variables and measures

Dependent variable. Overbidding was measured as the ratio between goodwill and post-acquisition total assets of the target company.

Independent variables. Before delving into the description of our independent variables and their measurements, it is worth noting that all variables are lagged by one year prior to the acquisition, to ensure that data are not influenced by the transaction and avoid endogeneity issues. Board Size reflects the number of directors sitting on the board in the year prior to the transaction. Independent Directors was computed as the ratio between the number of independent directors and the total number of directors appointed to the board in the year prior to the transaction. Female Directors captures the proportion of female directors, calculated as the number of women on the board divided by the total board size in the year prior to the transaction.

Committees measures the number of board committees. Ownership stake measures the percentage of shares held by the largest shareholder.

3.3. Model specification

To test our hypotheses, we estimated a multiple linear regression model. To assess potential multicollinearity concerns, we computed Variance Inflation Factors (VIFs). All VIF values fall well below the conventional threshold of 5, with the highest equal to 2.35.

The following model was estimated:

$$Overbidding_{i,t} = \alpha + \beta_1 Boardsize_{i,t-1} + \beta_2 IndependentDirectors_{i,t-1} + \beta_3 FemaleDirectors_{i,t-1} + \beta_4 Committees_{i,t-1} + \beta_5 OwnershipStake_{i,t-1} + \beta_6 Size_{i,t-1} + \beta_7 Leverage_{i,t-1} + \beta_8 ROA_{i,t-1}$$

Additionally, as a robustness check, we re-estimated the main specification separately for smaller and larger firms, based on total assets. While the reduced sample size limits statistical power, the direction of the estimated effects is consistent with the baseline model.

4. Results

Table 1 provides descriptive statistics. The mean value of overbidding amounts to 0.1, which indicates that, on average, the goodwill recognized in the post-acquisition balance sheet represents 10% of the acquirer's total assets. This suggests that the transactions were priced at a relatively high premium, consistent with prior evidence linking substantial goodwill to more aggressive bidding strategies. Concerning the independent variables, it is worth noticing that the minimum value of independent and female directors, as well as board committees, is 0, which can be ascribed to the heterogeneity of the sample: since the acquisitions were carried out by firms operating in different countries, they are subject to diverse corporate governance regulations and listing requirements, some of which do not mandate the presence of independent directors, gender diversity, or board committees. Interestingly, most acquirers feature the presence of a blockholder, reflecting a relatively concentrated ownership structure.

	Mean	Median	Minimum	Maximum	SD	Skewness	Kurtosis
Overbidding	0.10	-0.25	-1.53	4.83	1.32	2.13	4.53
Board Size	10.00	10.00	1.00	15.00	3.54	-0.28	-0.45
Independent Directors	0.31	0.33	0.00	0.90	0.21	0.82	1.61
Female Directors	0.18	0.17	0.00	0.57	0.14	0.70	0.26
Board Committees	3.37	3.00	0.00	7.00	1.50	0.29	0.42
Ownership Stake	51.98	49.55	4.60	100.00	31.17	0.26	-1.02
Size	13.10	13.27	8.31	17.05	1.87	-0.45	0.03
Leverage	9.88	4.16	0.03	81.86	8.75	0.93	3.29
ROA	5.46	3.87	-17.95	37.07	16.42	2.90	8.42

Table 1. Descriptive statistics

Table 2 displays the correlation between our variables, showing a significant positive relationship between overbidding and ROA (0.355 at the 5% level).

	1	2	3	4	5	6	7	8	9
Overbidding	1								
Board Size	-0.177	1

ROA	0.040 (0.022)*	0.046 (0.022)**
R^2	0.16	0.36

Table 3. Regression results

Contrary to our expectations, the hypothesis of a negative association between the board size and overbidding (H1) is rejected. Referring to H2 on the negative effect of board independence on overbidding, the findings contradict our predictions, showing a positive and statistically significant relationship with the independent variable (β=1.691; p-value<0.1). Results on the negative correlation between female directors (H3), board committees (H4) and controlling shareholders (H5) do not confirm our hypotheses. Considering our control variables, ROA is positively and significantly associated with overbidding, suggesting that the greater availability of internal resources can facilitate more aggressive bidding strategies. At the same time, strong prior performance may reinforce managerial overconfidence, leading executives to overestimate expected synergies from acquisitions.

5. Discussion and conclusions

Despite the well-known disruptive effects of acquisition overpayment, harming companies' financial performance and position and endangering their financial sustainability (Feng et al. 2016), relatively few studies explore the relationship between internal corporate governance mechanisms and overbidding.

In this context, our exploratory analysis provides preliminary insight into the interaction between the board of directors' characteristics and acquisition overpayment, overall showing that the oversight role of the board does not prevent managerial overbidding and outlining that, contrary to theoretical predictions, formal board and ownership attributes do not appear to constrain executives' bidding behavior in this setting.

Specifically, both the agency theory and the resource-based view predict that larger and diversified boards act as more effective monitors of the executives (Zheng and Tsai, 2019), also offering sounder advice (Alfraih, 2016; Alzeban, 2020; Jensen, 1993). By contrast, this study shows a different picture, indicating that the board characteristics and the ownership stake apparently do not limit executives' excessive bid premium in M&A deals. This seems to be particularly interesting when considering the multi-country nature of our sample, with companies operating in different institutional and cultural settings. In particular, our results align with a nascent line of inquiry, suggesting that the effectiveness of board monitoring mechanisms cannot be fully understood without accounting for the context in which boards operate (Miska et al., 2018).

On the one hand, the directors' appointment may be subject to different regulations, such as for gender quotas or independent directors, which may not be required in all countries. On the other hand, national culture may play a significant role in shaping directors' selection processes (Li et al., 2021; Slater, 2008), with cultural dimensions such as power distance, collectivism, or uncertainty avoidance affecting expectations about board members' roles, behavioral norms, and the extent to which they are expected to challenge top management (Li and Harrison, 2008).

In particular, an intriguing finding that emerges from this study is the positive association between overbidding and the board's independence, as this may indicate that beyond the potential

influence exerted by outside directors due to formal independence criteria, their actual role depends on both the adopted notion of independence and on context-specific characteristics. Indeed, legal independence prerequisites may be decoupled from substantive independence, as directors' actual monitoring effectiveness can be constrained by institutional norms, appointment processes, and relational dynamics within the boardroom (Crespí-Cladera and Pascual-Fuster, 2014; Marra, 2021).

Taken together, these counterintuitive results suggest that analyses of the role played by directors' characteristics in shaping board effectiveness may benefit from a more nuanced approach that considers the different national settings in which boards operate.

We thus contribute to the ongoing debate on how governance factors affect executives' conduct by suggesting that directors' attributes should be investigated by adopting a fine-grained analytical lens, as the effectiveness of the board scrutiny may depend on characteristics beyond formal prerequisites required by regulations (Amin et al., 2024). For instance, the positive impact of women on boards may be shaped by national cultural traits that influence expectations about gender, hierarchy, and conformity, potentially constraining their ability to exercise independent judgment and challenge dominant coalitions and qualifying them as grey directors (Licht et al., 2005).

Our results also align with prior studies positing that board independence can effectively contribute to a firm's outcomes when true detachment from managerial interests occur, as formal criteria per se are insufficient to ensure directors' autonomy (Johnson et al., 2013; Marra, 2021; Moscariello et al., 2019).

This study is, of course, a work in progress. Accordingly, we aim to further advance our understanding of the phenomenon under investigation through several complementary avenues. First, we plan to expand the sample size by including a broader set of acquisition transactions, moving beyond this initial exploratory subset in order to strengthen the statistical power of the analysis and further assess the robustness of our findings. Second, since overbidding was measured using an accounting-based proxy, we plan to conduct a robustness check relying on market-based measures. Third, we intend to incorporate country-level characteristics, including both cultural dimensions and institutional features into the analysis. Finally, we will undertake an additional robustness test using a composite corporate governance index, responding to calls for examining the concurrent role of multiple governance mechanisms. Such an approach acknowledges that governance practices may reinforce one another, while analyses focused on isolated mechanisms risk overlooking the interaction effects among different governance dimensions (Aguilera et al., 2012; Schnyder, 2012).

Intelligenza Artificiale ed efficienza aziendale: il caso del Consorzio Industriale del Lazio

Raffaele Trequattrini[1], Benedetta Cuozzo[2], Maria Schimperna[3], Giuseppe Russo[4]

1. Introduzione e rassegna della letteratura

I consorzi industriali sono enti pubblici economici, nonché uno strumento politico strategico, che favorisce lo sviluppo industriale attraverso la fornitura di servizi, il consolidamento dell'atmosfera industriale, delle infrastrutture e della logistica, ecc. (De Giorgi, 2007; Massarutto et al., 2019, L. 317/1991). Tra le attività principali vi sono la gestione di aree industriali, tramite servizi e assegnazione delle aree, e l'attrazione degli investimenti (Turina et al., 2011). Tali funzioni si collocano in un contesto reso ancora più competitivo dalla globalizzazione, in cui i territori sono chiamati a concorrere per mantenere e attrarre imprese nei propri confini (Pacetti, 2006). La formalizzazione della loro natura giuridica di Ente Pubblico Economico (Legge 5 ottobre 1991, n. 317) ha accentuato la necessità di adeguarsi al mondo produttivo ed ha accresciuto l'esigenza di un utilizzo delle risorse volto ad ottenere il massimo risultato con il minore impiego di ricchezza (Buccellato, 1983). In considerazione di ciò, i loro compiti sono stati ampliati e comprendono: i) l'erogazione di servizi primari; ii) l'innovazione tecnologica; iii) le reti informatiche polifunzionali, indispensabili per rendere le aziende competitive sui mercati internazionali. Pertanto, ciascun consorzio ha assunto nuovi ruoli e responsabilità, ponendosi al diretto servizio degli operatori economici insediati nelle proprie aree. In tal modo, hanno ricoperto il ruolo di attori cruciali per il progresso economico e sociale del territorio di competenza (https://www.ficei.it/notizie-ficei/). Tale funzione si colloca proprio in un contesto di forte competizione dei territori. Questi ultimi, infatti, competono affinché vengano considerati come la sede più appropriata per l'insediamento di attività produttive, risultando "vincenti" nella comparazione con altre aree nella misura in cui sono in grado di favorire il successo delle imprese collocate entro i propri confini (Pacetti, 2006). Alcuni strumenti possono rendere più o meno attrattivi determinati territori, come accaduto nel secondo dopo guerra con l'istituzione della Cassa per il Mezzogiorno nel Meridione, o più recentemente con l'istituzione delle Zone Economiche Speciali (ZES) (Lepore, 2012; Lepore e Spirito, 2017; Ferrara et al., 2022).

A questo si affiancano nuove sfide e opportunità derivanti dalle nuove tecnologie con impatti diretti sui processi aziendali (Trequattrini et al., 2021; Lombardi et al., 2022; Russo et al., 2023); tra le più dirompenti vi è l'intelligenza artificiale (IA) (Lombardi et al., 2021; Trequattrini e Schimperna, 2023). L'implementazione di quest'ultima in azienda è un utile strumento per migliorare la qualità e l'efficienza dei processi aziendali (Gravila et al., 2025; Scarton et al., 2025; Kumar e Shrivastava, 2025). La sua diffusione è cresciuta grazie all'avvento dei Big Data, degli

algoritmi avanzati e al miglioramento della potenza di calcolo e della capacità di archiviazione, con un profondo impatto sul processo decisionale umano (Duan et al., 2019). Per Boden (2019) l'IA è definibile come l'abilità di un computer a svolgere funzioni e ragionamenti tipici della mente umana. Dunque, l'obiettivo dell'IA sarebbe quello di imitare, quanto più possibile, per mezzo di macchine normalmente elettroniche, l'attività mentale umana (Penrose, 1989). È possibile distinguere differenti tipologie di IA: le opere artificiali che eseguono operazioni al posto delle persone e gli intelletti sintetici che sembrano destinati a sostituire gli esseri umani nell'assumere decisioni di carattere ristretto o di natura generale (Kaplan, 2016). In questo contesto, si vanno a delineare tre spazi decisionali: nel primo, le scelte dipenderanno dalle capacità di processare grandi quantità di dati, di gestire relazioni complesse tra dati, di considerare molte variabili, di effettuare analisi coerenti, oggettive, precise e accurate. Questo ambito sarà presumibilmente occupato dagli intelletti sintetici. Nel secondo, saranno predominanti le caratteristiche che favoriscono i punti di forza degli esseri umani. Pertanto, tale spazio resterà di competenza degli uomini. Nel terzo, saranno presenti caratteristiche miste, permettendo la compresenza di macchine ed esseri umani (Trequattrini e Schimperna, 2023).

In questa prospettiva, le imprese stanno impiegando l'IA per prendere decisioni più veloci, soprattutto nei contesti complessi (Edwards et al., 2000; Wilson e Daugherty, 2018; Kumar e Shrivastava, 2025). La sua implementazione permette, infatti, lo svolgimento di compiti per raggiungere obiettivi specifici, come l'analisi dei dati, la previsione dei prezzi, l'ottimizzazione dei processi, la gestione dei rischi e l'identificazione delle tendenze (Kumar et al., 2025). Può, altresì, supportare l'identificazione di nuove opportunità di mercato, il miglioramento della produttività e della soddisfazione dei clienti, permettendo di migliorare il vantaggio competitivo (Musa et al., 2025). Può essere, infine, impiegata per semplificare le operazioni quotidiane, come la gestione della produzione, la gestione dei magazzini, la gestione dei fornitori e la gestione della manutenzione (Trequattini e Schimperna, 2023; Rad et al., 2025). In taluni casi può essere affiancata a tecnologie geo-spaziali per il miglioramento della gestione dell'intera supply chain (Andrei e Scarlat, 2024).

In questo scenario di forte competitività e di rapida e profonda trasformazione, i consorzi industriali possono assumere il ruolo di attori chiave nella competizione dei territori, in una posizione ideale per sperimentare modelli di gestione dei processi basati sui dati, fondati sulla condivisione delle conoscenze, sulla cooperazione istituzionale, sull'intelligence geospaziale e sull'uso delle nuove tecnologie nella definizione dei processi aziendali.

Pertanto, l'obiettivo del presente studio è valutare se e in che modo le nuove tecnologie abilitanti supportano i consorzi e le parti interessate nel processo di insediamento industriale, contribuendo ad una più efficiente allocazione delle risorse territoriali e migliorando i processi decisionali. In tale prospettiva, la ricerca esamina come la disponibilità e l'uso dei dati geospaziali affiancata dalle nuove tecnologie abilitanti, tra cui l'IA, possano influire sulla qualità dei processi decisionali, sull'attrazione degli investimenti e sulla gestione delle aree industriali. In tale prospettiva, i consorzi, originariamente concepiti per fornire alle aree produttive infrastrutture e servizi essenziali, si sono evoluti fino a diventare facilitatori strategici dello sviluppo locale (Turina et al., 2011). Essi assistono nella creazione di imprese, sostengono la riqualificazione di aree abbandonate e collaborano con le autorità pubbliche per definire strategie di sviluppo in linea con le esigenze locali. Questa evoluzione li avvicina alla logica dei distretti industriali e dei sistemi produttivi locali (Varaldo, 2006; Lombardi, 2015), in quanto promuovono il coordinamento territoriale, il capitale relazionale e l'incontro tra domanda e offerta per le aree industriali. Più che semplici gestori di spazi, i consorzi agiscono ora come mediatori di conoscenza, contribuendo a costruire reti collaborative e catene del valore all'interno dei loro territori. Questo nuovo ruolo richiede la capacità di raccogliere, elaborare e interpretare dati territoriali ed economici complessi, aprendo così la strada all'adozione di strumenti digitali di supporto decisionale.

I consorzi sono spesso considerati attori amministrativi o infrastrutturali (De Giorgi, 2007), piuttosto che analizzati come enti strategici in grado di mediare la conoscenza, promuovere l'innovazione e adottare tecnologie digitali a supporto dell'attrazione di investimenti. Sebbene in letteratura siano presenti alcuni studi preliminari sul ruolo dei consorzi industriali e sulla digitalizzazione dei processi decisionali territoriali, il loro ruolo in questo contesto rimane in gran parte inesplorato. Inoltre, le ricerche sulle tecnologie si concentrano principalmente sulle istituzioni pubbliche o sulle grandi infrastrutture urbane, trascurando le dinamiche operative degli attori intermediari come i consorzi industriali. Alla luce del gap evidenziato, le domande di ricerca (RQ) sono le seguenti:

RQ1: "Come può essere implementata l'intelligenza artificiale per migliorare l'attrazione degli investimenti?"

RQ2: "Come può migliorare l'efficienza aziendale attraverso l'uso dell'intelligenza artificiale?"

2. Disegno della ricerca

Per colmare tale gap in letteratura e rispondere alle domande di ricerca, è stato adottato un approccio di ricerca qualitativo basato su un caso studio rilevante (Yin, 2014). La metodologia del caso studio è considerata efficace quando la ricerca affronta domande relative al "come" o al "perché" di eventi contemporanei sui quali il ricercatore ha un controllo limitato (Yin, 2014). Nel caso in esame, l'obiettivo è comprendere in che modo i dati georeferenziati e gli strumenti di IA influenzano i processi decisionali relativi all'allocazione delle aree industriali e perché i consorzi adottano o resistono a tali tecnologie nelle loro pratiche quotidiane. Questa metodologia consente una comprensione approfondita delle dinamiche istituzionali, organizzative e tecnologiche che modellano l'evoluzione dei consorzi industriali.

Nel particolare, il presente studio prende in esame il caso del "Consorzio Industriale del Lazio", ente che coordina lo sviluppo delle aree industriali in diverse province dell'Italia centrale. In particolare, sono state condotte interviste semi-strutturate su un arco temporale di un anno che hanno offerto una prospettiva completa sull'uso degli strumenti digitali e dei dati spaziali per la pianificazione delle aree industriali e il supporto all'insediamento delle aziende. Le interviste mirano a raccogliere percezioni, esperienze e valutazioni sull'efficacia della georeferenziazione e di altri strumenti digitali nei processi decisionali e operativi. Tali informazioni sono state integrate con quelle rinvenibili sul sito ufficiale del Consorzio e sui documenti pubblici del Consorzio (es. Statuto). In tal modo è stato possibile comprendere come il Consorzio utilizza dati geospaziali e l'IA nelle proprie attività tipiche, se tali strumenti migliorano l'efficienza dei suoi processi e, infine, come questo plasmi il ruolo attuale del Consorzio.

Le informazioni sono state analizzate attraverso un'analisi tematica, per identificare il modello utilizzato, questioni critiche ed opportunità emergenti. Al fine di assicurare robustezza e credibilità delle informazioni e dei dati, è stato implementato il seguente protocollo (Yin, 2014):

1) presentazione del caso (focus sulla realtà oggetto d'indagine);
2) procedure di raccolta dei dati e delle interviste (procedure per la protezione della privacy, identificazione delle probabili fonti di dati, presentazione dei contatti sul campo);
3) raccolta dei dati (struttura delle domande e raccolta delle evidenze);
4) presentazione dei risultati.

3. Il caso del Consorzio Industriale del Lazio: risultati e discussione

Sistematizzando le informazioni ricevute durante le interviste, dalla visione del processo, dalle informazioni sul sito ufficiale del Consorzio e dalla documentazione pubblica ufficiale dell'ente, è stato possibile delineare i risultati preliminari del caso studio.

Il Consorzio Industriale del Lazio è un ente pubblico-privato che coordina lo sviluppo delle aree industriali in diverse province dell'Italia centrale. È nato dalla fusione di cinque enti industriali presenti sul territorio della Regione Lazio (ASI Frosinone, Cosilam, Consorzio Roma-Latina, Consorzio di Rieti e Consorzio del Sud Pontino) ed oggi è il più grande d'Italia. I pilastri su cui si basa sono lo sviluppo, l'attrazione di investimenti e l'occupazione. In particolare, tra i compiti emergono:

- l'attuazione di specifiche azioni per la ricerca di investitori sia nazionali che esteri, promuovendo anche a livello internazionale opportunità di investimento nell'economia del territorio e ricercando la valorizzazione delle realtà produttive, anche di piccola e media impresa;
- la promozione e la gestione di progetti strategici di innovazione industriale, focalizzandosi sulla riqualificazione delle aree industriali dismesse, la logistica e la valorizzazione dell'ambiente;
- la realizzazione di opere per la fornitura di servizi necessari all'insediamento, allo sviluppo, alla riqualificazione ed alla riconversione delle imprese, oltre che sostenendo la diffusione di reti di telecomunicazione e di servizi telematici alle imprese insediate in queste aree (https://www.consorziolazio.it/il-consorzio/chi-siamo.html).

Inoltre, come da Statuto, si occupa anche della "predisposizione di una mappatura analitica delle aree disponibili, comprensiva delle informazioni necessarie alle imprese ai fini delle valutazioni sulla realizzazione degli insediamenti produttivi" (art.3, comma 3 Statuto del Consorzio Industriale del Lazio). L'ente oggetto d'indagine svolge, come tutti i consorzi industriali, principalmente attività riconducibili a i) gestione delle aree industriali e ii) attrazione degli investimenti. I risultati dimostrano che il Consorzio ha recentemente implementato l'IA per migliorare l'efficienza aziendale e portando al contempo un miglioramento nel processo di attrazione degli investimenti. Il sistema è articolato nelle seguenti fasi: i) mappatura; ii) schede; iii) IA; iv) dialogo IA-investitori; v) soluzioni. In tale processo gli investitori hanno un primo contatto direttamente con l'IA che risponderà alle loro richieste specifiche, restituendo il numero identificativo dei lotti adatti a disposizione del Consorzio. Successivamente, potranno negoziare direttamente quei lotti con l'ufficio commerciale dell'Ente. Tale modello comporta vantaggi significativi per entrambi gli attori coinvolti. Gli investitori riducono i tempi di ricerca e trattativa, evitando contatti inutili e un impiego eccessivo di risorse. Dal lato del Consorzio, il sistema consente di concentrare tempo e risorse su un numero contingentato di opportunità, negoziando in modo mirato con gli interlocutori effettivamente interessati. Questo, in linea con la dottrina (Edwards et al., 2000; Wilson e Daugherty, 2018; Kumar e Shrivastava, 2025), ha portato ad una migliore efficienza aziendale, riducendo il tempo impiegato in modo superfluo dagli uffici commerciali, ma anche ad una maggiore attrazione degli investimenti, grazie al raggiungimento di zero costi e zero burocrazia per gli investitori. In tal modo, gli investitori saranno incentivati a investire nei territori gestiti dal consorzio esaminato, anziché intraprendere l'intero iter procedurale previsto per altri territori. Inoltre, tale risultato è molto rilevante trattandosi di un ente pubblico economico, in cui gli aspetti legati all'efficienza sono più che mai centrali, e nel quale, pertanto, l'uso delle risorse dovrebbe essere sempre volto ad ottenere il massimo risultato con il minore impiego di ricchezza (Buccellato, 1983).

Questo porta un'evoluzione nel ruolo del Consorzio, passando da un ente la cui attività tipica era la gestione delle aree industriali, ad uno in cui il peso maggiore è quello dell'attività di attrazione degli investimenti. Tale trasformazione risulta cruciale, data la crescente competizione dei territori attraverso le politiche di attrazione, come quelle degli incentivi ZES e quelle legate alla burocrazia (all'aumentare della burocrazia aumentano i costi) (Lepore e Spirito, 2017; Ferrara et al., 2022). Quanto implementato dal Consorzio rappresenta uno strumento in grado di aumentare l'attrattività dei territori, snellendo i processi, migliorando al contempo l'efficienza aziendale e rafforzando il ruolo del Consorzio come fonte di attrazione d'investimenti. Inoltre, il modello creato dall'Ente permette la compresenza decisionale integrata di uomini e macchine,

nel quale i due attori si supportano l'un l'altro, evitando che le macchine possano prendere il sopravvento sugli umani (Trequattrini e Schimperna, 2023).

4. Conclusioni: originalità, implicazioni manageriali e limiti

Il presente lavoro risponde a diverse call, tra cui quella del XLI Convegno AIDEA. Lo studio colmando un rilevante gap in letteratura, propone avanzamenti negli studi sul ruolo attuale dei consorzi industriali (Buccellato, 1983; De Giorgi, 2007; Massarutto et al., 2019) e su come l'IA stia plasmando i processi decisionali e impatti sull'efficienza aziendale (Edwards et al., 2000; Wilson e Daugherty, 2018; Trequattrini e Schimperna, 2023; Kumar e Shrivastava, 2025).

I risultati della ricerca potrebbero avere implicazioni pratiche notevoli per i manager e i decision-makers politici: da un lato, mostrano come il ruolo dei consorzi industriali stia evolvendo da gestore di aree industriali a fonte di attrazione degli investimenti; dall'altro, rivelano come è possibile ottimizzare i processi aziendali attraverso le nuove tecnologie.

Questo contributo non è esente da limiti. I principali derivano dall'uso di un caso di studio singolo che riduce la generalizzabilità dei risultati e l'impiego di un metodo esclusivamente qualitativo. Tale approccio è stato necessario essendo all'inizio del fenomeno di integrazione dell'IA nei processi del Consorzio. Quando sarà passato maggior tempo dall'introduzione di tale strumento e/o altre realtà avranno adottato approcci simili, sarà possibile estendere la ricerca attraverso analisi quantitative e comparative.

Parole chiave: Consorzio industriale; efficienza; IA; attrazione degli investimenti; competizione dei territori

Ringraziamenti

Gli Autori desiderano esprimere il proprio ringraziamento al Consorzio Industriale del Lazio per la disponibilità accordata e per aver consentito l'utilizzo e la divulgazione delle informazioni primarie raccolte mediante interviste, che hanno contribuito in modo significativo allo sviluppo della presente ricerca.

Data-Driven Leadership e Strategic Intelligence: una prospettiva comparata sull'impatto dei dati nei processi decisionali in contesti globali frammentati

Francesco Della Rocca[1], Virginia Zambrano[2]

1. Introduzione

La crescente pervasività dei dati e delle tecnologie intelligenti ha trasformato radicalmente le modalità di governo e di decisione pubblica. La ricerca si propone di indagare, in una prospettiva comparata tra Unione Europea, Stati Uniti e Cina, come la *data-driven leadership* e la *strategic intelligence* influenzino i processi decisionali, la cultura organizzativa e la capacità di innovazione nelle amministrazioni pubbliche. Tale obiettivo si colloca all'interno di un quadro geopolitico e normativo frammentato, nel quale la sovranità sul dato è divenuta un elemento cardine della competitività economica e della legittimazione istituzionale. Come ha osservato Galetta (2019), il diritto contemporaneo non può più ignorare la natura algoritmica dei processi decisionali, poiché la traslazione di funzioni pubbliche verso sistemi automatizzati impone di ridefinire le categorie di legalità, responsabilità e trasparenza. L'ipotesi di fondo è che la capacità delle istituzioni di governare il dato determini, oggi, non solo la qualità della decisione amministrativa, ma la stessa effettività dei diritti fondamentali nella sfera digitale.

L'approccio metodologico integra l'analisi giuridico-normativa con la prospettiva manageriale, seguendo una logica qualitativa e comparativa. L'indagine parte da un esame sistematico delle principali fonti europee — il Regolamento (UE) 2016/679 (GDPR), il Codice dell'Amministrazione Digitale (d.lgs. n. 82/2005), la Direttiva (UE) 2022/2555 "NIS2", il Data Governance Act (Reg. UE 2022/868) e il recente Regolamento (UE) 2024/1689 sull'Intelligenza Artificiale — e le mette in relazione con i modelli statunitensi di *self-regulation* (CCPA 2018, CPRA 2020) e con la legislazione cinese, imperniata sulla *Data Security Law* e sulla *Personal Information Protection Law* (2021). Questa comparazione è accompagnata da una riflessione sulle trasformazioni organizzative e cognitive che derivano dall'adozione di sistemi decisionali basati sui dati, attraverso l'analisi di casi nei settori della sanità, della giustizia e della difesa, ambiti in cui la digitalizzazione incide direttamente sulla legittimazione e sulla fiducia del cittadino. Il metodo assume, in tal senso, un carattere interdisciplinare: la triangolazione tra fonti normative, letteratura scientifica e prassi istituzionali permette di osservare l'interazione tra cultura del dato, processi decisionali e capacità amministrativa. Dall'analisi emergono risultati coerenti e al tempo stesso differenziati. L'Unione Europea si distingue per una visione antropocentrica della tecnologia, in cui la protezione del dato costituisce una proiezione del diritto alla dignità personale, fondamento della cittadinanza digitale. Tuttavia, come osserva Esposito (2022), il modello europeo soffre di una "asimmetria di attuazione": pur definendo un quadro normativo avanzato, esso fatica a tradursi in pratiche organizzative realmente evidence-based. Gli Stati Uniti, al contrario, presentano un ecosistema innovativo più dinamico ma privo di una tutela organica, dove la *data economy* si sviluppa in chiave di mercato, con scarso coordinamento tra i livelli federali. La Cina rappresenta infine un paradigma alternativo, in cui la governance dei dati

[1] Dottorando di ricerca, GIUR/11, Università degli Studi di Salerno; frdellarocca@unisa.it – corresponding author

[2] Professoressa ordinaria, GIUR/11, Università degli Studi di Salerno; vzambrano@unisa.it

è funzionale alla sovranità tecnologica e alla pianificazione politica, riducendo lo spazio della responsabilità individuale. La comparazione conferma dunque che la *leadership data-driven* non è un modello universalmente esportabile, ma dipende dal contesto normativo e culturale entro cui si inserisce. Il lavoro mette in luce come la governance del dato, per produrre valore pubblico, debba fondarsi su una leadership capace di integrare il vincolo giuridico con la logica manageriale. Adinolfi (2018) ha mostrato come la leadership efficace, nei contesti complessi, non derivi dall'autorità formale ma dalla capacità di orientare processi di apprendimento collettivo. Applicata alla sfera digitale, tale visione implica un approccio riflessivo: il leader data-driven deve saper mediare tra etica e innovazione, promuovendo una cultura organizzativa che valorizzi il dato come bene comune e non come mero strumento di efficienza. Campo, Martella e Ciccarese (2018) sottolineano che l'algoritmo non è neutrale, ma riflette i valori e le asimmetrie del contesto sociale in cui viene progettato; pertanto, il diritto deve vigilare affinché la tecnologia resti subordinata alla finalità pubblica e al principio di legalità. In questa prospettiva, la *strategic intelligence* diventa un elemento di connessione tra conoscenza e potere decisionale: una funzione organizzativa che consente di trasformare i dati in insight, e gli insight in politiche pubbliche informate, tracciabili e responsabili.

Sul piano pragmatico, la ricerca propone un modello operativo per la pubblica amministrazione fondato su tre assi: la maturità digitale, la capacità di lettura del contesto e l'allineamento tra regolazione e innovazione. Le amministrazioni con alti livelli di *data maturity* mostrano, come evidenzia The European House – Ambrosetti & Salesforce (2023), una maggiore capacità di anticipare i rischi e di adattarsi a crisi sistemiche, poiché integrano la gestione dei dati nei processi decisionali quotidiani. Tuttavia, l'Italia e molti Paesi europei presentano ancora un deficit di competenze digitali e una scarsa cultura del dato, che ostacolano la traduzione dei principi di trasparenza e *accountability* in pratiche di governo del rischio. Gli obiettivi della ricerca sono dunque doppi: da un lato, individuare le condizioni giuridiche e organizzative che favoriscono la leadership data-driven; dall'altro, delineare strumenti di policy per rafforzare la *strategic intelligence* come capacità istituzionale, non solo come funzione tecnica. La sfida è rendere il diritto e la gestione pubblica complementari, superando la dicotomia tra controllo e innovazione. L'analisi riconosce anche i limiti del proprio impianto. La natura qualitativa dello studio e la disomogeneità dei dati comparati rendono difficile una validazione empirica generalizzabile. Inoltre, la comparazione tra modelli giuridici profondamente diversi, soprattutto nel caso della Cina, comporta un rischio di relativismo metodologico. Tuttavia, tali limiti rappresentano anche un'opportunità: la mancanza di indicatori uniformi di *digital accountability* sollecita nuove ricerche empiriche orientate alla misurazione del grado di maturità data-driven delle amministrazioni pubbliche, attraverso metriche condivise e replicabili. In questa direzione, la ricerca auspica lo sviluppo di osservatori interuniversitari e strumenti di valutazione che integrino indicatori normativi, tecnologici e culturali, favorendo una governance multilivello dei dati pubblici. L'originalità del lavoro risiede nella prospettiva ibrida che unisce diritto, management e analisi comparata. Superando la tradizionale separazione tra norma e organizzazione, la ricerca sostiene che la leadership data-driven costituisce una forma emergente di potere pubblico, in cui la capacità di gestire il dato diventa condizione di legittimità e di efficacia dell'azione amministrativa. Ambrosini e Bresciani (2020) hanno dimostrato come la cultura organizzativa sia il vero fattore abilitante della trasformazione digitale: la leadership, in questo senso, è il vettore attraverso cui i principi giuridici – legalità, trasparenza, proporzionalità – si traducono in processi operativi e decisioni responsabili. Il contributo scientifico è dunque duplice: da un lato, propone una rilettura del diritto amministrativo alla luce delle sfide algoritmiche; dall'altro, individua nella *strategic intelligence* una leva manageriale per la costruzione di amministrazioni resilienti e orientate all'apprendimento. Il dato, da strumento tecnico, diventa così infrastruttura cognitiva del potere pubblico.

In una prospettiva più ampia, la ricerca invita a ripensare la relazione tra sapere e decisione, tra informazione e legittimazione democratica. L'emergere di una leadership fondata sul dato non

è solo una questione di efficienza, ma di giustizia cognitiva: la trasparenza, l'inclusione e la capacità di spiegare le scelte diventano nuovi parametri della legalità amministrativa. La trasformazione digitale, per essere coerente con i valori costituzionali europei, deve tradursi in un diritto capace di orientare la tecnologia e non di inseguirla. È in questa direzione che la data-driven leadership assume un significato politico oltre che gestionale: essa rappresenta la possibilità di costruire un'amministrazione pubblica realmente intelligente, in cui il dato non sostituisce la deliberazione, ma la rafforza attraverso la conoscenza.

Strategie di offshoring e disponibilità a pagare dei consumatori europei per gli autoveicoli elettrici cinesi: un modello concettuale

Alfredo Celentano[1], Michela Matarazzo[2]

1. Inquadramento concettuale

Le strategie di offshoring delle case automobilistiche cinesi per entrare nel mercato europeo devono essere comprese all'interno di un più ampio contesto di trasformazione industriale globale. Il settore automobilistico è infatti ridefinito da tre dinamiche concomitanti: l'accelerazione della decarbonizzazione, la digitalizzazione dei veicoli e l'ascesa di nuovi attori globali che mettono in discussione il primato dei costruttori tradizionali (Holweg, Luo & Oliver, 2009; Carboni, 2023). Tra questi nuovi concorrenti, la Cina è emersa non solo come il più grande mercato automobilistico mondiale, ma anche come leader nella mobilità elettrica, sostenuta da ingenti investimenti e da catene del valore fortemente integrate (Santelli, 2024). Questo cambiamento genera al tempo stesso opportunità e barriere per i marchi cinesi in cerca di legittimazione in Europa, un mercato a lungo dominato dalle case automobilistiche tedesche, francesi e italiane.

La letteratura sull'immagine del Paese (country image, CI) mostra come le percezioni dei consumatori nei confronti dei marchi siano fortemente influenzate dalla CI, che funge da scorciatoia cognitiva nel plasmare le aspettative in termini di qualità, affidabilità e valore simbolico (Schooler, 1965; Han, 1989; Verlegh & Steenkamp, 1999). Nel caso della Cina, l'indicatore di Paese d'origine (country of origin, COO) risulta ambivalente. Da un lato, la Cina è associata a capacità tecnologiche avanzate nel settore dei veicoli elettrici (EV). Dall'altro, l'origine cinese è generalmente legata a standard qualitativi percepiti come inferiori, a un minore capitale simbolico e a una forma di dipendenza geopolitica. Questa duplicità rende il COO non un semplice fattore di sfondo, ma una variabile centrale nel determinare l'accettazione da parte dei consumatori europei.

Un secondo filone di studi enfatizza il ruolo della qualità percepita del prodotto (perceived product quality, PPQ) nella formazione delle decisioni di acquisto. La disponibilità a pagare (willingness to pay, WTP) dei consumatori è strettamente connessa alla loro valutazione della qualità del prodotto, in particolare nei beni ad alto coinvolgimento come le automobili (Peterson & Jolibert, 1995). Immagini-paese negative possono pertanto ridurre la WTP in modo indiretto, abbassando la qualità percepita e indebolendo la fiducia. Allo stesso tempo, segnali positivi quali la sostenibilità o il radicamento locale possono mitigare tali effetti, evidenziando l'importanza di variabili moderatrici e mediatrici nella relazione tra COO e WTP (Miller et al., 2027).

Due moderatori contestuali appaiono particolarmente rilevanti. In primo luogo, la natura del prodotto, se il veicolo è elettrico o dotato di motore a combustione interna, può modificare l'impatto del COO sulla qualità percepita. Dato il ruolo di leadership globale della Cina nella tecnologia EV, i modelli elettrici possono rafforzare la qualità percepita nonostante le associazioni negative legate al COO. In secondo luogo, strategie di offshoring "upward", come la

[1] Ricercatore, ECON-06/A, Università degli Studi Guglielmo Marconi; a.celentano@unimarconi.it – corresponding author

[2] Professoressa ordinaria, ECON-07/A Università degli Studi Guglielmo Marconi; m.matarazzo@unimarconi.it

localizzazione della produzione in economie avanzate, fungono da amplificatori di credibilità, riducendo la distanza simbolica e rafforzando il legame tra COO e qualità (Dunning, 2001; Pavlínek, 2018). Nel loro complesso, questi moderatori mostrano come le percezioni legate al COO non rappresentino passività fisse, ma segnali malleabili che possono essere ridefiniti attraverso le scelte strategiche delle imprese.

Infine, variabili a livello individuale quali l'efficacia percepita del consumatore (perceived consumer effectiveness, PCE) e la preoccupazione ambientale (environmental concern, EC) arricchiscono ulteriormente l'analisi. La ricerca evidenzia che i consumatori che percepiscono le proprie scelte come capaci di incidere sugli esiti ambientali, e coloro che manifestano una maggiore attenzione alla sostenibilità, risultano più propensi a sostenere prodotti ecologici di alta qualità, mostrando una WTP più elevata (Sweeney & Soutar, 2001; Arsyistawa & Hartono, 2022; Falchi, Grolleau & Mzoughi, 2022). Queste costruzioni concettuali legano le trasformazioni industriali a livello macro (transizione verde, strategie di offshoring) ai processi decisionali a livello micro del consumatore, fungendo da ponte tra prospettive istituzionali e individuali.

In sintesi, questo studio si colloca all'intersezione tra immagine del Paese, qualità percepita del prodotto e disponibilità a pagare, considerando al contempo moderatori strategici (orientamento elettrico, localizzazione produttiva) e moderatori individuali (efficacia del consumatore, preoccupazione ambientale). L'originalità dell'approccio risiede nella sua integrazione multilivello: esso mostra come i bias reputazionali associati al COO interagiscano con fattori tecnologici, strategici e individuali nel plasmare l'accettazione dei costruttori automobilistici cinesi in Europa.

2. Obiettivo e metodologia

L'obiettivo centrale di questo contributo è esplorare come i consumatori europei percepiscano l'ingresso delle case automobilistiche cinesi nei loro mercati e in che modo tali percezioni influenzino la loro disponibilità a pagare (willingness to pay, WTP). A differenza dei contributi empirici che testano specifiche relazioni mediante dati quantitativi, questo lavoro si colloca esplicitamente come paper concettuale. Il suo scopo è intrecciare gli apporti della letteratura in un quadro coerente e sviluppare ipotesi in grado di orientare future ricerche empiriche.

Il punto di partenza è il ben noto Country-of-Origin Effect (COO). Decenni di studi hanno mostrato come l'immagine di un Paese operi come un potente euristico nei processi decisionali di consumo, influenzando il modo in cui i prodotti vengono valutati in termini di qualità, affidabilità e valore simbolico (Schooler, 1965; Han, 1989; Verlegh & Steenkamp, 1999). Nel caso della Cina, l'indicatore di Paese d'origine è particolarmente ambivalente: da un lato, è associato a una leadership globale nella tecnologia dei veicoli elettrici e a un forte dinamismo industriale; dall'altro, porta con sé stereotipi legati a standard qualitativi inferiori e a una condizione di dipendenza geopolitica (Diamantopoulos et al., 2017). Questa dualità rende il COO non una semplice condizione di sfondo, ma un determinante della legittimità e dell'accettazione sul mercato. All'interno di questa cornice più ampia, l'articolo avanza sei ipotesi. Le prime due articolano i canali diretti e indiretti attraverso cui un'immagine-paese negativa influenza la disponibilità a pagare. Da un lato, percezioni sfavorevoli del COO sono attese ridurre direttamente la propensione dei consumatori a pagare un premio di prezzo (H1). Dall'altro, l'immagine-paese esercita un effetto indiretto tramite la qualità percepita del prodotto (perceived product quality, PPQ): quando il COO è negativo, le valutazioni di qualità tendono a peggiorare e questo, a sua volta, deprime la WTP (H2). Queste ipotesi evidenziano il ruolo centrale della reputazione nel plasmare le dimensioni sia simboliche sia economiche del comportamento di consumo.

Il framework riconosce inoltre che gli effetti del COO non sono statici, ma possono essere riformulati alla luce di moderatori contestuali. Due fattori appaiono particolarmente rilevanti. In primo luogo, la natura stessa del prodotto conta: quando l'auto è elettrica anziché con motore a

combustione interna, l'associazione con la riconosciuta expertise tecnologica della Cina negli EV può attenuare lo stigma legato al COO ed elevare le percezioni di qualità (H3). In secondo luogo, le scelte strategiche relative alla localizzazione produttiva, che definiamo offshoring "upward", possono funzionare come segnali di credibilità. Localizzando la produzione in economie avanzate, le case automobilistiche cinesi possono beneficiare del capitale reputazionale di tali contesti, riducendo la distanza simbolica e rafforzando la qualità percepita (H4).

Al di là di queste condizioni macro, il modello integra disposizioni a livello micro del consumatore. Anche quando la qualità viene riconosciuta, la misura in cui essa si traduce in disponibilità a pagare dipende da credenze e valori individuali. I consumatori che percepiscono le proprie scelte come in grado di contribuire a miglioramenti ambientali sono più inclini a premiare i prodotti di alta qualità con una WTP più elevata (H5). Analogamente, coloro che manifestano una più forte preoccupazione ecologica sono attesi attribuire maggiore valore ai veicoli sostenibili, amplificando il nesso tra PPQ e WTP (H6). In questo senso, i moderatori a livello del consumatore costituiscono un ponte cruciale tra dinamiche industriali e processi decisionali individuali.

Da un punto di vista metodologico, il contributo di questo articolo non risiede nella raccolta di nuovi dati, bensì nella sua integrazione concettuale. Combinando la ricerca sul COO con gli apporti relativi a qualità percepita, disponibilità a pagare e psicologia ambientale, lo studio propone un framework al contempo teoricamente solido e di rilevanza pratica. Le sei ipotesi traducono costrutti astratti in proposizioni verificabili, offrendo una road map per future indagini empiriche che potranno avvalersi di dati survey, modelli di regressione o modelli ad equazioni strutturali per validare le relazioni qui delineate.

In sintesi, l'impianto metodologico sottolinea l'originalità di questo lavoro come contributo concettuale. Esso collega segnali reputazionali (immagine del Paese), risposte strategiche (orientamento elettrico, localizzazione) e fattori a livello del consumatore (efficacia percepita, preoccupazione ambientale) in un modello multilivello. In tal modo, offre una spiegazione strutturata di come le case automobilistiche cinesi possano superare lo stigma legato al COO e costruire legittimità in Europa, predisponendo al contempo il terreno per una futura validazione empirica.

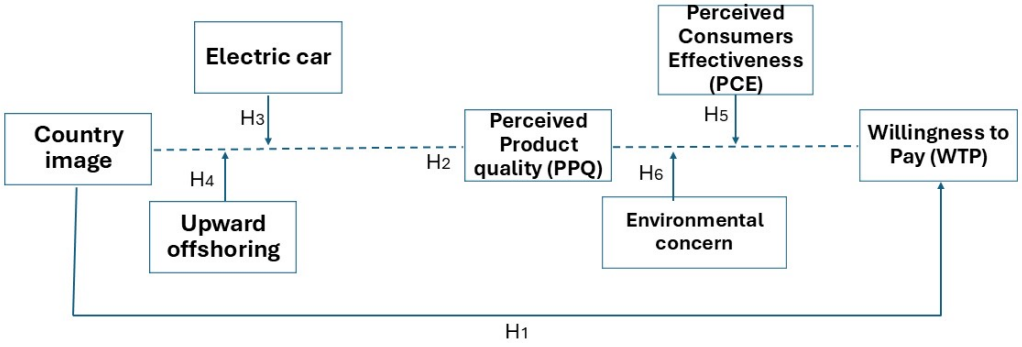

Figura 1. Framework Concettuale proposto

3. Risultati

Poiché questo contributo si configura come un paper concettuale, i risultati non consistono in evidenze empiriche, bensì nelle dinamiche attese che emergono dal framework teorico. L'obiettivo è illustrare come possa articolarsi l'interazione tra immagine del Paese (country image, CI), qualità percepita del prodotto (perceived product quality, PPQ) e disponibilità a pagare (willingness to pay, WTP), e come tali relazioni siano plasmate da moderatori tecnologici, strategici e a livello individuale.

Una prima evidenza riguarda l'impatto diretto dell'immagine del Paese. In linea con H1, una CI negativa è attesa ridurre la WTP. Ciò riflette la perdurante rilevanza degli stereotipi legati al Paese d'origine (COO): quando il Paese d'origine è percepito come meno affidabile, i consumatori esitano a riconoscere un premium price, indipendentemente dagli attributi funzionali del prodotto. Nel caso delle case automobilistiche cinesi, questa passività si manifesta in uno svantaggio strutturale nel competere in mercati in cui i marchi europei o giapponesi godono di un forte capitale reputazionale.

La seconda evidenza sottolinea il ruolo mediatore della qualità del prodotto. Come proposto in H2, percezioni negative del COO tendono a indebolire le valutazioni di qualità, il che a sua volta riduce la WTP. Questo meccanismo mette in luce la centralità della PPQ come ponte tra segnali reputazionali ed esiti economici. Anche qualora i consumatori non colleghino consapevolmente il COO alla loro sensibilità al prezzo, i giudizi di qualità fungono da canale attraverso cui il COO influisce sulla WTP. In tal senso, il COO non incide soltanto sulle associazioni simboliche, ma vincola direttamente il valore che i consumatori sono disposti ad attribuire a un prodotto.

Il framework suggerisce inoltre che lo stigma associato al COO non sia immutabile. H3 postula che l'impatto negativo della CI sulla PPQ possa essere attenuato nel caso dei veicoli elettrici. Qui la categoria di prodotto diventa cruciale: la riconosciuta leadership della Cina nella tecnologia EV e nell'innovazione legata alle batterie fornisce un contrappeso positivo allo scetticismo verso il COO. Quando il prodotto incorpora un expertise tecnologica allineata con le priorità europee di decarbonizzazione, le percezioni di qualità possono migliorare, neutralizzando almeno in parte lo stigma legato al COO. In modo analogo, H4 evidenzia il ruolo delle strategie di offshoring "upward", come la localizzazione produttiva in economie avanzate. Radicando le attività in contesti caratterizzati da forte legittimità industriale, le case automobilistiche cinesi possono inviare segnali di credibilità, ridurre la distanza simbolica e allinearsi alle aspettative dei consumatori in termini di qualità. Entrambe le ipotesi mettono in rilievo come il COO non rappresenti una passività deterministica, bensì una percezione malleabile, sensibile alle scelte tecnologiche e strategiche delle imprese.

Un ulteriore livello dei risultati attesi riguarda la traduzione delle percezioni di qualità nella disponibilità a pagare. Come suggerito da H5 e H6, tale traduzione non è uniforme, ma dipende da disposizioni individuali. L'efficacia percepita del consumatore (perceived consumer effectiveness, PCE) modera il legame PPQ-WTP plasmando il modo in cui i consumatori interpretano il significato delle proprie scelte. Coloro che ritengono che le proprie decisioni di acquisto possano contribuire positivamente agli esiti ambientali sono più inclini a premiare la qualità percepita con una maggiore disponibilità a pagare. In modo analogo, la preoccupazione ambientale (environmental concern, EC) rafforza questo nesso: i consumatori con forti valori ecologici tendono ad attribuire maggiore importanza ai veicoli sostenibili, risultando più disposti a pagare per prodotti percepiti come ambientalmente responsabili. Questi moderatori a livello individuale mostrano che il COO e le percezioni di qualità vengono filtrati attraverso i sistemi di valori dei consumatori, generando risposte eterogenee tra differenti segmenti di mercato.

Complessivamente, questi risultati concettuali offrono una spiegazione multilivello di come le case automobilistiche cinesi possano essere accolte in Europa. A livello macro, il COO agisce come baseline reputazionale che condiziona l'accettazione. A livello meso, leve strategiche quali il posizionamento sugli EV e la localizzazione produttiva offrono percorsi per ridefinire gli effetti del COO. A livello micro, credenze e valori individuali determinano il modo in cui le percezioni di qualità si traducono in comportamenti economici come la WTP.

In sintesi, il framework non pretende di presentare evidenze testate, ma di articolare esiti plausibili e teoricamente fondati. Mostra come il successo delle case automobilistiche cinesi in Europa dipenderà dalla loro capacità di gestire lo stigma reputazionale, mettere in risalto la leadership tecnologica, radicarsi strategicamente nei contesti locali e risuonare con i valori dei consumatori legati alla sostenibilità e alla responsabilità individuale. Queste intuizioni

predispongono il terreno per future ricerche empiriche, necessarie per validare, affinare o mettere in discussione le sei ipotesi avanzate in questo studio.

4. Limiti della ricerca ed implicazioni

In quanto paper concettuale, questo studio presenta una serie di limiti che devono essere riconosciuti. Il limite più evidente è l'assenza di una verifica empirica: le sei ipotesi qui proposte restano proposizioni teoriche, non ancora supportate da evidenze statistiche. Ricerche future dovranno validare il framework attraverso studi basati su survey, disegni sperimentali o modelli ad equazioni strutturali, al fine di valutare la forza e la robustezza delle relazioni ipotizzate.

Un secondo limite riguarda la specificità di contesto degli effetti legati al Paese d'origine (COO). Le percezioni delle case automobilistiche cinesi possono variare in modo significativo tra i diversi paesi europei, riflettendo tradizioni culturali, climi politici e politiche industriali nazionali. Il framework fornisce dunque una road map concettuale generale, ma il suo potere predittivo è verosimilmente destinato a variare in funzione delle condizioni locali. Infine, il COO e le percezioni di sostenibilità sono costrutti dinamici: con l'espansione della produzione delle imprese cinesi in Europa, il miglioramento degli standard qualitativi o l'adattamento delle strategie di comunicazione, le percezioni dei consumatori possono mutare, richiedendo studi longitudinali per cogliere tali evoluzioni.

Nonostante questi confini, il framework offre diverse implicazioni manageriali rilevanti. In primo luogo, esso sottolinea come l'immagine del Paese rimanga un fattore decisivo per l'accettazione da parte dei consumatori. I manager delle case automobilistiche cinesi devono riconoscere che il COO non è neutrale e che stereotipi negativi possono deprimere direttamente la disponibilità a pagare. Al tempo stesso, il modello mostra che tale stigma può essere gestito. Il posizionamento nel segmento dei veicoli elettrici consente alle imprese di valorizzare la riconosciuta leadership della Cina nella tecnologia EV, riformulando in chiave positiva le percezioni dei consumatori. Analogamente, l'adozione di strategie di offshoring "upward", ad esempio tramite la localizzazione produttiva nei mercati europei, può rafforzare la credibilità, ridurre la distanza simbolica e allineare il brand con ecosistemi industriali considerati affidabili.

In secondo luogo, il framework enfatizza l'importanza della qualità percepita del prodotto come driver centrale della disponibilità a pagare. Le strategie di comunicazione dovrebbero pertanto andare oltre l'enfasi sulla competitività di prezzo, concentrandosi invece su affidabilità, sicurezza e prestazioni tecnologiche. Investimenti in trasparenza e verificabilità, in particolare rispetto alle dichiarazioni in materia di sostenibilità, risultano altrettanto cruciali per costruire fiducia tra i consumatori europei.

In terzo luogo, l'analisi evidenzia che le risposte dei consumatori sono eterogenee. Moderatori a livello individuale, come l'efficacia percepita del consumatore e la preoccupazione ambientale, plasmano il modo in cui le percezioni di qualità si traducono in comportamenti economici. Per i manager, ciò implica la necessità di strategie di marketing segmentate, rivolte a gruppi di consumatori caratterizzati da forti valori ecologici e da un marcato senso di responsabilità personale. Un branding narrativo che sottolinei il ruolo del consumatore nella transizione ecologica ("la tua scelta conta") può risultare particolarmente efficace in questi segmenti.

Infine, i risultati presentano implicazioni anche per i decisori pubblici. Se l'accettazione da parte dei consumatori dipende dall'interazione tra stigma legato al COO, posizionamento tecnologico e localizzazione produttiva, le politiche industriali che incentivano investimenti sostenibili e sostengono l'occupazione locale possono svolgere un ruolo decisivo nel legittimare i nuovi entranti stranieri. Tali politiche non solo favoriscono la competitività, ma allineano l'accettazione di mercato con più ampi obiettivi sociali, quali la decarbonizzazione e la resilienza economica.

In conclusione, pur essendo limitato dalla propria natura concettuale, lo studio offre indicazioni operative per manager e policy maker. Per i manager, il percorso verso il successo in Europa consiste nel combinare leadership tecnologica, radicamento locale e narrazioni incentrate sulla sostenibilità. Per i ricercatori, il framework fornisce una base per future indagini empiriche che potranno affinare o mettere in discussione le proposizioni qui avanzate, contribuendo così ad arricchire sia il dibattito accademico sia la pratica manageriale.

5. Originalità

Questo articolo offre un contributo originale riformulando il Country-of-Origin Effect nel contesto dell'espansione delle case automobilistiche cinesi in Europa. Piuttosto che trattare l'immagine del Paese come un elemento passivo e fisso, lo studio la concettualizza come un fattore dinamico, il cui impatto sull'accettazione da parte dei consumatori può essere mediato e moderato da una molteplicità di condizioni. Collegando l'immagine del Paese in modo diretto e indiretto alla disponibilità a pagare, attraverso il ruolo della qualità percepita del prodotto, il framework mette in luce le dimensioni reputazionali, tecnologiche e individuali che plasmano il comportamento di consumo.

Il contributo risiede nella proposta di un modello multilivello che combina segnali a livello macro, scelte strategiche d'impresa e valori a livello del consumatore. In tal modo, l'articolo non solo arricchisce la letteratura sul COO, ma fornisce anche un'agenda strutturata per future ricerche empiriche sulla legittimazione e l'accettazione dei brand dei Paesi emergenti nelle economie avanzate.

Strategic routes and geopolitical risks in the Arctic: a perspective from corporate responsibility and intercultural governance

Francesco Maria Autolino[1], Forster Ampadu[2], Baba Ahmed Mulay[3], David Abel Díaz Pérez[4]

1. Introduction

In the space of a few decades, the Arctic has gone from being a geographical periphery to becoming a strategic space of primary importance, where global interests, environmental challenges and rich cultural diversity converge. The acceleration of ice melt has transformed a once inaccessible area into a hub for trade, energy and military projection. Emerging maritime routes, together with the opening of mineral and energy deposits, have turned the Arctic into a territory of opportunity, but also of vulnerability and contention. In this context, geopolitics, corporate responsibility and intercultural governance converge as fundamental axes of analysis.

The reconfiguration of the Arctic reflects Agnew's (1994) thesis that geopolitics is not limited to territorial control but also involves the discursive production of spaces of power. The Arctic, therefore, is not only a melting physical frontier, but also a discursive scenario in which states project sovereignty, companies seek legitimacy and local communities claim recognition.

The growing interest of powers such as Russia, China, and the United States has placed the region at the epicentre of a new multipolar order, a laboratory in which the balance between climate cooperation and energy competition is measured. As a result, companies operating in this space face a dual challenge: seizing logistical and economic opportunities while responding ethically and responsibly to intensifying political and environmental tensions.

The expansion of northern sea routes—particularly the Northeast Passage, the Northwest Passage and the Central Arctic Route—symbolises this paradigm shift. These routes promise to reduce distances between Asia and Europe by up to 40%, but their opening has triggered a silent race for control of polar corridors and infrastructure. As Lasserre and Têtu (2020) observe, the melting of the ice has transformed the Arctic into a new logistical frontier where economics, climate and geopolitics intersect.

This paper aims to develop geopolitical risk analysis capabilities applied to the Arctic, understanding how companies can anticipate and mitigate the effects of sanctions, trade wars and political instability. However, the analysis is not limited to the strategic level: it also aims to integrate an ethical and cultural perspective, in line with the corporate social responsibility (CSR)

formulated by Carroll (1991), according to which corporate sustainability depends on the balance between economic, legal, ethical and philanthropic responsibilities.

From this perspective, the concept of 'social licence to operate', developed by authors such as Wilson and Stammler (2016), takes on a particular significance in the Arctic: the legitimacy of a company is measured not only by its compliance with the law, but also by its ability to generate trust among indigenous peoples and local institutions.

Interculturality, in turn, becomes a key component of the analysis. Authors such as Hofstede (2001) have shown that cultural differences profoundly influence organisational relationships and global risk management. Applied to the Arctic, this implies that sustainability cannot be achieved without a dialogue between corporate rationality and the community values of peoples such as the Inuit, Sámi and Chukchi.

For this reason, the work combines three analytical dimensions:

Geopolitics: how global tensions are redefining control of routes and international cooperation.

Corporate responsibility: how companies respond to the ethical, legal and cultural challenges of the Arctic environment.

Intercultural skills: how the inclusion of local knowledge and ethical training strengthen stability and sustainability.

Ultimately, the central question driving this research is:

How can businesses develop a culture of geopolitical analysis and intercultural responsibility that will ensure their sustainability in an increasingly competitive and unstable Arctic?

2. The new Arctic routes: strategic logistics in a context of global fragmentation

Throughout geological history, the Earth's climate has undergone significant changes. According to the Gautier et al., (2009), over the last 800,000 years, the Earth has undergone multiple glacial cycles, including eight major glacial periods and their respective interglacial periods, processes closely linked to fluctuations in mean sea level. However, since the mid-20th century, the pace and magnitude of climate change have reached unprecedented levels in instrumental records.

We are currently in an interglacial period, commonly referred to as the Holocene, characterised by a sustained and accelerating increase in global average temperatures (Bardan, 2025). The report by Bardan (2025) confirms 2024 warmest year on record, continuing a trend of global warming', 2024 was the warmest year since systematic records began (1880), with an increase of 1.28 °C compared to the 1951–1980 average, surpassing the previous record set in 2023. The year-on-year increase of 0.10 °C intensified glacier retreat and contributed to sea level rise. Furthermore, compared to the average temperatures of the pre-industrial period (1850–1900), it is estimated that in 2024 the global temperature was 1.47 °C higher (Bardan, 2025).

Analysis shows unexpected amount of sea level rise in 2024, highlighting that global average sea level rose faster than expected in 2024, reaching 0.59 cm. This value exceeds the initial projection of 0.43 cm by 0.16 cm and is mainly attributed to the thermal expansion of the oceans induced by anthropogenic global warming. The result has fuelled growing concern in the scientific community.

Over the past four decades, the Arctic has warmed at more than twice the global average rate, leading to an accelerated reduction in sea ice. The minimum extent has decreased by about 40%, from 7 to 4.3 million km². In addition, Arctic sea ice is declining at a rate of 13% per decade. According to the National Snow and Ice Data Centre (2025), between 1979 and 2025, the total ice extent decreased from 15.4 to 13.1 million km²: a loss of 2.3 million km², or 15.5%.

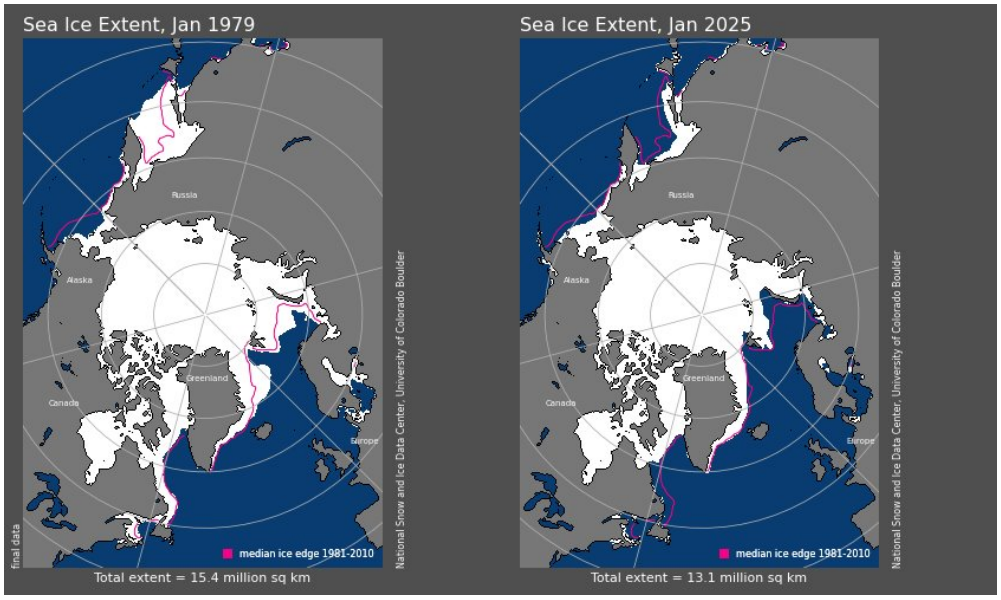

Figure 1. Evolution of Arctic ice melt from 1979 to 2025. Source: National Snow and Ice Data Centre

It is estimated that the Arctic could connect up to 75% of the world's population, highlighting its importance in global trade (Department of the U.S. Navy, 2021). The progressive melting of the Arctic Ocean has made possible what until recently seemed a pipe dream: sailing for months through the ice to connect Asia and Europe in record time. These polar routes—the Northeast Passage (Russia), the Northwest Passage (Canada) and the Central Route (high seas)—have become the new frontier of global trade, a space where logistical innovation, economic diplomacy and geopolitical rivalry converge.

The operability of the routes varies according to seasonality and is mainly determined by the presence and thickness of sea ice. When the thickness exceeds 10 metres, even the latest generation of icebreakers are unable to break through, forcing routes to remain closed or diverted. During the summer months, from late June to September, navigation conditions improve significantly, especially along the eastern and western routes. Nevertheless, the central route continues to have limitations, as it requires constant assistance from icebreakers, significantly increasing the logistical costs associated with transporting goods.

In addition, the Arctic has gained increasing strategic importance, driven by its wealth of natural resources. The U.S. Geological Survey (2008) study, 'Circum-Arctic resource appraisal: estimates of undiscovered oil and gas north of the Arctic Circle', estimates that approximately 22% of the world's undiscovered but technically recoverable gas and oil reserves are located within the Arctic Circle. Of this total, over 80% is believed to be in the ocean subsoil, mainly in areas under the sovereignty of the Russian Federation. In addition to hydrocarbons, the Arctic is home to a significant concentration of strategic mineral resources. Previous studies have identified large deposits of metals such as gold, platinum, nickel and rare earth elements, increasing the economic and geopolitical interest in the region (Linholt, 2006). These materials are essential for the technology, energy and defence industries, reinforcing their strategic importance in terms of control and exploitation.

In particular, the melting of the ice has opened up access to vast natural resources: it is estimated that the region contains 13% of the world's undiscovered oil and 30% of its undiscovered natural gas, both of which are essential for global energy and the functioning of industries and transport systems. In addition, the Arctic is rich in strategic minerals such as gold, nickel, cobalt and copper, which are essential for the production of batteries, electronic components and advanced technologies. Added to this are the reserves of fresh water stored in

glaciers and polar ice caps, an increasingly precious resource in light of the global water crisis. Finally, Arctic waters are home to abundant fish stocks—cod, salmon and shellfish—which support the food industry and local economies in several circumpolar countries. Progressive melting, combined with technological advances in exploration and extraction in extreme environments, has facilitated operational access to these resources. As a result, the Arctic has become an area of global competition, in which not only Arctic coastal states—especially Russia—but also extra-regional powers such as China and the United States aim to expand their influence and access to these riches.

According to Linholt's (2006) analysis, in terms of hydrocarbon production, the main extraction centres are concentrated in Alaska and Russia, which account for approximately 10.5% and 25.5% of global oil and gas production, respectively. Russia, in particular, has intensified exploration activities in key areas such as the Barents Sea, where reserves of up to 32,000 billion cubic metres of gas and natural are estimated to exist. Despite the challenges associated with exploiting these resources, the region's economic potential continues to be a key driver of territorial claims and state investment. This interest is intensifying with the melting of the ice, which has not only facilitated physical access to previously inaccessible deposits, but has also opened up new opportunities for maritime connectivity.

2.1. The Northeast Passage: Russian control and strategic dependence

The Northern Sea Route (NSR), which runs along the northern coast of Russia, reduces the distance between Shanghai and Rotterdam by almost 40%. It is the shortest and, to date, the most explored route, stretching from the Bering Strait to the North Sea. Over 90% of the journey made by container ships along this route takes place in waters under Russian jurisdiction. This is largely due to the fact that Russia has the largest concentration of the Arctic's coastal population, which has led to the development of significant port infrastructure in the main settlements on the northern coast.

Another determining factor in the proliferation of ports in the Russian Arctic region is the relative thinness of the ice for a significant part of the year. This condition is influenced by the country's hydrography: most of the rivers in northern Russia originate in the south and flow into the Arctic Ocean, helping to reduce ice formation in these areas. In contrast, in Canada, rivers tend to originate and flow within the northern regions or towards the west—particularly in Alaska—limiting this effect. These geographical and climatic conditions give the Russian route a higher level of security and efficiency in logistics operations and delivery times. Its logistical potential is indisputable, but geopolitical control is total: Moscow requires transit permits and supervises navigation using fleets of nuclear icebreakers.

Figure 2. Arktika, the world's most powerful Russian nuclear icebreaker. Source: U.S. Naval Institute

After the 2022 sanctions, Russia used this route as an instrument of economic power, redirecting traffic to non-Western partners, particularly China. According to Zreik and Derendiaeva (2025), Sino-Russian cooperation around the so-called Polar Silk Road constitutes a strategy of resilience vis-à-vis the Western-dominated maritime order. However, this alliance poses an ethical and operational dilemma for European companies: participating in NSR-related projects means exposing themselves to sanctions or compromising their international reputation.

For companies wishing to operate in this context, the challenge is to maintain strategic neutrality and diversify their logistical alliances. Porter and Kramer's (2011) perspective on shared value is relevant here: companies that integrate social and political interests into their strategy build sustainable competitive advantages even in highly uncertain contexts.

Figure 3: The Northern Sea Route: from strategies to realities. Source: Arctic Portal

2.2. The Northwest Passage: Canadian opportunities and sovereignty dilemmas

The Northwest Passage (NWP) stretches from the Bering Strait to Baffin Bay, crossing the territorial boundaries of Alaska (United States), Yukon, Northwest Territories and Nunavut (Canada) until it reaches the waters of Greenland (Denmark). It crosses the Canadian Arctic Archipelago and has emerged as an alternative to the Russian route. Although it offers a relatively more neutral route, it faces technical obstacles—persistent ice, poor infrastructure—and political obstacles: Canada considers the passage under its sovereignty, while the United States and the European Union define it as an international route.

This tension reinforces what Toal and Tuathail (1996) define as critical geopolitics, in which discourses of power materialise in selectively interpreted maps and boundaries. Businesses, caught between sovereign narratives, must act with legal and diplomatic caution. Furthermore, the route crosses Inuit territories, where consultation and consent processes are legally mandatory. Ignoring them would imply not only regulatory non-compliance, but also a serious reputational risk. The Canadian experience shows that companies that collaborate with indigenous governments achieve greater operational stability. Community inclusion is not an obstacle, but rather a preventive governance strategy, consistent with Sen (1999) idea of collective capabilities as the foundation of justice and development.

2.3. The Central Arctic Route: global promise, regulatory vacuum

The Central Route crosses international waters and is the shortest route between Asia and Europe. As the ice recedes, its navigability increases; however, the absence of a regulatory authority creates legal uncertainty. In this scenario, international maritime law—in particular the United Nations Convention on the Law of the Sea (UNCLOS)—constitutes the main framework, although its interpretation varies according to state interests. The absence of a common legal regime requires companies to adopt voluntary self-regulation and multi-level compliance mechanisms, anticipating possible disputes. As Fraser (2009) argues, global justice requires the simultaneous recognition of the dimensions of redistribution, representation and recognition. Transposed to the Arctic context, this means that commercial decisions must consider the balance between profitability, sovereignty and cultural legitimacy.

The three routes share one characteristic: dependence on an unstable international context. International fragmentation—with sanctions, military tensions and economic rivalries—forces companies to redefine the concept of security. In the Arctic, caution is a form of strategy. Organisations that incorporate geopolitical analysis, intercultural sensitivity and ethical commitment into their planning not only reduce risk but also contribute to the stability of the system.

The sustainability of the Arctic will therefore depend on the ability of economic actors to transform competition into cooperation. Such cooperation, however, must be based on business ethics and respect for the peoples who have inhabited the region for millennia.

3. Sanctions, trade wars and instability: the new geopolitical chessboard of the Arctic

The Arctic has become a context in which the dynamics of international trade are intertwined with political tensions, economic sanctions and territorial disputes. The region exemplifies what Agnew (2009) calls the 'rebirth of the geography of power', in which states are once again using natural spaces as instruments of geopolitical influence.

The war in Ukraine and the sanctions imposed on Russia since 2022 have reconfigured cooperation in the Arctic. The Arctic Council, historically a symbol of dialogue, has suspended its joint operations and Western-participated energy projects have been frozen. This rift marks the transition from 'cooperative geopolitics' to 'competitive geopolitics', in which alliances are defined by ideological affinities rather than scientific or environmental interests. The sanctions against Russia have hit liquefied natural gas (LNG) and maritime transport projects on the Yamal

Peninsula hard. Companies such as TotalEnergies and Shell have withdrawn, while China National Petroleum Corporation (CNPC) and COSCO Shipping have taken their place. This shift has strengthened the Sino-Russian axis, promoting the Polar Silk Road as an alternative to Western-dominated routes.

From a business perspective, sanctions produce what Porter (1991) would call an 'environment of distorted competition': market rules are subordinated to geopolitical alignments. Companies no longer compete solely on efficiency, but also on legitimacy and reputation. Operating in sanctioned territories can entail financial, reputational and even criminal risks. In this new arena, companies must develop political risk analysis capabilities: monitoring the impact of sanctions, mapping networks of actors and anticipating possible diplomatic breakdowns. This approach is consistent with the idea of Toal and Tuathail (1996) that geopolitics is not only the politics of states, but also the daily practice of institutions, companies and communities that build and negotiate power.

3.1. The trade war: fragmentation of the economic order

The rivalry between the United States and China has intensified global fragmentation, with direct effects also in the Arctic. As Zreik and Derendiaeva (2025) argue, the Polar Silk Road is both an economic initiative and an instrument of alternative diplomacy, designed to secure Chinese influence in a historically Westernised space . This competition transfers trade wars to extreme latitudes: subsidies, technological control and sustainability standards become instruments of power.

European and North American companies must navigate between two blocs that impose divergent regulations. On the one hand, the West demands environmental transparency and respect for human rights; on the other, Eurasia offers economic incentives and regulatory flexibility. In this dilemma, corporate responsibility becomes a moral compass. Following Carroll (1991) CSR pyramid, corporate sustainability involves balancing economic, legal and ethical dimensions. In the Arctic, this means that a company cannot be profitable at the expense of legitimacy, nor can it operate with only apparent neutrality in the face of regulatory violations.

3.2. Militarisation and structural risk

Economic instability is compounded by the progressive militarisation of the Arctic. NATO is increasing its presence in Norway, Iceland and Finland; Russia has reopened bases on the Kola Peninsula, while the US military presence in the Arctic is concentrated in Alaska and Greenland. Alaska is a key element in the US Arctic defence architecture: here, the country maintains a dense network of military infrastructure—air bases, radar stations and anti-missile systems—which ensures permanent surveillance of Arctic airspace and a rapid response capability to emerging threats.

A representative example of this strategy materialised in September 2024 with the deployment of over a hundred US soldiers, equipped with HIMARS rocket systems, on the island of Shemya, located at the western end of the Aleutian archipelago, approximately 1,930 km south-west of Anchorage. The operation was in response to increased joint military exercises between Russia and China in the North Pacific and Arctic regions, particularly near the coast of Alaska. At that time, eight Russian military aircraft and four naval units, including two submarines, were recorded operating near US airspace and maritime territory. The deployment was part of a larger force projection operation called Ocean-24, which also included the dispatch of a guided missile destroyer and a Coast Guard vessel. These manoeuvres reinforce the idea that the Arctic has ceased to be a passive surveillance zone and has become an active arena for strategic competition.

At the opposite end of the Arctic, the Pituffik Space Base in Greenland (formerly known as Thule Air Base) is the northernmost installation of the US Department of Defence. Located

approximately 1,210 km north of the Arctic Circle and 1,524 km from the North Pole, Pituffik plays a central role in aerospace and missile defence operations. The base houses high-precision radar systems integrated into the ballistic missile early warning system, enabling the detection and tracking of intercontinental launches. In addition, its strategic location facilitates the monitoring of satellites in polar orbits, contributing significantly to the United States' space situational awareness.

Strategic interest in Pituffik has resurfaced in relation to the development of hypersonic missiles by powers such as Russia and China. These weapons, capable of moving at extreme speeds and at low altitudes, pose a considerable technical challenge to current defence systems. According to military analyst and retired officer Troy J. Bouffard, there is currently no fully effective system for neutralising such threats. Consequently, the US strategy is based on deterrence and immediate response capability, further reinforcing the geopolitical value of installations such as Pituffik (Olmo, 2025). Finally, Greenland's geographical position—offering a direct route between Eurasia and North America—confirms its strategic importance, as was already the case during the Cold War. In this context, the administration of US President Donald Trump has once again emphasised the security of the island, questioning Denmark's ability to guarantee it and describing it as critical to US national defence.

Figure 4. Pituffik Space Base. Strategic operations and missile defence in the Arctic. U.S. Department of Defence

The growing militarisation of the Arctic has intensified the geostrategic rivalry between the United States, Russia and China, transforming the region into a theatre of multidimensional competition. Russia has consolidated a significant military presence through the reactivation of former Soviet bases and the expansion of the Northern Fleet, the most powerful component of its navy. These installations incorporate advanced air defence systems, port infrastructure for nuclear submarines and logistical capabilities that strengthen Russia's power projection in the Arctic. Russia's strategy aims not only to strengthen national defence on its northern flank, but also to secure its economic future by attracting foreign investment in strategic sectors such as energy and Arctic logistics (Chan, 2025).

China, although not an Arctic state, describes itself as a 'near-Arctic state' and has increased its involvement in the region through investments in energy infrastructure and the promotion of its Polar Silk Road initiative. This strategy is part of its global economic expansion policy and is accompanied by growing military and technological cooperation with Russia. The organisation of joint military exercises and participation in Arctic development projects reveal a strategic alliance that introduces new challenges for the United States and its Western allies.

In this scenario, even in the absence of open conflict, the region has become a theatre of symbolic deterrence. This creates an indirect operational risk for businesses: route disruptions, increased maritime insurance premiums, cargo surveillance and access control. In the words of Lasserre and Têtu (2020, p.20), "the Arctic has become a securitised space, where logistics is subordinate to politics" and Corporate sustainability therefore requires the integration of security analysis and diplomacy into strategic planning.

The context outlined above therefore requires the development of corporate geopolitical intelligence. It is not enough to react to sanctions or tensions: they must be anticipated. This involves training teams specialised in international risk, monitoring political indicators and maintaining institutional relations with governments and multilateral bodies. Sen's (1999) capability theory offers a useful conceptual basis: organisations, like individuals, must expand their capacity for rational choice in conditions of uncertainty. It follows that true corporate competitiveness lies in flexibility, knowledge and ethics in dealing with change. In short, sanctions and trade wars have shown that the Arctic is no longer an 'empty space' but a field of power. Companies that understand this change will be able to act prudently and responsibly, avoiding the opportunistic logic that has historically characterised extractive economies.

4. Corporate responsibility in the face of geopolitical risk: from opportunism to ethical governance

The transformation of the Arctic into a global logistics hub has tested the traditional limits of corporate responsibility. Operating in an environment where climate, politics, and culture are constantly changing requires a comprehensive corporate ethic that balances profitability and legitimacy.

Companies operating in geostrategic territories cannot be considered neutral entities. As Fraser (2009) suggests, economic institutions participate in the production and distribution of justice. In the Arctic, every corporate decision—a chosen route, a signed alliance, a built port—has ethical and geopolitical implications. The notion of 'business as a political actor' derives from the field of business ethics, in which authors such as Scherer and Palazzo (2011) argue that global corporations should assume responsibilities typically held by states in contexts of weak governance. From this perspective, corporate action in the Arctic is not limited to compliance with the law but includes the promotion of stability and intercultural respect.

The concept of social licence to operate (SLTO) summarises the transition from mere legal compliance to social legitimacy. According to Wilson and Stammler (2016), this licence is built on the consent and trust of local communities. In regions such as the Arctic, where identity and territory are inseparable, SLTO is more fragile and more valuable than any contract. Companies that do not recognise indigenous actors tend to encounter boycotts or blockades. Conversely, those that develop mechanisms for ongoing dialogue, based on transparency and reciprocity, strengthen their reputation and resilience. This is where Carroll's (1991) idea takes shape: corporate ethics as a strategic obligation, not as a moral ornament.

In this context, the new Arctic reality requires the concept of compliance to be extended beyond the legal perimeter. Companies must create systems of geopolitical compliance that consider sanctions, alliances, human rights policies and international commitments. This approach is linked to Matten and Crane's (2005) theory of the 'global corporate citizen', according to which corporations assume civic duties in the absence of effective state governance.

Compliance must also be intercultural: codes of conduct must be adapted to local norms and values, avoiding the imposition of external views. In this sense, the work of Geert Hofstede (2001) is crucial: understanding the cultural dimensions of power, communication and cooperation reduces strategic errors and improves negotiation.

In the Arctic, sustainability depends on the ability of public, private and indigenous actors to co-govern the territory. This model echoes Sen's (1999) idea of freedom as collective agency: development is only sustainable when decisions are shared and participatory. Cooperative governance involves moving from the discourse of 'social responsibility' to the practice of ethical co-responsibility. This includes indigenous participation in decision-making processes, co-financing of sustainable infrastructure and transparency in the distribution of benefits; the legitimacy of the Arctic's future will not be decided in international forums, but in the daily relationship between businesses and communities.

In contexts of high media and environmental exposure, ethical reputation is a survival asset. Porter and Kramer's (2011) theory of shared value states that the creation of economic value must be accompanied by the creation of social value. In the Arctic, this implies transparency of information, local cooperation and public accountability. Responsible businesses do not aim to operate with a 'permit', but with trust. Transparency, ethics and cultural respect are the new foundations of competitiveness in fragile territories. Contemporary justice requires balancing three principles—redistribution, recognition and representation—which, in the Arctic, translate into development, respect and inclusion.

5. Local governance and indigenous inclusion: key factors for business stability in the Arctic

The Arctic is not an empty territory or a frontier without history. It is home to communities that have inhabited, interpreted and governed the ice for millennia. The peoples who live in the region—such as the Inuit, Sámi, Chukchi, Athabaska, Aleuts and Nenets—not only possess ecological knowledge, but also legitimate political structures that shape the governance of the North. Business sustainability in the Arctic depends largely on companies' ability to recognise, integrate and cooperate with these institutions. Effective justice requires a combination of economic redistribution, cultural recognition and political representation. In the Arctic, this means that development must be participatory, intercultural and fair.

Economic, political and environmental transformations have had profound effects on the social and cultural structures of indigenous peoples. Among the most significant consequences are the loss of ancestral territories, forced displacement to urban centres, the migration of younger generations and the deterioration of the physical and mental health of communities (Inuit Circumpolar Council, 2020). These peoples maintain a close relationship—both spiritual and functional—with the natural environment. Their lifestyles, based on hunting, fishing, gathering, and the intergenerational transmission of traditional knowledge, depend directly on the stability of the Arctic ecosystem. Therefore, any significant alteration of the environment—such as ice retreat, changes in animal migration routes, or habitat contamination—poses a direct threat to the culture, livelihoods, and well-being of these communities.

Indigenous knowledge, known as Indigenous and Local Knowledge (ILK), is a key tool for climate risk management. Inuit observation systems, based on ice and wind patterns, enable environmental changes to be detected with a precision that complements modern science. The SmartICE project, developed in Canada, exemplifies how cooperation between science and traditional knowledge can improve maritime safety and reduce emissions. According to the International Work Group for Indigenous Affairs (IWGIA, 2024), such forms of collaboration show that 'sustainability can only be achieved through an alliance between local knowledge and technology'. From a business perspective, integrating indigenous knowledge is not merely an act of cultural courtesy, but rather a strategy of environmental intelligence. The experience of the

peoples of the North offers operational information on routes, seasons, wildlife and climatic conditions that no satellite database can replace.

However, the advancement of mining projects, military infrastructure and the expansion of maritime trade have contributed to the fragmentation of indigenous territories and the imposition of foreign ways of life, triggering processes of forced sedentarisation, loss of autonomy and cultural erosion. A worrying example is the progressive decline of Inuktitut, the indigenous language spoken by the Inuit in Canada, which is not only a vehicle of communication but also a structure of thought linked to the Arctic worldview. Its decline is accompanied by the disappearance of traditional rituals and customs, collective hunting practices and ways of transmitting ancestral knowledge. This not only weakens the cultural fabric but also deepens structural inequalities and reinforces dynamics of social marginalisation. Geographical isolation, reduced access to adequate basic services and the absence of intercultural public policies exacerbate these processes, affecting young people and the elderly, who have higher rates of depression, suicide and chronic diseases associated with the sudden change in traditional lifestyles (Hansen, 2016). Faced with this scenario, it will be necessary to adopt an approach that recognises the collective rights of indigenous peoples over their territories, cultures and ways of life, integrating them as central actors in policies on the future of the Arctic.

Despite the historical and contemporary challenges, they face, indigenous peoples have made significant advances in political representation and legal recognition. In the Canadian Arctic, for example, the creation of the territory of Nunavut in 1999 established a form of Inuit self-government, recognising territorial rights and decision-making capacity. In Scandinavia, the Sámi Parliaments in Norway, Sweden and Finland are consultative and representative bodies that influence language, cultural and territorial policies. These examples show that indigenous governance is not a utopia, but an expanding institutional reality.

At the international level, the indigenous peoples of the Arctic have gained formal representation, particularly in the Arctic Council, the main intergovernmental forum for regional cooperation. Within this structure, six indigenous organisations enjoy 'Permanent Participant' status, which gives them the right to participate in discussions on an equal footing with member states, although without voting rights. These include the Inuit Circumpolar Council, the Sami Council, RAIPON (Association of Indigenous Peoples of the North, Siberia and the Far East of Russia) and other key representatives. This institutionalised presence constitutes an unprecedented recognition of the fundamental role of indigenous communities in shaping regional policies on the environment, sustainable development, culture and security.

Although implementation is still uneven and faces structural resistance, these advances represent significant steps towards more inclusive, intercultural and equitable Arctic governance. These institutional models have been reinforced by international h l instruments that consolidate legal protection and recognition of collective rights. United Nations (2007) provides a fundamental regulatory framework, establishing the right to self-determination, control over territories and the maintenance of their own political, legal, social and cultural institutions. Similarly, Convention No. 169 of the International Labour Organisation (ILO) on Indigenous and Tribal Peoples, 1989 (Office of the United Nations High Commissioner for Human Rights, 1989), one of the most important legally binding instruments in this area, establishes the obligation of States to consult indigenous peoples whenever legislative or administrative measures that may directly affect them are envisaged. The Convention also guarantees rights to ancestral lands, work, health, education and the protection of traditional institutions.

For businesses, this represents a radical change: local actors are no longer 'beneficiaries' of economic activities, but political partners. This idea is in line with the theory of the 'global civic enterprise' proposed by Matten and Crane (2005), according to which corporations must take on a civic role and respect the democratic structures of the contexts in which they operate. In practice, this implies that corporate decisions must include processes of free, prior and informed

consultation (FPIC), as well as the inclusion of indigenous representatives in environmental and social governance mechanisms.

The principle of inclusion cannot be separated from that of distributive justice. As Sen (1999) warns, real development is measured by the capabilities that expand people's freedom. It follows that indigenous participation in business projects must be accompanied by tangible benefits: employment, education, health and infrastructure. Impact Benefit Agreements (IBAs) in Canada are examples of good practice, as they guarantee local participation in revenues and decision-making processes. This model translates Carroll's CSR into concrete redistribution policies. Conversely, when companies impose projects without consent or without fair distribution, people respond with civil resistance or international boycotts. In the Arctic—where reputation is as important as profitability—inclusion ceases to be an ethical gesture and becomes a tool for political and corporate stability.

Companies that succeed in intercultural territories develop what Hofstede (2001) defines as institutionalised cultural competence: the ability to recognise symbolic hierarchies and communication norms. In practice, this means establishing cultural liaison teams, adapting negotiation strategies and respecting the timings and protocols of local communities. Cultural diplomacy, applied to the corporate sphere, allows the company to position itself as a player in cooperation rather than as an external agent. In this way, dialogue becomes a tool for risk mitigation and trust building.

6. Intercultural skills and risk analysis: keys to the future of business in the Arctic

The future of the Arctic will require not only advanced technology, but also cultural intelligence and geopolitical foresight. Intercultural skills are the set of cognitive, affective and behavioural abilities necessary to interact effectively with different cultures. According to Hofstede (2001), sensitivity to local values determines the success or failure of cooperation. Companies that intend to operate sustainably will need to build teams capable of interpreting cultural contexts, managing political risks and making ethically informed decisions. These skills will enable companies to understand how international changes affect their operations. According to Agnew (2009), global power is no longer exercised solely by states, but also by economic actors who 'territorialise their strategies'. In the Arctic, this territorialisation requires ethical sensitivity: a company lacking geopolitical prudence can become hostage to tensions between powers. Developing such intelligence involves integrating political analysis, corporate diplomacy and local knowledge. This multidimensional view is associated with Porter and Kramer's (2011) approach to shared value, according to which sustainable competitiveness emerges when the company contributes to social well-being.

In the Arctic, where corporate decisions affect millennia-old ways of life, cultural empathy is not optional. Understanding traditional calendars, subsistence practices and community authority structures prevents conflicts and strengthens shared governance. The development of such skills must be incorporated into corporate training programmes: workshops on intercultural dialogue, alliances with Arctic universities and exchange programmes with community leaders. Geopolitical and cultural risk management therefore requires an ethic of knowledge. Global justice demands transparency in the production and use of information; in the corporate sphere, this means sharing environmental data, recognising indigenous authorship and accounting for impactful decisions. Businesses must become learning organisations, capable of adapting through critical reflection and the inclusion of different perspectives. This ethical learning strengthens reputation and builds trust in markets and communities.

The Arctic of the future will be a space where business survival will depend on cooperation. Intercultural governance, respect for human rights and economic diplomacy are not abstract ideals, but strategies for resilience. The balance between power and responsibility will be the

determining factor in the Arctic's future; in this sense, businesses must see themselves as co-responsible actors in a global sustainability project.

7. Conclusions

The Arctic has become an emblematic reflection of 21st-century tensions: the progressive melting of ice, the opening of new trade routes, pressure on ecosystems and the need for intercultural skills outline a scenario in which climatic, economic and social challenges are intertwined. This work has shown that sustainability in the North does not depend exclusively on technological progress or the volume of investment, but—above all—on political intelligence, cultural sensitivity and shared responsibility among the actors involved.

Companies operating, or intending to operate, in this region must understand that geopolitical risk management is not a peripheral function, but the core of any sustainable strategy. In the new global paradigm, competitiveness will be measured by the ability to simultaneously generate economic and social value, in harmony with local contexts and fragile ecosystems.

In this context, intercultural skills should not be seen as a complement, but as a fundamental condition for any development initiative. Far from being an obstacle, the indigenous communities of the Arctic are strategic allies, with deep knowledge of the territory, socio-cultural legitimacy and invaluable experience in climate adaptation and sustainability. Integrating them is not only a matter of justice, but also of effectiveness.

Corporate responsibility must therefore evolve towards a form of ethical diplomacy: companies that are able to balance power and prudence will not only ensure their own economic sustainability, but will also actively contribute to regional stability and, ultimately, global peace.

The following recommendations emerge from the analysis:

- Integrate geopolitical analysis into corporate strategic planning, especially in highly sensitive regions such as the Arctic.
- Strengthen ethical and intercultural compliance by incorporating principles of justice, equity and recognition of collective rights.
- Promote tripartite alliances (state-business-community) that favour shared governance models, with joint responsibility and ongoing dialogue.
- Integrate indigenous knowledge into environmental management, logistics and territorial planning processes.
- Promote intercultural education within organisations, from senior management to operational levels.
- Adopt information transparency as an operating principle and tool for social legitimacy.

In short, the Arctic is shaping up to be the great moral laboratory of contemporary capitalism. Companies that act with strategic intelligence, sound ethics and human sensitivity will not only prosper, but also build the conditions for lasting success.

The Polar Silk Road and international governance of the Arctic: geopolitics, indigenous participation and intercultural skills

Francesco Maria Autolino[1], Forster Ampadu[2], Luisa Fernanda Rodríguez Hevia[3]

1. Introduction

The Arctic has ceased to be a remote space and has become a crucial hub in the international system. The accelerated retreat of the ice cap has opened up navigation possibilities that seemed impracticable just three decades ago. This physical transformation has triggered far-reaching political and economic change. In a context marked by rivalry between powers—both Arctic and non-Arctic states—the region has become a laboratory where strategic interests, natural resources, commercial expectations and indigenous communities with a millennial presence converge.

Against this rapidly evolving backdrop, the Polar Silk Road, the Arctic dimension of China's Belt and Road Initiative (BRI) (World Economic Forum, 2023), is emerging. Since the publication of its Arctic Policy Strategy in 2018, Beijing has reinforced its intention to participate in the development of new northern sea routes, as well as energy and scientific projects (State Council of the People's Republic of China, 2018). The seasonal decline in ice has given rise to potential corridors such as the Northeast Passage, controlled by Russia, and the Central Arctic Route, access to which will depend on the evolution of international law and multilateral cooperation. The Chinese vision presents these routes as shorter alternatives between Asia and Europe, with the potential to reduce time, costs and dependence on traditional bottlenecks such as the Suez Canal (Lassere & Faury, 2020).

However, these logistical opportunities are linked to a tense political context. Russia, which has the world's longest Arctic coastline, has established itself as China's privileged partner in the region. Energy and maritime cooperation between the two countries has intensified since Western sanctions were imposed on Moscow in 2014 (Alexeeva , et al,m 2018)) and, more forcefully, since 2022. Cooperation around the Polar Silk Road is not only driven by economic reasons, but also as a response to an international order that both powers perceive as dominated by the West. For Moscow, China has become a key partner in supporting the Yamal projects and keeping the Arctic corridor active. For Beijing, Russia offers political access, port infrastructure and nuclear icebreakers that facilitate entry into an environment to which it does not belong geographically.

At the same time, the Arctic has gained renewed geopolitical importance. The United States, Canada, the Nordic countries and NATO are watching with concern the reversal of the cooperative dynamics that had characterised the Arctic Council for two decades. The deterioration of relations with Russia has paralysed part of the regional governance mechanisms, while military presence and competition for scientific and technological access are increasing. According to

[3] Professor, ECON07/A, Alfonso X el Sabio University; lfrhevia@uax.es

(Rahbek-Clemmensen & Thomasen, 2020), the region symbolises the transition from an order based on cooperation to one driven by strategic mistrust .

However, the Arctic is not just a place of rivalry between major powers. It is also a territory inhabited by indigenous groups who have their own systems of knowledge, governance structures and ways of relating to the environment that predate the presence of modern states. From this perspective, any discussion of trade routes, resources or infrastructure must incorporate an intercultural and ethical perspective. The effective participation of indigenous peoples in decision-making processes must be a requirement, but also a practical necessity to ensure sustainability and legitimacy. Documents such as the Circumpolar Inuit Protocols for Equitable and Ethical Engagement (Inuit Circumpolar Council, 2022) and the Ethical Guidelines for Research Involving the Sámi People in Finland (University of Oulu, 2024) establish clear principles of consultation, consent, recognition of Indigenous Knowledge and respectful cooperation. Their relevance is central to any actor aspiring to operate in the region, including Chinese, European and multinational companies.

This chapter is part of an effort to understand the relationship between geopolitical transformations in the Arctic and the intercultural skills necessary for responsible governance. The overall objective is to analyse the Polar Silk Road as a key element of China's advance in the Arctic and, at the same time, to highlight the importance of integrating indigenous peoples into decision-making processes that affect their territories.

From an interdisciplinary perspective, the chapter articulates two complementary dimensions: on the one hand, the strategic logic that has driven China to become involved in the region; on the other, the fundamental role of cultural intelligence in the interaction between businesses, governments and local communities . The central premise is that there can be no sustainable development in the Arctic if decisions are taken without the full participation of its ancestral inhabitants. Understanding indigenous values, norms, hierarchies, expectations and ways of life should not be considered a cultural addition, but rather a structural condition for avoiding conflicts, planning errors and irreversible environmental and social damage.

In this sense, the chapter offers a critical reading that connects geopolitics, trade and ethics. The Polar Silk Road cannot be interpreted solely as a logistical project, just as intercultural skills cannot be reduced to mere 'soft skills'. The Arctic is evolving into a space where global and local decisions intertwine, and where businesses and states must learn to operate in complex multicultural contexts.

2. The Polar Silk Road

The Polar Silk Road is the Arctic dimension of the Belt and Road Initiative (World Economic Forum, 2023), launched by China in 2013 with the aim of strengthening global connectivity through land and sea corridors. The inclusion of the Arctic in this strategy represents a significant change in the economic and geopolitical architecture promoted by Beijing. As indicated, since the Chinese government defined its Arctic policy in 2018, the country has sought to position itself as a central player in the exploitation of new maritime routes emerging due to seasonal ice melt, as well as in the development of infrastructure and energy projects in the region.

The Chinese vision is based on a strategic premise: the Arctic offers shorter routes between Asia and Europe. Shipping between Shanghai and Rotterdam can be reduced by about 30% by using the Northeast Passage along the Russian coast (Lasserre & Faury, 2020). This means shorter transit times, lower fuel costs and reduced congestion in traditional corridors such as the Suez Canal. Furthermore, volatility in the Middle East and risks to shipping in the Red Sea have increased global interest in polar alternatives. For Beijing, a country heavily dependent on maritime trade, diversifying routes strengthens economic security and mitigates vulnerability to geostrategic bottlenecks.

The Polar Silk Road is mainly based on cooperation with Russia, which exercises legal and military control over the Northern Sea Route (NSR).

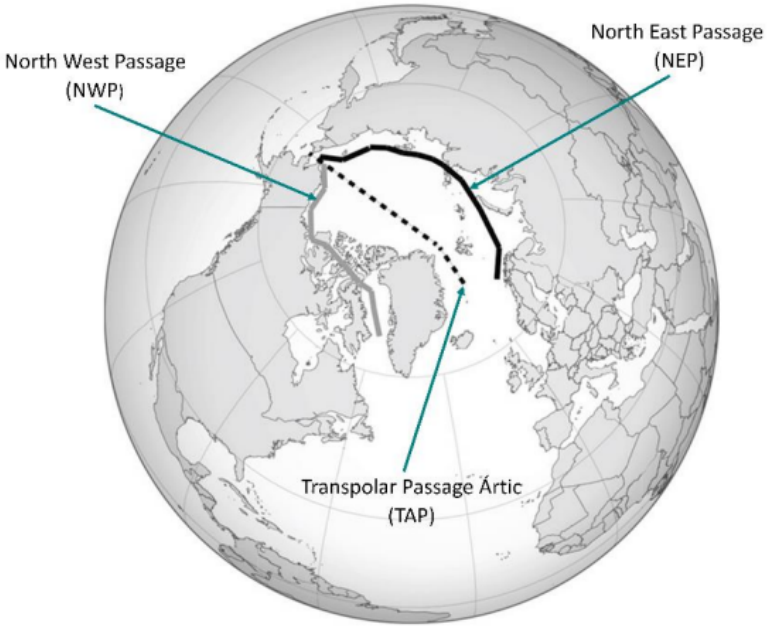

Figure 1. Arctic Marine Shipping Assessment (AMSA): Updated Recommendations (2021)

This collaboration is not only driven by logistical objectives, but also by political and energy interests. Russia has the longest Arctic coastline and a port infrastructure that, although limited, far exceeds that of other circumpolar states. Following Western sanctions imposed on Moscow, China has emerged as the most important financial, technological and commercial partner for Russian projects.

One of the most emblematic cases is Yamal LNG, located on the Yamal Peninsula. The project, led by PAO Novatek—Russia's largest natural gas producer—involves Chinese participation through the Silk Road Fund and the China National Petroleum Corporation (CNPC). In addition, the state-owned company COSCO Shipping has been instrumental in opening summer routes through the NSR, consolidating a trade flow that seemed unlikely a decade ago. China has also invested in icebreaker fleets and polar scientific capabilities, notably with the Xue Long 2, the first domestically built icebreaker. These investments pursue a dual objective: to ensure a Chinese presence in the Arctic and to improve operational capabilities in coastal areas subject to extreme conditions.

Figure 2. Xue Long 2, China's first domestically built icebreaker. Source: Cruise Mapper (2022)

The shared Sino-Russian vision for the Arctic is part of what (Alexeeva, et. al., 2018) call a 'strategy of geo-economic resilience'. In this logic, the Polar Silk Road compensates for restrictions on traditional routes and allows for the projection of influence in a space where the United States and the European Union have historically been dominant. Nevertheless, this collaboration operates in a delicate balance. China maintains global interests that require a certain stability in relations with the West, while Russia seeks economic support without relinquishing control over its Arctic areas. Cooperation is advancing, but Moscow retains a sovereigntist approach that limits Beijing's operational autonomy.

From a legal perspective, the Northeast Passage integrated into the Polar Silk Road is heavily regulated by Russia. The country requires transit permits, fees for icebreaker escort and strict navigation supervision. This regulatory framework is consistent with the broad interpretation of Article 234 of the United Nations Convention on the Law of the Sea, relating to the protection of the environment in ice-covered areas. For international companies, this regime generates additional costs and direct dependence on the Kremlin's decisions (Byers, 2019).

Outside the Sino-Russian axis, the vision of the Polar Silk Road extends to areas such as infrastructure, scientific research and sustainable development. The Chinese government, through its Arctic strategy, has insisted that its presence in the Arctic is 'peaceful, cooperative and respectful of the international order (State Council of the People’s Republic of China, 2018). Beijing has strengthened ties with the Nordic countries through investments in ports, scientific projects and research stations.

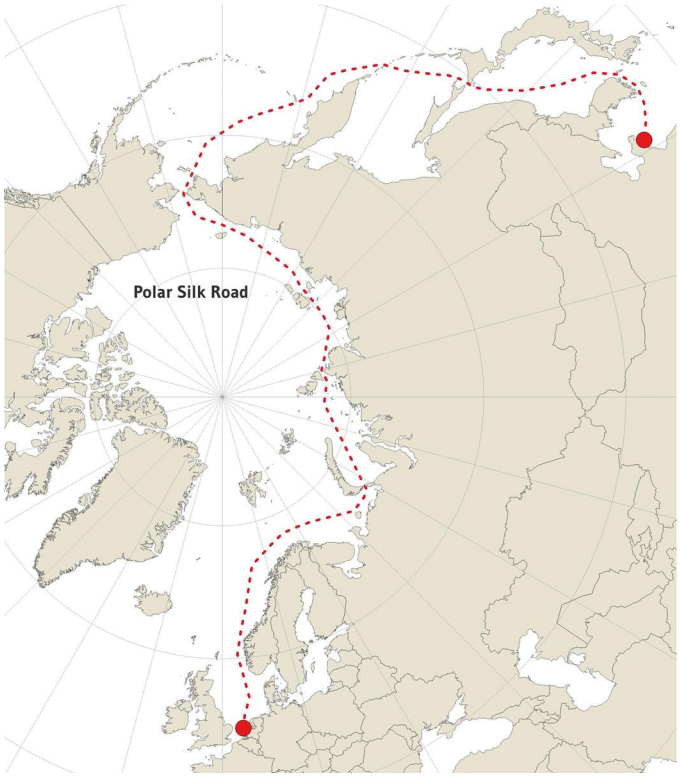

Figure 3. Polar Silk Road. Source: Arctic Centre, University of Lapland

In addition to the political dimension, there is also an environmental aspect. The feasibility of the Polar Silk Road depends on the evolution of ice melt: although the summer period extends the navigation window, conditions remain unpredictable. The risk of sudden ice formation, the lack of ports of refuge and the absence of SAR (Search and Rescue) infrastructure over long stretches of the Arctic pose significant challenges. This vulnerability requires public and private actors to integrate climate risk analysis into their decisions. In addition, increased traffic could amplify environmental impacts such as noise pollution, the risk of spills, or the alteration of marine mammal migration routes (Arctic Monitoring and Assessment Programme, 2021).

Therefore, the Polar Silk Road must be understood within the broader context of global governance in crisis. The international order is undergoing a process of fragmentation, in which supply chains seek resilience and powers reconfigure their alliances. The Arctic dimension of the BRI is a long-term strategic gamble that combines economic, energy, scientific and geopolitical interests. However, its implementation requires a delicate balance: China must project power without triggering disproportionate reactions; Russia seeks capital without ceding sovereignty; and Arctic and non-Arctic states attempt to preserve a stable and sustainable system of governance.

3. China’s geopolitical role in the Arctic

China's presence in the Arctic is one of the most significant geopolitical developments of the last two decades. Although it has no territory in the region, the country has managed to establish itself as an influential player through a combination of diplomacy, science, strategic investment and bilateral cooperation. In its Arctic policy strategy, the State Council of the People’s Republic of China (2018) defines itself as an Arctic-state, a formulation that reflects its intention to actively participate in shaping the future governance of a space that has become central to international trade, energy and security. This self-definition is a political gesture aimed at legitimising its

involvement in an environment traditionally controlled by the eight member states of the Arctic Council.

From a strategic perspective, China's focus on the Arctic responds to four main motivations: the opening of shorter sea routes to Europe; access to critical natural resources; strengthening its status as a scientific and technological power; and diversifying its national security architecture. The reduction in summer ice opens up opportunities for maritime transport, but also for the exploitation of hydrocarbons, minerals and fish resources, all of which are essential for the global economy and for the energy transition that China intends to lead.

In this geostrategic context, relations with Russia take on fundamental importance. Moscow, which controls most of the navigable Arctic coastline, is an indispensable partner for any country wishing to operate along the Northeast Passage. Energy cooperation at Yamal LNG and the large-scale liquified natural gas (LNG) project located on the Yamal Peninsula, Russia, participation in port infrastructure and growing commercial interdependence following European and North American sanctions have strengthened a relationship that, while pragmatic, has profound geopolitical implications. Russia brings experience, military infrastructure and territorial control, while China offers financing, technology and a stable market for Russian energy exports. This convergence of interests represents an axis of strategic convenience rather than an ideological alliance; however, its effects on the regional balance cannot be underestimated.

Despite this cooperation, China must act cautiously so as not to trigger mistrust among the Western Arctic states. Its growing presence has raised concerns about possible latent geopolitical ambitions. (Sørensen & Klimenko, 2018), in Emerging Chinese–Nordic Arctic relations, note that China's economic expansion could translate into disproportionate political influence, especially in vulnerable areas such as Greenland, where Beijing has attempted to invest in airports, mining and other strategically important infrastructure. Denmark, the United States and NATO have responded by tightening control over projects involving Chinese companies in Arctic territories, particularly those with military security implications. This vigilance has increased since 2019, when Washington made it a priority to prevent China from acquiring critical assets in Greenland.

At the same time, the United States has adopted a more assertive stance towards Chinese activity in the Arctic, linking it to the global rivalry between the two powers. The US Department of Defence's (2024) Report on Arctic identifies the region as an area where China is attempting to extend its influence through economic, scientific and diplomatic means. China's presence in polar research, for example, has gone from being considered scientific cooperation to being interpreted as a potential vehicle for strategic projection. The establishment of observation stations, participation in scientific expeditions and the expansion of icebreaker fleets are being watched with increasing attention, as they could have dual applications. At the same time, China argues that its scientific interest is legitimate and necessary to understand the global effects of climate change, a phenomenon that affects both the Arctic and ecosystems and societies in more southern latitudes.

Strategic tension around the Arctic is amplified by the deterioration of relations between Russia and the West. The partial suspension of the Arctic Council's operations after Russia's invasion of Ukraine in 2022 has weakened one of the main pillars of regional cooperative governance. In this vacuum, China has sought to project itself as a player willing to maintain scientific and economic cooperation, thereby reinforcing its narrative of responsible power. However, its proximity to Moscow raises doubts about its ability to act as a neutral intermediary.

Another key element of China's geopolitical role in the Arctic concerns its economic strategy. The inclusion of the Polar Silk Road in the BRI responds to a logic of diversification: China is seeking new trade routes that reduce its dependence on the Strait of Malacca and the Suez Canal, two vulnerable points in its global logistics architecture. At the same time, Chinese investments in Arctic mining and energy aim to secure the supply of strategic minerals needed for technological transition, including nickel, rare earths and cobalt. The combination of climate

risks, economic opportunities and political tensions transforms the Arctic into a space where economic decisions take on an immediate geopolitical character.

Finally, China also uses scientific diplomacy as a tool of influence. Polar research is one area where the country is attempting to project an image of itself as a constructive actor. The China–Iceland Arctic Science Observatory and participation in the global Arctic observation programme are examples of efforts to join international scientific cooperation networks (Bertelsen & Gallucci, 2016). While this 'soft' diplomacy helps to strengthen China's global reputation, it also allows it to expand its knowledge of the Arctic environment, improve its management capabilities in extreme conditions and support a narrative of 'legitimate participation'. Beijing believes that the Arctic will become a key space for the global economy of the future and for the reconfiguration of the international order. However, its progress is conditioned by factors beyond its direct control: rivalry between major powers, the fragility of the Arctic governance regime, and the growing need to integrate indigenous peoples as essential actors in any project aspiring to sustainability.

4. The importance of promoting intercultural skills in the Arctic

The Arctic is not only a geographical and geopolitical space, but also a complex socio-cultural fabric in which indigenous peoples with different values, languages, knowledge systems and community structures coexist. Inuit, Sámi, Chukchi, Nenets, Yupik and other communities make up a region characterised by deep historical continuity and ways of life that are intimately connected to the natural environment.

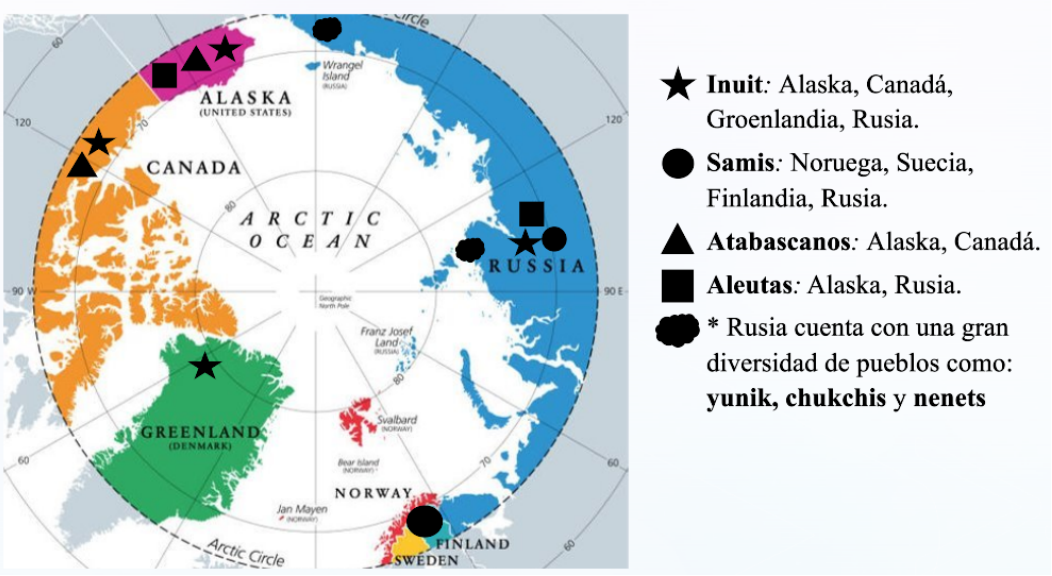

Figure 4. Indigenous communities in the Arctic

In this context, intercultural skills are not just a set of desirable professional abilities, but a structural requirement for ensuring respectful relationships, sustainable operations and legitimate decision-making processes. For international companies, governments and multilateral organisations, working in the Arctic involves interacting with knowledge systems that differ from Western ones and, above all, recognising the legitimate authority that indigenous peoples exercise over their territories, ways of life and development priorities (Inuit Circumpolar Council, 2022).

From an academic perspective, according to Deardorff (2006), intercultural competencies can be defined as cognitive, emotional and behavioural skills that enable a person to interact effectively and respectfully with individuals from different cultures. In the Arctic, these skills

take on a specific meaning, as cultural differences are not accidental but structural. Unlike multicultural urban contexts, relations with indigenous peoples in the Arctic involve recognition of their own legal systems, traditional forms of leadership, community values centred on reciprocity, and strategies for relating to the environment based on generations of observation and practice. Deardorff's model of intercultural competence proposes a combination of attitudes (respect, openness, curiosity), knowledge (deep understanding of the cultures involved) and skills (communication, active listening, adaptation). This approach conceives intercultural competence as a cyclical and dynamic process, particularly useful in contexts where relationships must be built with time, trust and continuous dialogue. Furthermore, (Earley & Ang, 2003)'s notion of cultural intelligence (CQ) offers a complementary understanding: the ability to interpret cultural behaviours and adjust one's actions according to the context. CQ includes cognitive, motivational and behavioural dimensions that enable organisations to navigate complex situations with cultural sensitivity.

Hall's (1976) classic approach to high- and low-context cultures offers further interpretative tools. Many indigenous Arctic cultures can be considered high context, where communication is based on implicit elements, silence, observation and reading the environment. In contrast, many international companies operate in low-context communication frameworks, which are more direct and explicit. This difference can lead to misunderstandings if not addressed with adequate training (Hall, 1976). The research of Triandis (1995) and Hofstede (2001) on individualism, collectivism and power distance is also relevant. Indigenous Arctic societies tend to favour consensus and community cohesion over individual interests . Decision-making processes are based on extensive consultation and the search for balance with the environment. For companies accustomed to hierarchical dynamics, accelerated timelines and linear planning, such practices may appear slow, even though they respond to forms of governance that have ensured community survival and well-being for centuries.

The convergence of these interdisciplinary theories allows us to understand why intercultural skills are essential in the Arctic. By way of example, it should be remembered that a significant part of the main regional economic activities cross indigenous territories: mining projects, port infrastructure, scientific stations, shipping routes and maritime expeditions. All these activities affect resources such as traditional hunting, animal migration routes and the cultural integrity of communities that depend on the environment for food security and identity continuity. For this reason, any project that ignores the intercultural dimension risks failure, generating conflict or being perceived as a contemporary form of colonialism (Wilson & Stammler, 2016).

Recent years have seen numerous examples of companies and governments making mistakes due to a lack of cultural sensitivity. Gaps in consultation processes, ignorance of Indigenous Knowledge, underestimation of community leaders or failure to recognise territorial rights have led to tensions that compromise the feasibility of projects. Conversely, initiatives that have genuinely integrated Indigenous peoples have demonstrated greater stability and lower reputational risks. The co-production of knowledge between scientific knowledge and forms of indigenous knowledge, as recommended by the Inuit Circumpolar Council Protocols (2022), is one of the most relevant practices in this area. This methodology not only combines scientific data and traditional knowledge accumulated over generations, but also recognises the epistemic legitimacy of both systems, promoting more integrated and sustainable decisions.

In this perspective, international organisations such as the United Nations, the International Labour Organisation and the Arctic Council emphasise the need to ensure prior, free and informed consultation processes, as established by the United Nations Declaration on the Rights of Indigenous Peoples (United Nations, 2007). These regulatory frameworks have promoted a gradual transformation in the way businesses and states approach indigenous peoples. Beyond mere legal compliance, the development of intercultural competence requires open-mindedness, institutional humility and a willingness to redistribute power in decision-making processes.

Therefore, cultural intelligence should not be understood as a one-way tool aimed exclusively at non-indigenous businesses or governments. It also requires recognising that local communities have the capacity to adapt to different external actors and to build forms of cooperation based on reciprocity and respect. Intercultural interaction in the Arctic is, therefore, a two-way process in which both parties contribute to the creation of more inclusive governance frameworks. This process must be based on intercultural skills that build trust, on cooperation supported by culturally sensitive communication, on corporate and economic relations, and on the influence of international public opinion.

This approach is particularly relevant for understanding the dynamics between China and the indigenous peoples of the Arctic. As Beijing increases its economic, energy and scientific presence, it becomes essential to build deep intercultural relationships. Chinese companies tend to operate in cultural contexts characterised by hierarchical structures and collective values, which can facilitate certain aspects of working with indigenous communities, but can also generate tensions if consultation is interpreted as a mere administrative formality. Intercultural dialogue requires real commitment, adequate time and a willingness to integrate different perspectives into the design and implementation of initiatives.

Intercultural skills are therefore an essential pillar of contemporary Arctic governance. Their relevance transcends effective communication: they are part of a broader ethical framework aimed at ensuring respect, sustainability, reciprocity and justice. The socio-cultural complexity of the region requires that every external actor develop a deep understanding of local dynamics, recognising that the survival and prosperity of indigenous communities are intimately linked to ecological balance and political self-determination.

4.1. Indigenous frameworks for legitimate Arctic governance

The integration of indigenous peoples into decision-making processes is a fundamental element in ensuring legitimate and sustainable governance of the Arctic. Beyond institutional rhetoric, indigenous participation requires real mechanisms for consultation, consensus, recognition of Indigenous Knowledge and equitable distribution of power. The United Nations Declaration on the Rights of Indigenous Peoples establishes clear principles in this regard, in particular the right to free, prior and informed consent (FPIC), an international standard that requires states, companies and organisations to ensure transparent and respectful processes before undertaking any activity that directly affects indigenous peoples or their territories.

The importance of this principle is reflected in the practices derived from protocols and guidelines published by indigenous communities and peoples in the Arctic. These include the Ethical Guidelines for Research Involving the Sámi People in Finland (2024) and the Circumpolar Inuit Protocols for Equitable and Ethical Engagement (2022), whose communities are represented in the Arctic Council by the Saami Council and the Inuit Circumpolar Council.

The Ethical Guidelines for Research Involving the Sámi People in Finland, published by the University of Oulu, are the first interdisciplinary guidelines specifically for research with the Sámi people in Finland. They were developed after several years of joint work between the Sámi Parliament, Finnish universities and Sámi communities, and apply to any discipline that investigates Sámi people, communities, territory or society in Finland. The guidelines also state that they can be used throughout Sápmi. Their main objective is to create culturally safe research environments, recognising Sámi self-determination, the collective nature of knowledge, the centrality of Sámi languages and the need to obtain free, prior and informed consent that is not merely formal. They emphasise shared responsibility throughout the entire research cycle (co-design, data collection, interpretation and dissemination), the return of results to communities in useful formats, and responsible governance of data and materials in order to avoid the misappropriation of indigenous knowledge.

Figure 5. Sámi indigenous community. Source: Artic Portal (2024)

The Circumpolar Inuit Protocols for Equitable and Ethical Engagement, developed by the Inuit Circumpolar Council, offer one of the most robust frameworks for operating ethically in the Arctic. Protocol 1, 'Nothing About Us Without Us', stipulates that no research, economic project or public decision can be developed without the active participation of the Inuit; this implies sharing decision-making processes from the earliest stages and recognising communities as political actors with veto power. Indigenous Knowledge occupies a central position: it is understood as a complete epistemic system, based on multigenerational observations of ecosystems, climate and animal life, which must be recognised as such and not automatically subordinated to Western science. From this perspective, the Arctic can only be understood holistically, considering the interdependencies between ice, wildlife, food security and hunting practices, which makes such knowledge an indispensable input for integrated decisions.

The protocols also develop concrete principles of good governance and relations with Inuit communities. Protocol 3, 'Practice Good Governance', requires transparency, accountability and meaningful participation in all phases of projects, obliging companies and external actors—including Chinese companies interested in energy investments or logisti s—to adapt hierarchical models to contexts where community consensus is essential. Protocol 4, 'Communicate with Intent', emphasises the importance of clear, continuous and culturally relevant intercultural communication, while Protocol 5 insists on accountability through consistent actions and tangible benefits. Protocol 6 calls for lasting, non-transactional partnerships with power and benefit sharing; Protocols 7 and 8 address community control of data and adequate funding to ensure truly equitable indigenous participation, avoiding extractive practices in both Arctic research and governance.

The Ethical Guidelines for Research Involving the Sámi People in Finland and the Circumpolar Inuit Protocols for Equitable and Ethical Engagement share a common basis: they recognise indigenous peoples as political subjects with the right to self-determination and control

over how knowledge about them is produced. Both documents insist on early community participation, assessment of benefits and risks, respect for indigenous knowledge, and the obligation to return results in useful forms. In both cases, the guidelines are developed through lengthy co-design processes with indigenous communities and academics and aim at 'culturally safe' working environments, where Indigenous Knowledge is recognised as a valid system in its own right, not simply as a complement to Western science.

Taken together, these principles provide a solid framework for understanding decision-making processes in the Arctic. This is not just a matter of cultural aspects, but of justice, self-determination and democratic governance in a territory whose ancestral inhabitants have historically been marginalised. In the era of the Polar Silk Road, in which extra-regional actors are seeking to expand their presence, the full adoption of these protocols and guidelines is essential to avoid past mistakes and build a sustainable future for all the peoples of the Arctic.

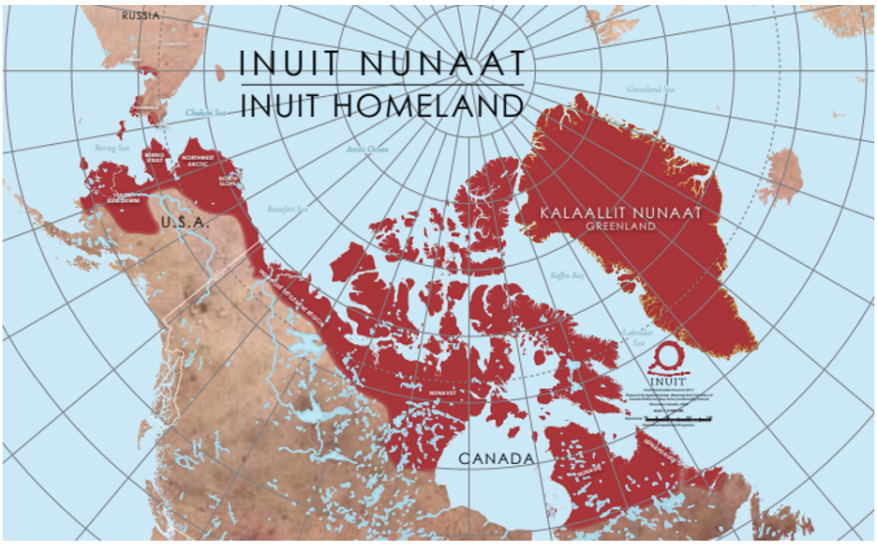

Figure 6. Map of Inuit Nunaat. Source: Inuit Circumpolar Council (2022)

4.2. Intercultural skills for inclusive governance

Intercultural skills, as analysed above, enable external actors to interact with the indigenous peoples of the Arctic in a respectful and effective manner. In the context of governance, these skills take on political significance as they aim to build institutions capable of fairly integrating indigenous voices into regulatory, negotiation and planning processes. Contemporary Arctic institutions, such as the Arctic Council, have recognised since the 1990s that indigenous participation cannot be symbolic. The status of Permanent Participants, granted to organisations such as the Inuit Circumpolar Council or the Saami Council, reflects this commitment, although gaps remain that require attention.

In this context, the framework of the 'Six Intercultural Competencies' is useful in helping to define more precisely the skills needed to move towards inclusive governance:

- Historical and political literacy
- Epistemic humility and plural integration of knowledge
- Relational responsibility and long-term commitment
- Communicative and linguistic adaptability
- Co-management and design of shared governance models
- Recognition and implementation of indigenous autonomy

Historical and political literacy is an essential starting point. Any actor operating in the Arctic must understand the processes of colonisation, territorial disputes, overlapping legal frameworks and the specific trajectories of each indigenous people. Without this understanding, even proposals presented as innovative risk reproducing colonial logic.

Epistemic humility and the plural integration of knowledge require recognition that Indigenous Knowledge is a complete system of knowledge, with its own methods and temporalities. Its incorporation cannot be reduced to a symbolic gesture. It is fundamental in a context where melting ice and climate change are altering ice patterns, wildlife routes and socio-ecological dynamics—processes that communities know first-hand.

Relational responsibility and long-term commitment remind us that participation is not achieved through one-off consultations. Communities value continuous presence, trust-building and reciprocity. This implies accompanying processes before, during and after decisions are made, taking responsibility for the effects of the measures adopted.

Communicative and linguistic adaptability requires adapting communication methods to local rhythms and realities. Legitimacy within communities is held not only by formal leaders, but also by elders, experienced hunters, older women and knowledge keepers. Furthermore, meetings must be organised according to climatic cycles, hunting seasons and family dynamics, and not on the basis of external calendars that rarely fit in with everyday life in the Arctic.

Co-management and the design of shared governance models transfer these skills to the institutional and organisational level. States and international bodies need regulatory frameworks that recognise indigenous rights, priorities and forms of knowledge. Free, prior and informed consent (FPIC) must be a non-negotiable principle for any economic, scientific or infrastructure initiative. At the same time, companies must review their internal structures, form intercultural teams, include indigenous advisors and adapt their communication methods. The tensions that Chinese, European and North American companies frequently encounter in the Arctic highlight the limitations of conventional corporate approaches when they are not adapted to local decision-making systems.

Recognising and implementing indigenous autonomy means moving towards real forms of self-government. This means guaranteeing territorial rights, ensuring binding participation in state institutions and incorporating Indigenous Knowledge into strategic decisions. Some Nordic countries have made progress, but significant gaps remain. In Canada and the United States, relations between federal governments and indigenous peoples remain marked by historical and administrative inequalities that require sustained reconciliation processes.

The application of these six competencies is necessary at the institutional, organisational and community levels. At the institutional level, they guide the development of regulatory frameworks that avoid the reproduction of colonial inequalities. At the organisational level, they help transform corporate and scientific practices to align them with principles of respect, co-management and relational accountability. At the community level, they strengthen direct interaction between external actors and indigenous peoples, recognising diverse leadership and respecting local rhythms.

A particular challenge arises with China's growing presence in commercial and scientific activities in the Arctic. Although its diplomacy presents itself as cooperative, Chinese state-owned enterprises often operate with hierarchical structures and limited participation processes, which can generate friction with the principles of Arctic community governance. In this context, intercultural skills serve as a tool for harmonising economic interests and local values. Similarly, Arctic states need to strengthen their own intercultural capacity: advances in self-government in some Nordic countries do not eliminate persistent gaps in land rights, representation and recognition of Indigenous Knowledge in decision-making processes.

Inclusive governance is, ultimately, an evolving process. There are no universal solutions for all Arctic regions, as each community has its own history and priorities. Intercultural skills should not be understood as a list of technical abilities, but rather as a way of working that combines

sensitivity, ethics and continuous learning. At a time when the Polar Silk Road is gaining relevance in the region, such skills are no longer a complement: they are becoming a prerequisite for ensuring sustainability, legitimacy and equity.

5. Conclusions

The Arctic is going through a decisive phase in which global transformations and deeply interconnected local processes are converging. The gradual opening of maritime routes increased geopolitical competition between major powers and the intensification of energy, scientific and logistical projects have transformed the region into a central arena of international politics. In this scenario, the Polar Silk Road emerges as one of the most significant developments of the 21st century: it represents both a strategic gamble by China to diversify trade routes and secure energy resources, and a reflection of the new multipolar order taking shape.

However, the future of the Arctic will not depend solely on the geo-economic interests of China, Russia, the United States or the Nordic countries. It will depend above all on the collective ability to establish governance that recognises the legitimacy and centrality of indigenous peoples, the true ancestral inhabitants of the region. Such governance must be ethical, inclusive and respectful of international law, in particular the frameworks established by the United Nations Declaration on the Rights of Indigenous Peoples and essential documents such as the Circumpolar Inuit Protocols for Equitable and Ethical Engagement.

Research shows that maritime routes, energy projects and scientific cooperation cannot be separated from the cultural, social and spiritual dimensions that define life in the Arctic. Indigenous knowledge is not a complement to science, but a comprehensive knowledge system that provides an understanding of the interrelationships between climate, animals, ecosystems and human well-being. Its integration into decision-making processes improves the quality of assessments, reduces risks and contributes to long-term sustainability.

From this perspective, intercultural skills should not be seen as ancillary abilities, but as structural elements of any project that aspires to operate in the contemporary Arctic. International companies must assume that trust, transparency and communication adapted to the cultural context are indispensable requirements. Inclusive governance means abandoning extractive or vertical approaches and moving towards models based on dialogue, respect and the co-production of knowledge. The Inuit, Sámi, Nenets and Chukchi communities, among others, are not mere 'stakeholders', but holders of collective rights and custodians of territories whose ecological integrity sustains life itself in the Arctic.

Furthermore, the geopolitical dimension cannot be ignored. The Polar Silk Road provides a lens through which to interpret the tensions between cooperation and competition in the international system. The Sino-Russian alliance along the Northeast Passage, the reactions of the Nordic countries, the US strategy towards the region and the growing militarisation show that the Arctic is no longer an isolated space. What happens there will affect global security, supply chains and international governance.

Faced with such complexity, the challenge is twofold: on the one hand, to manage competition between powers without compromising regional stability; on the other, to ensure that economic development does not come at the expense of the self-determination of indigenous peoples or the ecological balance of the Arctic. Intercultural skills, far from being a purely theoretical resource, are the bridge that allows these two objectives to be articulated.

In conclusion, the Arctic has become one of the most strategic regions in the world, but also a space where our capacity for coexistence, justice and sustainability is being tested. The Polar Silk Road symbolises the opportunities and risks of the 21st century. In this scenario, ethical and intercultural governance is not only desirable but essential. In a territory where local decisions have global effects and where indigenous knowledge is crucial to understanding the climate, the future of the Arctic will depend on the ability of all actors—states, businesses and international

organisations—to respect cultural diversity, recognise indigenous authority and build institutions that reflect the complexity of a world undergoing profound change.

1. Introduction

Greenwashing — the act of making misleading environmental claims in corporate disclosures — poses material risks to investors, regulators, and capital markets. The societal and financial stakes of greenwashing are high. As ESG-themed investment has grown to encompass trillions of dollars of assets, the gap between disclosed environmental commitments and actual corporate performance has attracted increasing regulatory scrutiny and, crucially, formal legal action. Sato et al. (2024) document a noticeable drop in abnormal stock returns at lawsuit filing, rising to 1.50% following unfavourable court decisions. Overall these figures underscore the materiality of the phenomenon for financial economists and practitioners alike.

Yet ex-ante empirical detection remains methodologically underdeveloped. ESG ratings disagree substantially across providers, assurance coverage is uneven, and text-based detection approaches have largely relied on ad-hoc keyword dictionaries that are neither theory-grounded nor externally validated. The result is a literature that describes greenwashing richly but predicts it poorly.

This study addresses this gap and asks whether greenwashing risk can be identified before enforcement occurs, using only the text of firms' sustainability reports. We propose a structured, theory-anchored workflow that uses a large language model (LLM)- based approach to evaluate firm sustainability reports against an established greenwashing typology. We build on Lyon and Maxwell's (2011) theoretical typology to construct a theory-grounded LLM-based greenwashing risk measure, which we relate to observed climate-washing litigation outcomes. We then test whether these scores carry forward-looking information by linking them to confirmed litigation outcomes: formal accusations recorded in the Sabin Center for Climate Change Law's Climate Case database. We contribute to the growing literature by linking text-based greenwashing risk measure against climate-washing litigation outcomes rather than against investor perceptions, media coverage, or ESG rating disagreements.

The contribution is threefold. Methodologically, we develop and illustrate a feasible, transparent, and replicable LLM workflow grounded in established theory. Substantively, we provide initial evidence that ex-ante detection is possible from disclosures alone. Conceptually, we bridge finance, law, and disclosure research by anchoring a text-based measure to real enforcement: a move that addresses the field's well-documented fragmentation across management, environmental science, and securities law.

Our theoretical anchor is the greenwashing typology developed by Lyon and Maxwell (2011, 2015) extended into integrated framework by Nemes et al. (2022), which formalizes the mechanisms through which firms mislead stakeholders about their environmental credentials. These mechanisms, which include selective disclosure, vague claims, and strategic omission of negative information, are conceived as deliberate, systematic rhetorical choices rather than opportunistic errors. Crucially, they map naturally onto linguistic features that LLMs are well-positioned to detect: those associated with ambiguity, imbalance, and limited verifiability.

Marquis and Toffel (2016) provide the strategic-disclosure logic: firms selectively disclose positives and omit negatives to conform to stakeholder norms, a behaviour visible in overly positive tone and reduced textual balance. Delmas and Burbano (2011) complement this by documenting the demand-side pressures (from capital markets, regulators, and individual managerial incentives) that make greenwashing rational even for financially robust firms. Together, these perspectives motivate hypotheses spanning AI-based indicators, textual features, institutional context, and firm characteristics."

We test a set of high-level hypotheses linking the likelihood of external allegations related to environmental communication to multiple firm-level dimensions. First, we examine whether AI-based indicators derived from sustainability disclosures capture signals associated with such allegations. Second, we analyze whether linguistic characteristics of disclosures—such as tone and complexity—are systematically related to increased scrutiny. Third, we consider the role of industry affiliation and regulatory context in shaping exposure to allegations. Finally, we investigate whether underlying firm fundamentals are associated with variation in allegation risk.

While mandatory ESG disclosure regimes (e.g., the EU's CSRD and the forthcoming Green Claims Directive) make omission harder, standardisation may incentivise more creative linguistic strategies that escape keyword-based detection. This reinforces the case for a semantically rich, context-sensitive analytical method.

The study draws on several primary sources. First, we identify accused firms using the Sabin Center Climate Litigation Database, a widely used and continuously updated compilation of climate-related legal cases. We algorithmically flag greenwashing cases by parsing case summaries for keywords indicative of potentially misleading environmental communication.

This screening process yields a sample of accused corporate entities across multiple jurisdictions and sectors. Cases arise under a variety of legal instruments. The economic and policy relevance of these cases is is underscored by enforcement actions against major asset managers and industrial firms, which demonstrates that greenwashing accusations carry material financial and reputational consequences.

Second, we construct a matched sample of non-accused firms to serve as a benchmark, aligning firms along key observable characteristics such as industry, geography, time, and size. This matching approach is designed to ensure comparability while mitigating confounding differences between accused and non-accused firms. The resulting panel covers multiple firms observed over several years, depending on the availability of sustainability disclosures.

Third, for each firm-year, we collect corporate sustainability or integrated reports, supplemented where necessary by relevant ESG-related sections of annual reports. These textual data are combined with firm-level financial information obtained from a standard commercial database. To reduce the influence of extreme observations, continuous financial variables are treated using standard winsorization procedures.

Methodologically, the study's primary contribution lies in the development of a theory-grounded, AI-assisted measurement approach to greenwashing risk. Specifically, we design a structured prompting architecture that operationalizes the dimensions of an established greenwashing framework through a sequence of explicit evaluative queries. This design embeds theoretical constructs directly into the LLM's reasoning process, enhancing interpretability and ensuring conceptual alignment between measurement and theory. The approach further emphasizes transparency and replicability by standardizing prompts and outputs across model

iterations, allowing consistent application across firms and reporting contexts. Beyond simple text classification, the method is designed to capture patterns of omission, exaggeration, and inconsistency in disclosures, translating qualitative assessments into a structured risk signal.

To complement the LLM-based measure, we consider a set of conventional textual and firm-level characteristics that are commonly used in disclosure research. These include broad linguistic characteristics of sustainability reporting, such as tone and readability, alongside firm attributes that may shape both disclosure incentives and exposure to scrutiny. We also incorporate dimensions related to industry affiliation, scale, and reporting environment in order to separate the informational role of the proposed measure from more standard correlates of allegation risk.

Empirically, the analysis is designed to preserve temporality by relating disclosure characteristics observed in one period to subsequent allegations. To improve comparability, accused firms are evaluated against a matched benchmark sample of non-accused firms with similar observable characteristics. This allows the empirical design to focus less on unconditional differences between firms and more on whether the proposed text-based measure captures variation that remains informative once basic differences in firm profile and disclosure context are taken into account.

The empirical strategy proceeds in several stages. A first set of specifications examines whether conventional textual indicators alone are associated with subsequent accusations. A second layer adds firm-level and contextual controls, reflecting the idea that greenwashing risk may arise not only from how firms write, but also from the incentives, visibility, and institutional settings under which they report. A final set of models introduces the LLM-based measure in order to assess whether a theory-informed semantic indicator captures aspects of disclosure risk not fully reflected in more traditional text-based proxies. In this sense, the objective is not simply to compare prediction across models, but to examine whether different measurement approaches appear to capture distinct layers of disclosure behaviour.

At a descriptive level, the data already suggest meaningful heterogeneity in both reporting style and the LLM-derived assessment of disclosure risk. This is important because it indicates that the proposed workflow does not merely reproduce uniform scores across reports, but instead differentiates across firms and reporting contexts in a way that is potentially useful for empirical analysis. More broadly, the design allows us to explore whether accusations are associated with simple rhetorical features, with deeper semantic patterns emphasized by theory, or with some combination of the two.

The early evidence obtained in our study is encouraging, though necessarily preliminary. Broadly, the results suggest that conventional textual variables capture some features of disclosure style, but that a theory-informed LLM-based measure may provide an additional and potentially distinct signal. This is consistent with the idea that aggregate textual proxies, while informative, may not fully reflect the more nuanced patterns of omission, imbalance, or selective emphasis that greenwashing theory highlights. At the same time, the analysis also indicates that allegation risk is unlikely to be explained by text alone, and instead appears to reflect an interaction between disclosure content, firm characteristics, and external scrutiny.

Taken together, these patterns support the feasibility of the proposed empirical approach. Rather than treating greenwashing as a purely conceptual construct or relying exclusively on broad textual heuristics, the framework illustrates how theory-grounded LLM outputs can be incorporated into a more traditional empirical design and examined alongside established controls. For the purposes of this study, the contribution is therefore less about claiming a definitive predictive model and more about showing that a structured, semantically rich measure of disclosure risk can be meaningfully brought into the empirical study of greenwashing.

As an additional credibility check, the empirical design can be supplemented with standard robustness and comparability tests. In particular, balance diagnostics on the matched sample help assess whether accused and benchmark firms are broadly similar along key observable dimensions prior to estimation. Sensitivity analyses can further examine whether the main

patterns are robust to alternative matching choices, variable definitions, and model specifications. More generally, the framework allows for checks using different subsets of controls, alternative text measures, and variations in the construction of the LLM-based indicator. Taken together, these steps help ensure that any emerging associations are not driven by a particular modeling choice or sample composition.

Several preliminary observations emerge from the analysis. First, the association between firm characteristics and accusation risk s broadly consistent with the view that greenwashing may reflect strategic communication incentives. This is consistent with the selective-disclosure logic of Marquis and Toffel (2016) and the capital-market-pressure mechanisms identified by Delmas and Burbano (2011).

The analysis also suggests that theory-informed LLM-based measures may capture aspects of disclosure not fully reflected in conventional textual proxies. While these traditional proxies reflect aggregate sentiment, the LLM-based measure is designed to engage with the underlying semantic content of disclosures, in line with theory-informed dimensions of communication. This suggests that such approaches may be better suited to identifying more nuanced patterns in reporting that are not fully captured by conventional text-based metrics.

The study is subject to several limitations that warrant caution in interpretation and point to avenues for future research. First, the analysis is based on a relatively limited sample of litigation-confirmed cases, and should therefore be viewed as preliminary, feasibility-stage evidence rather than a definitive benchmark. Second, the use of litigation outcomes as a proxy for greenwashing introduces potential noise, as such cases are unevenly distributed across jurisdictions and do not necessarily reflect final determinations of misconduct. Finally, as with any LLM-based approach, results may be sensitive to model specification and prompt design, highlighting the need for further validation and robustness analysis in future work.

In summary, this study provides initial evidence that greenwashing risk is detectable ex-ante in the text of sustainability reports using a structured, theory-grounded LLM workflow. Building on existing greenwashing typology, we propose a workflow to derive a LLM-based risk measure that helps relate formal climate-washing accusations in a litigation-observed matched sample. The measure appears to capture information not fully reflected in standard textual and firm-level indicators..

The methodological implications are practical and immediate. Regulators, ESG rating agencies, and institutional investors can, in principle, deploy structured LLM scoring as an early-warning tool, flagging disclosures for targeted review before enforcement actions materialise. The approach is scalable to large report corpora, language-agnostic in principle, and interpretable at the dimension level: the approach also has the potential to support more interpretable assessments by linking outputs to theory-informed disclosure dimensions. Future research could extend the analysis to broader samples, alternative outcomes, and different regulatory settings, while also exploring ways to strengthen the robustness, interpretability, and portability of LLM-based measures.

Chi è pronto per l'Euro Digitale? Il ruolo dell'alfabetizzazione finanziaria e della fiducia nell'innovazione finanziaria

Elvira Anna Graziano[1], Gerardo Petroccione[2], Carlo Drago[3]

1. Introduzione

La digitalizzazione sta modificando profondamente i sistemi finanziari, influenzando l'accesso e l'utilizzo degli strumenti di pagamento (Kamuangu, 2024). Questo processo si inserisce in un contesto in cui sostenibilità, innovazione e transizione digitale rappresentano priorità strategiche per governi e istituzioni (Gupta et al., 2023; Shalaby, 2024). Le tecnologie emergenti — dall'intelligenza artificiale alla blockchain — costituiscono leve cruciali per migliorare efficienza, trasparenza e inclusione (Hajian et al., 2025; Chin et al., 2022; Bresciani et al., 2021), ma la loro efficacia dipende dalle capacità cognitive e organizzative dei soggetti coinvolti (Martínez-Peláez et al., 2023; Di Vaio et al., 2024). Nel settore finanziario, il dibattito sulle Central Bank Digital Currencies (CBDC) e, in particolare, sull'Euro Digitale, ha rilanciato il tema della preparazione degli utenti (Cotugno et al., 2024). L'Euro Digitale rappresenta non solo un'innovazione tecnologica, ma un cambiamento sistemico che richiede nuove forme di literacy, fiducia e comprensione del rischio (Graziano et al., 2025; Boakye-Adjei et al., 2023). Nonostante la crescente produzione scientifica, persistono lacune conoscitive: molte ricerche analizzano singolarmente literacy finanziaria (Lusardi & Mitchell, 2014), fiducia digitale (Belanche et al., 2022) o preoccupazioni sulla privacy (Acquisti et al., 2015), senza approfondire come tali elementi interagiscano come capacità integrate (Xiao & Porto, 2017; Koskelainen et al., 2023). Inoltre, l'eterogeneità degli utenti è spesso sottovalutata, benché evidenze recenti mostrino differenze significative legate a età, conoscenze digitali e fiducia istituzionale (Zaimovic et al., 2025; Graziano et al., 2023). Alla luce di ciò, lo studio affronta tre domande di ricerca:

- RQ1: come conoscenza finanziaria, privacy, fiducia digitale ed entusiasmo tecnologico influenzano l'atteggiamento verso l'Euro Digitale?
- RQ2: quali profili di utenti emergono dall'interazione di tali elementi?
- RQ3: quali implicazioni derivano per la progettazione di politiche inclusive in ambito digitale?

Il contributo è organizzato come segue. Il quadro teorico di riferimento è presentato nel paragrafo 2. Il paragrafo 3 e il paragrafo 4 sono dedicati alla metodologia d'indagine, ai risultati e alla discussione di questi ultimi. Il paragrafo 5 contiene le conclusioni e le implicazioni della ricerca, mentre limiti e futuri sviluppi sono oggetto del paragrafo 6.

2. Quadro teorico

2.1. Literacy finanziaria e adozione di innovazioni

[1] Professoressa associata, ECON-09/B, Università degli studi di Roma "Link Campus"; e.graziano@unilink.it – corresponding author

[2] Assegnista di ricerca, ECON-09/B, Università Politecnica delle Marche; g.petroccione@unilink.it

[3] Professore associato, STAT-02/A, Università degli Studi di Roma Niccolò Cusano; carlo.drago@unicusano.it

La letteratura ha dimostrato ripetutamente che l'alfabetizzazione finanziaria influenza decisioni economiche, gestione del rischio e uso di strumenti innovativi (Lusardi & Mitchell, 2011; Cole et al., 2014). Nel framework TAM, una financial literacy più elevata aumenta percezione di utilità e facilità d'uso (Davis, 1989); nella teoria della diffusione (Rogers, 2003) la conoscenza rappresenta la base dell'adozione. Evidenze empiriche mostrano che utenti più alfabetizzati adottano più facilmente strumenti di pagamento digitali (Long et al., 2023; Strønen et al., 2019) e sono più inclini a considerare positivamente le CBDC (Solberg Söilen & Benhayoun, 2022; Palanisamy et al., 2025). In Italia, un elevato livello di alfabetizzazione finanziaria è correlato con maggiore utilizzo di pagamenti digitali (Banca d'Italia, 2022) e percezione positiva dell'Euro Digitale (Ferilli et al., 2024).

2.2. Privacy e adozione dei pagamenti digitali

La privacy rappresenta uno dei principali ostacoli all'adozione delle CBDC (Salmony, 2023). Gli utenti temono sorveglianza, perdita di anonimato e uso improprio dei dati (Acquisti & Grossklags, 2005; Acquisti et al., 2015). Il fenomeno rientra nel "privacy–innovation paradox" (Keith et al., 2013). Anche dal punto di vista comportamentale, la paura della gestione incerta dei dati si lega all'avversione all'ambiguità (Ellsberg, 1961). Recenti ricerche sull'e-CNY mostrano che la privacy riduce sia la fiducia sia l'efficacia delle variabili TAM (Tronnier & Qiu, 2024). L'ECB (2023) ha riconosciuto la privacy come tema centrale per l'Euro Digitale, evidenziando la necessità di trasparenza e limiti chiari alla tracciabilità.

2.3. Fiducia digitale ed entusiasmo tecnologico

La fiducia digitale facilita percezioni di utilità e controllo (Venkatesh et al., 2003), riduce percezione del rischio e sostiene l'adozione (Belanche et al., 2022). L'entusiasmo tecnologico aggiunge una dimensione affettiva: la letteratura mostra che atteggiamenti positivi verso l'innovazione amplificano l'effetto della literacy sulla propensione all'adozione (Xiao & Porto, 2017; Amin et al., 2025). L'Euro Digitale richiede dunque di considerare non solo competenze oggettive, ma anche orientamenti emotivi legati all'uso della tecnologia.

3. Metodologia

Lo studio adotta un approccio quantitativo esplorativo volto a identificare come caratteristiche sociodemografiche, competenze finanziarie, atteggiamenti digitali e preoccupazioni sulla privacy si combinino nel determinare diversi profili di predisposizione verso l'Euro Digitale. L'approccio, coerentemente con studi precedenti che analizzano fenomeni complessi caratterizzati da molte variabili qualitative (Greenacre & Blasius, 2006), integra due tecniche complementari. La Multiple Correspondence Analysis (MCA) viene usata per:

- sintetizzare le relazioni tra variabili categoriali,
- proiettare individui e categorie in uno spazio fattoriale a bassa dimensionalità,
- identificare pattern latenti,
- ridurre ridondanze prima della cluster analysis.

La tecnica è ampiamente utilizzata nelle scienze sociali per raggruppamenti data-driven (Greenacre & Blasius, 2006).

La Cluster analysis si applica per classificare gli individui in gruppi omogenei, basati sulle componenti MCA.

La raccolta dati è stata effettuata tramite Computer-Assisted Web Interviewing (CAWI) tra maggio e ottobre 2024. Il questionario online è stato distribuito attraverso le piattaforme di social network. Il metodo CAWI è stato scelto per intercettare un bacino ampio e diversificato di utenti, con particolare attenzione a fasce giovani e digitalmente attive. Il campione finale è composto da

502 partecipanti che hanno totalmente completato il questionario. Il questionario include 38 item, organizzati in cinque sezioni:

1. Dati sociodemografici: età, genere, area geografica, stato civile, istruzione, occupazione, reddito.
2. Alfabetizzazione finanziaria: domande standard sulla comprensione di interesse semplice, interesse composto, inflazione, diversificazione (Lusardi & Mitchell, 2014).
3. Comportamenti di pagamento: utilizzo di contanti, carte, mobile payment, app bancarie (Graziano et al., 2024).
4. Euro Digitale: conoscenza percepita, interesse, fiducia, benefici e rischi percepiti, timori sulla privacy (adattamento degli autori su Tronnier e Kakkar, 2022).
5. Frodi finanziarie: esperienza diretta, consapevolezza, percezione di vulnerabilità (adattamento degli autori su Shree et al., 2021; Brands and Van Doorn, 2022 ed Engle et al., 2025).

3.1. Preparazione dei dati e codifica

Poiché molte variabili erano categoriche (es. età, livello di istruzione, risposte "vero/falso/non so"), è stato necessario:

- uniformare formati e categorie;
- ricodificare variabili ordinarie (es. reddito) in classi omogenee;
- trattare la modalità "non so" come categoria informativa e non come mancante (cfr. Golman et al., 2017).

Non sono stati rilevati missing rilevanti, poiché la piattaforma CAWI impediva la consegna del questionario senza risposta.

3.2. Analisi empirica

Sono state incluse nel modello MCA tutte le variabili sociodemografiche, le variabili di financial literacy finanziaria, le percezioni sull'Euro digitale e le relative preoccupazioni sulla privacy. Dalla MCA sono state estratte dieci dimensioni, ordinate per varianza spiegata. Le cinque dimensioni selezionate - determinate tramite analisi screenplot - spiegano la quota più significativa dell'informazione. Tali dimensioni sono state usate come input della cluster analysis (Figura 1).

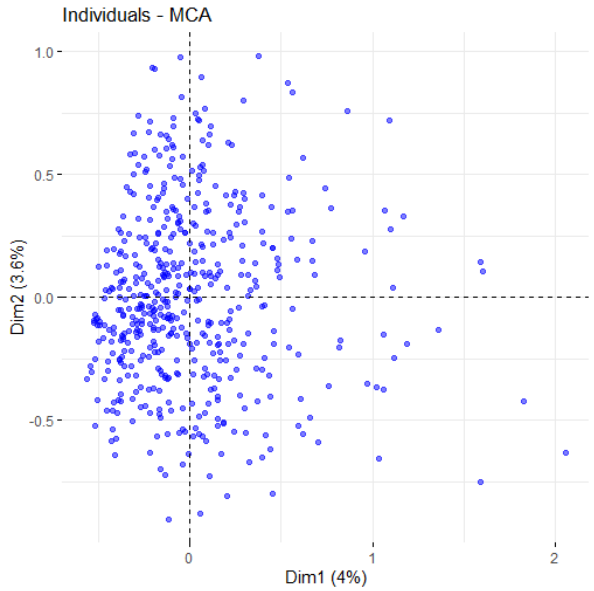

Figura 1. Estrazione dimensioni rilevanti attraverso MCA

Per una migliore leggibilità, la Figura 2 sintetizza visivamente le fasi del processo empirico adottato. Ciascuna fase si basa sulla precedente, contribuendo a garantire un'identificazione robusta dei cluster.

Questo approccio integrato ha permesso di identificare pattern latenti complessi rendendo possibile la derivazione di profili socio-cognitivi distinti.

La seconda fase prevede la classificazione degli individui in gruppi omogenei attraverso l'applicazione della cluster analysis. Seguendo il criterio di Elbow (Humaira & Rasyidah, 2020), che analizza la riduzione del within-cluster sum of squares in funzione del numero di cluster, e il criterio di Silhouette (Rousseeuw, 1987), che misura coesione interna e separazione tra cluster, sono stati individuati tre cluster come soluzione ottimale, offrendo un buon compromesso tra semplicità della struttura e capacità discriminante. Per garantire robustezza, sono stati applicati il K-means clustering e il clustering gerarchico (metodo Ward). L'uso congiunto dei due metodi permette di verificare la stabilità della classificazione (fpc; mclust in R). Per valutare la qualità dei cluster sono stati utilizzati:

- Silhouette average width;
- Indice di Dunn;
- Indice di Calinski–Harabasz (Caliński & Harabasz, 1974);
- Adjusted Rand Index (ARI) per confrontare le soluzioni K-means e Ward;
- Between-cluster vs total sum of squares ratio.

L' ARI elevato conferma che entrambe le tecniche convergono su strutture di clustering molto simili. Una volta assegnati i cluster, è stata condotta un'analisi descrittiva approfondita:

- incroci con variabili sociodemografiche,
- distribuzione delle conoscenze finanziarie,
- differenze nei comportamenti di pagamento,
- atteggiamenti verso l'Euro Digitale,
- livelli di preoccupazione privacy.

Le differenze tra cluster sono state visualizzate tramite:

- bar chart comparativi,
- grafici delle dimensioni MCA,

- convex hull plot per rappresentare la separazione tra gruppi.

Questa fase fornisce la base interpretativa per la descrizione dei profili.

L'elaborazione statistica è stata condotta utilizzando R 4.x, con i pacchetti FactoMineR e factoextra per la Multiple Correspondence Analysis, cluster, fpc e mclust per i modelli di clustering e le validazioni di robustezza, e ggplot2 per la rappresentazione grafica dei risultati.

Figura 2. Flowchart della Metodologia di Clustering

4. Risultati e discussione

I risultati dell'analisi condotta, mettono in luce tre interessanti profili socio-cognitivi. Il primo profilo è rappresentato dai "Giovani Professionisti Digitalmente Avanzati" (55,8%). Questo gruppo ha un'età media compresa tra i 26–35 anni ed elevato livello di istruzione. Essi sono finanziariamente molto alfabetizzati (Lusardi & Mitchell, 2014) con grande fiducia nel progresso digitale (Belanche et al., 2022). Rispetto all'Euro digitale, mostrano un forte entusiasmo pur consapevoli dei rischi legati alla privacy (Krishna et al., 2023). Questo cluster ha caratteristiche da early adopters, coerenti con la diffusione dell'innovazione (Rogers, 2003) e con il ruolo dei segmenti digitalmente competenti nel favorire transizioni tecnologiche (Kraus et al., 2023). Quello dei "Professionisti Affermati" rappresenta il secondo profilo emerso dall'analisi (29,5%). Con un'età media tra 36–45 anni e nonostante un alto livello di istruzione – il 61% dichiara di aver conseguito un master – e una buona alfabetizzazione finanziaria, essi mostrano un atteggiamento prudente verso l'Euro digitale, in quanto molto preoccupati delle ricadute in termini di privacy (Acquisti et al., 2015). Questo gruppo combina maturità finanziaria e moderazione tecnologica, coerente con quanto osservato in popolazioni con elevata competenza, ma bassa propensione al rischio digitale (Golman et al., 2017). Infine, l'analisi rileva il profilo dei "Giovani in Apprendimento" (14,7%). Essi sono tipicamente studenti a basso reddito e hanno mediamente tra i 18 e i 25 anni. È un gruppo che mostra molta incertezza nelle risposte – molto

spesso dichiara di non sapere. Coerentemente con la rilevazione dell'OECD (2025), sono finanziariamente poco alfabetizzati. La scarsa conoscenza finanziaria si riflette in un tiepido interesse nei confronti del tema dell'Euro digitale e una grande preoccupazione circa le ricadute sulla privacy. Questo profilo riflette dinamiche già osservate tra giovani a rischio di esclusione finanziaria nonostante familiarità digitale (Buenestado-Fernández et al., 2023).

La segmentazione emersa suggerisce che l'utente non è un soggetto omogeneo, ma presenta capability differenti (Martínez-Peláez et al., 2023), che influenzano accettazione, percezione del rischio e apertura all'innovazione. I risultati confermano che:

- l'alfabetizzazione finanziaria rappresenta un fattore abilitante, ma non sufficiente (Lusardi & Mitchell, 2014);
- la fiducia digitale e l'entusiasmo tecnologico amplificano l'intenzione di adozione dell'Euro digitale, in linea con i modelli TAM e UTAUT (Davis, 1989; Venkatesh et al., 2003);
- la privacy rappresenta un ostacolo trasversale, come mostrato nella letteratura sulle CBDC (Salmony, 2023; Tronnier & Qiu, 2024).

5. Conclusioni

Il presente studio ha esplorato il ruolo congiunto della conoscenza finanziaria, della fiducia digitale, dell'entusiasmo tecnologico e delle preoccupazioni sulla privacy nell'influenzare l'accettazione dell'Euro Digitale tra gli utenti italiani. Attraverso un approccio metodologico basato su Multiple Correspondence Analysis e Cluster Analysis, sono stati identificati tre profili distinti — Professionisti Affermati, Giovani in Apprendimento e Giovani Professionisti Digitalmente Avanzati — che rappresentano modalità differenziate di relazione con l'innovazione monetaria. Un primo elemento cruciale che emerge è che l'adozione dell'Euro Digitale non può essere interpretata attraverso un'unica variabile isolata. Al contrario, il processo risulta dall'interazione complessa di fattori cognitivi, comportamentali, emotivi e percettivi. La conoscenza finanziaria, pur essendo un fattore facilitante, non si traduce automaticamente in disponibilità a adottare strumenti innovativi, come l'Euro digitale. In linea con la letteratura (Lusardi & Mitchell, 2014; Koskelainen et al., 2023), i nostri risultati mostrano che la literacy deve essere accompagnata da adeguate competenze digitali e da un orientamento positivo verso la tecnologia perché favorisca realmente l'accettazione di una CBDC. La fiducia digitale e l'entusiasmo verso l'innovazione costituiscono, infatti, elementi catalizzatori. Gli individui del cluster dei Giovani Professionisti Digitalmente Avanzati, dotati di un'elevata combinazione di literacy finanziaria, familiarità tecnologica e apertura emotiva verso il cambiamento, manifestano i livelli più alti di predisposizione verso l'Euro Digitale. Questo gruppo incarna in modo emblematico il concetto di "dual literacy" (Xiao & Porto, 2017), in cui competenze finanziarie e competenze digitali non operano come fattori separati, ma come risorse complementari che, integrate, potenziano la capacità degli individui di trarre vantaggio dalle innovazioni emergenti. All'opposto, il cluster dei Giovani in Apprendimento presenta un quadro particolarmente rilevante dal punto di vista delle politiche pubbliche. Nonostante la familiarità tecnologica tipica delle generazioni più giovani, la scarsa alfabetizzazione finanziaria, l'incertezza decisionale e le elevate preoccupazioni sulla privacy rendono questo gruppo vulnerabile. In assenza di interventi formativi mirati, esiste il rischio che l'Euro Digitale — e più in generale la trasformazione digitale dei servizi finanziari — accentui divari informativi e capacità diseguali, contribuendo a forme di esclusione finanziaria silenziosa. Tale evidenza conferma quanto rilevato da studi sull'inclusione digitale dei giovani (Buenestado-Fernández et al., 2023). Un aspetto trasversale di particolare rilevanza riguarda il tema della privacy. In coerenza con il crescente dibattito accademico e istituzionale (Acquisti et al., 2015; Salmony, 2023; Tronnier & Qiu, 2024), i nostri risultati indicano che le preoccupazioni legate alla riservatezza dei dati, alla tracciabilità delle transazioni e ai potenziali utilizzi impropri delle informazioni sono diffuse in tutti e tre i cluster, con intensità differenti ma costanti. Ciò significa che la privacy rappresenta una barriera strutturale

all'adozione dell'Euro Digitale, non un problema circoscritto a gruppi specifici. Per questo motivo, la costruzione della fiducia istituzionale e la trasparenza nella governance dei dati costituiranno elementi determinanti per la legittimazione sociale della CBDC europea.

Si ritiene che il contributo del presente lavoro possa essere molteplice. Innanzitutto, il contributo più rilevante di questo studio consiste nell'evidenziare che l'accettazione dell'Euro Digitale è un processo eminentemente "capability-based". Non dipende solo dalla disponibilità di strumenti tecnologici o dalla loro diffusione sociale, ma dalla capacità degli individui di comprenderli, integrarli nei propri comportamenti finanziari e valutarne rischi e benefici. La prospettiva delle capability consente di leggere anche le differenze demografiche non come semplici variabili statistiche, ma come indicatori di risorse (cognitive, emotive, sociali) disponibili in misura diversa nella popolazione.

Un secondo contributo riguarda la segmentazione emersa: i tre cluster individuati offrono un quadro concreto e operativo per politiche pubbliche, banche centrali e operatori finanziari. La presenza di profili chiaramente differenziati implica che strategie "one-size-fits-all" sarebbero inefficaci e potenzialmente controproducenti. Invece, risulta necessario sviluppare:

- percorsi educativi specifici per fasce con bassa literacy finanziaria;
- linee di comunicazione dedicate agli utenti tecnologicamente avanzati;
- strumenti di tutela avanzata della privacy per consolidare la fiducia;
- interfacce digitali più inclusive, intuitive e accessibili.

Un terzo contributo ha natura metodologica: l'utilizzo congiunto di MCA e cluster analysis si è dimostrato efficace per analizzare pattern complessi in presenza di un elevato numero di variabili categoriali. Questo approccio può essere applicato ad altri contesti dell'economia digitale, dalla fintech adoption alla valutazione del rischio digitale, rafforzando il ruolo delle tecniche esplorative nella ricerca empirica. Infine, sul piano macro, lo studio suggerisce che la trasformazione digitale dei sistemi di pagamento europei richiede non solo infrastrutture tecnologiche robuste, ma anche la costruzione di un ecosistema culturale e cognitivo in cui gli utenti possano esercitare pienamente la propria autonomia finanziaria. L'Euro Digitale rappresenta un'opportunità significativa per rafforzare inclusione, sicurezza e innovazione, ma il successo dell'iniziativa dipenderà dalla capacità delle istituzioni di riconoscere e valorizzare la diversità delle capacità individuali. Solo attraverso un approccio differenziato, trasparente e orientato alla tutela degli utenti sarà possibile raggiungere una diffusione realmente sostenibile e socialmente equa.

6. Limiti e ricerche future

Come in ogni studio empirico basato su questionari e tecniche esplorative, anche questa ricerca presenta una serie di limiti che è importante riconoscere per interpretare correttamente i risultati e delineare possibili sviluppi futuri. Il primo limite riguarda il campionamento. L'utilizzo di un questionario CAWI diffuso attraverso social network ha permesso di raggiungere rapidamente un numero significativo di partecipanti, ma comporta l'assenza di una vera rappresentatività statistica rispetto alla popolazione italiana. È probabile, infatti, che individui meno digitalizzati, appartenenti a fasce d'età più avanzate o con minori risorse economiche e tecnologiche, siano sottorappresentati.

Il design CAWI tende infatti a intercettare principalmente utenti con una maggiore esposizione digitale e familiarità tecnologica; di conseguenza, le strutture di cluster individuate riflettono probabilmente percezioni più avanzate rispetto alla media della popolazione. Studi futuri dovrebbero controllare tale bias adottando strategie di campionamento stratificato o ponderazioni ex-post, così da garantire una rappresentatività più solida dei segmenti meno digitalizzati.

Inoltre, la partecipazione volontaria può aver favorito le risposte di persone già interessate ai temi della finanza digitale, introducendo un possibile bias di autoselezione che tende a sovrastimare la familiarità con strumenti digitali o l'interesse per l'Euro Digitale.

A ciò si aggiungono le limitazioni tipiche dei dati basati su autovalutazione. Le risposte fornite dai partecipanti possono essere influenzate da percezioni soggettive, interpretazioni diverse delle domande o dalla tendenza a dare risposte socialmente desiderabili. Tale dinamica può essere particolarmente rilevante nelle sezioni dedicate alla financial literacy, dove gli individui tendono talvolta a sovrastimare il proprio livello di competenza. Un ulteriore limite riguarda la natura trasversale del dataset: le informazioni raccolte riflettono un singolo momento nel tempo, mentre atteggiamenti e opinioni nei confronti dell'Euro Digitale possono evolversi rapidamente, soprattutto in un contesto tecnologico e regolamentare in forte trasformazione. Questa mancanza di longitudinalità rende difficile valutare come la familiarità con il tema, le campagne istituzionali o l'evoluzione delle tecnologie digitali possano modificare nel tempo le percezioni degli utenti.

Dal punto di vista analitico, occorre considerare anche le implicazioni derivanti dall'uso della Multiple Correspondence Analysis e della cluster analysis. La MCA, pur essendo una tecnica potente per sintetizzare relazioni tra variabili categoriali, implica inevitabilmente una riduzione della complessità originaria dei dati e può generare componenti talvolta difficili da interpretare. La cluster analysis, dal canto suo, offre una classificazione utile e leggibile dei diversi profili di utenti, ma resta pur sempre un metodo esplorativo, potenzialmente sensibile alle scelte effettuate in fase di modellazione, come il numero di cluster o il tipo di algoritmo. Anche se sono stati adottati diversi criteri di validazione per garantire la robustezza dei risultati, una certa dose di arbitrarietà è inevitabile. Un ulteriore limite concettuale riguarda l'assenza nel modello di costrutti psicologici che la letteratura considera sempre più determinanti nell'adozione di tecnologie digitali. Variabili come la fiducia istituzionale, l'avversione al rischio, la propensione all'innovazione o l'ansia tecnologica potrebbero contribuire in modo significativo a spiegare le differenze tra i profili individuati. Inoltre, il questionario rileva principalmente intenzioni e percezioni, ma non comportamenti effettivi. La distanza tra intenzioni dichiarate e comportamenti reali — ben documentata nelle scienze comportamentali — suggerisce prudenza nell'interpretare i risultati come pienamente predittivi dell'utilizzo futuro dell'Euro Digitale. Va considerato anche che il concetto stesso di Euro Digitale è ancora in fase di definizione. Le opinioni raccolte riflettono quindi un contesto caratterizzato da informazioni parziali, aspettative non consolidate e un certo grado di incertezza. Questo scenario può aver influito sulla stabilità delle risposte, generando variazioni dovute più alla percezione del nuovo che a una reale comprensione del progetto.

Alla luce di questi limiti, emergono numerose possibilità per ricerche future. Un primo filone consiste nell'impiego di campioni più ampi e statisticamente rappresentativi, che consentano di confrontare in modo più preciso atteggiamenti e competenze tra fasce diverse della popolazione italiana. Un secondo filone riguarda invece gli studi longitudinali, particolarmente utili per monitorare come la diffusione di informazioni e la progressiva definizione dell'Euro Digitale possano influenzare la fiducia, la privacy percepita e la predisposizione all'adozione nel corso del tempo. Un'altra direzione promettente è l'integrazione tra dati dichiarati e dati comportamentali reali, provenienti ad esempio dall'uso effettivo di strumenti di pagamento digitali o da sistemi di tracciamento anonimo dell'interazione con app bancarie. Tali dati permetterebbero di superare il limite dell'autovalutazione e ampliare la capacità predittiva dei modelli. Allo stesso tempo, studi sperimentali o quasi-sperimentali potrebbero contribuire a valutare come differenti modalità di comunicazione istituzionale — soprattutto in relazione alla privacy — influenzino la fiducia dei cittadini e la disponibilità a adottare una CBDC. Ricerche future potrebbero inoltre approfondire l'evoluzione del rapporto tra tecnologia, fiducia e inclusione finanziaria, integrando costrutti psicologici e socioculturali, oggi solo parzialmente considerati. Una prospettiva comparativa

internazionale potrebbe infine arricchire ulteriormente il quadro, confrontando il caso italiano con altri Paesi impegnati nello sviluppo di valute digitali delle banche centrali.

In conclusione, questi limiti non riducono la rilevanza dello studio, ma ne definiscono il perimetro e offrono una base solida per sviluppare analisi più ampie e approfondite. L'introduzione dell'Euro Digitale rappresenta un passaggio cruciale nella trasformazione del sistema dei pagamenti europeo, e comprenderne le determinanti sociali, cognitive e culturali richiederà un impegno di ricerca continuativo, multidisciplinare e sensibile alle rapide evoluzioni del contesto tecnologico e normativo.

Keywords: Euro digitale; financial innovation; CBDC; financial literacy; multiple correspondence analysis; cluster analysis

Exploring the Intersection of Environmental Sustainability and FinTech: Patterns, Developments, and Knowledge Gaps

Francesco Minnetti[1], Loris Di Nallo[2], Alberto Manzari[3], Anna Maria Calce[4]

1. Introduction

The convergence of green issues and FinTech represents one of the most dynamic and transformative areas of contemporary business and financial research. As global economies grapple with intensifying climate change demands and rising environmental risks (Saviano et al., 2024), the need for innovative technologica financial mechanisms has become pivotal (Kou & Lu, 2025; Salem & Shahimi, 2025), impacting risk assessment, investment platforms, resource allocation processes, and banking system behaviours (Drago et al., 2025). The intersection of these two trajectories, environmental sustainability on the one hand and FinTech innovation on the other, has spurred a growing body of academic research exploring the various drivers linking these two themes. Despite this, the field remains fragmented, theoretically underdeveloped, and empirically uneven.

The analysis, made using a systematic literature review (SLR), reveals a field marked by rapid acceleration, notable geographical variation, thematic heterogeneity, and a lack of consolidated theoretical anchors. Research on environmental sustainability and FinTech has grown considerably since 2018, with publication rates increasing sharply during and after the pandemic, reflecting a heightened global interest in digital tools that support climate resilience, sustainable investments, and low-carbon transitions. Growing academic interest is certainly also linked to broader economic and regulatory developments, including the rise of green taxonomies, the expansion of climate-related financial disclosures such as Corporate Social Responsibility Directive (CSRD), and the maturation of technological infrastructures capable of providing real-time environmental data, automating risk assessments, and facilitating decentralized validation mechanisms.

2. Methodology and data

This study conducts a SLR to examine how environmental sustainability and FinTech are jointly conceptualized, operationalized, and empirically investigated within the academic domain. The protocol is based on established guidelines for rigorous evidence synthesis (Kraus et al., 2020; Massaro et al., 2016; Petticrew & Roberts, 2006; Tranfield et al., 2003), in order to ensure that each step of the research is transparent, replicable, and robust. According to these methodological standards, we have developed a bibliometric and content analysis aiming to carry out detailed mapping of intellectual structures, thematic convergences, and conceptual trajectories

[4] Researcher, ECON-09/B, University of Cassino and Southern Lazio; annamariacalce@unicas.it

within the selected body of literature (Lombardi & Secundo, 2021; Kessler, 1963; Waltman et al., 2010; Van Eck & Waltman, 2009; 2010; 2017).

In order to develop a comprehensive and representative dataset, relevant studies answering our research questions about how environmental or green objectives and FinTech mechanisms intersect within business research were systematically identified, collected, and examined. The search strategy followed a multi-database approach, with Scopus, Web of Science, PubMed, and Google Scholar, which covered a wide range of peer-reviewed contributions across the fields of business, management, economics, and sustainability-related areas. This multi-source design assured high sensitivity and specificity in the identification of major academic outputs published between 2000 and 2026-a timespan sufficiently broad to include both foundational research and the most recent conceptual and technological developments.

The search query applied, TITLE-ABS-KEY ("environmental" OR "green" AND "fintech") AND (LIMIT-TO (SRCTYPE, "j")) AND (LIMIT-TO (SUBJAREA, "BUSI")) AND (LIMIT-TO (DOCTYPE, "ar")) AND (LIMIT-TO (LANGUAGE, "English")), was replicated conceptually in the other databases to ensure consistency in scope and terminological precision. So, the dataset underlying this study comprises English-language, peer-reviewed journal articles that focus on the intersection between environmental or green dimensions and FinTech, specifically within the Business, Management, and Accounting subject areas.

The initial retrieval produced 168 journal articles, which were subsequently organized into a structured dataset and subjected to a rigorous multi-stage screening process reflecting the methodological guidance of seminal SLR frameworks. Duplicates, non-academic materials, conceptually irrelevant publications, and non-English outputs were removed. After applying the inclusion and exclusion criteria aligned with the review's purpose, 113 scientific articles remained as the final validated sample for analysis.

Following dataset consolidation, we have conducted an extensive bibliometric analysis using VOSviewer software, which enabled the visualization and interpretation of keyword co-occurrence networks, citation structures, and thematic clusters. This approach enabled us to detect dominant conceptual groupings, underlying intellectual linkages, and evolving research fronts within the Environmental FinTech domain. Keyword co-occurrence mapping highlighted the frequency and relational intensity of core constructs, while citation analyses provided insights into influential authors, seminal works, and the propagation of knowledge across disciplines. Thematic clustering, in turn, exposed how environmental concerns, such as carbon reduction, green financing mechanisms, climate-related risk analytics, and sustainable investment behaviors, are embedded within FinTech-oriented business research.

Overall, by applying a structured protocol rooted in systematic review methodology (Kraus et al., 2020; Massaro et al., 2016; Petticrew & Roberts, 2006; Tranfield et al., 2003) and leveraging advanced bibliometric tools (Lombardi & Secundo, 2021; Kessler, 1963; Waltman et al., 2010; Van Eck & Waltman, 2009; 2010; 2017), the study provides a detailed and methodologically rigorous assessment of how the academic community conceptualizes and investigates the intersection of environmental sustainability and FinTech. The resulting synthesis not only maps the intellectual structure of the field but also identifies conceptual ambiguities, methodological gaps, and future research opportunities, contributing to a more coherent and integrative understanding of Environmental FinTech within business scholarship.

Briefly, in order to generate a clearer understanding of the emerging domain highlighted, using a rigorous analysis methodology, this research aims to identify patterns and potential future developments.

3. Results

Starting from the geographical perspective, the empirical analysis of the dataset highlights significant contributions from Asia, particularly China and East Asian economies, where robust

digital ecosystems coexist with ambitious state-led sustainability programs. In Europe, academic production reflects the region's advanced regulatory frameworks for sustainable finance and digital innovation. In contrast, the United States tends to emphasize technological development and market-driven innovation, with a particular focus on blockchain-based solutions, climate analytics, and digital environmental monitoring systems. Emerging economies, such as India, Indonesia, and Malaysia, are also contributing to research focused on sustainable digital lending, financial inclusion, and grassroots financing for renewable energy. This geographical dispersion highlights both the global relevance of environmental FinTech and its contextual dependence on development, as adoption patterns are closely linked to regulatory frameworks, technological infrastructure, market maturity, and societal needs.

Beyond the geographic patterns emerging from the dataset, a deeper understanding of how environmental sustainability and FinTech interact requires examining the intellectual dynamics that shape the development of this research field. It does not appear a single e unique trend of research. Instead, results reflect a complex interplay between institutional incentives, market demand, technological capabilities, and evolving societal expectations. As the literature in the dataset reveals, the emergence of the relationship between green issues and FinTech has unfolded through multiple trajectories that often intersect but rarely overlap fully, resulting in a heterogeneous body of knowledge characterised by diverse conceptual motivations and methodological orientations.

One of the most relevant dynamics concerns how different financial systems have integrated digital technologies into their environmental strategies. In some contexts, FinTech appears primarily as a mechanism to enhance the efficiency of traditional financial institutions by offering new tools for environmental risk assessment, cleaner reporting infrastructures, or automated compliance with sustainability regulations. In other contexts, FinTech operates as a disruptive force capable of reshaping how environmental value is produced, exchanged, or verified, leading to the development of novel financial instruments, such as tokenissed carbon credits, decentralized renewable-energy marketplaces, and blockchain-enabled sustainability certifications. This divergent evidence suggests that there is no single approach to the relationship between FinTech and the environmental theme, but rather different practices, whose meaning evolves based on institutional priorities, technological maturity, and specific environmental challenges.

In this sense, the analysis of the paper reveals an increasing interest in how environmental sustainability is embedded not only in financial decision-making but also in the broader architecture of digital ecosystems. Several studies examine how application programming interfaces (APIs), artificial intelligence algorithms, distributed ledgers, and big data infrastructures interact to generate new forms of environmental intelligence. These systems help better understand how climate impacts economic and financial activities, how sustainable the supply chain is, and how "green" investment portfolios are. While the technology used varies from study to study, a common element is the use of real-time data in environmental-related financial processes. This data-driven focus on sustainability signals a significant shift in finance: environmental information is no longer considered a secondary consideration, but a fundamental component of assessing risks, determining asset values, and complying with regulations.

Another closely related issue concerns the growing attention paid to green FinTech users. Several studies within the dataset highlight how digital interfaces influence individuals' environmental awareness, investment choices, and consumption patterns. Environmental FinTech applications increasingly leverage gamification strategies, behavioral nudges, and visual analytics to encourage greener habits or stimulate participation in low-carbon investment schemes. These contributions help broaden the understanding of sustainability-oriented financial innovation beyond institutional and technological mechanisms, positioning end-users as active participants in shaping environmental outcomes. Yet, despite this growing attention, this part of literature remains relatively underexplored. This means that future research directions could also consider

topics related to psychology, behavioral economics, and human-computer interaction in order to better understand how digital environments can effectively guide users towards environmentally responsible financial behavior.

However, the literature review also highlights a body of research highlighting potential problems in the interconnection of FinTech and green sustainability. In particular, it reveals tensions between the promise of digital sustainability and the risks or unintended consequences associated with digital financial systems, particularly pollution. Several studies raise concerns about the ecological footprint of financial technologies themselves, particularly those relying on energy-intensive infrastructures, such as some blockchain architectures. Others highlight the emergence of new vulnerabilities, including cybersecurity risks, algorithmic opacity, and data privacy challenges, which could undermine environmental governance if left unaddressed. Thus, these issues underscore the need for a more nuanced perspective on the relationship between FinTech and the environment, recognizing not only its potential to support sustainability goals but also the material and systemic risks associated with the increasing digitalization of finance. Therefore, future research may require a more critical assessment of the trade-offs, environmental externalities, and structural imbalances introduced by technological innovations in the financial field.

Another important insight from the analysis of the dataset is that green financial innovations are evolutionary. Green FinTech is not a separate category of technologies, but a constantly evolving set, influenced by experimental rules, market reactions, and new technologies.

Initially, studies focused on specific instruments, such as carbon footprint calculators or apps for financing small renewable energy projects. Instead, today academic papers take a broader view and analyse how digital infrastructures, institutions, and climate governance systems interact. This evolution demonstrates that environmental sustainability depends not only on the design of individual technologies, but also on coordination between various actors: regulators, investors, technology providers, and civil society. With the increasingly close integration of the digital and environmental transitions, this coordination becomes pivotal.

However, the literature highlights that such coordination is still uneven and often hindered by incompatible standards, fragmented regulations, and divergent interests.

Another relevant topic concerns the impact on capital. Several articles analyse how digital platforms facilitate access to green investment opportunities for retail investors, for example, through robo-advisory systems that integrate sustainability preferences. Others examine the potential of decentralized finance to democratize environmental investments, reduce transaction costs, and improve transparency in capital allocation to low-carbon projects. This line of research opens the debate on the potential utility of green FinTech in mobilizing private capital for climate change mitigation and adaptation, particularly in regions where traditional financial institutions face structural constraints or lack the necessary incentives to engage in green finance. On the other hand, the contributions of the dataset also highlight that the transformative potential of these innovations remains contingent on regulatory clarity, market conditions, and the credibility of environmental claims, factors that vary from market to market.

A final area of research focuses on how digitalization is changing the knowledge base of sustainable finance. The new opportunities offered by green FinTech allow many more stakeholders, such as technology companies, data providers, and even individual users, to contribute to sustainability assessments and environmental decisions.

This makes the process more transparent and collaborative, but it also raises questions about who is responsible, the quality of the data, and how to govern these systems. In this sense, the topic of data becomes very important. Research has begun to study these changes, but more in-depth analyses are needed to understand how distributed digital intelligence influences environmental policies, market regulation, and the role of institutions.

Then, focusing on the journals, it emerges that the journals represented in the dataset span sustainability research, digital innovation, financial economics, business strategy, and

information systems. This variety underscores the interdisciplinary nature of the field but also reveals the absence of a single, well-defined research strand. Articles discussing environmental FinTech appear in venues dedicated to environmental management, sustainable finance, emerging technologies, and digital transformation, suggesting the simultaneous presence of multiple epistemic communities contributing to the discourse. Thus, it emerges that the research patterns in the field are numerous. While this interdisciplinary reach enriches the field, it also contributes to conceptual fragmentation, as studies often employ incompatible definitions of green FinTech, divergent environmental indicators, or widely varying technological and analytical frameworks.

After identifying the most important clusters of interest, a co-occurrence analysis of keywords was conducted. The results reveal a conceptual framework centered on sustainability, green finance, FinTech innovation, blockchain, artificial intelligence, carbon finance, climate risk, digital transformation, renewable energy, and financial inclusion. From these recurring terms, it can be deduced that the intellectual architecture of the sector is composed of four main thematic clusters. The first reflects work on green finance and environmental impact assessment, where FinTech is positioned as a tool to improve measurement accuracy, enhance environmental disclosures, and enable more transparent climate sustainability reporting. From this perspective, technologies such as artificial intelligence and machine learning are being mobilized to process large volumes of environmental data, generate automated sustainability assessments, or detect greenwashing risks. The second thematic stream focuses on digital technologies that underpin sustainable finance infrastructures, particularly blockchain systems, digital identities, and distributed ledgers, which enable the decentralised verification of environmental claims, the issuance of green tokens, and the traceability of renewable energy certificates. These studies often conceptualize FinTech not merely as a financial innovation but as a technological substrate capable of transforming the governance of environmental assets. The third thematic group is focused on sustainable digital business models and financial inclusion, with a special emphasis on how mobile-based platforms, digital credit scoring mechanisms, crowdfunding mechanisms, and embedded finance solutions provide a vehicle for the expansion of green microloans, enabling small-scale renewable energy investments, or underserved populations' access to environmental finance products. This study typically situates green FinTech in broader development trajectories and explores how digital tools can overcome financing constraints that limit the diffusion of sustainable technologies in emerging economies. The fourth conceptual cluster brings together governance, regulation, and public policy, reflecting a growing interest in how regulatory frameworks shape the adoption and implementation of green FinTech solutions. In this respect, studies are casting light on regulatory gaps, digital compliance mechanisms, standard-setting processes, as well as on emergent forms of RegTech that can support environmental governance.

Across this dataset, several overarching patterns are evident. First, there is a consensus that FinTech should operate as a key enabler of sustainability, capable of solving longstanding inefficiencies in environmental data transparency, investment mobilization, and risk measurement. Digital technologies are often put forward as a solution to information asymmetry, investor confidence, automated carbon accounting processes, and scalable technologies for environmental monitoring. These arguments find resonance in the studies suggesting that FinTech can democratize access to sustainability-oriented financial products and induce behavioral changes among consumers by offering real-time tracking of carbon footprint or incentivizing green spending with apps. However, beyond these optimistic narratives, the evidence supporting FinTech's environmental effectiveness remains limited, inconsistent, and methodologically heterogeneous. Few studies, other than making normative claims about technology potential, provide an empirical assessment of actual environmental outcomes, creating a research gap between theoretical expectations and measurable environmental impacts.

The results also show heterogeneity in terms of methodologies. Qualitative case studies or conceptual models, as well as econometric or quantitative approaches, are used, for example, to assess the relationship between digital adoption and green credit allocation, environmental

performance metrics, or investment behavior. Other studies, however, use simulation models, experimental designs, or pilot implementations to illustrate potential technological applications. The lack of standardized environmental performance metrics leads to difficulties in comparing results across studies or in establishing cumulative evidence. This challenge parallels those observed in the sustainability literature more generally, where inconsistent methodologies and heterogeneous indicators prevent clear causal attributions.

Another critical dimension underlying the evolution of environmental FinTech is regulation. Strong, sustainable finance rules-for example, in the European Union-correlate with advanced FinTech-enabled sustainability initiatives, such as digital compliance solutions for green bond reporting, digital taxonomies, and automated sustainability screening tools. In contrast, regions with rapidly advancing digital infrastructures, such as China, are prone to develop more aggressively in areas like blockchain-based environmental monitoring or AI-driven climate analytics. But regulatory asymmetries also create barriers to scalability and cross-border integration. In fact, many studies call for harmonized global standards, improved digital governance mechanisms, and more transparency on what constitutes environmentally sustainable FinTech activities. Without such alignment, inconsistencies in measurement, disclosure requirements, and technological protocols may erode trust and hinder the adoption of green financial technologies.

The results from the dataset analysis, therefore, highlight gaps in the existing literature that hinder the sector's development, such as the lack of unified conceptual definitions. The limited empirical evidence on environmental outcomes further limits the ability to assess whether FinTech actually improves sustainable performance or simply replicates existing financial models through new tools. Furthermore, the geographical concentration of research can lead to knowledge imbalances, with an underrepresentation of regions that could benefit most from green FinTech solutions but lack the necessary infrastructure.

The potential risks associated with FinTech adoption in environmental domains remain not sufficiently addressed. Issues such as cybersecurity vulnerabilities, data privacy concerns, algorithmic biases, and digital divides can undermine both technological reliability and environmental effectiveness. Yet, these interdependencies have received minimal scholarly attention, suggesting the need for new conceptual and empirical models.

4. Conclusions

The findings of the SLR outline a field in its early but rapidly accelerating stage of development. The intersection of environmental sustainability and FinTech holds potential ability to advance climate mitigation, environmental stewardship, and sustainable development in general. Yet realizing this potential will require a more coherent theoretical foundation, harmonized measurement frameworks, robust empirical evaluations, and deeper interdisciplinary integration. In fact, results show potential and risk related to the interconnection between green themes and FinTeck, such as pollution related to intensive usage of energy. Scholars, policymakers, and practitioners will have to work toward greater clarity of conceptual boundaries, alignment of regulatory frameworks, and evidence-based assessments for the responsible and effective development of green FinTech ecosystems.

Briefly, this extended abstract provides an integrative, comprehensive, and critical synthesis of such emerging dynamics, providing a baseline for future researches.

Parole chiave: Green FinTech; environmental sustainability; sustainable finance; systematic literature review

Beyond Institutional Support: Relational Accountability and the Networks Behind the Unexpected Development of the Insurance System in Trieste

Eleonora Masiero[1], Loredana Panariti[2], Karen McBride[3]

1. Purpose

The development and expansion of an insurance sector can be explored and explained adopting different perspectives. With respect to Trieste, it has been claimed that the fast and successful expansion of the insurance sector was due to the willingness and institutional support of the Hapsburg crown.

With the aim of making Trieste the insurance centre for the Habsburg territories, since the beginning of the 18th century, the Habsburg dynasty strengthened the port of Trieste's economic expansion by privileging the city with the status of a free port (in 1719, Charles VI had privileged Trieste and Rijeka with a free port) and by introducing privileges and practices favouring merchants.

However, while historical facts demonstrate the positive expansion of Trieste's insurance firms, both at the local level and in the global market, during the 18th century a possible positive expansion in the insurance sector was not to be given for granted by the experts and the observer of the time.

In fact, at the end of the 18th century, several criticalities seemed to prevent the development of this sector. Among the main criticalities: Trieste did not have a great tradition of financial and insurance activities; Trieste did not have a strong tradition of financial and insurance activities; there were no insurance or security brokers in the city; the city suffered from a constant shortage of circulating money; it lacked the rules and channels necessary for international payments. Last, but not least, despite being the most important port of the Austro-Hungarian Empire, Trieste suffered from its proximity to Venice, which remained the most prominent port on the Adriatic Sea. (Panariti, 2003).

All in all, Trieste did not have a tradition of financial and insurance activities, but after a few decades, many insurance companies successfully operated in Trieste, offering a wide range of services to an international cohort of users. Besides, during the 19th century, Trieste became one of the most prominent insurance centres in Central-Eastern Europe and by the Mediterranean Sea.

In fact, during the nineteenth century, Trieste became one of the most crucial insurance centres in Central-Eastern Europe and the Mediterranean. After establishing insurance firms in Vienna, Pest, and Prague; Trieste insurance companies surpassed the territory of the Habsburg Empire, with a web of insurance branches located in every major city of the Italian peninsula, of the Mittleuropean and Eastern European cities and Levante. The most critical companies reached the territories of Africa, Asia and the Americas (Panariti, 2011). The insurance companies that

[1] Università degli Studi di Trieste; eleonora.masiero@deams.units.it – corresponding author

[2] Università degli Studi di Trieste

[3] University of Portsmouth

contributed to the supremacy of Trieste were Assicurazioni Generali (1831) and Riunione Adriatica di Sicurtà (1838), and the first section of Austrian Lloyd (1836), which at the time was an information agency serving the insurance companies of Trieste.

2. Study design/methodology /approach

Given these barriers to introducing and expanding the insurance sector, it may be asked what the reason behind the successful expansion of Trieste's insurance firms was.

To respond to this question, initially researchers collect and rely on primary and secondary sources to shed light on the set of privileges that supported the initial development of the insurance sector and, at the same time, to highlight the barriers to its effective implementation.

Later systematic archival research was conducted to collect and reconstruct the information pertaining the establishment of each insurance company operating in the city of Trieste between the 18th and 19th century.

To reconstruct the birth and development of the Trieste insurance system between the 18th and 19th centuries, the researchers used sources retained in the State Archives of Trieste (Intendenza Commerciale, 1748-1776, Deputazione di Borsa, 1755-1921, Cesareo Regio Governo 1776-1809) and the Finanz und Hofkammerarchiv of Wien (Kommerz, Litorale (1749-1813).

The Intendenza Commerciale was founded in 1731 and strengthened its powers during the Theresian period[4]. The Intendenza Commerciale had the objective of encouraging traffic between the German and Italian lands, especially with regards to the maritime trade of the hinterland, through the two free ports of Trieste and Fiume. The documents preserved in the fund Deputazione di Borsa represent a source for researching the economic situation in Trieste. From this documentation relationships between the Trieste merchant class and the central power emerge, and the regions with which they had trade and commerce. In contrast, the Cesareo Regio Governo in Trieste, which had been instituted to succeed the Intendenza Commerciale, had very broad competencies and directive and supervisory powers over trade, navigation, the application of maritime laws and seafaring. Both magistracies then reported to the courtly dicastery of Vienna on which they depended. The juxtaposition of the Trieste and Viennese documentation has made it possible to obtain a precise and articulated picture of the path that led to the birth of the first insurance companies and the distinct characteristics that allowed their development. Along with the archival documentation, contemporary publications dealing with the subject matter of the research were used. One of the first writings on insurance, was published in Trieste in 1797: "Riflessioni sulle assicurazioni marittime e loro progressi in Trieste", written by Samuele Vital. This document, although not particularly innovative, is of interest because it identifies the role played by social capital, consisting of cultural knowledge and training for those who worked in the insurance industry. The Collection of observations on marine insurance, on insuring against fire, river and air damage, and those on life insurance (Morpurgo, 1830), show us how the creator of Assicurazioni Generali determined and developed a new type of insurance company that would emerge from the narrow confines of maritime insurance to offer multiple services in the international arena.

[4] Maria Theresa of Austria, ruler of the Habsburg Monarchy, reigned from 1740 to 1780 and from 1765 in co-regency with her son Joseph II, who became ruler after her death. Joseph II's reign lasted only until 1790, when he was succeeded by his brother Leopold II, whose reign was even shorter and ended in 1792. His son Franz II, on the other hand, was sovereign until 1835, going through the difficult Napoleonic years. To oppose French hegemony in Europe, he assumed the title of hereditary Emperor of Austria in 1804, while he carried the title of Emperor of the Holy Roman Empire until 1806.

Accordingly, the collection of information has had as an object the mapping of the management background and relations. Hence, in this phase the exploration moves to unveiling actions and personal relationship of the most prominent figures leading the insurance sector in Trieste. The aim this second analytical phase is to shed light on the informal networks and personal relationship behind the development of the insurance system.

In this regards, collaborative networks, primarily based on informal coordination practices, are processes of mutual evolution, growing trust and interdependence among actors relying on direct personal relations (Larson, 1992; Rossignoli e Ricciardi, 2015). Collaborative network's actors are self-regulated, and identify themselves with shared interests and aspirations, or work toward solving common issues (Rossignoli e Ricciardi, 2015). Actors participating in these flat organisations are regarded as equals even if considerable differences in the degree of power may exist (Samlinger, 1993). Nevertheless, are the ethical values of mutual respect and trust among the people involved, that make collaboration within these networks effective and distinguish them from other hierarchical organised and institutionalised forms (Thompson, 2003). Among the ethical values, while reputation encourages the collaborative networks to behave altruistically, also independently from the probability of reciprocation, trust is a key factor enabling a stable social relationship based on reciprocal collaboration (Rossignoli e Ricciardi, 2015).

For this paper we may define these collaborative networks as informal systems of accountability. In fact, like all other types of social practices, collaborative networks take place and interact within formal, institutionalised systems of accountability. Accordingly, informal systems of accountability embrace all the forms of account that spring from the participation in the social world (Willmott, 1996). In this regard, a framework of accountability results from the institutional setting, the set of norms, the culture within a specific time and place (Willmott 1996). Trust, which necessitates relational thinking (Cremer, Snyder and Dewitte 2001) is a social phenomenon that requests a response regarding an accountability relation unrelated to the usual hierarchical forms (Jonsson 1996; Roberts 1991, 1996). When the level of trust is high, the informal accountability system is privileged, while the community members perceive the formal, sophisticated controls as unnecessary (Panozzo 2008). Bringing the concept of trust within the accountability relationship implies that, accountability involves "identity building in a social context" where the group rely upon and adheres to a set of norms and practices that serve a "coordinating purpose" (Jonsson 1996, 103-115). Accordingly, the shared identity, reinforced by the participant's behaviour, shapes the accountability system and its notion (Panozzo 1996; Selznick 1957). In other words, trust implies establishing some characteristics of the accountability relation. Jonsson's (1996, 103) words: "Leaving something of value in the hands of others, both imply risk-taking but trust also exposes relationships to the whim of those who rely on each other". However, trust may take various forms: resulting from the institutional, legal systems in place; or being based on calculative and rational choices; or deriving from relational interactions and shared identities (Hyndman and McConville, 2018).

3. Findings

Researchers argue that while the central institutions' actions commenced the insurance sector, its successful growth and, most importantly the overcome of barriers was mainly due to the development of an informal relational accountability systems based on the reciprocal collaborative network of international merchants and directors.

More specifically, findings shows that the actions enacted by the central government (e.g. set of privileges, controls and norms) were the necessary, but not sufficient condition, to bust the insurance system.

Instead, the informal, relational accountability system effectively supported the successful development of the insurance sector through the growth of collaboration among the merchants and collaborative networks of managers living and operating in Trieste. These managerial figures

and merchants found their anchor of collaboration, by gathering around the Stock Exchange of Trieste, and trusting the informal system of accountability they had created over time.

In doing so the network of merchants overcame the specific interests of each ethnic community and group and exploited the specific international connection while developing tight contacts based on a sense of belonging and reciprocal trust.

In fact, the merchants working in Trieste were part of different groups and ethnical communities (with different cultures, beliefs, and international connections) operating as "collaborative networks" primarily based on informal coordination practices, with a strong interdependence among the people relying on direct personal relationships (Larson, 1992; Rossignoli & Ricciardi, 2015). The network of collaboration, grounded on reciprocal, trust, was based not only on belonging to a specific community or an ethnic group, but on the shared identity and consequent collaboration among the different communities and groups living and working in the city of Trieste and having invested in homes in the city. In this regard, members of the collaborative networks identified with their shared interests and aspirations towards these common purposes (Rossignoli and Ricciardi 2015; Samlinger 1993). Accordingly, this trust reputation encouraged the collaborative networks to behave with reciprocity (Rossignoli and Ricciardi 2015).

4. Originality/value

The paper contributes to previous historical studies investigating the insurance sector (Denzel, 2022; Kingston, 2014; Panariti, 2011; Piluso, 2012; Plasschaert, 2021; Pons et al., 2020; Schisani & Ragozini, 2023) in several ways.

First, this work provides a detailed reconstruction of the dynamics enabling the development of the marine insurance sector between the 18th century and the 19th century, filling a gap in the literature. The paper does this by illustrating how the successful growth of the insurance sector in Trieste was mainly due to the development of informal accountability systems based on the reciprocal trust shared within and among collaborative, cosmopolitan networks of merchants, thus overcoming factors (e.g. the lack of liquidity) that might otherwise have impeded the sector's expansion, while supporting the achievement of otherwise unattainable results.

Second, by exploring historically the evolution of the introduction and expansion of the insurance sector in Trieste, this paper expands the scholarly understanding of the dynamics of informal systems of accountability (Boland & Schultze, 1996; Masiero, 2020; Panozzo, 1996; Roberts, 1996; Selznick, 1957; Willmott, 1996). The historical research reveals how relationships of trust and profound connections among collaborative networks (Rossignoli & Ricciardi, 2015; Samlinger, 1993; Thompson, 2003) of merchants were essential for developing an informal accountability system to boost Trieste's insurance system.

Finally, what emerges from this paper is the historically enabling role of collaborative networks and trust in supporting informal accountability mechanisms, thus bypassing the need for a higher degree of control than formal, hierarchical accountability systems should have implied.

1. Introduction

The problem of cost-efficiency and the quality of healthcare is a major issue of many healthcare systems in the world, especially those which rely on public healthcare (Graham et al., 1998; Weatherly et al., 2009; Owen et al., 2012). Different countries adopted different strategies to overcome this challenge, such as managerialisation (Borgonovi 2008, 2013; Anselmi, 2014), pay-for-performance regarding particular health issues (Petersen et al., 2006), and deincentivisation practices (Ries, 2012; Mozaffarian et al., 2018). All of these practices can be considered from a general perspective, because they impact the whole healthcare system, without excluding any healthcare organisation operating within it. However, trying to achieve the result of quality healthcare, thus effective and efficient (Orlandini & Amelio, 2022), can also be pursued by acting at the organisational level, thus intervening on those dynamics and structures which constitute the healthcare organisations themselves, such as organisational structure, organisational behaviour, relationships, technologies, production and management cycles, management of human resources and their learning and updating processes. In some cases, aiming to improve the overall quality of the healthcare system and the local health services delivery, it can happen that a hospital can merge with another or into a new one.

Hospital mergers are a practice widely used by healthcare organisations in modern healthcare systems, especially in the last few decades in Europe and the USA (Vogt & Town, 2006; Gaynor et al., 2012; Greaney, 2018). Mergers can be defined as a combination of previously independent hospitals, formed by either the dissolution of one hospital and its absorption by another, or the creation of a new hospital from the dissolution of all participating hospitals (American Hospital Association, 1992; Alexander et al., 1996). Thus, the practice of mergers regards whole healthcare organisations, deeply impacting them, and cannot be considered just arrangements for some functions or contracts. Hospital mergers can be explained by many reasons. First, they should increase sustainability (Cerezo-Espinosa De Los Monteros et al., 2021); second, they should optimise internal processes and practices on both the medical and the managerial perspectives (Zuckerman & Weeks, 1979; Beaulieu et al., 2020); third, they should decrease, by realising multihospital systems (Bogue et al., 1995), costs (Dranove & Shanley, 1995; Connor et al., 1997),

improve productivity (Ferrier & Valdmanis, 2004), quality (Beaulieu et al., 2020; Mariani et al., 2022), and the overall performance (Harris et al., 2000).

Hospital mergers can be differentiated into two major typologies, which are vertical and horizontal. Vertical merger is an arrangement whereby the new health care organisation offers a broad range of patient care and support services and is thus oriented towards cost reduction through the optimisation of processes (Conrad & Dowling, 1990); horizontal mergers are more oriented towards the realisation of economies of scale and the increasing of market power (Conrad & Shortell, 1996), thus are logics which are more present in private healthcare system models than in public health.

According to Harris (2000), the performance of a merged hospital can be measured by using technical efficiency as an indicator. Thus, it appears hospital mergers are one of the strategies which can be used to increase the overall performance and sustainability of hospitals and healthcare systems, such as digitalisation (Fontanella et al., 2024A), improvement of available technologies (Wu et al., 2012) and organisational structures (Taylor et al., 2015).

Shifting the attention to the past, healthcare and hospitals were not related to particular healthcare systems but often managed by the Church (Wolper & Peña, 2011) and charities (Baskerville & Servalli, 2016). Analysing the Medieval and Renaissance periods, charities played a crucial role in helping local governments in managing health issues and emergencies (Black, 2004; Servalli, 2013). Following Manetti et al. (2017), charity organisations helped Florence in managing the sanitary emergency caused by the plague. In this situation, the Confraternita of Misericordia took into account the complex situation, also providing health services. The role of Confraternities was pivotal in the social environment of Medieval and Renaissance societies, because they filled the gap between the civil and religious authorities, also providing many services which both the Church and the local government were unable to provide or provided in a non-optimal way (Black, 2003; Esposito, 2019). Among the services offered by Confraternities, there was also healthcare, which was delivered in hospitals and other facilities under the Confraternities' property (Flynn, 1989; Black, 2004). In the field of accounting history, many scholars have investigated the implications and the relationships which created between Confraternities, hospitals and civil and spiritual authorities. Manetti et al. (2017) proposed the role of the Confraternita of Misericordia in the management of the plague in Florence; Lazzini & Nicoliello (2021) investigated the Galliera Hospital and its dynamics under Foucault's governmentality lenses; Miley & Read (2016) proposed accounting as a tool to overcome stigma, and Baskerville & Servalli (2016) proposed a special issue about this topics, stimulating the production of many contributions. However, although the accounting history scientific literature provides many interesting and intriguing contributions about the multitude of facts and implications regarding hospitals, the organisations which manage them, and the role accounting has in these contexts, to the best of our knowledge, there are no contributions which analyse from the accounting perspective a hospital merger in the past. Aiming to fill this gap in the literature, this paper proposes the Santa Croce Hospital of Mondovì merger. Although there is no documentation about the original realisation of the infrastructure, nor the reasons why it was realised, the Santa Croce Hospital was the hospital of the Piazza district and it was owned and it was under the responsibility of the Santa Croce Confraternity, founded in 1319 (Billò, 2006). A few years later, in 1340, it obtained Pope Benedict XII's protection through a bulla, providing one of the first official evidence about the formal existence of Santa Croce as a hospital.

In the context of Mondovì, the Santa Croce was just the last hospital built, and it was the third in the Piazza district, following the realisation of Sant'Antonio Hospital and San Domenico Hospital, owned and managed by other Confraternities. In fact, there were already three other hospitals, divided into the other districts of the town, managed by other Confraternities and strictly linked with the Church. In the district of Breo, down Piazza's hill, the Confraternity of Disciplinanti Bianchi di Santo Stefano owned and managed the Breo's Hospital, which, in 1601, divided itself into two organisations: one was still the Breo's Hospital and the other, the new one,

was Piandellavalle Hospital, voted to Holy Mary of the Pilone. In the Carassone district, the Confraternity of Sant'Antonio Abate managed the homonymous hospital. Considering the small dimensions of Mondovì, especially during the historical period analysed, it is interesting to identify so many hospitals and, consequently, the interaction between so many different Confraternities, obviously disciplined and regulated by the Church.

The year 1547 is the year of interest for this research because the Santa Croce Hospital, which already had absorbed two minor hospitals (San Giovanni and San Francesco) in 1437 by order of bishop Alberto Gutturaio, merged with Sant'Antonio Hospital, San Domenico Hospital and the Confraternities of Porta di Vasco, Porta di Vico and Roata Damascena. According to the local authority, the operation was justified by efficiency and cost reduction. From the logistic and organisational perspective, although after the merger the Santa Croce Hospital assisted also the patients who were managed by previous hospitals, the location of the main building remained the classic one until the final merger of 1743, which made the Santa Croce Hospital commissioning the realisation of a new building in Piazza district, that will be known as the Major Hospital of Mondovì and which will host all the structures, departments and activities of Santa Croce Hospital, definitely transferred from its historical site. From the accounting perspective merger of 1547 is interesting because it highlights the control that both the local and the spiritual authorities exercised on the financial flows of hospitals, even if they were managed by charity Confraternities, which suggests the social importance of hospitals and healthcare even in Medieval and Renaissance (Auerswald, 2009). Furthermore, this fact highlighted the importance of financial sustainability (Munro, 2003; Johnson, 2017) in those historical periods, many centuries before the actual healthcare dimension, in which financial sustainability is one of the major issues (Birch et al., 2015; Lee et al., 2023; Fontanella et al., 2024B) for healthcare system, especially those oriented towards public health models. This led to the elaboration of the following research questions.

- RQ1: Had the merger actually reduced costs, and how did it make it possible?
- RQ2: Had the merger actually increased efficiency in the management of financing flows, and how did it make it possible?

The research team expects a positive answer to both the research questions, supposing the element which helped in decreasing costs is the increased efficiency in the use of new infrastructure and know-how sharing. Regarding RQ2, the research team supposes that the merger decreased the number of organisations operating in the territory, without deleting them as entities. This could have led people not to stop their donations (one of the most important financing sources), but to concentrate them into only one big organisation, increasing the overall capital available and increasing, as a consequence, the efficiency of the financing process itself.

Starting from this evidence and by answering to the research questions, this paper contributes to the scientific literature not only by closing the literature gap previously identified, but also by providing an accounting analysis of the merger of Santa Croce Hospital of 1547, which analyses the previous situation and the new organisational structure of the hospital, highlighting with accounting data the reasons which led to the operation and, by analysing the years following the merger, if the expected results have been achieved. In doing this, the paper is an element of originality. Furthermore, this paper enriches the accounting history scientific literature about charity organisations and hospitals during the Medieval and the Renaissance periods. Finally, this paper aims to contribute to the open debate about hospital mergers for cost reduction (Dranove & Shanley, 1995; Harrison, 2011; Schmitt, 2017) by proposing the first accounting historical research which proposes the logic through which cost-effective choices were made, considering that hospitals were managed and conceived in a completely different way than nowadays. In doing this, the case of Santa Croce Hospital seems to forecast the future, showing that public interest was a major concern even in a society in which these topics were barely considered and there were no evolved public apparatuses designed to pursue it. Finally, the solution of hospital merger justified by economic and accounting reasons can be seen as a sort of application of accounting

genius oriented towards the improvement of the quality of a service which is crucial for the well-being and the protection of life of the whole community.
